A. I think about two weks after the boat was moved to Miami, Mr. Hawkins, of the Miami office, called me and said that Captain Baker, who was then looking at the boat, had a charter and he had to leave—

Q. That was a charter to Baker's own boat?

A. Yes. And he asked me if I could get an engineer and a sailor to stay on the boat and look after it.

Q. What did you do?

A. I employed Schlappi and Elliott Bryant.

Q. Did you consult with Mr. J. S. Phipps before you did that?

A. No.

Q. Who fixed the rate of Schlappi's and Bryant's pay at that time?

A. I did.

Q. Do you remember when Schlappi's was paid for the work he then did?

A. He received two checks, as I remember it; one along about the first of April and another one in May.

Q. I show you duplicate voucher 8032, which is a part of Exhibit 3-U, and ask you whether or not that includes the time that Schlappi spent on the boat when you engaged him and sent him to Miami.

A. Yes.

Q. In whose handwriting is that yellow slip attached to that paper?

A. It is my handwriting.

Q. When did you make that up with reference to the date of the voucher?

A. Well, either the same day the voucher was made or the day before.

Q. I notice that of the total sum paid to Schlappi, part of it is charged to the Seminole Boat Company, a part to Mr. J. S. Phipps, and a part to Mrs. F. E. Guest Boats. Will you tell me how that came about and why?

A. Well, the part that was charged to the Seminole Boat Company was the time that he was on the Seminole when it was at the Royal Palm Dock, and the part that is charged to J. S. Phipps Boats—there is a part of that charge due to the trip that was taken that spring, and I believe that some of this also includes a trip that was taken on the Iolanthe later. I am just trying to see whether there is another voucher here on that. No, there isn't.

Q. In the ordinary routine of your office when those vouchers were prepared, did the charges appear on them?

A. You mean on the original check?

Q. Yes.

A. No, they didn't.

Q. I show you another piece of paper; can you identify that?

A. This is the original voucher of the duplicate voucher paid to Schlappi on May 6th.

Q. That is number 8032?

A. Yes.

Q. In other words, this is the top half of the original part of the check that went to Schlappi?

A. Yes, sir.

Mr. Underwood:

I offer that and ask leave to include it in Exhibit 3-U.

Mr. Matteson:

No objection.

Mr. Botts:

No objection.

The Court:

Let it be included.

Q. Now, Mr. Riley, how did the employment of R. C. Abel first come about?

A. I employed him in 1933, in June I believe it was, and I employed him to run Mrs. Guest's boat to take Mr. Townsend Martin to Bimini.

Q. Was that Abel's first employment by anyone in the Phipps family at Palm Beach?

A. Yes, sir.

Q. And from that time on how was he employed?

A. Well, he was employed in that particular job for about two or three weeks. Then in the fall of the same year I employed him to run another fishing boat, the Clip, which belonged to Mr. J. S. Phipps; and then from then on he worked more or less steadily for the various members of the family and the companies until 1935, at the time of the fire.

Q. Have you obtained from the files of the Palm Beach Company all the checks and vouchers to Abel?

A. Yes, all that I could find.

Q. Are those they?

A. I see that he was employed a good deal longer than the two weeks I said; also, I remember that he was employed after Mr. Martin took his trip; he was employed for general work on the Dorothy, Mrs. Guest's boat, as it was then known.

Q. At the moment just tell us those are all of the Palm Beach Company's checks to Abel?

A. These are all of the checks that I could find payable to Abel.

Mr. Underwood:

If your Honor please, I offer the checks, and I think it may be well for me to read the numbers into the record so we will know what the exhibit includes.

The Court:
All right.

Mr. Underwood:
Numbers 4206, 4247, 4365, 4383, 4453, 4511, 4757, 4836, 4837, 4861, 4973, 5009, 5169, 5244, 5292, 5320, 7735, 7950 and 8320 to some of which are attached supporting memoranda.

Now, as a convenient summary of those, I have made an analysis which I shall offer merely as a convenient summary, with the understanding that if is not binding on anybody.

Mr. Matteson:
I suggest that it be attached to the exhibit, with the understanding that the analysis itself is not binding on anybody.

Mr. Underwood:
That is quite all right. It is in fact my statement of what the exhibit shows.

The Court:
That is all right.

(Thereupon the checks numbered above, together with supporting data and the analysis above referred to, were marked Respondents' Exhibit 3-D.)

Mr. Matteson:
If your Honor please, I simply would like to make this statement on the record: That all of these various documents that are being introduced might possibly be objectionable on the ground that they are self-serving declarations. I am not going to object to them on that ground because we do want to have all of the documentary evi-

dence here. I want to simply make the comment that I am going to argue that as going to the weight of the evidence rather than to its admissibility.

Q. Will you tell us, Mr. Riley, whether or not these were made in the ordinary course of business?

A. They were.

Q. Now referring to Exhibit 3-D, voucher number 4206, I notice that charge appears as against Townsend Martin. Will you tell us how that came about?

A. Abel was working for Townsend Martin at that time for that week.

Q. I observe that voucher number 4453 is charged to Mrs. F. E. Guest Boat. How did that come about?

A. Abel was working for Townsend Martin at that time for that week.

Q. I observe that Voucher Number 4453 is charged to Mrs. F. E. Guest Boat. How did that come about?

A. Abel was working on the Boat Dorothy which belonged to Mrs. Guest.

Q. On Voucher Number 4757 I notice that Abel's pay was charged to Mr. Bradley Martin. How did that come about?

A. Abel was working for Mr. Bradley Martin.

The Court:

Who is Mr. Bradley Martin?

The Witness:

Mr. Bradley Martin is the son of Mrs. Martin, who was a Miss Phipps.

(By Mr. Underwood):

Q. He would be a nephew of John S. and H. C. Phipps?

A. That is right.

Q. I notice on Voucher Number 5320 the charge is against Mr. John S. Phipps Boat. Will you tell me how that came about?

A. He was working on a boat that belonged to Mr. John S. Phipps, the Clip.

Q. Here again Voucher Number 7735 the charge is against Mr. J. S. Phipps Boat. How did that come about?

A. Because he was working on the boat Clip which belonged to Mr. J. S. Phipps.

Q. Now on Voucher 7950 there is a portion of the charge to Mrs. F. E. Guest Boat and a portion to Mr. J. S. Phipps Boats. How did that come about?

A. Part of the time he was working for Mrs. F. E. Guest and part of the time for Mr. J. S. Phipps on one of his boats.

Q. I notice that on Voucher 8320 the division is made in three parts: Seminole Boat Company, Mrs. F. E. Guest Boat and Mr. J. S. Phipps Boat. How did that come about?

A. He worked for the Seminole Boat Company—

Mr. Matteson:

I object to the statement that he worked for the Seminole Boat Company. I think the point is that he worked on the Seminole on that date. Isn't that what the witness means to say? I think that the statement that he worked for the Seminole Boat Company is a conclusion, and I move to strike that out.

The Court:

I understand the point you make. I think it is proper to go in, however.

Mr. Underwood:

Will you go back and read the answer, so much of the answer as you have—

(Thereupon the answer was read as above recorded)

(By Mr. Underwood):

Will you continue your answer, please?

A. He also worked for Mrs. F. E. Guest and for Mr. J. S. Phipps.

Q. Attached to the duplicate voucher is a yellow sheet of paper. In whose handwriting is that?

A. Mine.

Q. Do you remember when you made that?

A. The day that the check was drawn, June 29th, 1935.

Q. And who decided how much was to be charged to each of those three?

A. I did.

Q. On what basis did you reach that decision?

A. On the same basis that we always used; we divided the time according to who he was working for.

Q. And that check was made payable to Mrs. Abel?

A. Yes.

Q. For wages that were due Mr. Abel up to the time of his death?

A. That is right.

Q. Now in looking at this voucher 7950 I notice the total amount is $36.45, of which $32.62 is charged to Mrs. F. E. Guest Boat and $3.83 is charged to Mr. J. S. Phipps Boat. Can you tell me what that $3.83 was for?

A. This is reimbursement for expenses of $3.83. There is some items listed—for expenses of 95 gallons of gasoline bought—

Q. For what boat?

A. For the Clip that Mr. J. S. Phipps owned. And I suppose "repairs to water pump"—

Q. What boat?

A. To the Clip.

Q. All right.

A. Five dollars for some work on a Plymouth car for Mr. Phipps, and then deducted from that $23.83 is $20.00 that had been advanced to Abel, leaving a balance of $3.83.

Q. The advance to Abel of $20.00 was by whom?

A. From Mr. Phipps.

Q. Was any part of that $3.83 in connection with the Seminole?

A. No, sir.

Q. In giving your answers to the last few questions you had before you one of the supports attached to the duplicate of that voucher?

A. Yes, sir.

Q. Does that bear your initials?

A. Yes, sir.

Q. When were those initials put on with respect to the date of the check?

A. Probably the same day that we drew the check.

Q. Abel wasn't always paid by check, was he?

A. No.

Q. How otherwise was he paid?

A. Paid by Palm Beach Company payroll.

Q. Mr. Riley, I show you a number of documents here which have heretofore been marked Libelants' Exhibits for identification Nos. 70, 74, 71, 69, 68, 73 and 72. Do you recognize these?

A. Yes.

Q. What are they?

A. They are payrolls of the Palm Beach Company.

Q. Have you looked through the Palm Beach Company Payrolls to pick out all of those reflecting payments to Abel?

A. Yes.

Q. Is that all?
A. This is all.

Mr. Underwood:
I offer these several payrolls in evidence.

Mr. Botts:
Under the same conditions heretofore stated, we have no objection.

The Court:
Does that mean that at the conclusion of the taking of the testimony these are to be withdrawn, just leaving the memorandum in?

Mr. Botts:
After we examine them and we find anything in them which we think is not admissible, we can object to it at that time; further, if we have no objection to them, then at the end of the testimony we will probably agree to substitute this or some other summary, if we happen to find any errors in this summary.

Mr. Underwood:
That is satisfactory.

The Court:
Is that agreeable?

Mr. Botts:
Yes.

The Court:
They are admitted subject to your right to make any objections and also, unless it is otherwise made to appear that there is some reason why it should not be concluded

in that manner, the originals will be allowed to be withdrawn and the summary substituted in lieu of the originals.

Mr. Matteson:
That is all right.

The Court:
Let them be admitted under the identification numbers under the ruling that I have just made.

The Reporter:
Mr. Underwood, are you offering them. You will notice that they were offered for identification under Libelants' exhibit numbers.

Mr. Underwood:
I am offering them under their identification numbers.

(By Mr. Underwood):
Q. Now did Mr. Anderson at your and my request prepare an analysis of those showing the dates of the payroll, the amount paid to Abel and the persons to whom charged?
A. Yes.
Q. Is this a photostatic copy of it?
A. Yes, sir.

Mr. Underwood:
Now I will offer this as a convenient summary, with the understanding that it is not binding in any particular where it may differ from the payrolls themselves.

Mr. Matteson:
Just attach it to the exhibit, it being agreed that the summary is not in evidence.

Mr. Underwood:

That is right. It is simply for convenience, so that these gentlemen and your Honor will not have to wade through these payrolls.

(Thereupon the summary above referred to was attached to Libelants' Exhibit 68 for identification, as per above arrangement.)

(By Mr. Underwood):

Q. Now, Mr. Riley, we will take this top payroll, marked Exhibit 70. I will ask you to explain to us the ordinary course of business as to making up these payrolls and obtaining information as to the charge and to whom they were charged.

A. We had one man delegated in our office to make up the payroll, and at the end of the week the various foremen on the various jobs came in and reported to him on what jobs their men were working the preceding week. We also had a method of keeping a day by day record that these foremen used, and in most cases they turned in that record and this man made up the payroll. In some cases where a man was working by himself, such as a painter or a carpenter, he kept his own time and at the end of the week he came in and gave this man the information so that he could properly charge out his work for the preceding week.

Q. Now on this Exhibit 70 can you find a place indicating where Abel was paid?

A. That is where he signed for his money (pointing).

Q. That sheet is dated at the top "week ending June 13, 1935", and the line to which you point says, "Abel, R. C. Cap. (meaning captain), $35.00". Is that Abels' signature in the left-hand column?

A. Yes.

Q. Will you just show us how that was charged; against whom?

A. It was charged to H. Bradley Martin.

Q. Does that appear on some paper?

A. Yes, it appears on the distribution sheet, as we call it.

Q. Is there such a sheet for each payroll?

A. Yes.

Q. And that appears on the first distribution sheet, which is the second sheet following the one you just referred to?

A. Yes, sir.

Q. Will you read that?

A. Read this?

Q. The entry insofar as it refers to "Abel".

A. It has shown at the top, "H. Bradley Martin"; then at the side, under the caption "employee" is "Abel, R. C." Under classification "Captain", and then it shows Thursday, Saturday, Sunday, Monday, Tuesday, Wednesday, Thursday, eight hours each". And then it says, "week" instead of "hours", and the number of hours and $35.00.

Q. Under "rate"?

A. Under rate, and the amount $35.00.

Q. Was that made in the regular course of business?

A. Yes, sir.

Q. Will you tell me whether or not the same routine was followed as to the other employees?

A. Yes, it was.

Q. I notice charges up here to business expense—Plaza grounds; West Plaza Building No. 1; West Plaza Building No. 2, and so on. Will you explain how that was done, and whether there was any difference between the way the other men and Abel were dealt with?

A. What is the question.

Q. I just want to know the routine as to charging the pay of these other accounts; how they compared with the routine as to Abel?

A. Just exactly the same; that is just what I explained; that the man who made this payroll had a report from the foremen of the various men who worked for us, as to where they worked the preceding week, and from that he made up this distribution sheet, as we call it. This particular one has twenty-five different accounts on this payroll.

Q. That is, the pay to the men employed during that week was charged to twenty-five different accounts?

A. Yes.

Q. Of which Abel was one, and the sheet shows the charge to Bradley Martin?

A. Yes.

Q. Look on the following week; do you find Abel there?

A. Yes.

Q. That is on the yellow sheet for the week ending June 6, 1931?

A. Yes.

Q. It shows the same that it did before?

A. That is right, and the same amount—$35.00.

Q. Will you show us the charge for that?

A. The charge is here on the distribution sheet.

Q. Against whom?

A. H. Bradley Martin.

Q. Why?

A. Because Abel was working for him that week.

Q. Let's look at the following week or the preceding week, whichever it is. Take the preceding week. Do you find Abel on that?

A. Yes.

Q. To whom is his pay charged there?

The Court:

He didn't sign that, did he?

A. No, he didn't.

Q. Who did sign for it?

A. The pay-master signed "holding"; Abel was probably out of town and the pay-master held it out for him, so as to send—

Q. Whose initials are these following the word "holding"?

A. J. M. Goring.

Q. That stands for the name of one of the men in your office?

A. Yes.

Q. To whom was that charged?

A. It was charged to Mr. J. S. Phipps Boats.

Q. Why was that?

A. Because he was working on one of Mr. J. S. Phipps' Boats.

Q. Do you remember which one?

A. I believe on the Iolanthe.

Q. Will you look at the next week?

A. Yes; on the week of May 23rd.

Q. Show us how that was charged.

A. That was charged to Mr. J. S. Phipps Boats.

Q. Why was that?

A. Because he was working on one of Mr. J. S. Phipps' boats.

Q. Which boat?

A. It is awfully hard to remember exactly; I think it was the Iolanthe that he was doing some work on during that time.

Q. Is there any memorandum you have from which you could refresh your recollection as to exactly which boat he was working on?

A. No, sir.

Q. I notice under this charge the name "C. Hart, boatman"; who was he and what was he doing at that time, if you remember?

A. Now, I am sure that Abel was working on the Iolanthe, because he and Hart did some painting on the Iolanthe together.

Q. So he was working on the Iolanthe that week?

A. Yes.

Q. His pay was charged to whom?

A. To Mr. J. S. Phipps Boats.

Q. Why was that?

A. Because he was working on the Iolanthe; he did some maintenance work on the Iolanthe.

Q. Now on this summary, on the first page as well as on the second page, I find charges in September and October, 1934 to the Seminole Boat Company and others, Townsend and Bradley Martin, and one to Palm Beach Building Number 50, and one to Mrs. F. E. Guest Boats, and on the second page, a charge to Townsend Martin and Bradley Martin. Will you tell me what the routine was as to these and how it came about, and why the pay was so charged?

A. He kept his own time, and he came in and told this paymaster Goring at the end of each week who he had been working for, and Mr. Goring made up the payroll according to what Abel told sim.

Mr. Matteson:

If Your Honor please, I object to the statement that he was working for the Seminole Boat Company. I take it that the witness means—

The Court:

It is a technical objection. I will sustain the objection. You can bring that out later.

(By Mr. Underwood):

Q. I will ask him the question directly, if I may: who kept Abel's time?

A. He kept it himself.

Q. In the making up of the payrolls, in the ordinary course of business, here did the paymaster get his information as to the person for whom Abel was working?

A. From Abel.

Q. Now will you see if you can find the payroll for the week of September 20th, 1934.

(Informal recess was taken for three minutes.)

Q. Mr. Riley, have you found the payroll for the week of September 20th?

A. Yes, sir.

Q. Does Abel appear there?

A. Yes, sir.

Q. Will you indicate the place? The name is in typewriting, Rupert Abel.

A. Yes, sir.

Q. Is that his first name?

A. Yes, sir.

Q. And did he sign there?

A. Yes, sir.

Q. Now will you show how that was charged?

A. It was charged to Seminole Boat Company.

Q. Does that appear on the distribution sheet?

A. Yes, sir.

Q. Was that made in the ordinary course of business?

A. Yes, sir.

Q. Do you recollect what work he was doing at the time?

A. Can't be positive about it; I think though that he was doing some painting in the bilges.

Q. On what boat?

A. On the Seminole.

Q. And now can you find the week—

Mr. Matteson:

Are these entries in the book, in his handwriting?

Q. Are those in your handwriting?

A. No, sir.

Q. Do you know whose handwriting it is?

A. This is the handwriting of J. M. Gorham.

Q. And who is J. M. Gorham?

A. He is an employe, or was then, of the Palm Beach Company office.

The Court:

Why did Captain Abel get a different rate of pay on that week?

A. Well, I think you will find that during that summer he got $20 a week straight through.

The Court:

But he didn't work every day?

A. No he didn't work on Sundays. During the winter he got $35 a week, working seven days.

The Court:

And in the summer $20 a week?

A. And in this particular summer I think he got $20.

Mr. Underwood:

If your Honor please, that is reflected on the summary; in that column you see a string of $20, one above the other; one week apparently he got $40; no reason for that.

Mr. Matteson:

May I ask all the captions on that page are in the same handwriting?

A. Yes, sir.

Q. All the captions are?

A. Yes, sir.

Q. Now, will you turn to the week of September 27; did he sign that payroll?

A. Yes, sir.

Q. As Captain?

A. Yes, sir.

Q. Will you show us how that was charged?

A. That was charged to Seminole Boat Company.

Q. He worked four days that week?

A. Yes, sir.

Q. Do you remember why that was?

A. Well, he drew only two, so he must have worked somewhere else for the other two days. He worked the other two days on Palm Beach Company's building number 50.

Q. And against whom was his work on these two days charged?

A. To Palm Beach Company; we have separate charges for our various buildings, so it was charged to the Palm Beach Building number 50, maintenance.

Q. Why building number 50?

A. Because that is the building he was working on.

Q. Were those entries with reference to that week, made in the usual course of business?

A. Yes, sir.

Q. Now will you turn to the week of October 11th?

A. Yes, sir.

Q. He got a full week's pay, $20, that week?

A. Yes, sir.

Q. How was that charged?

A. It was charged, $5 to J. S. Phipps Boats.

Q. The other $15.

A. And $10 to the Seminole Boat Company, and $5 to Mrs. F. E. Guest Boats.

Q. Why was that pay split up that way?

A. Because those—he worked on J. S. Phipps Boats two days, he worked for the Seminole Boat Company three days, and for Mrs. F. E. Guest one day.

Q. Were those entries made in the regular course of business?

A. Yes, sir.

Q. I think that is enough for the moment, at least. Now who was it, over a period of years prior to the fire, who paid the bills for storage of the Seminole?

A. The Palm Beach Company.

Q. On whose authority?

A. On my authority.

Q. And who approved the bills?

A. I did.

Q. Did Mr. J. S. Phipps ever approve a bill for the storage of the Seminole?

A. No, sir.

Q. Are you familiar with the course of business in the payment of storage charges on the Iolanthe?

A. Yes, sir.

Q. Will you tell what that was?

A. Well, in the first instance I would approve the bill and then if Mr. Phipps was available I would submit that bill to him and he would approve it. In some instances he paid the storage with his own, his personal check; but in most instances it was paid by Palm Beach Company check.

Q. How about the Dorothy, Mrs. Guest's boat?

A. That followed the same course; I approved the bill, and I had an understanding with Mrs. Guest that,—what I mean is, that she knew what the rate was per month, and that I approved the bills and go ahead and pay them through the Palm Beach Company.

Q. I show you a file of four of Pilkington's bills and four checks, each covering storage on the Iolanthe. Will

you tell me whose checks that are, if the signatures—if you recognize the signatures.

A. Those are personal checks of Mr. John S. Phipps.

Mr. Underwood:

I may say for the record that those four have previously been marked Respondents' Exhibit K for identification.

Q. Then on those four instances Mr. John S. Phipps paid storage bills on the Iolanthe?

A. Yes, sir.

Mr. Underwood:

I offer these in evidence.

(The papers comprising Respondents' Exhibit K for identification were admitted in evidence and filed as Respondents' Exhibit K.)

Q. As far as you know, did Mr. John S. Phipps ever pay any storage bills on the Seminole, personally?

A. No, sir.

(Discussion was had off the record.)

Q. Mr. Riley, here are a number of Pilkington's bills which apparently include Palm Beach Company's vouchers. Will you look through those and see if you can identify those as Palm Beach Company's vouchers? I mean, the whole pile; that top bunch does not seem to be Palm Beach, it is Boulevard Mortgage Company.

A. Those are all Palm Beach Company vouchers.

Q. Those that bear "Palm Beach Company" in printing on them, are Palm Beach Company vouchers?

A. Yes, sir.

Q. Now can you look through here and find any Seminole Boat Company bills that bear your o. k.?

A. Yes, sir, here is one right here.

Q. That is a bill dated December 31, 1934?

A. Yes, sir.

Q. It covers charges on the houseboat Seminole?

A. Yes, sir.

Q. When did you put that o. k., JFR?

A. Prior to the time the check was drawn. Probably a week or ten days before.

Q. The check was drawn January 23, 1935?

A. Yes, sir.

Q. Now look at the next one underneath that; does that bear your o. k.

A. Yes, sir.

Q. That is for the week of January 31, 1935, and covers the Seminole?

A. Yes, sir.

Q. Now look at the next one, does that bear your o. k.?

A. Yes, sir.

Q. It covers the Seminole?

A. Yes, sir.

Q. Will you tell me whether or not that was the routine?

Q. Yes, sir, that is the routine.

Q. Did anybody else approve the Seminole Boat Company's bills for storage?

A. No one but me.

Mr. Underwood:

Now I will offer all this batch of Palm Beach Company checks and Boulevard Mortgage Company checks and Seminole Boat Company checks, which are previously described in the record, toward the end of the March hearing in some detail, giving the number of checks and the number of vouchers, as I recall; all being Pilkington's bills for storage, in some instances of the Seminole, in others of the Iolanthe, and perhaps the Dorothy and

possibly the Clip. Is there need to identify them any further?

Mr. Matteson:

With respect to these, I simply want to say that I reserve the right to comment on the weight and importance of the evidence, but I have no objection to them being marked as exhibits.

Mr. Underwood:

I see that the envelope has previously been marked Libelants Exhibit 75 for identification; I should have looked at that first.

The Court:

What will become of these at the conclusion of the hearing? Do you want to leave them in the record?

Mr. Underwood:

I think your Honor I will have to take the exhibits back to New York to write a brief on them.

The Court:

But I mean so far as the Court.

Mr. Underwood:

At the conclusion of the case I think on consent of all parties we will withdraw them so the Court files will not be encumbered with them.

(Discussion.)

The Court:

Without the necessity of putting in copies of each one?

Mr. Matteson:

It may be that the situation will be such that we would like to have the exhibits physically before the Court, when the Court comes to consider the case.

(Discussion.)

I am sure we can make satisfactory arrangements so the Court's files will not be unnecessarily encumbered.

(Libelants' Exhibit number 75 for identification, was admitted in evidence as an exhibit on behalf of Respondents, and marked 75 in evidence.)

Q. Now, Mr. Riley, you remember the fire on June 24, 1935?

A. Very well, yes, sir.

Q. What was the occasion of the engagement of, or the bargaining with John Thomas? Will you tell us what you had to do with that?

A. I think it was in April of that year, 1935, that Mr. John S. Phipps asked me if I could have made a rope netting, sort of a baluster, I support you would call it, or series of balusters made of rope, that went around the back end of a boat, from the rail down, and he wanted to have that made on his boat, the Iolanthe, and he asked me to see if I could find someone that could make it. So I didn't know of anyone, and I asked Abel if he knew of anyone. He said he wasn't sure but that he would see if he could find someone. And a while later, two or three weeks, he told me that he was sure that John Thomas could make such a netting, and that John Thomas was on the Keys fishing then, so I couldn't make any deal with him offhand. However he said that he thought John Thomas would make it for about,—I think it was twenty or twenty-five dollars. I wrote a letter,—Mr. Phipps was

not here at that time, so I wrote a letter to him and gave him the price and asked him if he would like to have it made; and he wrote back that he would.

Q. For what boat was that to be made?

A. Iolanthe.

Q. Did you ever deal directly with Thomas on that?

A. No, sir.

Q. Had Thomas ever been employed by any of the companies for which you from time to time performed services?

A. No, sir.

Q. There is on your payrolls I think the name of John Thomas?

A. Yes, sir.

Q. Can you tell us how that comes about?

A. He is a colored employe, has been with Mr. J. S. Phipps on his estate for the past ten or twelve years.

Q. That is not the same man?

A. No, sir.

Q. Now on the morning of June 24, 1935, you saw Abel?

A. Yes, sir.

Q. Did you have—issue any instructions to him?

A. Abel came in about nine o'clock on that morning, he had been doing some painting on the Iolanthe, the week previous and up to the day before. It was raining on this particular morning; he came in and said he couldn't do any painting. I said, "Well, it might be a good day to go down and inspect the Seminole, then, and if you will wait about half an hour I will go with you." So he left the office, went over to West Palm Beach on some errand, and telephoned from West Palm Beach that he had run into John Thomas, and that John Thomas would be leaving again for the Keys in a few days, and would I like to take him along with us so that he could see the rope netting on the back of the Seminole, and get

an idea of how to make one for the Iolanthe. I told him I thought that was a good idea, but since we didn't have anything but a coupe to ride in, I thought I wouldn't go down, the two of them could go. I told him to come back by the office, so he did, and I gave him a check made out to Pilkington for $10. This check represented the difference between $50 per month,—or $50 check that I had sent Pilkington for storage on the Seminole and the $60 a month which he had agreed to accept rather than $75 a month that he had asked. Also I gave him a note to Mr. Pilkington asking him to allow Abel to go on the Seminole, and also to remove certain fishing tackle or equipment, also just before he left he asked me about gasoline for his car and I told him to go down and fill it up; and he said how charge it, I said "Seminole Boat Company"; and he left shortly thereafter.

Q. I show you check of Palm Beach Company, number 8297 in the sum of $10 which has been marked Libelants' Exhibit number 59-A and is a part now of Exhibit 75. Can you tell me whether or not that is the check you gave Abel on that day?

A. Yes, sir, that is the check.

Q. How was that charged?

A. Charged to Seminole Boat Company.

Q. I show you paper which apparently bears no date, which has heretofore been marked Libelants' Exhibit 60; please tell us whether or not that is the paper you sent to Abel to give to Captain Pilkington?

A. Yes, sir, that is.

Q. Is that your signature?

A. Yes, sir.

Q. What was the material you speak of Abel was to bring back?

A. There was some glass bottom buckets, and grains and gaffhooks.

Q. Who owned that property?

A. Seminole Boat Company.

Q. Now before that conversation and those instructions to Abel that morning, had you had any conversation with Mr. John S. Phipps on that subject?

A. On what subject? You mean the—

Q. On the subject of Abel's going to Lauderdale, to the Seminole?

A. No, sir.

Q. Was Mr. J. S. Phipps in Palm Beach or thereabouts at that time?

A. No, sir.

Q. Do you know where he was?

A. I am not sure, I think at New York.

Q. So far as you know was there any fishing trip in prospect for Mr. J. S. Phipps at that time?

A. No, sir.

Q. Had you received instructions to do anything whatever in reference to any fishing trip for Mr. J. S. Phipps at that time?

A. No. None at all.

Q. Did you give Abel anything else besides the check and the note?

A. No, sir.

Q. Did you give him any keys?

A. No, sir.

Q. Did you have the keys to the Seminole, at Palm Beach?

A. No, sir.

Q. Mr. Riley, I show you Respondents' Exhibit S. Will you tell me when you first saw that?

A. Is this the original or the duplicate?

Q. You look at it and tell me. You might tell by looking on the back.

A. This is the original.

Q. Let me ask you then,—I will take that back; show you Respondents' Exhibit S-1. Tell me when you first saw that.

A. Between the first and tenth of July, 1935.

Q. Under what circumstances?

A. I was checking a bill, gasoline bill for this Palm Beach service station.

Q. Do you know R. C. Abel's signature?

A. Yes, sir.

Q. Can you tell me whether R. C. Abel's signature appears on that paper?

A. It does.

Q. Well, when you first saw that slip, will you tell me whether or not the words beneath "R. C. Abel", the words "Seminole Boat Co." were on it?

A. They were, yes, sir.

Q. What did you do about that when you saw that paper?

A. I went down to see the owner and manager of the Palm Beach service station and asked him if he had the original.

Q. What is his name?

A. Mr. Hawkins.

Q. Is he in Palm Beach now?

A. Yes, sir.

Q. What is his business there now?

A. He is in the service station business.

Q. What is the name of the service station, and where is it?

A. It is the Royal Park Garage, located on County Road in Palm Beach.

Q. Is it a Shell station now?

A. Yes, sir.

Q. Now when you went down and put that question to him what did he produce, if anything?

A. He produced the original.

Q. I show you Respondents' Exhibit S. Can you tell me whether or not that is the paper he produced?

A. Yes, sir.

Q. At that time?

A. It is the paper.

Q. Can you recognize the signature there?

A. Yes, sir.

Q. Is that Abel's signature?

A. Yes, sir.

Q. Can you tell me whether or not the words "Seminole Boat Co" were on that original when you first saw it?

A. They were.

Q. Did you write those words "Seminole Boat Co."?

A. No, sir.

Q. Did you see anybody write those words?

A. No.

Q. Mr. Riley, I show you Pilkington's Exhibit number 7 and ask you if you can identify those.

A. Yes, sir, I can identify those.

Q. What are they?

A. They are gasoline tickets and slips, all signed by R. C. Abel.

Q. I notice that some of them bear other words; for example, slips for January 2, 1935, bears up at the top "Chry coupe". Does that mean Chrysler coupe?

A. Yes, sir.

Q. Did that have a particular significance?

A. Yes, that indicated the charge.

Q. Can you tell me what the ordinary course of business was as to these gasoline purchases by Abel?

A. When the bill came in the charges were made in accordance with the car that was written on the slip, in other words whoever owned that car was charged with it,—with the gasoline.

Q. What had your instructions to Abel been on that subject?

A. It was to indicate the car that he was putting the gasoline in.

Q. Now I notice some of these do not bear any such indication. Was that a departure from the ordinary course of business, or was there some understanding about that?

A. Well, he had an allowance of five gallons of gas a week to put in his own car.

Q. To whom was that charged?

A. That was charged to J. S. Phipps.

Q. What was the routine?

A. Well, on those that have no name,—some of them do; I know this is for Chevrolet coupe, which was a car that belonged to him. Those were all charged to J. S. Phipps.

Q. Do I understand then that when he put no name on them, they were charged to J. S. Phipps; and when he designated his own car, they were charged to J. S. Phipps?

A. Yes, sir.

Q. When the charge was to be made otherwise, who—he was supposed to designate it on the slip?

A. Yes, sir.

Q. Getting back to the day of the fire, did you have any conversation with John Thomas before the fire?

A. No, sir.

Q. Did you give him any instructions either oral or in writing?

A. No, sir, I don't remember ever seeing John Thomas until after the fire.

Q. Now what was the first you knew of the fire?

A. The newspaper there in West Palm Beach telephoned the office and told me about it.

Q. What did you do?

A. Well, by the time I hung up the receiver, Mr. Pilkington was on the other line, and he told me about the fire.

Q. What did he say?

A. —and explosion. There was an explosion right after Abel and his friend went aboard; he wasn't positive that his friend went aboard at that time, but he said that he did, and that the whole boatyard was on fire.

Q. What did you do?

A. I left in about fifteen minutes or twenty minutes and went to Ft. Lauderdale.

Q. Did you see the Seminole when you got there?

A. Yes, sir.

Q. Was she burning still?

A. She was burning in the bowel and there was smoke still coming out of the engine room part, about amidship, I don't know just where the fire actually was coming from.

Q. Was she sunk yet?

A. No, sir.

Q. What time of day did you get there?

A. 3:50 I believe; 3:45, right around that time, nearly four o'clock.

Q. Did you see the Seminole off and on for the balance of that day?

A. Yes, sir.

Q. I show you photographs; do you identify that as a photograph of the Seminole taken that afternoon.

A. Yes, sir.

Q. Can you approximate the time when that was taken?

A. Well, it was either just before I left or just after I left.

Q. Did you see the photographer there?

A. No, sir, I didn't.

Q. Does that fairly represent all you saw?

A. Yes, sir.

Q. At about the time you got there?

A. Yes, sir.

Mr. Underwood:

I offer that in evidence.

(The said photograph was admitted in evidence and marked Respondents' Exhibit 3-W without objection.)

Q. Just one more question about it: These white streaks across the picture there on the left, what are they?

A. That is the water from the fire hose.

Q. I show you another one, Mr. Riley. Can you state the same thing about that?

A. Yes, sir.

Mr. Underwood:

I offer that in evidence.

(The said photograph was admitted in evidence without objection and marked Respondents' Exhibit 3-X.)

Q. Now these two exhibits 3-W and 3-X,—is the large boat in the right hand side of each of those pictures the Seminole?

A. What is left of her.

Q. I show you another picture; can you say the same thing of that?

A. I would say this picture was taken later than those.

Q. Taken the same day?

A. Yes, sir.

Q. The same afternoon?

A. Yes, sir.

Q. Is that the Seminole?

A. Yes, sir, this is right here.

Q. That photograph of a man without coat standing on the stern of the boat, is that the Seminole he is standing on?

A. Yes, sir.

Q. The boat beyond is apparently a car-float of some kind?

A. A barge.

Mr. Underwood:

I offer that.

(The said photograph was admitted in evidence without objection and marked Respondents' Exhibit 3-Y.)

Q. Mr. Riley, I show you another general view, was that taken that afternoon?

A. Yes, sir.

Q. Is the Seminole in there?

A. Yes, sir.

Q. The boat in the foreground, if you call that the foreground, is not the Seminole?

A. No, sir.

Q. But beyond her lies the wreckage of the Seminole?

A. Yes, sir.

Mr. Botts:

There are two men in there—there are three men in there; the hulk directly beyond the man in the middle is the hulk of the Seminole, is that correct?

A. Yes, sir.

Q. The boat in the foreground bears the name, San Cristobal?

A. Yes, sir.

Mr. Underwood:

I offer that.

Mr. Botts:

No objection.

(The said photograph was admitted in evidence and marked Respondents' Exhibit 3-Z.)

Q. Now did you see Captain Pilkington there when you got there?

A. Yes, sir.

Q. Did you have a conversation with him?

A. Yes, sir.

Q. Did you have a conversation with him about the cause of the fire?

A. Yes, sir.

Q. What is your recollection of what he said?

Mr. Matteson:

If your Honor please, for what purpose is this offered?

Mr. Underwood:

All purposes. We offer it as an admission against interests, which is admissible to prove the facts stated by the person making the admission.

Mr. Matteson:

I object, if your Honor please, to any statement by Captain Pilkington at that time, on behalf of Libelants, as not binding on them in any way, shape or form; incompetent, immaterial and irrelevant.

Mr. Botts:

So far as I am concerned I assume that this is probably the same circumstance that Mr. Hawkins testified about; and I think it would be admissible as to my client, under the same circumstances as that would.

(Legal discussion was had.)

The Court:

I shall rule the evidence is competent as against Pilkington and not competent as against the Libelants; subject to a change of ruling on arguments presented, or of the Court's own motion, to make the ruling consistent.

Mr. Underwood:

I shall at the proper time, submit authorities on it.

(The preceding questions and answers were read.)

A. Well, about five minutes after I got to the boat yard I went in to see Captain Pilkington and he was in a room,—well, the office and the room were sort of all one. And I asked him if he had any idea what caused the fire. He said he couldn't understand; that Abel and his friend had gotten the keys at his house, and that he saw Abel go aboard and didn't see the friend go aboard, and that is about four or five minutes there was this explosion that started the fire, that burned the whole boat yard; that he just couldn't understand why there was an explosion because he knew there was no gasoline aboard.

Q. Was anybody else present at that conversation?

A. No, sir.

Q. Were you present with Captain Pilkington when Mr. Hawkins and Mr. Webber were there?

A. Part of the time, yes, sir.

Q. And did you hear Captain Pilkington make any statement about the cause of the fire, when Mr. Webber and Mr. Hawkins were there?

A. Yes, sir.

Q. Was there anybody else there?

A. I don't remember anyone else.

Q. Well, will you tell us what you remember hearing Captain Pilkington say at that time?

A. I remember him saying that he couldn't understand the cause of the fire, because he knew there was no gasoline aboard the Seminole.

Q. That was in the presence of Mr. Hawkins, Mr. Webber and yourself?

A. Yes, sir.

Q. Do you remember him saying anything else at that time?

A. No.

Q. Were you there all the time?

A. No.

Q. What were you doing about that time?

A. I had already talked to Pilkington; I took Hawkins and Webber in to meet him and I wasn't interested in listening to the reasons any more; I was trying to find where this fellow Thomas was; I had understood that they had taken him to a hospital, and I was trying to get information about him.

Q. Were you in the room all the time that Pilkington was talking to Hawkins and Webber?

A. No, sir.

Q. Did you do anything about Thomas that afternoon?

A. Yes, sir.

Q. Tell us what you did?

A. I went to the hospital, found him in a room with four other patients,—three or four other patients and talked to him as best I could. Of course he wasn't very coherent, and I also talked to his wife, who was there, and at the time I went in nothing had been done about his wounds at all; he had a broken leg and a very bad cut back of his ear,—his head. And so I said something should be done. His wife wanted to give him a private room right away; so I telephoned Mr. Alley in West Palm Beach and asked him for authority to guarantee the hospital bills; that was what was holding the hospital up, they didn't know who was going to pay the bill.

Q. Did you get authority from Mr. Alley?

A. Yes, sir.

Q. What arrangement did you make?

A. I talked to the head nurse, or the owner of the hospital, I don't know which she was, and told her to give him a private room right away, to have a day and

night nurse; and I also talked to the doctor, Doctor Blount, and instructed him to get all that he needed, if he thought that he needed to consult about it, to bring in—some other doctor.

Q. Do you remember how many different times you talked to him that day or saw him?

A. That was the only time I talked to him or saw him.

Q. Did you attempt to discuss the origin of the fire with him?

A. I asked him if he knew what happened.

Q. I don't think you should be permitted to say what Thomas said. Did you attempt to discuss with him the origin of the fire?

A. I tried, yes, sir.

Q. Did you get anything coherent in the way of an answer?

Mr. Botts:

Objected to as calling for a conclusion of the witness.

(Discussion by counsel.)

Mr. Matteson:

This was at what time?

Q. Can you fix the time?

A. Between four-thirty and five o'clock.

The Court:

I think he can testify.

Mr. Botts:

I will withdraw the objection.

Mr. Matteson:

I have no objection.

(The question was read.)

A. No.

Q. Did you see him during the evening?

A. No, sir.

Q. Now it has been brought out Mr. Riley, before you testified here today, that following that time the Palm Beach Company has made various payments to doctors, nurses and others in connection with Thomas' injuries, and various payments to Thomas himself from time to time. Will you tell me whether or not you ever had any agreement with Thomas as to how much is to be paid to him, or how long he is to be paid, or anything of that sort?

A. No agreement at all; no, sir.

Q. Tell me whether Thomas has ever advanced and claim against the Seminole Boat Company or any of the Phipps family.

A. None whatever.

Q. Has he ever said that he had a claim?

A. No, sir.

Mr. Matteson:

Of course he is speaking, so far as his knowledge goes.

Mr. Underwood:

To him, or within his hearing, that is right.

Q. And so far as you know is there any agreement of any nature with Thomas as to compensation for his injuries?

A. None at all that I know of.

Q. Did you make any arrangements about the recovery of Abel's body?

A. Yes, sir.

Q. Tell us as briefly as you can what you did as to that.

A. Well, on the day of the fire, that night, after the fire department couldn't do anything else, I attempted to

get located a pump, to pump out the hull of the Seminole, so that we could get the body.

Q. Were you able to do that that night?

A. I wasn't, no.

Q. Now did you employ a diver?

A. I did the next day, yes, sir.

Q. That was Carl Holm?

A. Yes, sir.

Q. What did he do?

A. Well, he did some diving for about two or three hours,—about three hours, I think.

Q. Did you make any agreement with him?

A. Yes, sir.

Q. What was the agreement?

A. The agreement was that I would pay him $10 an hour.

Q. How much did you pay him?

A. I paid him $50.

Q. Cash or a check?

A. Cash.

Q. And he did not succeed in recovering the body?

A. No, sir.

Q. Then did you engage anybody else to do any work on the Seminole?

A. Yes, I engaged Captain West, who had a barge and a pump.

Q. Before you did any of these things, did you have any conversation or instructions from John S. Phipps?

A. No, sir.

Q. Did West bring his pump?

A. Yes, sir.

Q. And he pumped on the Seminole?

A. Yes, sir, he pumped out the Seminole. That was the second night after the fire.

Q. That was Tuesday night?

A. Yes, sir.

Q. And were you there when she floated?

A. Yes, sir.

Q. About when was that?

A. About 1:30 or 2:00 o'clock in the morning.

Q. Were you there the following morning, Wednesday morning?

A. Yes, sir.

Q. And briefly what transpired that morning?

A. Well, at about 2:00 o'clock the night before, they decided not to pump any more. Went into Ft. Lauderdale, and came back about six in the morning, five-thirty or six. And they still hadn't started pumping again, and I sat in the car and went to sleep, about, I reckon six-thirty or seven, Carl Holm woke me up, told me he had found indications of the body. And then I arranged to have the body removed.

Q. Were you there when pumping stopped early on Wednesday morning?

A. Yes, sir.

Q. And were you there during the time between the beginning of the pumping job and the time pumping stopped early Wednesday morning?

A. Yes, sir, I was there.

Q. And where were you during that time?

A. I was in the car.

Q. Were you on the boat at all?

A. No.

Q. The body was removed on Wednesday morning?

A. Yes, sir.

Q. After the removal of the body did you see Holm do anything with reference to the parts of the wreckage of the Seminole?

A. Yes, sir, I did.

Q. What did he do?

A. I saw him use a hack saw, I think it was a hacksaw, or a file, to mark some valves that he had taken off the boat.

Q. Did he remove some part of the boat?

A. Yes, sir.

Q. Did anybody ask your permission to remove those parts?

A. No, sir.

Q. Did you give anybody your permission to take anything off the Seminole?

A. No, sir.

Q. Now, what were you doing when you saw Holm using a hacksaw?

A. I was talking with Schlappi and another man, I don't know what his name was, on the porch of Captain Pilkington's house.

Q. Who had arranged with Schlappi to come down?

A. I had.

Q. Did you talk with Mr. John S. Phipps before you did that?

A. No, sir.

Q. What did you bring Schalappi down for?

A. Captain Holm suggested that I have him come down, because Schlappi knew the various outlets in the hull of the Seminole, and could help them by pointing them out so they could stop them up before they started pumping.

Q. Did you engage Holm for any purpose other than to dive for Abel's body?

A. No, sir.

Q. Did you request of him a report on any subject?

A. No, sir.

Q. Did you have any discussion with him about a report on any subject?

A. Not on that day, no, sir.

Q. Well, when was it, and what was it?

A. On Wednesday I went down to Ft. Lauderdale, and as I was leaving I saw Holm and he called me over and said "Would you like to read a report on—my report on

the accident?'" I said, "Yes, I would." And I read the report. It was addressed to Mr. Miller; and after I finished, he asked me if I would like to have a copy of it and I said I would. About four or five days after that I received a copy in the mail, from him.

Q. I show you Respondents' Exhibit number 1, ask you whether or not that is the receipt you got from Carl Holm for the $50 you paid him?

A. Yes, sir, that is the receipt.

Q. I show you Respondents' Exhibit number 2 and ask you whether or not that is the report you got from Holm.

A. Yes, sir, that is the report.

Mr. Underwood:

I will say for the record, those pencil marks on there are of my own making.

Q. Now do you know whether Mr. Alley is an officer of the Seminole Boat Company?

The Court:

Is that in evidence. (Discussion.)

Mr. Underwood:

The receipt apparently is not marked for identification, but the report is.

The Court:

Do you offer it now?

Mr. Underwood:

No, sir.

(The last question was read.)

Q. Did you know that in April 1931 when you received certain instructions from him that you have mentioned?

A. Yes, sir.

Q. Were there any other corporations or persons for whom you performed services at Palm Beach, beside the Palm Beach Company?

A. Yes, sir.

Q. And has a list been prepared of those?—I show you Respondents' Exhibit 3-S, is that the list?

A. Yes, sir, this is the list.

Q. Will you tell us for the record the nature of the duties you perform for the other companies and individuals indicated in that list,—not in detail; but in a general, brief way.

A. I didn't get the first part of that question.

(The question was read.)

A. Well, I did have charge of maintaining buildings, developing property; I have done some landscaping on various developments, and on the estates; I managed and handled the automobiles of the corporations and individuals, boats of the corporations and individuals. That pretty well covers it if you don't want to go into detail.

Q. Now, Mr. Riley, Captain Pilkington has testified that after the Seminole was laid up in April, 1935, you telephone Pilkington and asked him whether the Seminole had been put under the shed, and that he said that she not been and that he had no keys with which to get in her, and that you said you would get the keys. Will you tell us whether or not such a conversation took place?

A. Yes, sir.

Q. What was the substance of it?

A. I telephoned him and asked him if the Seminole had been put under the shed, and he said, No, that it hadn't,

that for one thing he had to arrange his boats so he could get the Seminole in for permanent berth,—in her permanent berth. And he also said that he didn't have the keys and I says "Well, I will arrange right away to get them to you; I don't have them either." And immediately upon—after talking with him, I called Miami and talked to Mr. Webber, and asked him if he would get the keys up to Mr. Pilkington right away.

Q. Do you remember when that was?

A. I am not sure, I would say two or three days after the boat was put there for storage.

Q. Now from that time on until the time of the fire, did you have any discussion with Captain Pilkington about keys?

A. None.

Q. Neither he nor Mrs. Pilkington asked you about keys?

A. No, sir.

Q. Either orally or in writing?

A. No, sir.

Q. Did you see Captain Pilkington between the time of that conversation and the time of the fire?

A. No, sir.

Q. Did you see Mr. Pilkington in that interval?

A. Yes, sir.

Q. Did she say anything about keys?

A. No, sir.

Q. What was the substance of the subject under discussion when you saw her?

A. About the rate that they were going to charge on the Seminole for storage.

Q. You were discussing the Seminole?

Q. But nothing was said about keys?

A. No, sir.

Q. Did you ever say in substance to Captain Pilkington that you would be down to inspect the Seminole at any particular interval?

A. No, sir.

Mr. Matteson:

Just a minute. You are referring to some specific statement of Captain Pilkington's as to what Mr. Riley said. I think you ought to refer to specific statements there instead of just in a general way.

(Discussion between counsel.)

Mr. Matteson:

I have no objection.

A. No, sir.

Q. Captain Pilkington testified that on one or two occasions Abel had removed gasoline from the Seminole by means of a can, and that he had told Abel not to do that, and refused to let Abel work on the boat because he had done it; and that he told Abel to tell you that Abel could not work on the boats because he had done it; and then that you phoned and told Pilkington to put the Iolanthe outside of the shed so she could be brought to Palm Beach, where Abel could finish the work. Did any such thing occur?

A. I never heard of that, sir.

Q. Did you ever have a conversation with Captain Pilkington about Abel's taking gasoline out of one boat and putting it in another, or taking gasoline out of the Seminole?

A. No, sir.

Q. Mrs. Pilkington has testified that she saw you on the Tuesday or the Thursday before the fire, to return a $50 check; is that the fact?

A. Yes, sir.

Q. Can you fix the date?

A. No, sir, I can't.

Q. Now she testified that on that occasion you told her that Mr. Phipps didn't want to pay $75; is that a fact?

A. No, sir.

Q. Now, Mr. Patten,—do you know Captain Patten?

A. Yes, sir, I have seen him up there; I saw him here in Court.

Q. He has testified that he had a conversation with you on the day after the fire, in which you told him that you were Mr. John S. Phipps' secretary; is that the fact?

A. No, sir.

Q. He also testified that you said that if you had not been so busy you would have come down with Abel and the explosion would not have happened; is that right?

A. I don't recall talking to anybody at all; if I did talk about the fire I probably said there that I was very glad I didn't come down; because I was.

Q. Did you ever tell anybody you were Mr. Phipps' secretary?

A. Never; I never have been Mr. Phipps' secretary.

Q. Mr. Riley, I show you another photograph; can you tell me whether that is a photograph taken of the Seminole after the fire?

A. Yes, sir.

Q. Do you know about when that was taken?

A. In August, I believe, 1935.

Q. Could you identify the place in the engineroom where that is?

A. It is on the forward bulkhead of the engineroom, on the starboard side.

Mr. Underwood:

I offer that.

(Said photograph was admitted in evidence without objection and marked Respondents' Exhibit 4-A.)

Q. I show you another photograph; was that taken at the same time?

A. Yes, sir.

Q. Is this bulkhead here on the left, the forward bulkhead of the engineroom?

A. Yes, sir.

Q. That photograph is looking from the port to the starboard side?

A. Yes, sir.

Mr. Underwood:

I offer that.

Mr. Botts:

No objection.

(The said photograph was admitted in evidence and marked Respondents' Exhibit 4-b.)

Mr. Underwood:

You may cross examine.

Cross Examination.

By Mr. Matteson:

Q. Mr. Riley, would you mind taking this sheet of paper and writing your name at the top?

(Witness writes on paper.)

Now would you mind writing "Seminole Boat Company" underneath that?

(Witness writes.)

Will you do it once more for me.—I ask to have this marked for identification.

(Said paper was marked Libelants' Exhibit 107.)

Q. Now I would like to go through these vouchers, Mr. Riley, taking up the file, the latest file, of checks dated in '35; the first bill of Captain Pilkington in that file was dated December 31, '34?

A. Yes, sir.

Q. I take it that that "o. k. JFR." in the lower right hand corner was written by you?

A. Yes, sir.

Q. Now I will ask you about the words "Seminole Boat Co." to the left, was that written by you or not?

A. No, that is not written by me. I think by J. M. Gorham.

Q. He was one of the men in the office?

A. Yes, sir.

Q. What position did he hold?

A. He was paymaster; he drew all the checks and did quite a bit of the bookkeeping.

Q. What was his relation with Mr. Anderson, who has been referred to?

A. Well, he was Mr. Anderson's assistant.

Q. Now, while we are at this point in the trial, this check 7402 is the lower half of a document that was all in one piece to begin with.

A. That is correct, yes, sir.

Q. And the sheet immediately under it is made at the same time as the original check by carbon, is it not?

A. Yes, sir.

Q. What do you call the upper half of the check, that is torn off? Is there a name for it?

A. No, we don't have any name for it; it is principally to tell the person who receives the check what bill we

are paying. In other words we give this description on the original, so that a person being paid will know what bill is being paid.

Q. So on the upper half of the check you write a description of the item which is being paid?

A. Yes, sir.

Q. And that is transmitted by carbon to the duplicate and triplicate copies, is that right?

A. Correct.

Q. Now I call your attention to the fact that on this duplicate copy of the words "Charge Seminole Boat Company, $50." appear to be in original typewriting?

A. That is correct, yes, sir.

Q. They do not appear on the original voucher?

A. No, sir.

Q. So that the document that went to the payee would contain a description of the item which was being paid, and attached to that, a check in payment of the item, but will contain no reference to the initial charge with respect to the item?

A. That is correct.

Q. All they would know about that, that they had gotten a check from the Palm Beach Company for that item?

A. That is correct.

Q. And the nature of the charge was reserved and put on the duplicate and triplicate copies, and that was entirely a matter of pure internal office record?

A. Yes, sir. There are two very good reasons for that, if you would like to know them.

Q. Well, that is all right. Now referring again to this duplicate voucher 7402 I see that the lower portion, what is the carbon of the upper half, there are various headings under which initials appear.

A. Yes, sir.

Q. Under "Extensions checked", what are those initials there?

A. That is J. M. Gorham. That is the man that signed this, made the charge.

Q. The same man that wrote the "Seminole Boat Co." on the bill?

A. Yes, sir.

Q. Those initials are supposed to be J. M. G., I think?

A. Yes, sir.

Q. And are these the same initials under the word "entered"?

A. Those are the same.

Q. And under the word "Certified correct" what initials are those?

A. E. J. Anderson.

Q. And under "Approved for payment" what are those initials there?

A. Those are E. J. Anderson, R. C. Alley and H. W. Robbins.

Q. In each case the initials appear?

A. Yes, sir.

Q. And not the full names. Who is H. W. Robbins?

A. H. W. Robbins in our New York office, and he signs main account checks to reimburse our paymaster account checks.

Q. So this HWR is put on after it reaches New York?

A. Yes, sir.

Q. You make duplicate and triplicate copies, do you?

A. Yes, sir.

Q. And each copy—which copy do you send to New York?

A. The duplicate; we keep the triplicate.

Q. So that this particular document that is here, apparently came from the New York files, is that right?

A. Yes, sir.

Q. Now from the initials appearing on this particular slip, it would appear that when the document was prepared, that is, when the voucher was prepared, the extensions were checked by J. M. Gorham?

A. Yes, sir.

Q. I suppose that would be the first operation?

A. Yes.

Q. Before anything else was done?

A. Yes, sir.

Q. Then which would come next, the "Certified correct" or "approved for payment"?

A. Well, the "extensions checked" and the "certified correct" would be the next, and then "approved for payment", and then "Entered" would be the last.

Q. "Entered" would be the last?

A. Yes, sir.

Q. So the initials JMG, under the word "Entered" indicates Mr. Gorham is the man who actually made the entries in the books, is that right?

A. Yes, sir, that is correct.

Q. This Pilkington bill dated January 31, '35, the initials "O. K. JFR" are yours, is that right?

A. Correct.

Q. On this bill February 28, '35, the initials "O. K. JFR" is that your writing?

A. Yes, sir.

Q. And the "Seminole Boat Co."

A. Is my writing.

Q. In each case it is your writing?

A. Yes, sir.

Q. On this bill of Mr. Pilkington dated May 1, '35, is written "O. K., JFR." Is that yours?

A. Yes, sir.

Q. Is "Seminole Boat Co." yours?

A. That is my writing, yes.

Q. And here is a bill dated December 31, 1930, this contains some writing, this bill relates to storage on the Iolanthe?

A. Yes, sir.

Q. This writing, "Too much; write and try to get better rate. JSP." Is that Mr. Phipps' writing?

A. Yes, sir.

Q. And the initials "JFR" are yours?

A. That is my writing.

Q. And the "O. J. J. S. P." is Mr. Phipps?

A. Right.

Q. Who is this, "J. S. P. Boats"?

A. That is my writing, that is the charge.

Q. Now there is one that was marked Pilkington Number 5 for identification, a bill dated April 30, '31; "Charge Seminole Boat Company" written in ink; is that yours or someone else's?

A. I think that is mine; yes, I am sure it is mine

Q. Now here is a bill dated March 31, 1931, in which there is a note at the bottom "Have talked to Pilkington" and at the bottom signed "JFR"; is that all your writing?

A. Yes, sir.

Q. That relates to the Iolanthe, I believe?

A. Yes, sir.

Q. Now on this bill of May 31, '31, written in pencil, "Charge Seminole Boat Co.", is that yours?

A. Yes, sir.

Q. I notice on this bill of May 31, there is an item relating to v21215 and after it is written the word "Clip". Are they the same boat?

A. Yes, sir.

Q. Is the word "Clip" in your own handwriting?

A. Yes, sir.

Q. And the initials "JFR"?

A. Yes, sir.

Q. And the quotation "O. K. J. S. P." is Mr. Phipps'?

A. Yes, sir.

Q. This bill of June 30, '31, is "Seminole Boat Co." written by you?

A. Yes, sir.

Q. And June 30, '31, "Charge J. S. P. Boats" is that written by you?

A. Yes, sir.

Q. August 31 ,'31, the bill, "Charge Seminole Boat Co." is that yours?

A. Yes, sir.

Q. On September 30, '31, "Charge Seminole Boat Company", in pencil, is that yours?

A. Yes, sir.

Q. And this August 31, '31, "Charge J. S. Phipps Boats" is that yours?

A. I believe so. This is a little larger writing than I usually do, but I think that is mine.

Q. On this bill dated August 31, '31, someone has written in the lower left hand corner "J. S. Phipps Boats"; do you know whose that is?

A. I am not positive; I think it is the writing of—I think the same person wrote that that signed the initials "EE", but I am not sure of it.

Q. Who is that?

A. She was the stenographer, Ethel Edwards.

Q. And this bill of October 31, '31, "Charge Seminole Boat Co." in ink is yours?

A. Yes, sir.

Q. Now in Exhibit 75, on this bill, December 31, '33, someone has written, "Mrs. F. E. G. Boats"; who is that?

A. That looks like J. M. Gorham's handwriting to me.

Q. The initials are yours?

A. Yes, sir.

Q. The bill of December 31, '33, "Seminole Boat Co." in pencil, is that yours?

A. No, sir; I think J. M. Gorham, I would rather not pass on his signature,— mean his writing. I think that is who it is.

Q. And on this bill dated January 31, '34, "O. K. JFR", and "Seminole Boat Co." is that part yours?

A. That is my writing.

Q. And down below "Seminole Boat Co." again, is that your writing?

A. No, sir, I think it is Gorham's.

Mr. Botts:

Make a memorandum, please. "Seminole Boat Co." that is nearer the top of the page is the writing that the witness identified as being his; and that towards the bottom of the page, that is not.

Q. This bill February 28, '34, "O. K. JFR"; "Seminole Boat Co." is yours?

A. Yes, sir.

Q. And bill on March 31, '34?

A. I think that is mine, yes, sir; must have slipped when I made that letter F; it doesn't look like my F.

Q. May 31, '34, the writing is yours, is it, in ink?

A. Yes, sir.

Q. The same as to June 30, '34?

A. Yes, sir.

Q. And on July 31, '34, is the writing in pencil yours?

A. Yes, sir.

Q. On this July 31, '34, the "O. K. JFR" and immediately under it, "Seminole Boat Co." is that yours?

A. I am not sure of the "Seminole Boat Co." I wouldn't like to say definitely on that.

Q. The writing at the left of the page, the initial "J"?

A. That is Gorham, J. M. Gorham.

Q. And on August 31, '34, "O. K. JFR"; Seminole Boat Co.", is that yours?

A. Yes, sir.

Q. September 30, '34, "O. K. JFR" is that yours?

A. Yes, sir.

Q. Is the "Charge Seminole Boat Co." yours?

A. Yes,—no, sir.

Q. That is Gorham, is it?

A. That is.

Q. On October 30, '34, the "O. K. JFR" is yours?

A. Yes, sir.

Q. "Charge Mr. J. S. P. Boats" is that yours?

A. I think that is Mr. Gorham's.

Q. Same on October 31, '34?

A. Yes, sir.

Q. November 30, '34, is the handwriting in pencil yours?

A. Yes, sir.

Q. And two bills of that date, one immediately following is the writing in pencil on that page yours?

A. Yes, sir.

Q. I don't want to take the time to go all through these, but there are only two more. Here is a note at the bottom of this one, this bill dated December 31, '31, which reads, "Seminole Boat Co.; we think this price should be at most $65. J. F. Riley"; is that all your writing?

A. Yes, sir.

Q. On January 31, '32, is the "Seminole Boat Co." in pencil, your writing?

A. Yes, sir.

Q. On February 29, '32, "Seminole Boat Company" is that your writing?

A. Yes, sir.

Q. March 31, '32?

A. Yes, sir.

Q. On April 30, '32?

A. Yes, sir.

Q. On September 30, '32, the initials, and the "Seminole Boat Co." in pencil, is that all yours?

A. Yes, sir.

Q. October 31, '32, is the "Seminole Boat Company" yours?

A. Yes, sir.

Q. Now on this bill August 31, '32, there is some writing at the top of the page, "Can you get reduction on storage on Iolanthe and Seminole from September on?" Is that Mr. Phipps' writing?

A. I can't identify that.

Q. Mr. Phipps has placed his initials on it, "O. K. JSP."

A. Yes, sir.

Q. You are familiar with Mr. Phipps' writing?

A. Yes, sir, I have seen his writing, but I am not a handwriting expert.

Q. Well, from your recollection of the circumstances and incidents and your familiarity with his writing.

A. It looks like it.

Q. It appears to you to be Mr. Phipps' writing?

A. Yes, sir.

Q. And this at the bottom, in pencil, "J. S. Phipps Boats".

A. That is my handwriting.

Q. Here is one on November 30, '32, "O. K. J. F. R."; Seminole Boat Co." that is yours?

A. Yes, sir.

(And thereupon the hearing was recessed until 2:00 o'clock p. m. of the same day.)

May 11, 1939, 2:00 P. M.

Afternoon Session.

The Court:

All right, gentlemen; you may proceed.

1910 Thereupon JAMES F. RILEY, JR., a witness in behalf of the Respondent Phipps, resumed the stand and was examined and testified further as follows:

By Mr. Matteson:

Q. Mr. Riley, you were telling us how you came to see this exhibit, Respondents' S-1, the carbon of the gasoline

ticket. I think you said you were checking over the accounts in the Palm Beach office when you saw that for the first time?

A. Yes, sir.

Q. Was that your usual practice?

A. Yes, sir.

Q. Of course there were a great many of these slips signed from time to time, so that you would see a good many of them coming over your desk, in the office at Palm Beach?

A. Yes, sir.

Q. And these tickets invariably, I take it, covering the charge for gas were against the account of J. S. Phipps, is that right?

A. Not all of them.

Q. There may have been some additional designation on them, but they all carried the same J. S. Phipps at the top?

A. In that particular account, yes.

Q. You mean at this Palm Beach Service Station?

A. Yes, sir.

Q. So that the account of the Palm Beach Service Station was in the name of John S. Phipps?

A. That particular account was; there were other accounts; there was one account in the name of Palm Beach Company, and there was another account in the name of H. C. Phipps. I believe that is all.

Q. You mean all at the Palm Beach Service Station?

A. Yes, sir.

Q. So there were at least three accounts there, one of which was the account of J. S. Phipps?

A. Yes, sir.

Q. And the gasoline in this case was charged to the account of J. S. Phipps at that station?

A. Yes.

Q. Now, Mr. Riley, what was the system with respect to the billing of the accounts; did they send you a bill first of every month?

A. Yes, sir; they sent the statement and attached the signed slips to that statement.

Q. And I take it that what they attached were the carbon copies, is that right?

A. Yes, sir.

Q. And that was the usual system?

A. Yes, sir.

Q. When you got the bill the first of the month you would get a statement and attached to it were the carbon copies of gasoline slips aggregating the charge made on the bill?

A. Yes, sir.

Q. Now, you are quite clear about that, I take it?

A. Yes, sir; that is the way it was handled.

Q. You did not get two slips; you just got the carbon with the bill?

A. Either the carbon or the original; sometimes they sent the original and sometimes the carbon; most of the time we got the carbon.

Q. You didn't get both copies; you didn't get the original and the carbon?

A. No, sir.

Q. Which was the usual practice; there must have been some practice for them to send you the carbon or the original?

A. The usual practice was the carbon; I saw on one or two occasions—I have seen the originals come in with the bills.

Q. But practically always it was the carbon?

A. Yes, sir.

Q. It was not the practice, you say, to get the slips in duplicate; that is, the original and the carbon with the monthly statement?

A. No, sir.

Q. I notice that there was an error made on this slip in the addition; in the first place, it was originally totaled as being $2.24, and that was scratched out and underneath

there is written "$2.19". Do you know anything about that?

A. No.

Q. Had that change been made when you first saw the slip for the first time?

A. I don't remember the change; I didn't notice it.

Q. I will show it to you (handing document to witness).

A. Yes, it had been made.

Q. Before you saw it?

A. Yes, sir.

Q. So, when you saw the carbon, as I understand it, you went over to the service station and saw the original there?

A. Yes, sir.

Q. When you saw it for the first time it was just in the form in which we have it here?

A. Yes.

Q. New Exhibit 7 here, consisting of a lot of gasoline slips, about 46 in number, which were produced by Mr. Underwood,—were they taken from your files there at the Palm Beach office?

A. Yes, sir.

Q. When you paid the bill, I take it, that the original slip would still remain with the service station, is that right?

A. Yes; in other words, they would keep one.

Q. In other words, they kept one in their records and you only got one at any time?

A. Yes, sir.

Q. I call your attention to these 46 slips which have been produced here, and I call your attention to the fact that, with the possible exception of three, they are all originals. Do you notice that?

A. Yes

Q. Everyone is an original; you recognize that, do you not?

A. Yes.

Q. And of these three exceptions it appears that two of those at least were originals; in other words, it appears to me that these two are originals and that one is a carbon?

A. I don't know; they look like carbons to me, too.

Q. At least there are only three possible carbons in the entire 46, is that right?.

A. That is right; I didn't look at every one.

Q. I tried to fan them out so that you can see all of the backs. You can identify the backs by the carbon on the back of the original?

A. Yes; they are all originals.

Q. So that would seem to be just the reverse of the ordinary course of business as you explained it to me, wouldn't it?

A. Yes. Of course they may have had a different man, may have had various bookkeepers; one might have handled it one way and another another.

Q. These slips all cover a period within a year of the time of the fire, don't they?

A. I am not sure of that absolutely.

Q. I think that is correct. Well it would appear that out of these 47 slips, with the possible exception of three, that this one, Exhibit S-1 is the only case in which the carbon came to you, is that right?

A. That is as I remember it; that I saw the carbon.

Q. Now, Mr. Riley, what was the date, as near as you can fix it, when this bill of the Palm Beach Service Station was paid?

A. We usually pay our bills between the 10th and the 25th of the month; my guess would be it was somewhere in that neighborhood.

Mr. Matteson:

Have you those bills handy, Mr. Underwood?

Mr. Underwood:

Which ones?

Mr. Matteson:

The Seminole Boat records or what purports to be the records of the Seminole Boat Company.

(By Mr. Matteson):

Q. I show you this voucher, No. 97, a part of Phipps' Exhibit "Z", showing you an entry under August 9th, Palm Beach Service Station, gas, $2.19. That apparently represents the payment of this bill; is that right?

A. Is that the amount of the bill?

Q. That was the amount of the check, $2.19.

A. Yes; that seems to be right.

Q. And the date of that payment is indicated as August 9, is that right?

A. Yes.

Q. Is that approximately the date on which you first saw this slip?

A. No, sir.

Q. Does that enable you in any way to fix the approximate date?

A. No.

Q. At least it was not later than August 9th, is that right?

A. That is right.

Q. Now, did you have some photostatic copies of these slips made when you discovered them?

A. Yes, sir.

Q. I find an item in here "Seminole Boat Company account, petty cash, photostatic copies of gas bill, $2.90; is that right?

A. That is correct.

Q. So that you had these photostats made and charged them to the Seminole Boat Company, did you?

A. Yes, sir.

Q. Why did you do that?

A. Well, I considered it a direct charge to the Seminole Boat Company.

Q. I mean, why did you have photostats made of that at all?

A. Well, I wanted more of them for the files in case I needed them at any time.

Q. You never had obtained photostats of any others, had you?

A. No.

Q. Why did you obtain photostats of this?

A. Oh, just as I stated before, I wanted to have them in my files.

Q. Did it occur to you at the time that the authenticity of this document might be later questioned?

Mr. Underwood:

May we have the time in that question fixed?

Mr. Matteson:

At the time he had the photostats made.

A. No, sir.

Q. You had not thought of that?

A. No, sir.

Q. Did you regard these slips at that time as an important piece of evidence in response of this case?

A. Well, I regarded it as an important piece of evidence, but not particularly in this case, because there wasn't any case at that time, I don't believe.

Q. After the fire on June 24th which originated on the Seminole you realized at once that there was a serious possibility of there being claims made, did you not?

A. I didn't at once, no, sir.

Q. It never entered your mind that there would be claims arising out of that disaster?

A. Not for the first two or three days.

Q. You don't say that you got these slips and made photostats of them within two or three days after the fire, do you?

A. No.

Q. You want us to understand, Mr. Riley, that your testimony is that at the time you found these documents and made photostats of them you had no thought whatever of any claims being made arising out of this fire?

A. No, I don't want you to understand that.

Q. I am asking you what your state of mind was at that time?

A. Well, I thought that if there was an occasion of someone making a claim that would be good evidence.

Q. You thought that these would be important evidence in the event any claim was made, is that right?

A. That is correct.

Q. And the importance of such evidence would of course be, if it had any, to show that on the day of the fire Mr. Abel was an employee of the Seminole Boat Company, wouldn't it?

A. Yes, sir.

Q. So that in the event any claim was based on the action of Mr. Abel it would appear that the claim was against the Seminole Boat Company and not anybody else, is that right?

A. That is correct; he was working for the Seminole Boat Company.

Mr. Matteson:

I move to strike out the answer, if your Honor please.

The Court:

I think it is a voluntary statement and not responsive to the question. I will grant the motion to strike that last sentence.

Q. Then the importance of the evidence, if any, would be against the interest of the Seminole Boat Company and in favor of the interest of anybody else that would be involved, is that right?

Mr. Underwood:

If your Honor please, I object to this witness being asked to consider the importance of evidence in this case. He is not permitted apparently to give a full and complete answer, and that is one reason I make my objection.

The Court:

I think the question is well taken. I will overrule the objection.

A. The only way I can answer that is to say that the reason I thought it was important was to show that this man was working for the Seminole Boat Company.

Q. To whom would that be of importance?

A. I can't say that it would be of any importance to anyone personally, but just in case of any sort of suit that might develop.

Q. It didn't occur to you at that time that if any liability arose out of the actions of Mr. Abel on this occasion could be shown to be arising out of employment with the Seminole Boat Company that that would be protective of the interests of the stockholders or anyone else that might be involved?

Mr. Underwood:

I object to that unless the time is fixed. The question says "at that time". I do not understand what time is meant.

Mr. Matteson:

It is understood that all of these questions refer to the time that he had the photostats made of these tickets.

A. Will you read that question?

(Thereupon the preceding question was read by the Reporter as above recorded.)

The Court:
Read it again.

(Thereupon the question was re-read by the Reporter as above recorded.)

A. Of course at that time Abel had a widow and I thought it was good evidence to show that he was working for the Seminole Boat Company that day.

Q. Now let me ask you the question this way: did you think it would be of any advantage to the Seminole Boat Company as a corporation to have this evidence and the demonstration of its authenticity?

A. No, sir.

Q. On the contrary it would be detrimental to the interests of the Seminole Boat Company as a corporation, would it not?

Mr. Underwood:
I object to that as argumentative.

The Court:
Well, it is in a sense argumentative, but it goes to the reason why he did things. I think it is within the realm of cross examination. I will overrule your objection.

Mr. Matteson:
Read the question.

(Thereupon the preceding question was read by the Reporter as above recorded.)

A. Yes, I suppose it would; I don't know.

Q. Then may I ask you, Mr. Riley, why you charged the expense of procuring these photostats against the Seminole Boat Company?

A. It seemed like the right thing to do at the time.

Q. For whom were you acting when you did this?

A. When I charged the photostats?

Q. Yes; when you procured the photostats?

A. I don't know that I thought of who I was acting for then.

Q. In other words, you have many capacities in your position at the Palm Beach Company and it is sometimes difficult to determine in which capacity you are acting, is that right?

A. Well, I suppose I know who I am working for at times. There are a lot of activities in the company.

Q. Now in 1931 you received your first instructions in respect of the Seminole, is that right?

A. Not the first ones.

The Court:

Are you leaving that subject matter right now?

Mr. Matteson:

I do not think of anything else at this time.

By the Court:

Q. What did you have photostated?

A. Gasoline slip.

Q. Just one of them—

A. Yes.

Q. Did it cost $2.90 to get that one photostated?

A. $2.90.

Q. It cost $2.90 to have that one slip photographed or photostated?

A. I think we had more than that; I don't remember the number, your Honor.

Q. You don't recall now whether you had a large number of copies of the one slip made or whether you had a good many slips photostated?

A. I think the original was the one that was photostated, this gasoline slip, that is the only gasoline slip that

was photostated but how many pictures I had made I don't remember.

Q. As I understand it, Mr. Riley, this slip came to your office first along with a bill for the total amount of gasoline purchased at that station during the preceding month?

A. Yes.

Q. And that was for June?

A. Yes.

Q. I reckon that bill came in along the first of July, is that right?

A. Yes, sir.

Q. When did you have the photostats made?

A. I don't remember exactly; some time during July; the latter part of July, I think.

Q. Did I understand your testimony this morning that immediately (I don't mean immediately but before you took any action on the mater of paying that bill) you went down to see the manager of the station?

A. Yes, sir.

Q. Why did you go there?

A. Because I wanted the original; I wanted to see if he had it.

Q. Do I understand it now that your best recollection that you got along with the bill that was rendered the 1st of July the copies?

A. Yes, sir.

Q. You wanted to see if the original was in existence?

A. Yes, sir.

Q. And that is the reason you went down there?

A. Yes.

Q. Did you get it from the station at that time?

A. Yes, sir.

Q. When you went back to your office you had the original and the copy both?

A. I might have gotten it the next morning; the man might have had to look it up.

Q. After your visit to the station and you came back to your office you had both the original and the copy, whether it was that day or the next day?

A. Yes, sir.

Q. Did you get any other slips down there that day?

A. Any other originals?

Q. Yes.

A. No, sir.

Q. Just that one?

A. Yes.

Q. You are quite sure that these 46 odd tickets first came into your possession along with the bill rendered?

A. Yes, sir.

Q. And you didn't get them in connection with this photostat down at the service station?

A. No, sir, I didn't.

The Court:

That is all I care to ask.

(By Mr. Matteson):

Q. With respect to the time when you got this slip, how long after it was it that you had it photostated?

A. I can't remember exactly; it was the latter part of July, I think, but I cannot be positive.

Q. Who was it, if anyone, that instructed you to have the photostats made?

A. I believe Mr. Alley did.

The Court:

Where are the photostatic copies now?

The Witness:

I don't know exactly. I think there is one in one of those files there.

The Court:

What did you do with them at the time?

The Witness:

I put one in our file; I turned over one or two to Mr. Alley, and it seems to me those were all; I don't know whether there was over three or four made.

(By Mr. Matteson):

Q. Now I think, Mr. Riley, you stated that it was in 1931 that you got some instructions from Mr. Alley with respect to the Seminole?

A. Yes, sir.

Q. At that time Mr. Alley was head of the Palm Beach office, was he not?

A. Yes, sir.

Q. By the way, on June 24, 1935, was he still the head of the Palm Beach office?

A. He was still the manager of the Palm Beach Company; he had moved his office and had a law office of his own, and I was in physical charge of the Palm Beach office.

Q. But you still recognized him as the manager of the office?

A. Yes, sir.

Q. Now, Mr. Alley, as the head of the Palm Beach office, was generally the representative of the Phipps' interests in Palm Beach, was he not?

A. Yes, sir.

Q. And in addition to being the head of the office of the Palm Beach Company he performed many functions in connection with the various corporations in which the Phipps were interested and the various individual members of the Phipps' family, was he not?

A. What date are you speaking of now?

Q. I am talking about 1931, but I suppose it would apply to both dates.

A. I am not familiar entirely with what Mr. Alley's duties were at that time.

Q. Well you recognized him in 1931 as your superior officer?

A. Yes, sir.

Q. And that was because he was in charge of the Palm Beach Office?

A. Yes, sir.

Q. And it wasn't unusual for you as his subordinate in that office to take instructions and orders to do various things for members of the Phipps' family or for any of the corporations that they were interested in?

A. No, sir.

Q. In fact it was customary for you to do so?

A. Yes, sir.

Q. Your employment and your salary came entirely from the Palm Beach Company, did it not?

A. Yes, sir, so far as I know.

Q. You never have been in the employ of the Seminole Boat Company, have you?

A. You mean has the Seminole Boat Company ever paid me any money?

Q. Yes.

A. No.

Q. So that by reason of any pay or salary connection there has never been any reason why you should do anything for the Seminole Boat Company?

A. No, excepting in that Mr. Alley told me to work with them and it was a part of my duties if he told me to do it.

Q. So that when Mr. Alley told you to perform certain functions with respect to the Seminole Boat Company it wasn't because he was an officer of the Seminole Boat Company that you were required to comply, but it was because Mr. Alley is the head of the Palm Beach office and had the right to give orders, is that right?

A. I would say it was both. Of course I knew he was an officer of the Seminole Boat Company.

Q. And also in the employ of the Seminole Boat Company at that time?

Mr. Underwood:

I object to that as calling for a legal conclusion.

Mr. Matteson:

I will withdraw it.

(By Mr. Matteson):

Q. You received no salary nor any pay that would put you under any obligation to the Seminole Boat Company as such?

A. No, sir; I never received any money from the Seminole Boat Company.

Q. But you were under necessity, by reason of your employment and your payment by the Palm Beach Company, to take his order as manager of the Palm Beach Company; that is correct, it is not?

A. As my manager, yes.

Q. Now I think that you said that your introduction to Captain Pilkington was by Captain Bryant?

A. Yes, sir.

Q. And that that was in 1931?

A. I think so, yes, as near as I can remember.

Q. Well, during 1931 at any time did Mr. John S. Phipps go to the Pilkington Yard with you?

A. Not with me, not that I remember.

Q. Your introduction by Captain Bryant was purely verbal, was it not?

A. Yes.

Q. You probably are aware, in connection with this case, that there had been a designation in writing to Captain Pilkington of Mr. Huff as the man in charge of the boats, including the Seminole?

A. Yes.

Q. Was there any written communication to Captain Pilkington superseding that employment and appointing you in his place, as far as you know?

A. Not that I know of; no, sir.

Q. Now at that time, 1931, the Iolanthe and the Dorothy were stored at the Pilkington Yard for certain periods, were they not?

A. I am not sure but I think they were, though I am not certain that the Dorothy was owned by Mrs. Guest in 1931; I won't say for sure about that; I don't remember.

Q. There were three boats, either of Mr. J. S. Phipps or other members of the Phipps' family stored there during that year, were there not?

A. I don't remember.

Q. I notice that the bill here for storage on the Iolanthe during January, 1931 and for the month of February, 1931—

A. Yes.

Q. And for the month of April, 1931?

A. Yes.

Q For the month of March, 1931?

A. Yes.

Q. For the month of May, 1931?

A. Yes.

Q. And during the same month part of the time the Clip was stored there?

A. Yes, sir.

Q. Here is a bill for June storage on the Iolanthe and the Clip in 1931?

A. Yes.

Q. And again in July on the Iolanthe and the Clip?

A. Yes.

Q. In August for the Iolanthe and the Clip?

A. Yes.

Q. And here is one in October for the Iolanthe and the fishing boat; I suppose that is the Clip?

A. Yes.

Q. So all three of his boats were there during that year, is that right?

A. The Iolanthe, the Clip and the Seminole, you mean?

Q. Yes.

A. I don't remember about the Seminole. I know these were there because we paid bills for them.

Q. You were in charge of the Iolanthe and the Clip as well as the Seminole?

A. Yes, in a way.

Q. Throughout that year, or at least from the time of your introduction by Captain Bryant?

A. Who?

Q. Bryant?

A. Yes. I employed Captain Bryant.

Q. I am saying that from the time of your introduction by Captain Brayant you were in charge of all three of these boats, is that right?

A. Yes.

Q. What time of the year was it that you were introduced by Captain Bryant, do you recall?

A. As I recall, sir, it was in the spring; I don't know just what month.

Q. Around April?

A. It would be entirely a guess; I don't know.

Q. I show you this bill for storage on the Seminole in April, for storage on the Seminole from April 20th to April 30th. It seems to be the first bill with respect to the Seminole in that year. I suppose that indicates that the Seminole went in storage at Pilkington's that year about April 20th, is that the fact?

A. That is what it would indicate, yes.

Q. Was that when Captain Bryant introduced you to Captain Pilkington?

A. It must have been after that date, because the Seminole was already there.

Q. And had been there for some time?

A. I don't remember how long.

Q. Was that the first time that you had been to the Pilkington Yard?

A. That is the first time that I remember, yes.

Q. Was Captain Bryant's introduction sufficient to put you in charge of all of these boats insofar as Pilkington was concerned?

Mr. Underwood:

I object to that as calling for a legal conclusion, your Honor.

The Court:

I think that is subject to that objection.

(By Mr. Matteson):

Q. In Captain Bryant's introduction of you to Captain Pilkington was anything said about the Iolanthe or the fishing boat Clip?

A. I don't remember definitely whether there was or not.

Q. How was your authority to deal with the Dorothy and the Clip communicated to Captain Pilkington, do you know?

A. No.

Q. You have no recollection of that at all?

A. No.

Q. Captain Bryant was the Master of the Seminole at that time, was he not?

A. I believe he was, yes.

Q. As I understand it, Mr. Riley, your introduction by Captain Bryant was the only communication to Captain Pilkington dealing with your authority in respect of the Seminole of which you have any recollection?

A. Yes, sir.

Q. Or either of the other boats, for that matter?

A. Yes.

Q. Where is the office of the Palm Beach Company located?

A. Located in the Plaza at Palm Beach.

Q. It is now known as Bessemer Properties, Inc.?

A. Yes.

Q. That is since 1937?

A. 1937, yes.

Q. It is the same office?

A. Yes.

Q. And the same organization substantially?

Mr. Underwood:

I object to that if it means to go into the reorganization of the corporation. If he means the physical plant, I have no objection.

Mr. Matteson:

That is what I intend.

A. That is correct; the same employees.

Q. What does the office there consist of?

A. Building?

Q. How many rooms and where located?

A. We have one main office and a couple storage rooms and three private offices.

Q. Who occupies the private offices?

A. I occupy one; Mr. H. C. Phipps has one when he is down, and Mr. J. S. Phipps has one when he is down. During the summer, when they are not here, we very seldom use the two offices except for files.

Q. Now in the winter of 1934-35 do you recall what period Mr. J. S. Phipps was in Palm Beach, approximately?

A. It will have to be approximate; I don't know exactly.

Q. All right.

A. Probably from around Christmas-time until the 15th of April or maybe the 1st of May.

Q. But when Mr. Phipps is in Palm Beach does he transact his business at the office of the Palm Beach Company?

A. Mr. Phipps does not transact his business himself. He is retired. If you mean personal bills here, I will say that he okeyed some at his home and he okeyed some at the office; some of his checks were drawn at his home and some were drawn at the office.

Q. When did he retire?

A. I do not know, sir.

Q. Well, during this period of 1934-35 was he in the office daily?

A. This is a guess. He might be in every day for one week and the next week he wouldn't come in at all; you never knew how to figure that.

Q. But he is there frequently, is he not, when he is in Palm Beach?

A. Yes.

Q. You are called upon to do a great many things in company with Mr. J. C. Phipps, are you not?

A. Yes, I have been in his company and have been in Mrs. Guest's company and have been in Mr. H. C. Phipps' Company. I don't know that one dominates the other; I work for all of them.

Q. It is fair to say, is it not, that Mr. John S. Phipps comes to the office a good deal more frequently than Mr. H. C. Phipps?

A. No, sir.

Q. I want to ask you about Mr. J. S. Phipps' estate; where is that located?

A. His home?

Q. Yes.

A. On North County Road, Palm Beach.

Q. How large a place is that?

Mr. Underwood:

I object to this; it is wholly immaterial in this case.

Mr. Matteson:

I think it is quite important in connection with the relations between Mr. Riley and Mr. Phipps, and I think we are entitled to know. Mr. Riley has testified that he has had many duties in connection with Mr. Phipps' estate. I want to find out what those duties are and how extensive they are, and how close his relations are with John S. Phipps.

The Court:

I do not see what the size of the home has to do with that.

Mr. Matteson:

It might have to do with the amount of detail in connection with it.

The Court:

I want to allow a fair amount of latitude in cross examination, but I really do not see the materiality of that, however, I will let you proceed.

Mr. Matteson:

Read the question.

(Thereupon the preceding question was read by the Reporter as above recorded.)

Q. I don't care about the number of acres, but just give us an idea.

A. It is 26 acres. Do you want to know the size of the house?

Q. No.

A. All right.

Q. What duties have you had in connection with the estate?

Mr. Underwood:
May we have the time fixed?

Mr. Matteson:
I am talking about the period in 1934-35 season.

A. Well, I suppose I have, you would call it, business management, and I think that covers it.

Q. You have the business management of Mr. John S. Phipps' estate in your charge?

A. Yes, sir.

Q. And that is true when he is away as well as when he is there?

A. Yes, sir.

Q. You are from time to time called upon to represent Mr. Phipps in various matters in connection with the estate and in connection with other of his personal affairs, is that right?

A. Yes.

Q. You act for him?

A. I act for him with his permission, yes.

Q. Of course.

A. Yes.

Q. And in his absence you have authority to deal with his matters coming up, routine matters coming up, in connection with his personal affairs?

A. You mean his estate; the home there?

Q. Yes.

A. Yes.

Q. Now I suppose in that connection you have on occasion been required to deal with strangers on behalf of Mr. John S. Phipps?

A. With strangers?

Q. I mean with people that you have not met before and who may not know who you are.

A. If you mean salesmen who come in that would like to sell the estate something, or something of that sort, yes.

Q. I do not necessarily mean anyone coming to the office; in fact, I assume there must be occasions in connection with Mr. Phipps' affairs when you have to approach others, is that right?

A. I don't think it is true except in that I do talk to people who want to sell things to the estate, and that's about all; when it comes to his own personal business I do not have anything to do with that.

Q. There are occasions when you purchase things for the estate and have to go out and purchase things for the estate?

A. Yes, sir.

Q. When you do deal with someone on the outside with spect to some matter that concerns Mr. Phipps personal how do you describe yourself; how do you identify yours as representing Mr. Phipps?

A. I usually identify myself as representing the estate because the Palm Beach Company through me or through the Palm Beach Company sort of handle affairs of that sort for the Phipps Estate as well as others.

Q. When you say you represent yourself as representing the estate, what do you mean?

A. I mean that the name of his place is Casa Vendita, and I am in a sense business manager of Casa Vendita, but not the business manager of John S. Phipps.

Q. You never have indicated to anyone under any circumstances that you were the representative of John S. Phipps?

A. No, sir.

Q. Whether you described it as secretary or manager or any other capacity?

A. No.

Q. Now with respect to June 24, 1935—

A. Just a minute. May I change one thing there in the last answer I gave?

The Court:

Yes.

A. There are other properties that are owned by Mr. John S. Phipps, and of course I manage those other properties also. He has not confined me just to his one home or estate.

Q. I appreciate that. I meant my question to be general and to apply to any representation of Mr. Phipps with respect to any of his interests. Do I understand that you have never on any occasion indicated to anyone that you were acting as the representative of John S. Phipps?

A. No.

Q. As a matter of fact in many dealings you have representing him?

A. I have represented the properties that he owned, yes; maybe that is considered as representing him. If you mean though, that if someone comes in and wants to borrow some money from Mr. Phipps that I can receive him and say, "Yes, I can loan you the money,"—that is not it at all.

Q. I am not suggesting that at all.

A. All right.

Q. Getting back to June 24, 1935, I understand from your testimony this morning that the decision with respect to going to Ft. Lauderdale was made on the morning of that date?

A. That is correct.

Q. And it was made because it was raining on that day?

A. Yes.

Q. So that there was no possible way that Abel could have known the day before or the evening before that he was going to Ft. Lauderdale on June 24th, is that right?

A. Except that we had talked about it several times within the last three or four weeks previous to the time he actually went down there, and I said, "As soon as we had the opportunity"; I told him as soon as I had an opportunity I would go and would have him go with me and he knew that I had it in mind.

Q. But there was no reason other than the general possibility of such a thing happening at some time in the future that would be any basis for his understanding the night before that he was going to make a trip to Ft. Lauderdale the following day as far as you know?

A. As far as I know he didn't know that he was going to make the trip to Ft. Lauderdale on the 24th.

Q. You had said nothing to him about it?

A. Not for that date.

Q. Now with respect to this fishing tackle; for what purport was that required?

A. It was just to go in storage; we always stored the glass bottom buckets and gaffhooks during the summer, because they were left out on the upper deck of the Seminole, and of course out in the weather, and we just stored them. Usually they were stored in Miami, but this particular trip they apparently forgot to leave them there.

Q. Well, how do you know that?

A. Mr. Hawkins told me that.

Q. Is it a fact that preparations were then being made for a fishing trip on the Iolanthe?

A. No.

Q. Where was the Iolanthe at that time?

A. The Iolanthe was at Mr. J. S. Phipps' dock.

Q. Palm Beach?

A. Yes.

Q. Was this equipment sometimes used in the Iolanthe?

A. No, sir, the Iolanthe had its own equipment.

Q. Isn't it a fact that the Martins were going to make a fishing trip at that time, about that time?

A. Not that I remember; no, sir.

Q. Were the Martins in Palm Beach at that time, or were they expected?

A. I don't believe they were.

Q. You don't know?

A. No, I don't know. Yes, I do, too; I know they were not in Palm Beach.

Q. Were they expected?

A. No, I don't know that.

Q. Now from the spring of 1931 I understand that you were in complete charge of the Seminole.

A. When it was in Palm Beach or at Ft. Lauderdale, yes.

Q. And you had received instructions to make regular inspection of the Seminole, had you not?

A. Not regular inspections. I received instructions to make inspections from time to time.

Q. And is it a fact that when the Seminole was in storage at Ft. Lauderdale, you visited her there approximately once a month?

A. Well, it depended on whether I could get there or not; I tried to get down there once a month, but I don't think I did; probably the trips were six weeks apart.

Q. On this occasion of June 24, 1935, she had been in storage there for approximately something over two months, had she not?

A. I don't remember when she was put in; I think that is about right; it was about the 15th of April or a little after that she was put in storage.

Q. You had not visited her during that time, had you?

A. No.

Q. And other times when she had been there you had been down there and made inspections from time to time?

A. Yes.

Q. And when you made these inspections did you go through the boat?

A. Yes, sir.

Q. Of all her parts?

A. Well, on most occasions I did. Some occasions I didn't go into the bilges at all; it depended on whether I had a Captain with me or not.

Q. What do you mean by "bilges"?

A. The bilges down in the hull.

Q. You mean on some occasions you didn't look under the floors?

A. That is right.

Q. But except for that, whenever you went, you went all through the vessel, is that right?

A. Except in the engineroom.

Q. You didn't go in the engineroom from time to time?

A. I have been in the engineroom when she was in commission; I don't believe I ever have when she was in storage.

Q. You say you were charged with the duty of making the inspections of the Seminole while she was at Ft. Lauderdale and your never did inspect her engineroom?

A. Well, the window along the companionway was always open, and I stuck my head down in there and looked around. That is about as good an inspection as I could make of the engineroom.

Q. You never climbed through the window or went in that engineroom?

A. Yes, on a number of occasions.

Q. On the occasion of some of these inspections?

A. I am not positive that I was ever in the engineroom on an inspection, but if the Captain was along with me it is very possible that I did go along with him.

Q. You didn't always have a Captain with you, of course?

A. Not always, no.

Q. Most of your inspections were made with the Captain, weren't they?

A. I would say 75 per cent of them, yes.

Q. On these occasions you say that you never went into the engineroom?

A. I don't believe I have ever been in the engineroom unless a Captain was with me.

Q. But you did inspect the engineroom, by looking through the window?

A. Yes, sir.

Q. What was your experience before you went with the Palm Beach Company; what previous experience had you had?

A. I had been a timekeeper for a building contractor there in West Palm Beach. Previous to that I worked for a brick and tile manufacturing company.

Q. Your experience then, I take it, had been almost entirely in construction and real estate management?

A. Yes. Of course I had not had much of that at that time; at the time I went with the company.

Q. Do you mind telling us your present age, Mr. Riley?

A. Not a bit. Thirty-seven.

Q. As far as expenditures with respect to the Seminole were concerned, you told us that you had a mental limit of two or three hundred dollars.

A. Yes.

Q. And the only time that you exceeded that amount was with the personal approval of the stockholders?

A. Yes, sir. That is on one job; of course if you are doing painting and doing plumbing work, reupholstering furniture and remaking mattresses, all of those things together might go to make more than two or three hundred dollars, but for one certain job, like working on motors, running to more money than that I would always get permission.

Q. And you did have the management of the other family boats as well as the Seminole?

A. Yes, sir.

Q. That includes the Iolanthe and the Clip and the Dorothy, is that right?

A. Yes. I had the management with the approval of those who owned them.

Q. Of Course. And they approved everything that was done on them.

A. Yes.

Q. And that was all because of your employment by the Palm Beach Company and your obligation to respond to personal calls of members of the Phipps family?

A. Yes, but I want to get myself straight on that, though: There is quite a difference between management that I had of the personal boats and the management I had of the Seminole, because every little thing on Mrs. Guest's boat and every little thing on Mr. Phipps' boat had to be approved by them before the work was done.

Q. In other words, your authority with respect to the Seminole was somewhat broader than with reference to the others?

A. Yes; much broader.

Q. You were telling us about a conversation that took place with Captain Pilkington when Mr. John S. Phipps was present, where there was a discussion of rates and a statement by Mr. John S. Phipps with respect to the advisability of moving the boats to Gulfstreat. You gave us something of an interpretation of what was said. I wish you would tell me as exactly as you can the exact language that Mr. J. S. Phipps used on that occasion.

A. I think I gave that this morning, as well as I can remember.

Q. Will you give it to us again?

A. He started—he walked along and heard the gist of the conversation, and he said that he just couldn't pay too much for storage of boats, and that I had decided, meaning me, that unless he continued to make the rate

$50 a month on the Seminole, that I was planning to take the boats to Gulfstream.

Mr. Underwood:
Read that answer.

(Thereupon the following portion of the previous answer was read by the reporter, at which point the reading of the answer was interrupted by the witness: "He walked along and heard the gist of the conversation and he said that he just couldn't pay too much for storage of boats—")

The Witness:
That is wrong. I didn't say-he said that he just couldn't pay—

The Reporter:
I read it as I recorded it.

Mr. Underwood:
I am asking the witness to correct the answer as incorrectly read by the reporter.

Mr. Matteson:
I want to say that it was read just exactly as I heard it.

Mr. Botts:
And exactly the way I heard it.

Mr. Underwood:
Not the way I heard it.

The Court:
The witness will be the judge. Commence all over and state it again.

The Witness:

Well, he heard the gist of the conversation and said that we couldn't afford to pay too high rates on the storage of boats, and that unless Captain Pilkington kept his rates as they were that I (meaning me) had thought it best to take the boats to Gulfstream and store them there.

Mr. Underwood:

Again I am not clear, your Honor, as to just what went in. May I have that answer read?

(Thereupon the preceding answer was read by the reporter as above recorded.)

The Court:

Does everybody understand the answer now?

Mr. Botts:

I understood both.

The Court:

You may proceed.

Q. Mr. Riley, that makes three times now you have said that Mr. Phipps said "that I (meaning me, quoting you) had a certain idea. I do not suppose that Mr. Phipps would be so ungrammatical as to use the word "I" in referring to you. What I want to know is exactly what he said.

A. That is what I am trying to give you, but after all of these years—after all, this was five years ago, and of course you know—

Q. He did not refer to you as "I"; that is your—

A. That Jim had decided to take the boats to Gulfstream.

Q. You think that is what he said?

A. Either Jim or Mr. Riley; I don't know which.

Q. And when he said that he was referring to all of the boats there were in storage or accustomed to be stored there.

A. Yes. There were only two at that time, as I remember it; the Seminole and the Iolanthe.

Q. Now referring to these payrolls. I hold in my hand the summary with respect to the amount paid to Mr. R. C. Abel. He was employed as a boat Captain, was he?

A. They called him that on the payroll.

Q. He was so described throughout the payroll as a boat Captain?

A. Just "Captain" I would say.

Q. And he was the registered Master of the yacht Iolanthe, was he not?

Mr. Underwood:

I object to that as not the best evidence. The registration papers, if your Honor please, are filed in the Customs House, and they are temporarily suspended from time to time, and I don't know whether this witness knows whether the registration papers were in effect, and I think the basis of his knowledge ought to be—

The Court:

If he knows, I think it is all right to ask him.

The Witness:

I don't know.

Q. Well, it is a fact, is it not, that his employment was principally in connection with the Iolanthe?

A. No, I wouldn't say that.

Q. If we say principally in connection with the Iolanthe and the Clip, would that cover it?

A. Well, he worked on those boats more than any other boats, yes.

Q. And he was employed regularly, week in and week out at a monthly wage, was he not?

A. No, sir, he was employed on a weekly rate.

Q. Well, he was employed week in and week out on a weekly rate?

A. Yes.

Q. And his wages were uniformly charged to J. S. Phipps except at such times as he worked on boats for business of others?

A. His wages were charged to J. S. Phipps when he was working for J. S. Phipps, yes.

Q. And that was something over ninety-five percent of the time, wasn't it?

A. I haven't figured it out.

Mr. Underwood:

I think that is a matter of calculation and that we can agree upon it. If you want an accurate percentage we can figure it out in dollars and cents.

Mr. Matteson:

I want to bring out the fact that it was only on rare occasions that his wages were charged to anyone else.

Mr. Underwood:

That depends on the definition of the word "rare". I do not see that that gets us anywhere, your Honor.

The Court:

Well, the facts speak for themselves. We can make that calculation, if necessary.

A. Most of the charges on here are to J. S. Phipps.

Q. Now there were one or two occasions, three I guess, where his wages were charged to the Seminole Boat Com-

pany. Can you tell us and refresh your recollection by referring to payrolls, if you wish; for instance, during the week of September 20, 1934, his wages of $20 was charged to the Seminole; can you tell us what he was doing that week?

A. To the best of my recollection he was painting around the hull of the boat.

Q. I see that a part of the following week, September 27, 1934, was also charged to the Seminole; was that a part of the same job?

A. I am not positive; it was either painting in the bilges or doing other maintenance work on the boat.

Q. And again in the week of October 11, 1934, $10.00 was charged. Can you tell us what he was going then?

A. He was doing some work in connection with the maintenance of the boat.

Q. And those were the only occasions from January, 1934 down to June 24, 1935, that any of his wages were charged to the Seminole Boat Company?

A. Yes, sir, that is, from these payrolls, unless there were some checks drawn to him and charged to the Seminole Boat Company.

Q. Now there is a voucher here representing the payment of the final installment of his wages, which vouchers is a part of Phipps' Exhibit 3-V, which final voucher shows the payment of $60 to Mrs. R. C. Abel. That was the final installment of Captain Abel's wages, was it not?

A. Yes, sir.

Q. And that was paid on June 29, 1935?

A. Yes, sir.

Q. Do I understand that this memorandum that is attached to it, which is in your handwriting, and on which the charge was made at the time the check was made out?

A. Yes, probably the same day the check was made out.

Q. So that your decision to charge the Seminole Boat Company with $5.00 for one day's wages was made five days after this fire, is that right?

A. Yes.

Q. And when you made up this memorandum—

A. I won't say my decision was that day; that is the day I wrote it up.

Q. That is the date this written memorandum was made?

A. Yes, sir.

Q. And at that time did you have in mind the same thing that you had in mind when you had photostats made of Exhibits S and S-1, that the fact of his employment by the Seminole Company on that date might be a very important matter for somebody?

A. No, sir; this was done just in the regular routine of business. I made out these slips from time to time, and I charged the man for whatever job he was working on.

Q. You stated that the vouchers showing payments to Abel, which constitute the exhibit I was just showing you, Exhibit 3-V, were all that you could find in your office. Does that mean that the vouchers are missing for some of the weeks that are described in the summary of the payrolls; there is no voucher covering the entire employment as indicated by the payroll.

A. No, I don't mean that; I think that they are all here; I am not positive; I will have to check them by weeks to see.

Q. They should all be here?

A. Yes.

Q. In other words, you should have in your office a voucher for every payment which has been made by the Palm Beach Company, is that right?

A. Yes.

Q. Now, Mr. Riley, Schlappi was also engineer of the Iolanthe, wasn't he?

A. Yes, sir. He acted as engineer of the Iolanthe on occasions.

Q. During 1934 and 1935 was the Iolanthe continuously at Palm Beach?

A. I don't believe so. I think the Iolanthe was in storage in Ft. Lauderdale uttil the spring of 1935, but I would have to look through the records and make sure of that.

Q. Well, in the 1934 vouchers there are vouchers, month by month for the Iolanthe up to November, and the November bills says "Out November 25". Does that refresh your recollection as to when the Iolanthe left the Pilkington yard?

A. That says that she left on November 25th.

A. It says it left here on November the 25th; I am not sure where it was until around the first of May; I know it was at Palm Beach around the first of May, 1935.

Q. Well, there was a period during March and April when it appears from the testimony already given that Schlappi was working on the Seminole. But can you tell us from the payrolls except for that period, where he was working?

A. Schlappi was employed to work on the Seminole, I think, sometime in March and he stayed on the Seminole until after the trip that was made to the keys, was finished up. Before that employment on the Seminole he wasn't employed by us, that I can remember.

Q. So his name should appear, if he was employed, on these payrolls?

A. No, sir; he was never paid on payrolls; he was always paid by check.

Q. Always paid by check?

A. Yes, sir.

Q. Did you produce a series of checks here?—Now the first voucher that appears here in 1935 for the payment of wages, is this one dated May 6, 1935; is that right?

A. Yes, sir.

Q. Now that covers wages here over quite a period.

A. Yes, sir.

Q. There is, Seminole Boat Company, twenty-two days; Mr. J. S. Phipps Boats, thirty-one days; would that be on the Iolanthe?

A. That is either on the Iolanthe or it is during the time that Mr. Phipps had the boat on a trip,—when he himself took it on a trip.

Q. That was the last trip that the boat made, in April 1935?

A. Yes, sir.

Q. Is there any way that we can get behind this voucher to find the exact periods that are covered by those different charges?

A. No, sir, there is not, because Schlappi gave me this time, when I made this out; he had kept the record of the days that he spent on various jobs and he gave this to me and I wrote it out and then had the check drawn for it. In other words there is no payroll or item, slip or anything that would show the dates covered by these numbers of days?

Q. The only memorandum is the yellow sheet attached in your writing?

A. Yes, sir.

Q. And that does not give any dates?

A. No, sir, I don't believe it does. No.

Q. He didn't give you any memorandum that would be more specific than that?

A. No, he gave me that verbally and I wrote it down.

Q. When Schlappi was employed by Mr. Phipps, it was usually as engineer of the Iolanthe, is that it?

A. Well, I would say he worked about half and half, on the Seminole and on the Iolanthe. He worked some for Mrs. Guest.

Q. I think, from my notes when you were referring to this voucher, you said something about a trip on the Iolanthe later.

A. Yes, sir.

Q. What was that trip?

A. That was a trip to Dimini I believe; yes, to Bimini.

Q. When was that, do you know?

A. That was made after the Seminole came back to storage at Ft. Lauderdale; it was around the 25th of April, would be my guess.

Q. And Schlappi acted as engineer on that trip?

A. Yes, sir.

Q. Now as I understood your testimony you said you had one man to make up the payrolls; who was that man?

A. At that time it was J. M. Gorham.

Q. Covering what period?

A. Well, of course he had help, someone else would do it when he was on vacation, but he did it practically entirely from about 1929 through 1935.

Q. During 1934 and '35, how many people outside of the Phipps were in the office at Palm Beach?

A. Four.

Q. And who were they?

A. There was a stenographer, Mr. Anderson, Mr. Gorham and myself. We might have had two stenographers, I don't remember for sure.

Q. You refer to one whose initials were BB, this morning; is that one?

A. EE; no, she wasn't there in 1934 and '35.

Q. Who was there in the office in '34 and '35?

A. Bess Higgins; I believe her name was Bess McDougall at that time. She has been married.

Q. I think you said that when you went to the hospital in Ft. Lauderdale, you were required to guarantee the payment of Thomas' hospital expenses there?

A. Yes, sir.

Q. And did you sign the usual form of agreement for the hospital at that time?

A. I don't remember whether I signed an agreement, or just—I think I just telephoned the lady in charge and told

her I would see her later, and I don't remember whether I signed anything or not.

Q. Well, in whose name did you give that guarantee?

A. I don't know whether I told her personally, or whether I used the company name. If I used the company name, I used Palm Beach Company. I think I just told her personally; she took my word for it for some reason.

Q. Did you tell her who you were?

A. Yes, sir, I told her who I was.

Q. And who did you tell you were?

A. I told her I was with the Palm Beach Company.

Q. You spoke of seeing Carl Holm marking certain valves with a hacksaw, and making disposition of them: And you were asked if you gave permission for those actions on his part. You said that you did not. You did not make any objection either, did you?

A. No, sir; I was not interested in valves at that time at all.

Q. You spoke of some conversation with Captain Pilkington, in which I think you said that he told you that there was no gasoline on the Seminole. You knew that that information was erroneous, that there must have been gasoline on the Seminole at that time, didn't you?

A. I knew there must have been something, because of the explosion.

Q. And you knew, as a matter of fact, all of the gasoline could not be removed from the tanks of the Seminole, didn't you?

A. No, sir, I didn't know it.

Q. You wrote a number of letters to Captain Pilkington, or the Pilkington Boatyard, that appear in the file here; and I note that you invariably signed your own name alone, writing on the stationery of the Palm Beach Company, or else on one occasion,—on two occasions you signed Palm Beach Company, under your name. That

was the way you wrote to Pilkington, was it, using your name of the name of the Palm Beach Company.

A. Yes, sir; I see I have used the name of the Palm Beach Company here.

Q. Most of the time you simply signed your own name?

A. Yes.

Q. This occasion of this conversation with Pilkington about rates, when something was said about taking the boats away, was not the only time that Mr. John S. Phipps expressed an interest in the rates charged on the Seminole, was it?

A. No, sir, I think there was another occasion.

Q. And that other occasion you referred to this memorandum that he wrote on Pilkington's bill of August 31, '32?

A. Yes, sir.

Q. On that occasion he asked to see if you could get a reduction on the Iolanthe and the Seminole, from September on, did he not?

A. Yes, sir.

Q. You say those two occasions are the only occasions when the matter of rates for storage on the Seminole were discussed between you and John S. Phipps?

A. The only other time I remember is one time when Mr. Pilkington reduced the rates on his own; in other words, we hadn't asked for a reduction, and I received a letter from him saying that he was reducing them? I told Mr. H. C. Phipps and Mr. J. S. Phipps about it. That is the only other time I remember talking about rates. The time of the conversation, there hadn't been any conversation between—I mean the conversation between Pilkington and Phipps and myself before that there hadn't been any conversation between Mr. Phipps about it.

Q. You have told us about the only occasions on which the matter of storage was discussed with Mr. J. S. Phipps at all?

A. The ones I remember, yes, sir.

Mr. Matteson:

I think that is all.

Q. Mr. Riley, do I understand you that no one, so far as you know, either verbally or in writing vouched for your authority to Captain Pilkington other than Mr. Bryant, Captain Bryant, who was Captain of the Seminole? Is that true?

A. That is the only one I know, yes, sir.

Q. And as I understand, you hired Captain Bryant?

A. Yes, sir.

Q. And then he vouched for you?

A. Yes, sir.

Q. And on the basis of that, over a period of years, you undertook to give written directions to Captain Pilkington with respect to this boat, the Seminole, and other boats?

A. Yes, sir. Captain Pilkington—I mean Captain Bryant, knew Captain Pilkington, had known him for quite a while I think, at the time he introduced him to me.

Q. And how long after that occasion was it before you visited this yard with Mr. J. S. Phipps?

A. Well, the only other time except 1934, that I can remember, is in 1932; I am not positive whether it was '32 or '33, but it was in the spring, and it was—well, probably in April, or the first of May. That was in 1932 I think.

Q. You visited the yard with Mr. Phipps?

A. Yes, sir.

Q. And when was it that Captain Bryant introduced you to Captain Pilkington?

A. I think it was 1931, the best of my recollection.

Q. Approximately a year earlier?

A. Yes, sir.

Q. Mr. Riley, could it be possible in your judgment, that the sequence of events is, after these many years, con-

fused in your mind, and that you were there with Mr. Phipps on the first occasion of your introduction?

A. No, sir, there is no confusion in my mind at all; because the reason is—the reason I know it was Captain Bryant, because I was either riding in his car or he was riding in mine, I don't remember which,—I think, in mine, and I got lost on the way he told me to turn up a certain street, and I misunderstood him and went the other street, and finally got on the right road. That is the reason I recollect it so perfectly. I had never been to Pilkington's yard before that, at that time.

Q. And is it possible Mr. Riley, in your best judgment, after these long years, that the occasion when you were there with Mr. Phipps was not a year later, but the same year that you went there with Mr.—with Captain Bryant?

A. Well, that is possible, from this standpoint; that it might have been '31, '32 or '33; that I was there. I think I could find from the records of the summary that the trip was taken, and from those I could tell you exactly what year it was that I was there with Mr. Phipps.

Q. It is possible then, as I understand it, that a relatively short time, perhaps a few weeks, might have intervened between the time you were there with Captain Bryant, and the time you were there with Mr. Phipps? I say, that is possible?

A. That is possible, yes.

Q. All right; now then, when you were there with Mr. Phipps, do you have at this time any definite recollection as to just what you did, and where you were, and what was said, on that occasion? I mean, after all these years, can you recollect that picture definitely at this time?

A. Well, of course I know the purpose of the trip.

Q. Wait a minute, would you mind answering the question yes or no, and then make any explanation you want to? I say, can you now recollect it with clearness and definiteness, or are there some indefinite features of that transaction?

A. I would rather not answer it yes or no, because I couldn't tell you just how long I stayed there, no. I don't know whether it was fifteen minutes, a half an hour or an hour.

Q. All right then; there is, as is natural, a certain amount of indefiniteness with reference to the circumstances attending on that visit; is that true?

A. You mean indefiniteness as to what we did?

Q. As to generally what took place there at the time. You don't remember all the details, do you?

A. I think I do,—everything that was of importance. We went there and found the boat, checked the boat over; and I couldn't say what was said when we walked to the boat, no; I can't be positive about that.

Q. All right; now then, do you know whether or not you remained with Mr. Phipps during the entire visit?

A. No, sir, I couldn't swear to that.

Q. In other words it is entirely possible that you might have remained on the boat, looking at some things, or looking at some other boat, and Mr. Phipps walked off and engaged in conversation with others? That is entirely possible, isn't it?

A. That is a possibility, yes.

Q. Then I understood you to say that you never heard Mr. Phipps say to Captain Pilkington, in substance, "This is my secretary", or "Mr. Riley is my secretary", or "Mr. Riley is my representative", or anything of that kind?

A. Mr. Phipps has never called me his secretary; I never have been his secretary.

Mr. Botts:

Would you read the question?—I don't believe the answer is responsive.

(The last question preceding was read.)

Q. I asked you the question, did you hear him make such a statement?

A. No.

Q. With reference to Mr. Phipps' properties, and the management and upkeep of his properties in Palm Beach, you were in a sense his representative?

A. In the same way I told Mr. Matteson, exactly.

Q. In the management of his boats? Don't think I am trying to trick you; I will say, the boats Iolanthe and Clip; you were in a sense his representative in connection with keeping up those boats and caring for them, weren't you?

A. Yes; I took recommendations and gave them to him, and he approved them or disapproved them as he saw fit.

Q. If Mr. Phipps had said to Captain Abel "Mr. Riley is my representative in connection with my boats," that would have been true, wouldn't it?

A. You mean on his boats Iolanthe and Clip?

Q. I say, "With reference to my boats," now. Do you consider the Seminole his boat?

A. No, sir.

Q. Well, then, answer the question.

A. Yes, that would have been.

Q. That would have been true?

And you did, as a matter of fact have the detail or the control with reference to the storage and care of Mr. Phipps' boats, the Iolanthe and the Clip, didn't you?

A. Yes, sir; I knew what the storage bills were, had them approved.

Q. You approved them and they were paid under your approval?

A. No, they were approved by Mr. Phipps also in most cases.

Q. In most cases?

A. Yes, sir.

Q. All right. Now then, except possibly for the personal approval which you sometimes secured, with reference to the payment of bills on the Iolanthe and the Clip,

your handling of the details with reference to the Iolanthe and the Clip and the Seminole were about the same, weren't they?

A. No, sir, they weren't; because I couldn't expend the money on the Iolanthe or the Clip without Mr. Phipps' approval.

Q. But with reference to the storage charges, the storage charges on the Iolanthe and the Clip were paid by checks of the Palm Beach Company, weren't they?

A. Yes, sir.

Q. And the storage charges on the Seminole were always paid, weren't they?

A. Yes, sir.

Q. And with reference to the Iolanthe and the Clip, you would send word to Mr.—to Captain Pilkington, what you wanted done with reference to them, would you?

A. I think for some work, yes.

Q. And you would do the same thing with reference to the Seminole, wouldn't you?

A. Yes, sir.

Q. And in your mind, the difference was with reference to the Clip and the Iolanthe, you were acting for J. S. Phipps, but with reference to the Seminole, in your mind, you were acting for the Seminole Boat Company, is that true?

A. Yes, sir.

Q. But the checks all came from the same source?

A. They were all made by the Palm Beach Company, except a few, that Mr. Phipps—

Q. And the main—

Mr. Underwood:

Let him finish his answer.

A. Except a few that Mr. Phipps made on his own checks, paying for the storage of the Iolanthe or the Clip.

Q. And your contact, however, with Captain Pilkington, was so near identical with reference to the three boats, that it would be difficult for even you to point out any distinction, as far as you were concerned, wouldn't it?

Mr. Underwood:
I object to that, if your Honor please as argumentative.

(The question was read.)

The Court:
Overrule the objection.

Q. Answer the question.
A. Of course Captain Pilkington didn't know what arrangements I had. All he knew, I was looking after the Seminole, and also on occasions I looked at the Iolanthe and the Clip,—if that is what you mean.
Q. Yes. Then in truth there was little difference so far as between you and Captain Pilkington, if any; isn't that true?
A. Yes, I don't know that I ever went into explanation with him as to my duties.
Q. Now then, on this occasion when you and Mr. Phipps were there, it is entirely possible that in your absence Mr. Phipps did make to Captain Plikington a statement to the effect that you were his agent, representative, secretary, or something of that kind.

Mr. Underwood:
If your Honor please, I object to that as speculative. Anything is possible in Mr. Riley's absence.

The Court:
I think it is proper cross examination.

A. I suppose it is possible, yes.

Q. And you can't say that it didn't in fact take place, can you?

A. It didn't take place in my presence.

Q. All right. I have asked you that already; that is all right, I understand that. Now then with reference to the handling of Mr. Phipps' properties, which we will limit to his estate and lands and his boats, the Iolanthe and the Clip,—you state in substance that you performed the ordinary functions of management, and that Mr. Phipps gave instructions to quote your exact words, not in the ordinary course of business. Now will you explain to us just what those things were which you characterized as not in the ordinary course of business, and in respect to which Mr. Phipps gave especial instructions. Can you illustrate?

A. Well, I certainly wouldn't built an addition to Mr. Phipps' house without his telling me to do so. On the other hand, I would pay the employes on the estate, that he knew were there, without his special permission; he knew they were there and knew how much they were to get.

Q. And with reference to his boat, you would pay the employes of his boats without special instructions there through the company?

A. Yes, sir.

Q. Of course I understand that, in the ordinary method that had been established for paying his personal obligations. And the method of paying Mr. Phipps' personal obligations with reference to his estate, and with reference to his boats, was exactly the same as the method for paying the expenses and disbursements with reference to the boat Seminole, isn't that true?

A. No, sir, because he approved the bills on his estates, with the exception of payrolls. Payrolls of course go on in the summer and there is no way of approving them. The bills were sent to him in New York, for work on his

estate, and given to him here in Palm Beach when he was here in the winter, he approved them.

Q. I limited my question to the ordinary expenses for upkeep of his estate, and the payment of ordinary expenses for labor and so forth on his boats. Now, isn't it true that the method of payment of these ordinary expenses on his estate and on his boat, and on the boat Seminole, were identical? Isn't that true?

A. No, sir; I just gave the reason why it wasn't true.

Q. I wonder if you can find voucher 8320.

A. Which bunch was it in? June 29.

Q. June 29. Will you take that please, Mr. Rliey now that as I understand it had three items. One charged to the Seminole Boat Company. How much was that?

A. $5.00.

Q. And one charged to Mrs. F. E. Guest; how much was that?

A. $10.00.

Q. And some charged to J. S. Phipps Boats; how much was that?

A. $45.00.

Q. Now then, those were ordinary expenses with reference to those three boats, weren't they?

A. You mean did I have to get them approved?

Q. I say, those were ordinary expenses with reference to those three boats, weren't they?

Mr. Underwood:

If your Honor please, I submit that the witness feels that he doesn't understand the question.

Mr. Botts:

He doesn't need counsel's help in answering it.

Mr. Underwood:

May I be permitted to make my comments without interruption?

Mr. Botts:

No, sir, you cannot when you are trying to instruct the witness how to answer.

Mr. Underwood:

I resent that accusation. This witness does not need any instruction from you or from me. The witness started his answer with the word "If", so I assume that he didn't feel that he understood the question.

Mr. Botts:

He can say so, if he wants. I am not trying to deceive this witness.

Mr. Underwood:

I think you were trying to mislead him.

The Court:

Do you understand what ordinary expenses are?

A. Well, I wanted to ask him one question.

Q. All right, go ahead.

A. I want to ask if you mean by that that I have to get approval to pay that $10.00 and that $45.00.

Q. I haven't asked you that question. No, sir, that wasn't what I asked—Mr. Reporter, will you read the question.

(The last question was read; "I say, those were ordinary expenses with reference to those three boats, weren't they"?)

A. Yes, those are ordinary expenses.

Q. All right; and who approved the payment of the charge to the Seminole Boat Company?

A. I did.

Q. Who approved the payment for Mrs. Guest's boats?
A. I did.
Q. Who approved the payment of J. S. Phipps' Boats?
A. I did.
Q. Did Mr. Phipps approve them?
A. Well, he didn't on this particular occasion. He approved—
Q. All right, I know that:

Mr. Underwood:
May he finish, please?

A. He approved the work that Abel was doing on that boat.
Q. His approval isn't on the bills, is it?
A. No, sir.
Q. Then is there the slightest difference in the method of handling and paying those three items chargeable to those three people?
A. No, sir.
Q. All right. And isn't that the exact situation that obtained with reference to all other ordinary, usual expenses, with reference to Mr. Phipps' estate,—Mr. Phipps' boat—the boat Semniole? Do you understand that question?
A. I don't exactly understand what you mean by ordinary, no. If you mean payrolls, labor, that is true.
Q. Well, I will quote your words; "Expenses in the ordinary course of business"; you understand that, you used the phrase.
A. Well, by that I meant, payrolls; that is what I had particularly in mind.
Q. Then you didn't mean, repairs?
A. You mean, purchase of material and so forth?
Q. Made in the ordinary course of business; you didn't mean repairs?
A. Not special repairs, no.

Q. Did you mean any kind of repairs?

A. Well, if this man put in a new piece of pipe in the boat, why I suppose that is ordinary business, yes; because he was working, and bought a piece of pipe and put it in.

Q. I want you to understand, Mr. Witness, that I am not trying to trick you about any question; there are some things that I want to give you a chance to make clear, because I am going to comment on them later, and I don't want to be charged with being unfair about that. So if you don't understand the question, I ask you not to answer it until you do. Now you employed Mr. Schlappi, the engineer, didn't you?

A. Yes, sir.

Q. And you assigned him a part of the time to the boat Seminole, didn't you?

A. Yes, sir.

Q. And you assigned him a part of the time to the Iolanthe, didn't you?

A. Yes, sir, when we needed him,—when he was needed.

Q. And you o.k'd the payment of his salary or wages?

A. Yes, sir.

Q. And you o.k'd it to the identical manner, whether he was working on the Iolanthe, or the Seminole, didn't you?

A. I did so far as the vouchers are concerned, yes, sir.

Q. Did you consult anyone in connection with the selection of Mr. Schlappi to act as engineer?

A. The Captain of the boat, yes.

Q. You consulted with the Captain?

A. Yes.

Q. And that is all?

A. Yes.

Q. Now then as I understand it, you had the dealings with Mr. Thomas which resulted in his receiving these monthly gratuities?

A. Yes.

Q. Now did Mr. Thomas approach you and ask you to do something of the kind?

A. No. We discussed it together; I wouldn't say he approached me, and I didn't approach him on it.

Q. All right, where were you when the discussion of this—I don't want to use the word, settlement,—this method of adjusting affairs with Mr. Thomas, occured?

Mr. Underwood:

If your Honor please, I object to the question. There is no suggestion in the evidence thus far, that this was any method of adjusting affairs with Mr. Thomas.

(Discussion by counsel.)

The Court:

As I understand the question, it is, doing business with Mr. Thomas.

Mr. Underwood:

We don't object to that at all.

A. I was—he asked where?

Q. Yes.

A. In the hospital in West Palm Beach.

Q. That was during the period that the Palm Beach Company was disbursing funds in payment of Mr. Thomas' hospital and doctor's expenses?

A. That is right, yes, sir.

Q. And tell us just what you said to Thomas, just what he said to you, if you can.

A. Well, it was—got to the point where he was going to be released from the hospital, and I think I asked him

what his house arrangements were, where he lived; and he told me that he had been worried about that, because of course there was this lameness in his leg; that he wasn't going to be able to go up and down stairs and nobody could carry him up and down stairs. That he had been living in a garage apartment on the second floor, and that he felt he ought to have a house, one-story house. So they told me at the hospital that he should have an attendant for a while, to help him get around. At the time, his wife was pregnant, needed help also. So I don't know just how,—what basis the $125 a month was on, I don't remember the details; but it was the difference between the house rent; he also advised me that his pay had been cut, because he wasn't able to work, and there was that. And then this attendant and the help for the wife; also, telephone to be put in the house so that he could get in touch with the doctor.

Q. Now Mr. Thomas had never been an employe of the Palm Beach Company, as I understand it?

A. No.

Q. Nor, of the Seminole Boat Company?

A. No.

Q. Nor of any of the other Phipps organization?

A. No, sir.

Q. Nor of Mr. Phipps or any of his relatives personally, so far as you know?

A. No, sir.

Q. And then you weren't purporting to pay him wages as an employe?

A. No.

Q. Did you tell him who suggested that they make these continued and substantial payments?

A. No one did suggest it, except me.

Q. No one told you that you were authorized to pay out all this money to Thomas?

A. I talked the matter over with him, and then consulted with Mr. Alley. Mr. Alley gave me approval to go ahead and do it.

Q. Now then, was the payment,—the making of payments aggregating as they have something over $7,200, was that in or out of the ordinary course of business?

A. I should say that was out of the ordinary course of business.

Q. And as I understood it, you said that when payments on the boat, Seminole or for Mr. Phipps', out of the ordinary course of business, came up, you consulted either with the stockholders or with Mr. Phipps; is that right?

A. No, I said I usually consulted with Mr. Alley or with the stockholders.

(And thereupon the hearing was recessed until 9:30 o'clock a. m., the following day.)

Forenoon Session.

May 12, 1939, 9:33 o'clock A. M.

Hearing resumed pursuant to adjournment of the previous day, the witness JAMES F. RILEY, JR. being upon the stand, on continued cross examination.

Q. All right, sir. Now getting down to this fishing tackle that you wanted to get off the Seminole; as I understand it, that was some, what you call grains, or three-pronged fishing spears?

A. Yes, sir.

Q. Some glass bottom buckets?

A. That is right.

Q. Some, I believe you stated, gaff hooks?

A. Right.

Q. Did you say boat hooks. I have forgotten.

A. No, gaff hooks; and I think there was some bait nets, I think they call them, made out of wire.

Q. That would be wire with cotton string mesh, is that what you mean? Isn't it fish net or something of that kind?

A. No, I mean the bait nets that they put live net in and drop down in the water. I can't describe them.

Q. I call them bait cars. I think that is the technical name for it.

A. That may be.

Q. Now as I understand it you say that previous to this year, those things had been stored in Miami?

A. That was my understanding. We never had stored them at Palm Beach.

Q. You never had stored them at Palm Beach. You don't know as a matter of fact if they had ever been stored anywhere—I mean, of your own knowledge?

A. Nothing except what Mr. Hawkins told me.

Q. You don't know of your own knowledge then?

A. No.

Q. And so far as you know they might have been left on the vessel during the summer?

A. Possibly so, but I don't believe so. I think I would have seen them on the vessel on my inspection trips.

Q. Not at the time when you discussed with Thomas, these payments that were made to him, and began the practice of making these monthly payments to him, you were aware that Mr. Thomas had never previous to that time been an employe of the Seminole Boat Company or of the Palm Beach Company, or any of the Phipps personally?

A. Yes, sir.

Q. And you were also aware that, save and except for a possible junk value of the vessel Seminole, that the Seminole Boat Company was entirely without any assets which could have been made the subject of any claim?

A. I was not aware of that. I don't know anything about the books of the Seminole Boat Company, what the set-up is.

Q. Oh, you didn't know anything about the financial standing of the Seminole Boat Company?

A. I don't know anything about the books of the Seminole Boat Company, if that is what you mean.

Q. Wait a minute; did you know anything about the financial condition of the Seminole Boat Company?

A. Well, I knew that the Seminole Boat Company owned the Seminole and another small boat.

Q. And another small boat?

A. Yes, sir.

Q. You knew it had no bank account?

A. Yes.

Q. And you knew it had no income?

A. Well, they tried to make an income.

Q. Well, it didn't in fact, have a nickel of income except contributions from the stockholders, since about 1931, isn't that a fact?

A. No, I never did handle the charters.

Q. Since it has been in your charge, the boat Seminole had never earned a dime?

A. It never was chartered out of Palm Beach and it was at Palm Beach that it was in my charge.

Q. From the time you had charge of the boat Seminole, beginning at about 1932, up until the time of the fire, it had never earned a dime, had it?

A. Not that I know of.

Q. And you knew that all of its obligations had been paid in the first instance by the Palm Beach Company, on vouchers approved by you, and the Palm Beach Company reimbursed from the stockholders of the Seminole Boat Company? You knew that, didn't you?

A. Yes, sir, I knew that the Palm Beach Company advanced moneys to the Seminole Boat Company.

Q. And you knew that they got those moneys back from the stockholders of the Seminole Boat Company, didn't you?

A. Eventually, yes.

Q. Yes, all right. Now then Mr. Riley, didn't you as a matter of fact know—now let's get right down to brass tacks. Didn't you know that the Seminole Boat Company after that fire had no assets whatever except possibly value of the boat Seminole; and I will ask, the value of this small Prigg fishing boat? Don't you know that was its sole assets?

A. Those were all the assets that I knew of, yes, sir.

Q. And you had been the active manager of it for about four years, had you?

A. Yes, sir.

Q. And you didn't know anything else?

A. Well, I was active manager of the Seminole, yes, and those are all the assets I ever heard of in the Seminole Boat Company.

Q. Well, you had a pretty well convinced idea that it had no assets, except those that I have mentioned, didn't you?

A. Yes, sir, I don't think it had any others.

Q. Now then, knowing that the Seminole Boat Company had no assets except those that I have mentioned, and that the fire originated on the Seminole, and so on, you knew that John Thomas couldn't successfully collect any substantial amount from the Seminole Boat Company, didn't you, even if he could successfully get a judgment against them? You knew that, didn't you?

A. I suppose I did, I never thought of it.

Q. Well, I am trying to get just exactly what you were thinking about then, when you initiated these payments ultimately running up to seven thousand, two hundred odd dollars to John Thomas. Just what liability were you thinking about?

A. Well, I felt sorry for John Thomas. There was a man that had either—his pay had been cut, and he had no way of living, that I could see, the way he was going to have to live.

Q. Of course everyone would feel sorry for them; there were lots of other unfortunates in Palm Beach, weren't there?

A. Yes, sir, that is true.

Q. Did you happen to make any such gratuitous payments to any other unfortunates in Palm Beach along about that time?

A. No, sir, not that I remember.

Q. Well, then, can you give any explanation now, other than the natural human sympathy which we all have for an unfortunate,—why you voluntarily made these various substantial payments, which are still continuing to this young man?

A. Well, nothing more than what I have said; I felt sorry for him; I went to Mr. Alley and asked him if we couldn't do something for him. He asked me how much, and I told him.

Q. You are the one that suggested it, then?

A. Yes, sir.

Q. Oh, yes. Now then you were at that time interested in collecting and preserving evidence with reference to this transaction, weren't you?

A. Yes, sir.

Q. Especially evidence that would fix liability on the Seminole Boat Company?

A. No, not especially; just trying to get the facts.

Q. Just trying to get the facts; all right. Now then in view of your interest in this evidentiary situation, I will ask you this: If at the time when you suggested these payments to John Thomas, it remotely occurred to you that John Thomas was the only living witness to that transaction?

A. I knew that he was the only living witness, yes, sir, except Pilkington and the rest of them that were there at the yard.

Q. Did you think of that circumstance in connection with the advisability of making these payments?

A. I didn't at the time, no, sir.

Q. You didn't. Now my recollection is that at the time when you made this guarantee to the Broward General Hospital, you did so in the name of the Palm Beach Company, or by identifying yourself as being connected,—or personally identifying yourself as being connected with the Palm Beach Company, is that right?

A. Yes, sir.

Q. All of these expenses of John Thomas appear now to be recorded in the ledger of the Seminole Boat Company; you are aware of that, aren't you?

A. I believe they are, yes.

Q. Did you direct that these items be charged against the Seminole Boat Company?

A. I believe so, yes, sir.

Q. All right now, just when was it, will you mind telling us, when you decided that you would charge these expenses against a company different from the one in whose name you made the guarantee?

A. Well, that was the usual course of business, with anything that pertained to the Seminole Boat Company, we charged to the Seminole Boat Company on the Palm Beach Company books.

Q. But you didn't make the guarantee in the name of the Seminole Boat Company, did you?

A. No, sir.

Q. I am just trying to find out whether or not the thought of carrying this Palm Beach Company guarantee in effect by recording the charges in the books of the Seminole Boat Company, with the thought that occurred to you along the time maybe when you were getting photostats of these gasoline slips?

A. No, sir, I don't believe so, because I paid, as I remember it I paid the hospital $200 on the next day after the fire; either the next day or the third day.

Q. Now I believe you said that you were present when you saw Mr. Carl Holm pick up some valves from the rubbish and debris in the engineroom of the Seminole and mark them with a hacksaw or a file?

A. Yes, sir, I was present.

Q. I am not sure that I can quote you exactly, but my recollection is that you said at that time that you were not particularly interested in those valves?

A. I was not.

Q. Up to that time you had never been interested in the valves from the engineroom of the Seminole, is that true?

A. That is true, yes, sir; never thought of them.

Q. During all these years when you were inspecting the Seminole from time to time, during all those years, you hadn't been interested in those valves, had you?

A. Well, I left that entirely up to the engineer and Captain. I don't know anything about valves.

Q. During all those years you had never inspected those valves, had you?

A. No, sir.

Q. And during all those years you had never inquired to find out whether anybody else had done so, had you?

A. No, sir.

Q. All right. Had you ever looked at the tanks of the Seminole?

A. No, sir.

Q. You didn't know a thing in the world about how they were constructed, or anything else, did you?

A. No, sir.

Mr. Botts:

I think that is all.

By Mr. Matteson:

Q. May I ask just a few questions more?

The Court:

Yes, sir.

Q. Mr. Riley, Captain Abel did act, at least part of the time, as Master of the Clip, did he not?

A. Yes, sir.

Q. And he also acted as Master of the Iolanthe?

A. Yes, sir.

Q. When it was in operation. He had never acted as Master of the Seminole?

A. No, sir.

Q. I was looking over these gasoline charges here on these different slips; there seem to be a number of them for a Ford coupe. Whose car was that?

A. A Ford coupe?

Q. A Ford coupe.

A. It would be impossible for me to say offhand, I don't know.

Q. Well, here—look at these, who did you charge those to when they came in?

A. It looks to me as though these slips are for the car that was owned by Abel. I thought he had a Chevrolet coupe. The reason I say that is because in most cases the amount of gasoline is five gallons; and he was allowed five gallons of gasoline per week. There is the 19th, 24th—

Q. Well, here are quite a number that have no heading at the top, except J. S. Phipps, and they are all five gallons too.

A. I believe these—those are all under—for gasoline on the car that Abel had.

Q. You are referring now to these slips that I have shown you, that have no heading except, John S. Phipps?

A. Yes, sir.

Q. Now I have shown you a number with the heading, Ford Coupe; and here are a number of more; some seem to be headed, Chrysler Coupe and Chrysler sedan.

A. The Chrysler sedan belongs to Mr. J. S. Phipps.

Mr. Underwood:

May I see the ones you say are headed Chrysler coupe? —That isn't Chrysler. I don't want to say this in the presence of the witness; come over here and I will tell you what it is:

Mr. Matteson:

I have no objection to your suggesting it to the witness.

Mr. Matteson:

I don't want to be in the position of suggesting anything.

Q. This one I have referred to as Chrysler coupe, may be a Chevrolet coupe.

A. Chiv, that looks like.

Q. So that is a Chevrolet coupe. Then we have a Ford sedan, Chevrolet coupe, and a Chrysler sedan.

A. Have a Ford coupe instead of a Ford sedan.

Q. Did I say sedan? Ford coupe, *Chrysler* coupe, Chrysler sedan, is that it?

A. Yes, sir, that is correct.

Q. Now can you tell me whose cars these were, and to whom the charges were made on those different cars?

A. On these tickets that have no car marked on them at all, I am sure that is Abel. The Ford coupe I am not sure of, I don't know who that belonged to. It might have belonged to Abel and later he traded it in for this Chevrolet coupe; I know at the time of the fire he had a Chevrolet coupe. The Chrysler sedan belonged to Mr. J. S. Phipps personally.

Q. And did Abel at times drive the Chrysler sedan for Mr. Phipps?

A. Yes, sir, he has.

Q. And did he use his own car on company business?

A. You mean other than for Mr. J. S. Phipps?

Q. Well, I mean the general business that you would assign to him.

A. No, not unless he bought gasoline for it.

Q. What was the reason for the allowance to him of five gallons a week?

A. Well, he did a lot of running around with his car; he came to and from work in his car; and Mr. Phipps said "Just to let him have five gallons of gasoline a week."

Q. He did do more or less running around on the company business?

A. No, sir.

Q. I thought that is what you said was the reason for the allowance.

A. No, not company business; on Mr. J. S. Phipps' business.

Q. On Mr. J. S. Phipps' business. So when he wasn't occupied actively as Captain of one of the boats, he would sometimes act as a chaueffeur, is that right?

A. No, sir, not as a chaueffeur. The times that he would use that Chrysler sedan would probably be, if he went on a hunting trip or a fishing trip, they would go out and do some fresh water fishing, of that sort, and he did go on quite a few duck hunting trips, and he usually used the Chrysler to carry along paraphernalia with, that was used.

Q. Well, did he or did he not use these cars for general errands, or occasional errands, for you or for Mr. Phipps?

A. You mean the Chrysler sedan or any of them?

Q. Any.

A. He used his own car for errands for Mr. Phipps.

Q. You were saying yesterday that this entry number 4206, representing Abel's salary for a week, charged to

Townsend Martin, was because he was doing something for Townsend Martin that week. Can you tell me what he was doing for Townsend Martin that week?

A. No, sir, that would be impossible.

Q. But is it possible, or is it a fact, that Mr. Townsend Martin was using the Clip that week?

A. I don't know; it is possible.

Q. You haven't any recollection at all of what he was doing for Townsend Martin?

A. No, sir, I don't.

Q. Did Townsend Martin at that time have the use of the Clip?

A. Yes, Mr. Phipps loaned it to him.

Q. And on such occasions, would the wages of Abel be charged to Mr. Townsend Martin?

A. No, not when he was on the Clip. If it was, Mr. Phipps loaned it to him he never charged him for the operation of it.

Q. And you didn't charge the wages involved, to Mr. Townsend Martin?

A. I don't believe so. I don't think Mr. Phipps ever made him pay the wages when he was using the Clip; but I am not positive of that.

Q. Then I take it that this second voucher, 4247, $32.60, for salary and reimbursement of expenses to Abel, charged to Mr. Townsend Martin—do you have any recollection of what that was for,—what he was doing for Mr. Townsend Martin at that time?

A. No, sir, I don't.

Q. And then here the next voucher, 4364, four weeks' salary, charged to Mr. Townsend Martin, do you recall what that was?

A. No, sir, I don't.

Q. No recollection?

A. I can't say exactly what he was doing. I think I might find out from the files.

Q. That was in 1933, wasn't it?
A. Yes, sir.

Stipulation:

It is stipulated that in the first line on page 1562, the word "with" should read "without".

The Court:
That is stipulated with all counsel, is it?

Mr. Botts:
Yes, I remember it clearly.

Mr. Underwood:
Yes, that is right.

Re-Direct Examination.

By Mr. Underwood:

Q. Mr. Riley, do you remember whether you had any conversation with anybody before you went down—between the time you got the carbon copy of the gasoline slips, and the time you went down for the original?

A. I might have had conversation with Mr. Alley, I am not positive of that.

Q. Do you remember about that definitely, either way?

A. No, sir.

Q. Mr. Riley I note that of these forty-six gasoline slips the ones dated May 15, 1934,—there are two of that date—one dated May 16, 1934 and one dated May 11, 1934, are all charged to Chrysler sedan; and three I think, bear in addition to the designation of car, the initials, T. B. M. That is May 16 to 17, inclusive, 1934. Is it not a fact that Abel's pay for the week of May 17, 1934 was charged in part, and for the week of May 24, 1934 was charged ap-

parently in toto, to either Mr. Townsend or Mr. Bradley Martin?

A. Yes, sir, that is correct.

Q. When this analysis of the payroll of Abel's was made up, is it a fact that Townsend Martin's and Bradley Martin's charges were included in the same column?

A. Yes, sir.

Q. So without looking at the original payrolls, you can tell whether it is Townsend or Bradley?

A. No, sir.

Q. The original payrolls would show that?

A. Yes, sir.

Q. The original payrolls would show that?

A. Yes, sir.

Q. Can you tell me why it was that the gasoline purchased for the Chrysler was charged to one of the Martins, if the Chrysler was owned by John S. Phipps?

A. It is possible that the car might have been loaned to Townsend Martin on that particular occasion, and that naturally he wouldn't expect to have loaned him the car with gasoline, he might have insisted on paying for it.

Q. You were asked some questions about your dealings with John Thomas, while under fire. Did you ever make any agreement with him, directly or indirectly, expressed or implied, as to the character of his testimony?

A. No, sir.

Q. Or as to what he would say as to what transpired on the Seminole on the day of the fire?

A. No, sir.

Q. When Mr. Botts was speculating with you about the possibilities of signing the gasoline tickets, I observed that he held the pad in his left hand, with his thumb, his left thumb firmly fixed across the pad at the top, covering the line reserved for the name and address of the charge, and he asked you whether or not the thing might slip. I am going to ask you to tell me and show the Court

under what other circumstances a man might possibly hold that pad to sign it; not all possibilities but just a few that occur to you.

A. Well, in some cases, in the first place this top is made out in the office before they ever bring the ticket out to you; I have seen them mark it a lot of times; they see who comes up, and makes the ticket out and bring it out for you to sign. When they hand it to me in the car, I usually put it on my steering wheel like that.

Q. You have indicated your thumb covering up more than half an inch of the left margin of the pad.

A. Yes, sir.

Q. And no other finger on top of the paper?

A. No, sir.

Q. All right, go on.

A. Or, I put it on the sill of the door, on the side, and sign it.

Q. Indicating the same position of the thumb?

A. Yes, sir.

Q. Have you ever seen anybody sign a gasoline ticket where the pad was held by the station attendant, and the signature written by the purchaser, without holding the pad himself at all?

A. No, sir, I don't believe I have.

Q. Have you sat in a car and reached outside the car to sign the ticket, when the station attendant was holding the pad?

A. No, sir, I don't believe I have.

Q. Is it quote possible that a man might also sign the pad by holding it in his hand as I have it now, with the three fingers against one side, and the thumb against the other side, but neither fingers nor thumb over the top of the paper?

A. Yes, sir, I think he could sign that way.

Q. Is it quite possible that the upper ticket might slip over the lower ticket while the pad was being signed in some such way?

A. Yes, sir.

Q. You have recalled, I think, sending a man down to the Seminole shortly after returning from the cruise in the spring of 1935, to bring back some beds or springs or something of that sort?

A. Yes, sir.

Q. Do you know whose property those things were?

A. They belonged on the Iolanthe, which was owned by J. S. Phipps.

Q. You mean that they had been borrowed for this cruise from the Iolanthe?

A. Yes, sir.

Q. Now at that time what was Randall's position in the office?

A. I suppose you would call him office boy. He did errands.

Q. How old a person is he?

A. Sixty-three I believe.

The Court:

He was in the office of the Palm Beach Company?

A. Yes.

Q. He was in substance the Palm Beach Company's office boy, was he?

A. I think I am right about that. He used to work for Mr. J. S. Phipps, and he was at our office, and I am not sure the year, it was either '34 or '35, but I believe at this time he was working there in the office, as office boy.

Q. Did you make any report to anybody of your inspections of the Seminole?

A. Well, I discussed the inspections with Mr. Alley.

Q. Did you make any reports concerning the engine plant and the gasoline lines or tanks of the Seminole?

A. No, sir.

Q. How did you get your information as to the condition of the engines and the gasoline lines and tanks and

the electrical equipment and so on, in the engineroom of the Seminole?

A. I depended entirely on the Captain and engineer to tell me whether there was anything necessary,—repairs or replacements.

Q. Did you have any report from them from time to time, as to that?

A. Yes, sir.

Q. Have you had any mechanical experience yourself?

A. No, sir.

Q. You told us yesterday that you worked for a contractor, as I recall it, before you went to work for the Palm Beach Company. What did you do before that?

A. I worked in a brick and tile manufacturing plant.

Q. And before that?

A. I was at school before that.

Q. Where did you go to school, and how long were you in school, and what did you study?

A. I went to prep school for two years.

Q. Where?

A. At Marion, Alabama; and then I went to Washington and Lee University in Virginia one year, and went to Alabama Polytechnic Institute in Auburn, Alabama for one year.

Q. You were asked yesterday, with voucher number 97 of Exhibit 78 before you, about the entry dated August 9, Palm Beach Service Station, gas $2.19, indicated the date of payment. Do you remember that?

A. Yes, sir.

Q. What payment do you mean that that indicated? Payment from whom, to whom?

A. Well, this August 9 does not indicate the day that we paid the Palm Beach Service Station.

Q. What does it indicate?

A. It indicates—

Mr. Matteson:

Does the witness know? * * *

A. I really don't know, no.

Q. Do you remember what you were about to do, if anything, with the originals of these two gasoline tickets signed by Abel on the day of the fire, when you had the photostats made?

A. I gave the original, and I think a copy too, to Mr. Alley, and kept the photostats in our files.

Q. You said something yesterday about being in charge of the Iolanthe and the Clip. Who was it that gave your instructions to you as to that?

A. Mr. Phipps.

Q. Did you get any instructions as to that from Mr. Alley?

A. No, sir.

Q. Have you that file of Pilkington letters, to and from? —I show you Libelants' Exhibit 49, did you write that letter?

A. Yes, sir.

Q. That is in August, 1931?

A. Yes, sir.

Q. I show you another letter dated April 16, 1935; did you write that letter?

A. Yes, sir.

Q. That Libelant's Exhibit 53. Is that the one that you gave to Randall, of whom we spoke a moment ago?

A. Yes, sir.

Q. When did he go down there with reference to the date of that letter?

A. He went down the same day.

Q. Mr. Matteson has asked me too, to have you identify all your letters in here; we will go through and do it. There is Exhibit 49, dated August 26, 1931; you wrote that?

A. Yes, sir.

Q. Exhibit 55 dated January 2, 1932?

A. Yes, sir.

Q. Exhibit 41 dated May 18, 1933?

A. I dictated that but didn't sign it.

Q. Who signed it?

A. I don't know; the stenographer's initials are there.

Q. There are some initials below the pen and ink, J. F. Riley?

A. Yes, sir; the initials are E. H., which indicate Edna Holmes.

Q. Exhibit 50 dated September 13, 1932, did you write that?

A. Yes, sir.

Q. —and sign it?

A. Yes, sir.

Q. Exhibit 56 dated March 21, 1933, did you write and sign that?

Q. Exhibit 57 dated May 3, 1933, did you write and sign that?

A. Yes, sir.

Q. Exhibit 47, dated May, either 2 or 3, 1934, did you write and sign that?

A. Yes, sir.

Q. That is all in your handwriting?

A. Yes, sir.

Q. Exhibit 48 dated September 5, 1934; is that all in your handwriting?

A. Yes, sir.

Q. Exhibit 53 dated April 16, 1935, did you write and sign that?

A. Yes, sir.

Q. Exhibit 60, without a date, did you write and sign that?

A. Yes, sir.

Q. That is the one you gave to Captain Abel on the day of the fire?

A. Yes, sir, all in my handwriting.

Q. And Exhibit 62 dated September 30, 1935, did you write and sign that?

A. Yes, sir.

Mr. Botts:

I take it the one he didn't sign, he accepts responsibility for as if signing. I don't know what is in it.

A. Yes, I accept.

Q. Mr. Riley, you were asked yesterday about the nature of your management of the J. S. Phipps estate. I would like to ask you how that compared with your duties as to the personal estate of H. C. Phipps and Mrs. Guest, and Howard Phipps.

A. Practically the same.

Q. And generally, what are those duties as to the estates? And by estates, I mean their residences and the land around them.

A. Well, they have certain employees on the estate; they are paid each week, and I in a general way supervise their work; I supervise any repair work that is necessary on the improvements; and when any new construction is done I usually handle obtaining bids, having plans made for that sort of work, and any repairs in the house, I have a staff of men that make repairs on plumbing, carpenter work, painting.

Q. When you made purchases for those estates and for companies that you occasionally do things for, what is the form of making those purchases?

A. We use a requisition system in our office. A requisition is made out to the company or contractor, whoever it might be, that we are ordering the work done, or buying any goods there.

Q. Whose requisition is that?

A. Palm Beach Company's requisition.

Q. You were asked yesterday, and we had some discussion about the ordinary expenses in connection with

the Seminole. Will you tell me what was ordinary for the Seminole, compared with what was ordinary for the Iolanthe? And the Clip, and Mrs. Guest's boat, Dorothy?

A. Well, what was ordinary for the Seminole was, various small repairs that I would authorize, o.k. the bills for and have paid. In the case of the Iolanthe and the Clip and Mrs. Guest's boat the work was approved before it was done, and then in some cases the bill was approved after the work was finished, before the bill was paid.

Q. When you say it was approved before it was done, on the Iolanthe and the Clip and the Dorothy, by whom was it approved?

A. By the owners of those boats; in most cases verbally.

Q. Was that true of the ordinary expenses on the Seminole?

A. No, sir.

Q. You were asked yesterday whether Mr. Martin,—I have forgotten whether Townsend or Bradley Martin, was in Palm Beach at the time of the fire, and you said that you recalled whether he was or not, but you weren't asked what you recall. What is your recollection as to that?

A. I know he wasn't in Palm Beach the day of the fire, because I had a telegram from him the next day, asking that I buy flowers and send them to Abel's funeral.

Q. Where did that telegram come from?

A. It came from New York.

Q. There was some discussion yesterday about when it was you decided to make the charge against the Seminole Boat Company for Abel's pay for June 24, 1935, as it appears on voucher 8320 of Exhibit 3-V. When did you determine that Abel's pay was to be charged for that day, to the Seminole Boat Company?

A. I determined that on the day of the fire.

Q. When did you make the charge?

A. On June 29, 1935.

Q. What part of the day of the fire did you reach that determination as to the charge?

A. In the morning, before Abel left Palm Beach.

Q. You were asked yesterday whether this file of vouchers is all that there were for Abel. Tell me just what you did in that respect.

A. Well, we had a system of filing these vouchers as to name, in alphabetical form; and we went through and got all vouchers that had the name, R. C. Abel, on them.

Q. Who went through and picked them out?

A. Mr. Anderson.

Q. Who did he give them to?

A. He gave them to me.

Q. You gave them to me?

A. I gave them to you or to Mr. Alley.

Q. Did you give me or Mr. Alley all that Mr. Anderson gave you?

Mr. Underwood:

I will ask my friends to accept my statement that is all I received.

Mr. Botts:

All right, we will even stipulate that.

Q. There was some mention yesterday of a trip to Bimini, following the fire Who made that trip?

A. In the Iolanthe?

Q. Yes.

A. When, did you say?

Q. Who. Who made the trip?

A. I understand you to say, following the fire?

Q. Was it following—I should say, following the lay-up of the Seminole. I am sorry.

A. Mrs. Guest.

Q. Did you find anything that will make your memory certain as to when it was that you and Mr. Phipps first went to Pilkington's yard together?

A. Yes, sir.

Q. What did you find?

A. I found a list of groceries that I had made up at the time the trip was taken, in the summer—August, 1932.

Q. Is that the list?

A. Yes, sir.

Q. Is that what refreshes your recollection?

A. Yes, sir.

Q. What year was it that you and Mr. Phipps first went to Pilkington's together?

A. In August—I mean in about April or May, 1932.

Mr. Matteson:

I shan't offer this, because I don't think it is necessary to encumber the record; but you may examine it if you like.

Q. While Mr. Botts was cross examining you yesterday about what was said by Mr. Phipps on that first trip in 1932, you said, according to my notes, "I couldn't say what was said when we walked through the boat." To whom did you refer when you said, "We walked through the boat?"

A. Mr. Phipps and myself.

Q. Where was Mr. Pilkington when you and Mr. Phipps were on the boat?

A. I don't know, he wasn't in the boat.

Q. Now, you were asked whether on that occasion it is possible that Mr. Phipps may have gone off by himself and talked with others. What is your recollection as to whether he did that or not?

A. I don't remember him going off and talking to anybody.

Q. Do you remember being separated from Mr. Phipps on that occasion at all?

A. I don't remember it, no, sir.

Q. You were asked some more questions about this voucher and these payments to Abel, voucher number 8320 of Exhibit V, and you were asked whether you got authority from Mrs. Guest for that $10.00 charge, and from Mr. Phipps for the $45.00 charge, at the time you made the charges. You answered in the negative, as I recall it. Will you tell me anything more you have to say about your authority to charge that $10.00 and that $45.00 to Mrs. Guest and Mr. Phipps respectively?

A. Well, I had permission to do the work that that indicates, both on Mr. J. S. Phipps' boat and on Mrs. Guest's boat.

Q. From whom did you get that permission?

A. From Mr. J. S. Phipps and from Mrs. Guest.

Q. In other words they approved those expenses before they were incurred?

A. That is right.

Q. So that you needed no further approval at the time the bill came on for payment?

A. No, sir.

Q. I think you have said Mr. Riley, that your interest was not in the valves and so on that Holm was handling and removing from the boat, on the Wednesday morning, I think it was, following the fire. Do you remember what your interest was centered on at that time?

A. My interest then was entirely, getting the boat out of the boat, and making the funeral arrangements for the body.

Q. You were asked about the employ of Schlappi as engineer on other boats other than the Seminole. Will you tell me where your authority came from, as to that?

A. From the persons who owned those boats.

Q. And was it general or specific authority? That is, did you have general authority to do that; or, when a boat was going to be used, did you get specific authority?

A. In the case of Schlappi, he had proved satisfactory as an engineer, and I had general authority.

Q. Well my point is not quite that. Who was it wanted an engineer when you hired Schlappi for the Iolanthe, for example?

A. The owner wanted an engineer, J. S. Phipps.

Q. As I understand it then, it was the owner that decided that he wanted an engineer, and it was you who decided that he would have Schlappi at that time?

A. Yes, sir.

Mr. Underwood:

That is all.

Mr. Botts:

Listen to this; I want to ask a question and see if this is agreeable: It is stipulated that the document produced by the witness, from which he stated he refreshed his memory as to the date when he and Mr. Phipps visited the Seminole, consists of an itemized list of groceries, and that the only date appearing on it is a pencil memorandum, August, or Aug.—1932.

Mr. Underwood:

Will you read the last part of that to me.

(Statement was read.)

The only pencil memorandum as to date?

Mr. Botts:

As to date, I mean, yes; I said, the only date is a pencil memorandum, August 1932.

Mr. Underwood:

That stipulation is satisfactory to me.

Mr. Botts:

Then we won't have to file the document in evidence.

Mr. Underwood:

That makes it necessary for me to ask a couple of more questions:

Q. When did you find this document?
A. This morning.
Q. Was the date, Aug. 1932, on it when you found it?
A. Yes, sir.
Q. And in whose presence did you find it?
A. Yours and Mr. Alley's and Mr. Anderson's.

Re-Cross Examination.

By Mr. Botts:

Q. As I understand it you found that document this morning?

A. Yes, sir.

Q. Now then, when, previous to today, had you last seen that document?

A. I don't know, Mr. Botts; it has been a long time ago.

Q. Back in 1932, perhaps?

A. Perhaps, I just don't remember when the last time I saw it was.

Q. Now then there is nothing on that document remotely referring to a visit to the boat Seminole or the Pilkington yacht basin, is there?

A. No, sir, not to my knowledge.

Q. Then the connection between this document, and the visit, so far as there is any, is purely in your mind, isn't it?

A. That is right.

Q. Now did you ever have any other grocery list for the Seminole?

A. Yes, sir, I think there have been some others.

Q. Weren't there grocery lists—weren't there groceries bought for the Seminole in 1931?

A. I don't remember whether there was a trip in '31 or not.

Q. You don't know?

A. No, sir.

Q. Well, after all, about the only connection between the two is that you found a grocery list and that you have some recollection in your mind that the year that those groceries were bought, was the year that you and Mr. Phipps visited the Seminole, is that it?

A. Yes, sir, that is the only trip that I can remember, that was taken during the summer; that was in August.

Q. And your impression now is that in the spring—I believe you fix it about April, to the best of your knowledge?

A. Yes, sir.

Q. —prior to this trip, was the time when you and Mr. Phipps visited the Seminole at Pilkington's yacht basin?

A. Yes, sir.

Q. And that is your best recollection at this time?

A. Yes, sir.

Q. Now then I understood from you in answer to Mr. Underwood's question, that after you had procured these two gasoline slips, the original and the carbon, and had them photostated, you then delivered the original to Mr. Alley and you retained photostats for your file, is that correct?

A. That's the way I remember it.

Q. Yes. Now then this was just about the time, or shortly after you had the photostats made, that you delivered the original documents to Mr. Alley, was it?

A. Yes, sir.

Q. So that would probably be some time in the early part and maybe up to the middle of August, 1935, when you delivered those slips to Mr. Alley? That would be about the time wouldn't it?

A. From the middle of July on through. I don't know just when it would be.

Q. Well, I think the bill for the photostating, I have it in my mind, that is in August.

Mr. Matteson:

August 9th.

Mr. Underwood:

That is the date on the Seminole Boat Company vouchers, but it doesn't follow that that is the date the photostating company was paid.

Mr. Botts:

All right, I just wanted to get it straight in my mind.

Mr. Underwood:

If that date is important we will try to dig out from our files the original bills from the photostating company.

Q. From the time that you first had your attention called to this carbon copy of the slip up until the time that you delivered the same to Mr. Alley, it was continuously in your custody and under your control?

A. Yes, sir.

Q. And from the time that you—probably on the same day as you indicated, secured the original of the slips from the filling station, until you delivered both the documents to Mr. Alley, that original was in your possession, is that right?

A. Yes, sir, except—

Q. Except the time when it was being photostated?

A. Yes, sir.

Q. And that delivery might have been any time from sometime in July to as late as perhaps the middle of August,—that time of delivery to Mr. Alley?

A. Yes, sir; I can't place—I mean I can't designate the exact time.

Q. But anyway, during that whole period you have had the documents?

A. Yes, sir.

Mr. Botts:

That is all.

By Mr. Matteson:

Q. Mr. Riley, this slip from which you refreshed your recollection, this typewritten page, it has no typewritten date on it of course, but the date of August 1932 is written across the top.

A. Yes, sir.

Q. Is that a memorandum of yours? Did you write that?

A. No, sir.

Q. I notice that the charge—I suppose it is a charge, the word, boat, is written at the top of page 2?

A. Yes, sir.

Q. Who wrote that?

A. That looks like mine; I wouldn't be positive, but it does look like my writing, yes, sir.

Q. And various little pencil corrections down the page, do you know who made those?

A. This pencil correction of Hormel is mine; and table and packs. I believe that is all of them.

Mr. Matteson:

I would like to have this marked for identification.

Mr. Underwood:

I have no objection.

(Thereupon the said typewritten list was marked Libelants' Exhibit 108 for identification.)

Q. You say you attended Alabama Polytechnic for a year?

A. Yes, sir.

Q. What were you studying there?

A. Architecture.

Q. With respect to this charge appearing on the Seminole books for gasoline and for photostats, dated August 9, 1935, you said in the first part of your testimony this morning that that was not the date on which it was paid. Later on I gathered that you just didn't know whether it was or not; is that the fact?

A. No, I said I feel positive that that is not the date that we made the check out, Palm Beach Company's check to pay that gasoline account.

Q. But you don't know, that is just your thought about it?

A. Yes, sir.

Mr. Underwood:

I will get the check if you have and interest in its exact date.

Mr. Matteson:

At this particular juncture, I don't care.

Q. Where was the Iolanthe at the time of the fire?

A. It was at Palm Beach.

Q. And was Schlappi working on her at that time?

A. No, sir.

Q. This trip that Mrs. Guest made to Bimini on the Iolanthe, to whom were the expenses of that trip charged?

A. I can't say offhand. Mr. Phipps may have given her the trip, or she may have paid for it. I really don't know, without going to the record.

Mr. Matteson:
That is all.

Mr. Botts:
Just one more thing.

Q. What is the name of this man that runs this filling station? Is it Harkness or Harkins?
A. Harkins.
Q. Harkins?
A. Yes, sir.
Q. Now, when you went to Mr. Harkins to get this original of this slip, what explanation did you make to him as to why you wanted it?
A. I just told him I wanted it.
Q. Didn't tell him why?
A. Asked him if he had it.
Q. Didn't tell him why you wanted it, or anything?
A. No, sir, I don't remember telling him.

Mr. Botts:
That is all.

(Witness excused.)

2037 MR. R. A. ALLEY was recalled as a witness on behalf of Respondents and further testified as follows upon:

Further Cross Examination.

By Mr. Botts:
Q. Mr. Alley, you have heard Mr. Riley's statement with reference to the original and carbon of these gasoline slips being delivered to you?

A. That is right.

Q. You recall the circumstance of that delivery to you, do you?

A. Yes, I remember it.

Q. I don't suppose you recall the exact date?

A. No, I couldn't now.

Q. From the time when Mr. Riley delivered those documents to you have they been,—and up until I will say you delivered them to Mr. Underwood, who produced them here in Court,—have those documents been continuously in your custody and control?

A. They were either in my control or in the control of Mr. Scott. That is, I don't recall whether I delivered personally to Mr. Underwood, or whether I sent them to Mr. Scott to deliver them to Mr. Underwood.

Q. You kept them in your safe or files there in Palm Beach until they were ultimately sent to New York, either directly to Mr. Underwood, or for delivery to him, is that right?

A. That is correct.

Mr. Botts:

All right, that is all.

Re-Direct Examination.

By Mr. Underwood:

Q. What was the first you knew about this gasoline ticket?

A. Mr. Riley called me as soon as he had received the bills from the Palm Beach Service Station and told me that he had this gasoline slip, it was a carbon of the gasoline slip. And I suggested to him that he go to the service station and get the original.

Q. When, with respect to the time Mr. Riley called you and told you that he had this carbon that you told

him to go get the original, did you first see the gasoline slips yourself? In other words, did you see the carbon before you saw the original?

A. I did.

Q. Or did you see them both at the same time?

A. I saw the carbon, I think I saw the carbon the day he called me to tell me that he had the carbon.

Q. Was that before or after he had gotten the original?

A. It was before he secured the original. I think when he told me that he had the carbon, I saw it at that particular time, on the same date.

Q. Were the words Seminole Boat Company on that carbon when you first saw it?

A. They were.

Q. Did you give him any instructions about this photostating of the gasoline tickets?

A. I did.

Q. Was it on your instructions that he did that?

A. It was.

Q. What was the purpose of that?

A. I think Mr. Riley gave a very good explanation of that; it was to have a complete record of what had taken place.

Q. How soon after they were photostated did the two tickets themselves come into your possession, do you remember?

A. The two tickets, to my recollection, came into my possession immediately after being photostated.

Q. How soon after that did you turn them over to someone else?

A. I can't recall that; I don't recall the particular time they were sent on to you.

Mr. Underwood:

That is all.

Re-Cross Examination.

By Mr. Botts:

Q. It was very shortly after that, they were sent on to New York, was it?

A. That is my impression.

Q. All right. Now, Mr. Alley, did it occur to you as a lawyer, that the original, of which you had a replica or carbon copy in your possession, would bear far more evidences of credibility and integrity if it remained in the possession of the filling station until called for, rather than both the original and the carbon remaining in the possession of the same person? I say, did that occur to you?

A. Well, I don't recall whether it occurred to me or not.

Q. It occurs to you now, doesn't it?

A. Well, of course that is true; if a slip came through a source that it had been in all the time up until the time of trial, why that is the better way.

Q. In other words, if, when that carbon was produced, if you had left it with the filling station man and it was brought in in that way, it would have kind —wouldn't have been so good for us, would it?

A. Perhaps that was a mistake I made.

Mr. Botts:

That is all.

Further Re-Direct Examination.

By Mr Underwood:

Q. What was your purpose in getting the original?

A. In the first place I wanted to see the original; in the second place I wanted to be sure that the original was preserved. I think those are the two reasons.

Mr. Underwood:

That is all.

The Witness:

If we had it in our possession, we knew it would be preserved.

Further Re-Cross Examination.

By Mr. Matteson:

Q. Mr. Alley, in your position there in Palm Beach, I think that you have at least two capacities; you were the vice president of the Seminole Boat Company and you are also the representative of Mr. Phipps and the other members of the family, is that right?

A. I think that is true, yes.

Q. In your capacity as vice president of the Seminole Boat Company, I should have thought that your reaction to this slip would have been "Well, this is just too bad; it is not of any value to the Seminole Boat Company"; is that right?

A. Well, I suppose that is strictly true. It does show that the work was done for the Seminole Boat Company, that is very true.

Q. And in your capacity as representative of Mr. Phipps, it appeared to you as a very good piece of evidence, is that right?

A. Well, it certainly to my mind, fastened the responsibility on the party it was on. As you say, I represented mixed parties. I don't remember which particular party's advantage it would be to, at that particular time; but it certainly recorded the true facts.

Q. Then I take it that the interest that you were principally serving, in attempting to authenticate and preserve this evidence, was Mr. Phipps, rather than the Seminole Boat Company; is that right?

A. Well, you are probably right about that, yes. I don't think there is any question about that; no kidding about it.

Further Re-Direct Examination.

By Mr. Underwood:

Q. Did you have in mind that the time for whom you were acting in preserving this thing, or whether you were doing something for one that would be disadvantageous to another?

A. Well, I can't recall my exact mental processes at the time. It may be true that I felt it would protect someone else more than it would the Seminole Boat Company; it probably was true.

(Witness excused.)

(Thereupon an informal recess was taken for three minutes. And thereafter discussion was had between counsel and Court as to the question of handwriting.)

Mr. Matteson:

I am perfectly willing to state on the record, that the exhibits S and S-1, and also a certain number of the tickets that are included in the bunch that have been labeled Exhibit 7, small initials in ink near the corner, at one place I think on the ticket, F. M. H. are the initials of those of one of several handwriting experts—rather of persons whom we have consulted with respect to the authenticity of the handwriting.

Mr. Underwood:

And that those are the initials of Mr. Holt of Jacksonville.

Mr. Matteson:
That is right.

(Witness excused.)

(Mr. Edward J. Anderson was called as a witness on behalf of Respondents.)

Mr. Underwood:
Before proceeding with this witness, your Honor, I would like to offer in evidence the deposition of Anthony Schinigoi, taken at New York on April 19, 1939; the reason being that he was bound north and wouldn't be here in this district at this time. He was the cook on the Seminole on the last cruise.

Mr. Matteson:
(Following discussion.) The question and answer recorded at page 15 addressed to this witness, who was the steward of the Seminole, is this: "You say there were two Mr. Phipps that were on this trip?"
"A. Yes." "Q. How do you recognize the difference between them? Is one an older man and one a younger man, or how is it?" "A. Mr. Phipps—the one that I believe was the owner of the Seminole—I know him a little more because he chartered the Molly-O the year before; and the other Mr. Phipps is maybe a little different—and that is the difference between the two." There is an apparent omission but I think Mr. Underwood is willing to agree that Mr. Phipps who chartered the Molly-O the year before, was Mr. John S. Phipps. Is that correct?

Mr. Underwood:
That is correct.

(Thereupon the said deposition was admitted in evidence and marked as Respondents' Exhibit 4-C.)

2045 MR. EDWARD J. ANDERSON, as a witness on behalf of Respondents, was sworn and testified as follows:

Direct Examination.

By Mr. Underwood:

Q. What is your name, please?

A. Edward J. Anderson.

Q. Where do you live?

A. West Palm Beach, Florida.

Q. And you are employed by whom?

A. Bessemer Properties, Inc.

Q. How long have you been employed in that office?

A. Since August, 1927.

Q. What is the nature of your work as—

A. Accountant.

Q. What experience have you had as an accountant,—what training?

A. I had a course in accountancy at the City Business College, Chattanooga, Tennessee. I had several years training in—in the office of a C. P. A. and also additional study in the International Accountants Society.

Q. How long have you been working as an accountant?

A. Since 1921.

Q. Have you examined the books of the Seminole Boat Company,—and by that I mean, the document heretofore marked Exhibit 76, Y and Z?

A. I have.

Q. Did you keep those books at any time for any period?

A. Those books were given to me around the first of the year, 1934. I have kept the record since January 1st, 1934.

Q. Are you familiar with the books and—

A. I am.

Q. Have you gone through them and made an analysis of them, at my request?

A. I have.

Q. Is that a copy of your analysis?

A. That is.

Mr. Underwood:

I offer that for identification. This is the document, copies of which were handed to counsel, yesterday.

(Thereupon the said document was marked Respondents' Exhibit 4-D for identification.)

Q. Now, Mr. Anderson, can you tell me how much cash the Seminole Boat Company got in 1928, and from what sources?

Mr. Matteson:

If your Honor please, the books were not kept by the witness at that time. I haven't any objection to what he has read from the books, subject to these facts on cross examination, of course. But I want it understood that he is merely testifying as to what these purported books show.

The Court:

That is all you offer it for?

Mr. Underwood:

That is all I offer it for if your Honor please. I thought that this would be a simple way of getting be-

fore the Court, what these books show as to certain things. * * * It is understood that unless the witness speaks of his own knowledge, that he is testifying to what the books show.

Mr. Botts:

With reference to this summary, is this summary that you have, a summary from the ledger, and does it reflect merely what this journal ledger shows? Or does it also include the information from the voucher files which have been filed in evidence?

A. It is an analysis of the general ledger of the Seminole Boat Company, in connection with these journal vouchers.

Q. Do you mean by that, this information as it appears on this analysis, is taken from both?

A. Both.

Mr. Botts:

You refer to this book which seems to be number 76, that is a combination journal and ledger, is it not?

A. To a certain period, yes.

Mr. Botts:

Now then this summary reflects the data as shown by this exhibit 76 and also 77 and 78? Am I correct?

A. That is correct.

Q. Will you tell me, Mr. Anderson, whether, from the accountant's standpoint, the journal voucher files are considered part of the books?

A. They are.

Q. This analysis which you have made, does it correctly reflect what the books show as to the disbursements made by the Seminole Boat Company,—disbursements made for the Seminole Boat Company by others, and repayments made by the Seminole Boat Company for such persons?

A. It does.

Q. Does this analysis likewise correctly disclose the payments made by the stockholders of the Seminole Boat Company, to repay those disbursements made on behalf of the Seminole Boat Company by others?

A. It does.

Q. I notice that at the upper half of the first page of this analysis there is a narrative; what was the source of the information contained in that narrative? You may look at the analysis if you want to know what I am referring to.

A. The stock register, the general ledger, and the Seminole Boat journal and check-voucher files.

Q. Does that narrative correctly reflect the facts as they appear from those books?

A. It does.

Q. Now prior to the time when the books came to Palm Beach, can you tell me the course of the transaction when a payment was made on behalf of the Seminole Boat Company by the Palm Beach Company?

Mr. Matteson:

You are speaking now as to what the books show, too?

Mr. Underwood:

Of course.

Mr. Matteson:

He has no knowledge himself of what happened before the books came to Palm Beach.

Q. That is right; this is all what the books show.

A. Palm Beach Company would make a disbursement for an expense of the Seminole Boat Company; they would be debit or charge Phipps Realty Account and credit their cash account.

Q. Do you mean by that to say that when the Palm Beach Company in those years made a payment on behalf of the Seminole Boat Company the Palm Beach Company would be repaid by the Phipps Realty Company?

A. That is true.

Q. I take it you have no personal knowledge of how the Phipps Realty Company handled the transaction from then on?

A. Only from information from the records that are available here.

Q. Well, speaking from those records, tell me as much as you can about the transaction from that point on.

A. The Phipps Realty Company would advise Boulevard Mortgage Company of such items; Boulevard Mortgage Company in turn would set up an account crediting Phipps Realty Company and debiting Seminole Boat Company.

Q. That is after the Phipps Realty Company had paid the Palm Beach Company, the Boulevard Mortgage Company would pay the Phipps Realty Company?

A. Not at that time.

Q. Well, eventually?

A. Eventually, yes.

Q. Credit it first on the books and then later pay?

A. That is correct.

Q. And, still as reflected by those books how would the Boulevard Mortgage Company be paid?

A. Phipps Realty Company would collect from the stockholders and notify Boulevard Mortgage Company of such collections; and then of course the entry would be to offset the previous entries made for the disbursement.

Q. Let's see if I understand that. On the collecting end the Phipps Realty Company would debit the stockholders, or in other words collect the money from them, is that right?

A. That is correct.

Q. Having collected the money from the stockholders, would credit the Boulevard Mortgage Company with the amounts on those collections?

A. That is correct.

Q. And on the books of the Seminole Boat Company, those amounts would then be entered as debits to the Boulevard Mortgage Company,—or in other words reflect the fact that Boulevard Mortgage Company had been paid?

A. Would reflect the fact that the Boulevard Mortgage Company had been paid?

Q. Now following the time when the books came into your possession, was there a change made in the method of handling these charges?

A. Do you mean, the company handling the charges?

Q. Let me put my question in another way: Following the time the books came into your possession, they were at Palm Beach?

A. Yes.

Q. Now at that period, when the Boulevard Mortgage Company made a payment on account of the Seminole Boat Company, can you tell us the method by which that payment reaches the books of the Seminole Boat Company?

A. Exactly the reverse.

Q. Of the previous method?

A. Of the previous method.

Q. By that do you mean Boulevard Mortgage Company would charge Phipps Realty Company?

A. Right.

Q. And Phipps Realty Company would credit Boulevard Mortgage Company?

A. Correct.

Q. And Phipps Realty Company would charge Palm Beach Company or Seminole Boat Company?

A. Palm Beach Company.

Q. Palm Beach Company; and Palm Beach Company would credit Phipps Realty Company?.

A. Correct.

Q. And then Palm Beach Company would charge Seminole Boat Company?

A. Yes, sir.

Q. And Seminole Boat Company would credit Palm Beach Company?

A. Correct.

Q. Now when the stockholders repaid those expenses, how did those repayments move?

A. Money was received by the Phipps Realty Company.

Q. From the stockholders?

A. From the stockholders. Palm Beach Company was notified—that relieved them of their account.

Q. You mean by that, the Palm Beach Company was credited?

A. That is correct.

Q. With those payments?

A. That is correct.

Q. Palm Beach Company in turn would credit Seminole Boat Company?

A. Seminole Boat Company.

Q. And Seminole Boat Company in turn would charge Palm Beach Company on its books with those credits?

A. No.

Q. Well, you tell me.

A. When the funds had reached—I mean the journal entry had reached the Palm Beach Company's books, crediting Seminole Boat Company, Seminole Boat Company would then transfer its liability to Palm Beach Company, its liability to Palm Beach Company to the stockholders, on the basis of their reimbursement, which was customarily one half each.

Q. In other words, the payment from the stockholders would flow through Phipps Realty Company, Palm Beach Company, down to Seminole Boat Company.

A. That is correct.

Mr. Botts:

And the final offsetting payment would be a charge on the books of the Seminole Boat Company against the stockholders,—or credit?

A. Credit to them:

Q. Now there is one thing I would like to have you tell me a little more about, on this analysis. On the fifth page, under the year 1935, expenses paid by Palm Beach Company, the total is $5,503.36 and that does not appear to include the cost of the Prigg boat; yet on page 7, for the year 1935, Palm Beach Company, opposite the word "Expenses etc. paid" the total is $6453.36. Will you explain that difference please.

A. Under the year '35 are listed expenses paid by Palm Beach Company account of the Seminole Boat Company. The purchase of the Prigg Boat is a capital disbursement, and therefore would not appear under the expenses.

Q. How was it set up on the ledger?

A. As a capital account.

Q. It appears as an expense in one place, but as a capital account in the other?

A. Yes, sir, that is correct.

Q. That accounts for the difference?

A. The difference.

Q. Now at what time did you begin to charge Mrs. Guest with a proportionate share of these expenses, instead of Mr. H. C. Phipps?

A. For one half of the expenses, beginning January 1st, 1935.

Q. Do you remember when you were advised that that was to be the practice?

A. About March of '35.

Q. Now, Mr. Anderson, I show you voucher number 52 in the voucher file Exhibit Z. Some question was raised about that, when Mr. Hawkins, I think was on the stand, and he denied that he was an accountant and could explain it. Can you tell me what this voucher means?

A. It means that Boulevard Mortgage Company has set up on its accounts, an account receivable from Seminole Boat Company for certain expenses paid, outside of the Boulevard Mortgage Company's office.

Q. And what is the amount?

A. $541.50.

Q. And what does that mean as to the accounts payable by the Seminole Boat Company? Does it record anything as to Seminole Boat Company's obligations?

A. It shows their obligation to Boulevard Mortgage Company of $541.50.

Q. For the items, the three items enumerated,—repairs and maintenance $116.50, storage $25.00 and wages $400.00?

A. That is correct.

Q. I show you bill of Captain Pilkington; I show you voucher number 1190 of the Palm Beach Company dated May 2, 1931; can you tell me whether or not so much of that as reflects the storage on the houseboat Seminole, $25.00 is the same item recorded on the table before you, journal voucher number 52?

A. That is correct.

Q. That is the same thing?

A. The same thing.

Q. Now the Palm Beach Company duplicate voucher to Seminole Boat Company, $25.00, written on it in typewriter, in the first instance, is that correct?

A. That is correct.

Q. Was the Seminole Boat Company crossed out and Phipps Realty Company put in, at the Palm Beach office or elsewhere?

A. Elsewhere.

Q. Is that in line with what you have told us about the way these debits and credits moved from the Phipps Realty Company?

A. It is correct.

Q. Did you have a breakdown of the wages, $400.00, as it appears on voucher number 52?

A. I have a statement showing these; I don't have the supporting data.

Q. I show you letter dated June 23, 1931, with a paper attached marked at the top Boulevard Mortgage Company in account with Phipps Realty Company. Can you tell me whether or not that was the source of the information from which journal voucher 52 was made up?

A. That is correct.

Q. This letter of June 23, is addressed to Mr. Handley at Miami and signed by Mr. LeCount, is that right?

A. That is correct.

Q. On the attached statement there appears, Captain Pilkington storage charge of $25.00.

A. That is correct, and wages totaling $400.00.

Q. Yes.

A. That is correct.

Q. And the other item is $116.50?

A. That is correct.

Q. So that the pencil notation at the right, $541.50 is the total of the charge shown on journal voucher 52?

A. That is correct.

Mr. Underwood:

I offer the letter and the statement attached.

A. May I suggest that for the sundry items under $116.50, that you refer to items as listed above.

Q. As they appear in pencil on the statement attached to the letter.

(The said paper was admitted in evidence and marked Respondents' Exhibit 4-E.)

Q. Now before we leave this, I show you Palm Beach Company check and voucher number 111 dated April 30, 1931. Can you tell me whether or not that is the basis of the $200.00 charge in respect to Captain Bryant as it appears on the statement which is now a part of Respondents' Exhibit 4-A?

A. It is.

Q. That also shows that Captain Bryant's pay for that month was originally charged to the Palm Beach Company, against Seminole Book Company?

A. That is correct.

Q. And that charge was changed elsewhere to Phipps Realty Company?

A. That is correct.

Q. Do you know whether that was made at New York?

A. To the best of my knowledge it was.

Q. Where did these duplicates go from your office?

A. To the Palm Beach Company office or Bessemer Properties, now.

Q. In the north.

A. In the north.

Q. It was either New York or Jersey City?

A. Jersey City.

Mr. Underwood:

I offer the voucher and the original check.

(The said papers were admitted in evidence and marked Respondents' Exhibit 4-F.)

Mr. Underwood:

If your Honor please, I could illustrate the way this was done, by innumerable transactions; but at the present time at least I don't think it is necessary to encumber the record by further instances. * * *

Q. Now, Mr. Anderson, Mr. Alley made a suggestion to me which I think I should have thought out myself. When you came down here the other day, a day or two ago, did you go up to the Boulevard Mortgage Company and get out from their files their journal voucher 350, referred to in Seminole Boat Company journal voucher 52?

A. I requested them to get it out.

Q. Is that the document they handed to you?

A. Yes.

Mr. Underwood:

Now it may be I haven't strictly proved it; I can if necessary bring somebody down from the Boulevard Mortgage Company to identify for us their journal voucher 350, which is the one referred to in Seminole Boat Company journal voucher 52. So I offer that in evidence, to show the corresponding transaction on the books of the Boulevard Mortgage Company.

Mr. Matteson:

I have no objection at the moment; reserving my right to ask further proof of examination from the man who made the entries.

Mr. Underwood:

All I ask is on that point, that if further proof is going to be demanded, that it be demanded before the trial closes. * * *

The Court:

It will be admitted subject to that.

(The said paper was admitted in evidence and marked Respondents' Exhibit 4-G.)

Q. Mr. Anderson, can you turn to the journal voucher which shows the first payment by the stockholders paid for expenses incurred during the year 1935?

A. We have two journal vouchers regarding the disbursements and expenses for 1935; one for a period January 1, to May 1, and one for May 1 through December 31.

Q. What is the total for the period, January to April?

A. $2449.81.

Q. What do the books of the Seminole Boat Company show as to the source of that money?

A. That it was advanced by Palm Beach Company.

Q. And who repaid it, and in what amount?

A. It was repaid by M. J. S. Phipps, one half, and Mrs. F. E. Guest one half.

Q. The difference between the halves is a penny?

A. That is correct.

Q. Now I show you a letter dated May 31, 1935, addressed to you by Mr. LeCount of New York, with a statement attached of Seminole Boat Company, January to April, 1935, and tell me please whether or not that is the source of the information, as the result of which you made up this journal voucher number 96 from the books of the Seminole Boat Company.

A. That is the supporting data for journal voucher number 96.

Mr. Underwood:

I offer that.

Mr. Matteson:

I have no objection of it, as his statement of the source of the information from which he made the entries.

Mr. Underwood:

Not to prove the expenses were incurred, of course; but to prove the course of dealings and the whole transaction.

Mr. Matteson:

But this is the source of information from which he prepared this voucher number 96.

The Witness:

That is correct.

Mr. Matteson:

That is what it is offered to show?

Mr. Underwood:

As well as how the charges themselves were made and allocated and repaid.

Mr. Matteson:

Well, this document only relates to the source of the information he got, doesn't it?

Mr. Underwood:

That is correct. * * * I offer it to show whatever it shows.

Mr. Matteson:

Well, I object to it as evidence of disbursement.

Mr. Underwood:

I don't contend for a moment that it shows that these moneys were actually paid by anybody.

(Discussion.)

(The said paper was admitted in evidence and marked Respondents' Exhibit 4-H.)

Mr. Underwood:
I think that is all.

(Following discussion between counsel and the Court as to reporting costs, hearing was adjourned until 2:15 o'clock p. m. of the same day.)

Afternoon Session.

Mr. Underwood:
It is stipulated by all parties that Loyal Randall, a witness on behalf of the Respondent Phipps, who is presently available, would, if called, testify that on April 16, 1935 he went to othe Seminole at Pilkington's and removed therefrom certain bed springs and/or beds or cots from the alleyway abaft of the engineroom, and that he did not go into the engineroom at all on that date, and that he brought with him on that occasion a letter dated April 16, 1935, addressed to Pilkington's Boat Yard signed J. F. Riley, heretofore marked Libelants' Exhibit 53, and delivered the same to Captain Pilkington.

Mr. Botts:
We agree to that.

Mr. Matteson:
That is all right.

2062 Thereupon EDWARD J. ANDERSON, a witness produced in behalf of the Respondent Phipps, resumed the stand and was examined and testified further as follows:

Cross Examination.

By Mr. Matteson:
Q. Mr. Anderson, you have described to us the manner in which these disbursements were made and were

charged to the Seminole Boat Company and reimbursed, and, as I understand it, it was entirely a matter of debits and credits, and it never represented the passing of any cash or funds through the treasury of the Seminole Boat Company.

A. Are you referring to the expenses paid by the Boulevard Mortgage Company and Palm Beach Company?

Q. Yes; subsequent to the closing of the bank account of the Seminole Boat Company.

A. Those entries were made by journal.

Q. And they did not represent the cash transactions as far as the Seminole Boat Company was concerned?

A. They did not.

Q. So, as I understand it, taking this typical transaction that we have been through, the disbursement was first charged on the books of the Palm Beach Company as a debit to the Seminole Boat Company and a credit to their own account?

A. That is correct.

Q. And periodically a statement of those debits and credits would be sent to the chief auditing office in the north, is that right?

A. That is correct.

Q. Then later you would receive from the same office a statement of the debits and credits that had been forwarded after they had been approved in the chief auditing office?

A. That is correct.

Q. And at a still later time you would be notified of a credit established in favor of the Palm Beach Company on the books of the main office in the north?

A. That is correct.

Q. So, that then your debits and credit on the books of the Palm Beach Company would be canceled out?

A. That is correct.

Q. As far as those items were concerned the transaction would be then complete?

A. It would be a closed transaction.

Q. A closed transaction?

A. Yes.

Q. And that would be true even though there never was any record made on the books of the Seminole Boat Company?

A. Yes; those entries would be made.

Q. So the only purpose of transcribing these entries that had already been made in the books of the Palm Beach Company on a book or record, which you call the record of the Seminole Boat Company, would be merely to record something that had already taken place?

A. That is correct.

Q. Then, as I take it, the final approval of all of these interlocking transactions was with the chief auditing office in the north?

A. Not altogether.

Q. Well, you would send them to them in a certain form and then they would be audited there?

A. May I explain the reason for such procedure?

Q. Surely.

A. Disbursements made through the Palm Beach office for account of Seminole Boat Company and disbursements made in Miami by the Boulevard Mortgage Company for account of Seminole Boat Company would have to be formulated for certain periods before they would enter the books of the Seminole Boat Company, and it was merely for the purpose of getting these two sources of disbursements together into one group before making entries in the books of the Seminole Boat Company.

Q. I appreciate that, but what is in the books of the Seminole Boat Company is merely a transcript of already completed transactions which are fully stated on the books of the Palm Beach Company and/or Biscayne Boulevard Mortgage Company.

A. That is correct.

Q. And the final auditing of those transactions was in the hands of the chief auditing office in Jersey City, or in the north, or wherever it was?

A. That is correct.

Q. So that in keeping any books of the Seminole Boat Company you are separately performing a ministerial act, if you call it that, of recording there the records that already appear on the books of the Biscayne Boulevard Mortgage Company or the Palm Beach Company?

A. That is correct.

Q. For instance, you have referred to this first voucher, number 90, in Phipps' Exhibit "Z", which consists of three pages; it consists of three pages, does it not?

A. It does.

Q. The only thing that you had to make that up from was just this carbon copy of a typewritten statement that came from the office of Mr. LeCount at 465 East 57th Street, New York City?

A. That wasn't the entire supporting data used in preparing these so-called entries.

Q. This letter that I have referred to, Respondents' Exhibit 4-H, is what you used in making up voucher number 90?

A. May I look at the totals; it wasn't used in preparing journal number 90, but journal number 96.

Q. 96?

A. Yes.

Q. Then to change the question, this carbon copy of a typewritten statement that you got from New York with this letter, Respondents' Exhibit 4-H that I have just referred to, was all that you had to make up this voucher 96 from?

A. No, it was not.

Q. What else was there?

A. The original records of disbursements of the Palm Beach office.

Q. They had been sent to New York sometime previous to this?

A. The Palm Beach office retains copies of all—

Q. Of course. Then, I take it, that what you mean is that of course you have your own records and they have been sent to New York and used as a basis of making up the statement there which comes back to you in the form of Exhibit 4-H, and from those records you can determine whether what you sent to New York has been fully approved and recorded on this statement; is that right?

A. In total, yes.

Q. And you can use the Palm Beach Company's records for checking that, but when you make up this record, voucher 96, you make it up from this slip attached to Exhibit 4-H rather than from your own records, don't you?

A. Not entirely.

Q. In what respect can you supplement the typewritten slip, Exhibit 4-H, in making up voucher 96?

A. With the copies of any entries of disbursements.

Q. What purpose was that used for?

A. For the detail; this is a consolidated statement and it doesn't carry the items in detail.

Q. So that when this slip comes back from the New York office it gives you enough information to identify the different items and you apply the details from your own record, is that right?

A. That is correct.

Q. So, as I understand it, the original and the only record, so far as the Seminole Boat Company records are concerned, are found in these vouchers; I mean beginning from the time that the books came down to you beginning with 90 and running through 103?

A. Yes, sir.

Q. I do not mean to mislead you by saying "only record", but I would like to ask you this: Are the items

set forth in these vouchers, numbers 90 to 103, afterwards posted into the various ledger accounts which are kept in this book, Libelants' Exhibit 76 for identification?

A. The procedure is to post all entries from the journals on the general ledger.

Q. Then you refer to this book, Libelants' Exhibit 76 for identification as the general ledger?

A. I do.

Q. So that after these voucher sheets, 90 to 103, were made up from them you made postage of the various items into the general ledger, is that right?

A. That is correct.

Q. So that these voucher sheets, 90 to 103, are made first, and from them postings are made into the general ledger?

A. That is the procedure.

Q. Now, just taking another example at random, I pick up the first voucher in the file of Pilkington, vouchers for the year 1934, which indicates a payment to Captain Pilkington of $75.00, and a division of that charge on the duplicate voucher shows a part charged to the Dorothy, charged part to the Seminole and part to the Iolanthe, and the charged parties respectively, Mr. F. E. Guest Boats, Phipps Realty Company and Mr. J. S. Phipps Boats; is that right?

A. That is correct. May I say that the original check prepared in the office of Palm Beach Company bears a charge to Seminole Boat Company rather than to Phipps Realty Company. The charge to Phipps Realty Company was applied at a later date.

Q. After the voucher left your office?

A. That is correct.

Q. By the way, the vouchers are made in triplicate?

A. They are.

Q. Where does the duplicate go?

A. To our northern office.

Q. Is that returned to your office?

A. It is retained in the north.

Q. So that this particular voucher, which is a duplicate, apparently came from the files in the north?

A. That is correct.

Q. While we are discussing this, I note that the description of the items is for storage on the Dorothy so much, storage on the Seminole so much and storage on Iolanthe so much, this appearing in carbon copy, and the rest in original typewriting. I suppose that that means that the part that appears in carbon appeared also on the upper half of the original check and that the part that appears in regular typewriting appears only on the duplicate and triplicate copies.

A. That is correct.

Q. Now I would like to follow the transaction from this point exactly as it would occur in your office. I notice that there are headings here; Extensions checked, entered, certified correct, approved for pay, payee", and under certain of these headings initials appear. Those represent different stages of the transaction in your office, I take it?

A. That is correct.

Q. What is the first stage; what is the first state, is that the checking?

A. Of the original invoice.

Q. And that is indicated by the initial under the word "check"?

A. That is correct.

Q. What are those initials on this particular invoice?

A. J. M. Gorham.

Q. What is the next step?

A. The check is then passed on to me and I check it and initial it as to its correctness, and I also "approve for pay" at that time.

Q. First of all, Mr. Anderson, you put your initials under the word "correct", is that right?

A. Correct.

Q. Then you put your initials under "Approved for pay"?

A. That is correct.

Q. Now, Mr. Anderson, I see some other initials under "Approved for pay." What initials are those?

A. In that instance it is R. C. A.; Mr. R. C. Alley.

Q. Then before the transaction goes any further, after you have approved it for payment, it is also approved for payment by Mr. Alley?

A. At that time the check required two signatures, and at the time I approved this that was indication that it was approved for payment and signed and is ready for delivery.

Q. So the "Approved for pay" is put on at the same time the check is signed by the same people who put their initials under "Approved for pay"?

A. That is correct.

Q. Then what is the next thing that happens?

A. The duplicate and triplicate are separated, and the duplicates are periodically sent to the northern office; the triplicates and in some instances the duplicates. In this instance Mr. Gorham at the time marked "Entered J. M. G." which was a practice that was discontinued at a later date, because it was confusing to put it both on the original and the duplicate; it was confusing in the New York office.

Q. I take it that the change that was made was that originally Mr. Gorham would put his initials under the word "Entered" both on the duplicate and triplicate?

A. Well, only on the duplicate. You see, when this check is completed and signed by both parties it is recorded in the check register and assigned a number. A short time before that time or after that time it is entered in the check register, and for some period of

time—I don't know how long—we made our entries from the duplicates, before forwarding, but at some period since 1927 we discontinued so stating on the duplicate and entirely made that notation on the triplicate.

Q. The triplicate being kept or retained in your office?

A. That is correct.

Q. And that change must have been made sometime after this date of January '17, 1934?

A. That is correct.

Q. But the initials "J. M. G." under the word "Entered" would indicate that from the copy this was posted into the books and entered in some book, is that right?

A. That is correct; in what is known as a check register.

Q. What is the book of the Palm Beach Company in which this transaction is entered as indicated by Mr. Gorham.

A. That is entered in what we call the check register, giving the bank account on it, its number, crediting that account and debiting the various accounts as charged.

Q. You call that the check register?

A. That is correct.

Q. Then what is the next stage so far as your office is concerned?

A. That is as far as our accounting in the Palm Beach office goes.

Q. You say the bank is credited and certain parties are debited. Where do those debits appear?

A. The check register.

Q. In the check register?

A. It is a columnar book with spaces so headed.

Q. For instance, how many columns in that book?

A. It varies. It depends on the number of different accounts that you carry. You can use fly-leaf, and you can have ten, twenty, thirty or fifty, or as many as required.

Q. You mean you have as many as twenty or fifty columns occasionally?

A. That is right.

Q. And among these columns would be there one for the Seminole Boat Company?

A. It is possible that there is one for the Seminole Boat Company; it is also possible that at that time the charges were few and it wasn't necessary to carry a column, and would be carried under miscellaneous and so marked as a charge against Seminole Boat Company.

Q. If it was in the miscellaneous column it would be with a lot of other miscellaneous items, most of which were not charged to the Seminole Boat Company, is that right?

A. Yes, that is correct.

Q. I suppose that you must have some other record that gathers together the items chargeable to the Seminole Boat Company, is that right?

A. We have no records of Palm Beach Company other than the check register book.

Q. Didn't you have a ledger into which you posted from the check register?

A. We didn't keep the books of original entry of Palm Beach Company in the office at that time.

Q. There seems to me that there must be some other record in your office correlating these others than the check register?

A. We carry various records for our information, not for bookkeeping purposes, but purely for information of the officials and heads of the departments; we carry them for reference, so that they at any time can know what accounts are being paid and in what amounts.

Q. What are those books?

A. I can't give them a title; merely a running account.

Q. Running account?

A. Yes.

Q. As a type of ledger account; do they correspond to a ledger account?

A. The difference between the account that is kept and a ledger account is that it is not balanced out at any period of time; it doesn't carry the capital accounts, and it is not closed out year after year; it is simply totaled across.

Q. What is the description or name you give to these books so that we can have something in common to talk about?

A. You can call it "Summary ledger."

Q. Summary ledger??

A. Yes.

Q. In the summary ledger would there be a sheet headed "Seminole Boat Company?"

A. There would.

Q. And another one headed "John S. Phipps Boats?"

A. That is correct.

Q. Would there be other accounts of John S. Phipps?

A. Yes.

Q. How many different accounts do you suppose you had relating to John S. Phipps personally?

A. That is hard to say.

Q. Just give us some idea.

A. Some ten to twenty, depending on the type of work that was in progress at that time.

Q. Various matters in which he was personally interested?

A. Yes.

Q. In this voucher that we were talking of originally, which is number 5426, I see in this file there are attached to it three bills which aggregate the amount for which the voucher is drawn. Mr. Anderson, I take it the bills are what you call the supporting data, is that right?

A. That is correct.

Q. Does that supporting data remain in your office with respect to the various items paid by the Palm Beach Company?

A. Generally it is attached to the duplicate.

Q. And then that goes to the office in New York?

A. That is correct.

Q. And does it remain there?

A. It does.

Q. It is not returned to you?

A. It is not, unless requested for some reference.

Q. So that these three bills attached to this voucher we have been talking about came back from New York?

A. That is correct.

Q. Apparently for a special purpose, that is, by some special request.

A. By special request.

Q. Taking the various items that are described in this sheet attached to Exhibit 4-H, the supporting data for all of these items would be in the New York office and not in your office?

A. They should be, with few exceptions.

Q. Do you know whether, Mr. Anderson, as a matter of fact you had or have in your office the supporting data for the items on this list attached to Exhibit 4-H?

A. I don't. May I correct that? I don't know what I answered before.

Q. I think that was the purport of your answer.

A. All right.

Q. Taking this voucher number 90, which is the first one that appears here, it says at the bottom of that voucher, "Record disbursements as per statement from New York for year 1934 for account of Seminole Boat Company charged to account of Palm Beach Company". Does that indicate that this voucher number 90 was

taken from a sheet similar to this one that is attached to Exhibit 4-H?

A. It was prepared in connection with the sheet, using our office records enough to give us the details necessary to formulate the journal entry.

Q. And it was a sheet such as that just described here of this nature that I just read as a part of the statement from New York?

A. That is correct.

Q. Do you have that statement with you?

A. I do not.

Q. Now this voucher number 91 is simply a statement of depreciation in reserve set up on the books of the Seminole Boat Company, and it relates to no other corporation at all, is that right?

A. That is correct.

Q. Now this voucher number 92, where does the information for that come from?

A. From the preceding journal entries recording the expenses for the year 1934.

Q. In other words voucher 92 is a summary of 91 and 90?

A. Not exactly; it is not called a summary; that is the entry that closed the operating expenses in the profit and loss for the year.

Q. But as a matter of fact, without being technical about the language, the items that appear on voucher 92 are the summary of the same items that appear on vouchers number 90 and number 91, are they not?

A. That is correct.

Q. Which simply means that you are now preparing a voucher which charges to profit and loss the entire expense represented in the other two vouchers, expenses and depreciation.

A. Yes.

Q. This next one, number 93, covers partial reimbursement to the Palm Beach Company for 1934 disburse-

ments for the account of the Seminole Boat Company. Where does the data for that sheet come from?

A. In the form of advice from our northern office.

Q. That means that you received a statement from the northern office that H. C. and John S. Phipps had been debited with the amount shown and that Palm Beach Company had been credited?

A. No, sir. I received advice that they had paid their expenses for that year.

Q. Of course that transaction took place in the north?

A. Yes.

Q. And you merely received advices of it?

A. Yes, sir.

Q. And the same applies to voucher number 94, which is a statement showing the completion of the reimbursement to Palm Beach Company for the disbursements for the year 1934, is that right; in other words, what you stated about the other one applies to this one, too?

A. Yes. May I explain that?

Q. Yes.

A. You say that Palm Beach Company was reimbursed prior to that time. That merely is an entry for the books of Seminole Boat Company to show that the liability for accounts payable on the books of Seminole Boat Company to Palm Beach Company had been shifted or transferred to Mr. J. S. Phipps and Mr. H. C. Phipps.

Q. I notice this check says "Check for Bessemer Investment Company $220.35"; is that the source of the reimbursement.

A. In that instance it was; we received a check for this one reimbursement.

Q. And that appeared on the books of Palm Beach Company?

A. That is right.

Q. So that came from the books of Palm Beach Company and not from the north?

A. Yes, sir.

Q. Where is the office of Bessemer Investment Company?

A. I don't know.

Q. Is that in the north?

A. I presume it is.

Q. It was from that point that you received this check for reimbursement?

A. This is the check that I received, yes.

Q. Now this next sheet states that it is to cover the purchase of Mr. H. C. Phipps' one half interest by Mrs. F. E. Guest. What does this represent; does it represent the transfer to the credit of Mrs. Guest of the book value of the stock in the corporation, or just what is it?

A. That has nothing to do with the stock. On March 23rd Mr. H. C. Phipps sold his one half interest in the Seminole Boat Company to Mrs. F. E. Guest, and in making this purchase Mrs. Guest received the liability of Seminole Boat Company to Mr. H. C. Phipps in the amount of $12,947.00.

Mr. Underwood:

Does that represent an acknowledgment on the books of the Seminole Boat Company that it owes Mrs. F. E. Guest $12,000 and odd dollars in lieu of H. C. Phipps?

A. That is correct.

By Mr. Matteson:

Q. Now this next entry, voucher number 96, shows reimbursement to Palm Beach Company for advances for expense in operation of "Seminole" for the period January, 1935 to April 30, 1935. What does that represent?

A. It represents the payments by the stockholders for the operating expenses for that period.

Q. How was that paid?

A. That was in the form of a letter advising payment.

Q. A letter from New York?

A. Yes, sir.

Q. Now take this next voucher we are talking of, voucher number 96. We were speaking of the last entry which shows reimbursement. Preceding that on the same sheet are expenses and the charge to the corporation for what period?

A. For the period of January 1st to April 30th.

Q. Now where were these items taken from; where did you get the information to make up that sheet?

A. From the original records or duplicate records or triplicate records in the Palm Beach office, and the statements supplied as customary from the northern office.

Q. Then there was a statement from the northern office which was the general basis for the making up of this voucher, is that right, as supplemented by your own record?

A. May I make a statement there, please?

Q. Yes.

A. For this period to the best of my knowledge there were no disbursements included in this journal other than those made in the records in the Palm Beach office.

Q. Even so, the vouchers were sent to the New York office in the usual way?

A. They were.

Q. And after being approved there a statement came back simliar to the statement attached to Exhibit 4-H?

A. I wouldn't say that.

Q. That would be the customary thing, wouldn't it?

A. Not unless there were other entries to be considered or combined in this statement.

Q. You don't know whether there was or not?

A. I do not. To the best of my knowledge there wasn't any.

Q. Then we come to voucher number 97. What was the source of the information from which that was made up?

A. Records in the office of the Palm Beach Company, to the best of my knowledge.

Q. They were forwarded to New York in the usual way?

A. They were.

Q. Did a statement come back from the New York office similar to 4-H?

A. I cannot say.

Q. You do not know?

A. No.

Q. Voucher 98 is simply a writing off of the value of the yacht Seminole as a result of the fire, is that it?

A. Yes.

Q. Charged to profit and loss?

A. Yes, sir.

Q. Voucher number 99 represents a collection of 1935 expenses, which I take it, is more or less a summary of the two preceeding vouchers, is that right?

A. It is a summary of the operating expenses for the year 1935.

Q. As represented in the two preceding vouchers?

A. In the preceding vouchers. I do not say the two preceding vouchers; I didn't check the vouchers.

Q. Voucher number 100 consists of two pages recording expenses charged to the account of Seminole Boat Company during the year 1936, is that right?

A. That is correct.

Q. And vouchers for those expenses were sent to the New York office in the usual way?

A. They were.

Q. Did a statement come back similar to the one marked 4-H?

A. I don't know; to the best of my knowledge I would say that it did not come back.

Q. Why do you say that?

A. Because of the entries originating in the office of Palm Beach Company which I had access to.

Q. In the natural course of events you sent all of your vouchers for that year to New York, and didn't you receive some kind of a statement from New York with respect to them?

A. It is not customary when it is not requested and it is not unusual.

Q. Voucher 101 is a similar summary of expenses for 1937, is that right?

A. Yes.

Q. All vouchers were sent to New York, of course?

A. Yes.

Q. Was there a statement from New York with respect to those?

A. To the best of my knowledge there was not.

Q. Voucher 103 represents expenses for the last three months of 1938, does it?

A. Yes.

Q. Can you tell us whether there was any statement from New York with respect to those expenses?

A. To the best of my knowledge there was not.

Q. These last statements—with respect to these last three statements you said you were quite sure that there had not been a statement from New York. Where would the supporting data be with respect to those items?

A. In the northern office.

Mr. Matteson:

I do not want to unduly encumber the record, but I would like to have a chance to examine the supporting data for all the items represented in vouchers 90 to 103, inclusive. Can that be arranged?

Mr. Underwood:

That can be arranged, however it will take some time.

Q. The initials on the vouchers would represent the man who entered the transaction in the check register, would they?

A. Generally speaking, yes.

Q. Well, why "generally"?

A. Because there are some irregularities to that due to absences from the offices, absence from the office, and it being necessary to get the items posted and, as I said before, the initials were customarily put on the duplicate voucher at the beginning.

Q. Let me get this right: Do you mean say that if you post an item you might under some circumstances put down Mr. Gorham's initials?

A. No, I wouldn't.

Q. Or that if he posted an item he might put down your initials?

A. No, I do not mean that. I mean that in all instances there might not be initials as to who entered it; it might be a blank.

Q. Well, the man who makes the entry is supposed to initial the voucher when he makes the entry?

A. Not necessarily; I do not know of any rule requiring it.

Q. But it is customary, isn't it?

A. In books of original entry, yes.

Q. Your check register is a book of original "record"?

A. They are for us only and not for accounting purposes or balancing general ledgers.

Q. You wouldn't make an entry and not make your initials and then several days later put your initials on it, would you?

A. No.

Q. The very purpose of having a place for "entry initials" is so that you will initial it right then and know that it is done and you won't have to refer to it again, is that so?

A. Not necessarily.

Q. Well, as a matter of bookkeeping practice, Mr. Anderson, that is good bookkeeping practice?

A. When you are keeping general books, yes, books of original entry, but when you are keeping memorandum accounts you do not always adhere to the rules that apply to "Books of record."

Q. You don't think these accounts you keep in the Palm Beach office are of sufficient importance to follow good bookkeeping practice?

A. We did follow good bookkeeping practice.

Q. Good bookkeeping practice requires that you put down your initials when you make the entry, doesn't it?

A. Not necessarily.

Q. As an accountant of many years' experience would you say that?

A. I would yes. I will say that many entries are made in check registers without any notation, because the checks are numerical and because you couldn't skip one, and in many instances there is only a check mark made, which will show that the voucher had been entered, and it is not necessary to initial a voucher to indicate that it was entered in the cash books.

Mr. Underwood:

You mean "check book"?

The Witness:

They are the same. Check register.

Q. The very purpose of having a place for "initials" is so that when an entry is made you are able at any

moment after that to determine who entered it, is that right?

A. There is never a question on that point as far as this check register we are referring to is concerned.

Q. If you entered an item you would want to have it in such shape that anyone would be able to know who made the entry?

A. That depends on the entry I was making.

Q. You don't think that is important with respect to these books that you keep in Palm Beach?

A. I do not.

Q. Now in these books that were kept in Miami they had similar voucher sheets except that they were all hand written, is that right?

A. I don't know; I didn't check them up. Generally they are hand written.

Q. They have the same spaces at the bottom that you have on your own sheets?

A. Yes, sir.

Q. All of these vouchers that were kept in the Miami office have at least two sets of initials on them, don't they?

A. I haven't examined them to determine that.

Q. Well, we can determine that. Let me ask you about this top voucher number 103; it bears your initials "E. J. A."

A. Yes.

Q. When did you put those initials there; the reason I ask is because I observed that when the document was first produced in this Court there were no initials there.

A. I would not attempt to say that. Ordinarily I would say I would put them on when I posted it.

Q. Isn't it a fact that you put these initials there within the last three days?

A. The fact is I think I put them there last evening. I recall now that I put them there last evening.

Q. And that is true of the second page, is it not?

A. I do not believe it is. You say you have evidence that it wasn't there before and I don't recall that, but I do remember initialing the sheet last evening.

Mr. Underwood:

As a matter of fact, it was done before last evening, was it not?

The Witness:

Maybe it was; it was within the last two nights.

Q. How many sheets did you initial night before last?

A. I don't recall initialing but one sheet; I don't recall initialing two sheets.

Q. You say that you didn't initial the second sheet appearing in this file night before last?

A. I didn't say that.

Q. You don't deny that, do you?

A. I recall initialing it in the last two nights.

Q. Let me get this straight: You recall initialing the first one night before last, but you don't recall initialing the second one night before last?

A. That is correct.

Q. But you don't deny that you may have done it night before last?

A. I don't.

Q. Now I call your attention to the fact that it appears from these records that the vouchers have been both made by and approved by yourself and not by any other person; is that right?

A. As to the posting, yes, but as to approval of the charges in the beginning, from which the vouchers were made, no; they were approved by various department heads.

Q. These original transactions from which these were taken, of which these are summaries, were approved in regular normal course?

A. Yes.

Q. But these voucher sheets that we have here in this file, which you say represent the records of the Seminole Boat Company as it is now constituted, are in no case approved by anyone else than yourself and in many cases are indicated as being approved as well as paid by yourself, is that right?

A. Yes.

Q. And that you recognize as a substantial variation from the method of keeping books in Miami where there are always two initialing, one indicating approval and the other indicating the making and posting.

A. May I be permitted to explain why?

Q. Yes.

A. In the Miami office they have several bookkeepers whose duties are to do certain things. In our office I have duties to perform that several or as many as four perform in the Miami office.

Q. Are you the only bookkeeper in the Palm Beach Company's office at Palm Beach?

A. No.

Q. What other bookkeepers do you have?

A. We have one assistant.

Q. Is Jack Gorham there now?

A. No.

Q. Who is your assistant?

A. Mr. Anthony.

Q. Wouldn't the normal practice be for you to have these made up by your assistant and the approval by you?

A. It wasn't in this case, because I did it.

Q. Now, Mr. Anderson, let me ask you this: You have not said, and I will ask you whether you will say

now: Whether these sheets, vouchers, 90 to 103 were made contemporaneously with the events they record or whether they have been made at some later time. Will you tell me when you made up these sheets?

A. Generally I make up the vouchers for Seminole Boat Company sometime during the first quarter of the following year.

Q. I am not asking you about what you generally do or about general entries with respect to the Seminole Boat Company; I am asking you about these particular sheets that are here in this file that I pointed out to you, and which are a part of Phipps's Exhibit "Z", and I want you to tell me when these particular sheets were typewritten and made.

A. That I could not do.

Q. Isn't it a fact, Mr. Anderson, that all of these sheets were made up at the same time, and at a later date from the records that you had in the Palm Beach office?

A. They were not.

Q. Let me show you the first of these vouchers, for instance, number 90, which bears a date in 1934, and I will ask you when that was made.

A. To the best of my recollection it was made between January and March of 1935. I can refer to this and probably tell you exactly.

Q. Now I will ask you to compare this sheet, which you say was made in 1935, with the sheet which I suppose was made in 1938 or 1939.

A. 1939.

Q. I will ask you to compare the bottom sheet with the top sheet and state if there is not every indication that they were made at the same time, whether or not they are in the same state of freshness and as a matter of fact weren't they made at the same time?

A. My answer to that would be that they show the same signs as the prior vouchers of similar years. For

instance, I see no difference between the voucher 89, dated December 30, 1933, and the one here (pointing) dated December 16, 1931, so far as freshness is concerned.

Q. They are all a good many years old; all going back prior to 1933?

A. Yes.

Q. Now, there are two sheets right in here, right in the middle and they happen to bear the initials "B. H." which are initials other than yours, and I will ask you to look at these and see if they don't look substantially older than the first one I referred to in 1934.

A. I put these initials on myself to indicate that I didn't prepare it, but the stenographer wrote this for me, and those are her initials, however.

Mr. Underwood:

You mean that those are her initials?

The Witness:

I put them down myself so I would know that she typed it.

Q. Mr. Anderson, I am not suggesting any bad purpose on your part because, as I understand it, the records in the transactions would have been complete on the records of the Palm Beach Company, whether these records were kept at all, but I am asking you as a matter of fact if it is not the fact that from 1934 on for a period of years these records were not made up contemporaneously, but at some later time you made these up, going all the way back to the beginning.

A. I did not.

Q. You deny that?

A. I do. I am positive that the one made in 1934 was entirely separate from any others. My statement being that all of these "journals" you referred to were not made up at one time.

Q. Now in your last statement you said that you were positive that the one for 1934 was separate from any others. How about the ones following 1934?

A. 1938 I would say definitely was not prepared at the same time. As to 1935, 1936 and 1937 I could not commit myself, because I do not recall the exact dates that they were prepared.

Q. Why do you remember 1934 better than you do 1935, '36 and '37?

A. Because it was the first year I closed the books of the Seminole Boat Company.

Q. Is it a fact that you made the 1934 sheets in the early part of 1935 and then that you made the 1935, 1936 and 1937 sheets at some later time than indicated?

A. I recall making probably two years at one time.

Q. Which years were those?

A. I would not attempt to say.

Q. When did you make those?

A. If that was the case, I made it in the following year of the last entry that was made.

Q. You mean, assuming for the moment, that they were 1935 and 1936,—you mean that they would have been made together sometime in 1937, is that right?

A. Yes.

Q. And that may be the case?

A. It is possible, yes.

Q. Is it possible that you made three years together?

A. I think not.

Q. What records did you make in 1938?

A. In '38?

Q. Yes.

A. I made in 1938 journal entry number 102 to record the disbursements for the period of January 1, 1938 through September 30, 1938.

Q. As I understand you, there were two years at some period when there were no entries made in the Seminole

Boat Company's books but they were made at the close of that two year period?

A. Yes.

Q. You can't remember when that was?

A. I do not remember.

Q. Now, I want to ask you this, Mr. Anderson: There have been from time to time advances made of payments made by the stockholders to make good the recurring deficits of the company, have there not been?

A. What?

Q. There have been payments made by the stockholders of the corporation from time to time in various ways to make good the recurring deficits of the company?

A. Yes.

Q. And those advances or those payments, if you are going to set up books, have to be put down on the books of the company in some fashion, do they not?

A. They do.

Q. In other words, you have got to have a ledger account into which can be put or posted everything that the company receives or pays out.

A. Are you referring to Seminole Boat Company?

Q. Any company.

A. Yes.

Q. In other words, you have got to have that to balance your books.

A. Yes.

Q. So I take it that when those advances have been made by the stockholders you have set up an account or there has been set up an account in the books in the names of the stockholders and under which they are credited with these payments, is that right?

A. Yes.

Q. And as a matter of bookkeeping that shows a credit to the stockholders and a debit to the corporation?

A. Yes.

Q. Now you do not suggest that there have been any notes given to the corporation by the stockholders for these payments, do you?

A. I know of no notes—do you mean by the Seminole Boat Company?

Q. So that when you referred to this voucher back here, number 95, showing a transfer of Mr. Henry S. Phipps' interest to Mrs. F. E. Guest, what you were telling us was that the amount that stood on the books in the ledger account in the name of H. C. Phipps is credit representing these payments that had been made had been transferred to another account in the name of Mrs. Guest?

A. Yes.

Q. I am looking for a page in the ledger that has entries and postings running over a period of years, and I happen on this one which is headed "Medical expense, Seminole fire." There are entries in there in the year 1935, the year 1936, the year 1937 and the year 1938; is that right?

A. Yes.

Q. And you tell me that the entries in the ledger are taken from these voucher sheets that we have just been discussing, numbers 90 to 103?

A. Yes.

Q. Now during this two year period when you didn't make up any voucher sheets that you can recall, then of course there were no postings in the ledger?

A. Yes; there were no posting in the ledger.

Q. So that for at least two of these years the entries must have been made in the ledger simultaneously, is that right; approximately simultaneously?

A. Approximately, yes.

Q. How many of these years from 1935 through 1938 in this particular ledger account were made at approximately the same time?

A. To the best of my knowledge I would say, referring to ledger sheets, that the years 1936 and 1937 were made approximately at the same time.

Q. You do not include 1938?

A. No, I do not.

Q. You do not include 1935?

A. I do not.

Q. Do you say that all of the entries, beginning in 1935 and running through 1938, are not of approximately the same age?

A. They are not.

Q. They were all made by you?

A. They were.

Q. So wherever we find it in this book, without taking time to go through and look at a lot of different accounts, we can take it that your testimony is that the entries with respect to 1936 and 1937 were made sometime in 1938?

A. I did say only that it was probable they were; I don't recall definitely that those two years were made at the same time; it is possible they were made two or three or six months apart.

Q. But you deny that the entries that relate to the year 1934 were made in any year other than 1935?

A. I do.

Q. Or that the entries in the year 1935 were made in any other year than 1936?

A. To the best of my knowledge they were not.

Q. How much or how large a staff do you have in the Palm Beach office?

A. Generally we have a stenographer, her assistant, myself, my assistant, and Mr. Riley, as far as clerical work is concerned.

Q. You have not named the assistant bookkeeper, have you?

A. That is Mr. Anthony; my assistant.

Q. That is the entire staff in the accounting department; is there any other department?

A. Mr. Riley has the department of operations and maintenance.

Q. Does that have a staff?

A. Yes.

Q. Is that in the same office with yours?

A. It is.

Q. Just what does the Palm Beach office in Palm Beach consist of?

A. The main office, filing rooms and three private offices.

Q. Who have the private offices?

A. The first private office is occupied by Mr. Henry C. Phipps when he is in Palm Beach; the second private office is occupied by Mr. John S. Phipps when he is in Palm Beach, and Mr. Riley occupies the other office.

Q. When Mr. John S. Phipps is in Palm Beach he occupied that office, does he?

A. From time to time.

Q. Is he there quite a bit of the time?

A. I would like to know what you mean by "quite a bit of the time."

Q. You tell me.

A. Sometimes he is there every day, and sometimes he goes for three or four days hand running, and then he will skip a week; it is hard to say what portion of the time he is in Palm Beach that he is in his office.

Q. He just spends a considerable time there?

A. No, not a considerable time.

Q. He takes a great deal of interest in the affairs of the company?

A. As far as my knowledge is concerned I do not know of any personal interest that he showed; I had no conversation or instructions pertaining to the company from Mr. Phipps since my connection with the Company.

Q. His office is next to the one of Mr. Riley?

A. No; the one next to Mr. Riley is Mr. Henry C. Phipps.

Q. The first office is that of Mr. Henry C. Phipps, then Mr. John S. Phipps and then Mr. Riley's office?

A. Mr. Riley's office is the small office leading off of the foyer; Mr. Henry C. Phipp's office is the larger office, and then Mr. J. C. Phipps' office joins Mr. Henry C. Phipps' office on the south. My connection with Mr. John S. Phipps would be to greet him "Good morning"—

Q. Sometimes he comes in pretty early in the morning?

A. I am not there to know.

Q. How many times was he there before you?

A. I never saw him there before I was.

Q. I would hardly think that you would. You have never known of an occasion when Mr. Phipps arrived before you did?

A. I have not.

Q. What time do you go to the office?

A. In the summer time at eight o'clock and in the winter time at nine.

Q. You say Mr. Gorham is no longer with you?

A. No.

Q. Where is he?

A. He is connected with the Coastal Realty Company in West Palm Beach.

Q. What other employees have you still in the office that were there in 1935?

A. In the accounting department?

Q. Yes.

A. Mrs. McDougall, Mr. Riley and myself.

Q. Are they all there now?

A. Yes.

Q. That is all?

A. May I make one correction as to the personnel of the accounting department?

Q. Yes.

A. Mr. Riley, has Mr. Glazier who takes care of his errands and so forth, and he also pinch hits as a time-keeper on the payrolls—

Mr. Matteson:

That is all.

Cross Examination.

By Mr. Botts:

Q. Mr. Anderson, as I understand, these Seminole books, so far as being an actual record of what has transpired, are more or less a superfluity, is that right?

A. I would not say that it was a superfluity.

Q. All right; those simply reflect what has already been recorded in some other books of record, is that true?

A. Yes.

Q. And those other books and records are of the Palm Beach Company primarily, is that right?

A. It depends on the period covered.

Q. From 1934 on?

A. Yes.

Q. Then the actual disbursements from 1934 would be reflected in the books of Palm Beach Company and in the ledger account of that company?

A. It would be reflected in the Palm Beach Companies books up to January 1, 1937 and in Bessemer Properties' books from 1937 on.

Q. And this Seminole Boat Company was not an active trading company or anything of that kind?

A. Not to my knowledge.

Q. So that as a matter of fact, for all practical purposes, just occasionally when you had the time you would go in and bring the Seminole Boat Company's books up to date; was that the way it was handled?

A. Not exactly.

Q. Well, it was something along that line, wasn't it?

A. I did it at the first opportune time for the preceding year in the first part of the next year as possible.

Q. For instance, I notice here under the account of "Salaries", that there are some twenty or thirty entries all under date of December 31, 1935. Now that was an accumulation of practically the whole year, is that right?

A. Are you referring from this period of 1935?

Q. Yes.

A. To—

Q. To where the account seemed to end?

A. Yes, that is an accumulation.

Q. Now getting over to these medical expenses, those were all entered for 1935 under date of December 31st, weren't they?

A. Yes.

Q. And the same is true under this sundry account for 1935; that is all reflected under one date, I believe?

A. No. It is reflected in June and December, and at this time I would like to make a statement of one or two instances as shown by the journal vouchers posted to this general ledger; during some years there was a statement made and generally prepared for a part of a year and it wasn't carried over to the following year.

Q. When you allowed this two year period to elapse without posting anything to the books of the Seminole Boat Company, did you receive a request from anybody to bring these up to date?

A. Not to my knowledge.

Q. You just happened to get around to it after a couple of years?

A. Not exactly that.

Q. How was it?

A. For instance, one of the principal reasons for holding up, if I did, 1936 and 1937, was to know the charges of medical expenses to the Seminole fire.

Q. You knew them as you went along, didn't you?

A. Yes.

Q. You mean you wanted to find out how they wanted you to charge it, is that right?

A. Yes.

Q. You didn't know whether they were going to charge it to Mr. J. S. Phipps, the Seminole Boat Company or Palm Beach Company or just how?

A. I won't say that. I definitely knew that we wouldn't charge it to Mr. J. S. Phipps.

Q. How do you know that?

A. The same as I know they wouldn't charge it to me or to you. There would be no occasion to charge it to him.

Q. You didn't know whether to charge them to Palm Beach Company or Seminole Boat Company?

A. I won't say that, because Palm Beach Company had already disbursed it.

Q. You entered it in the books of Palm Beach Company?

A. Yes.

Q. And you just waited to find out whether or not they wanted you to go through the formality of setting up these entries in reference to this corporation that had no assets and was performing no functions, and you just wanted to know whether they wanted you to go through the detail of writing it down, is that the idea?

A. It is not.

Q. There must have been some reason for waiting.

A. I stated my reason.

Q. All of these items were charged to somebody when they were first made?

A. Charged on the books of Palm Beach Company to Seminole Boat Company. Before placing them on the books of the Seminole Boat Company I had to find out whether it was proper to put it on there. At that time

there was no one present that I could get the information from or to advise me what I should do with them.

Q. You mean Mr. Phipps wasn't there?

A. Mr. Riley. I had never consulted Mr. Phipps relative to charges.

Q. Mr. Riley was there all the time, wasn't he?

A. I don't believe Mr. Riley is capable of passing on whether a charge should be put on the books or not.

Q. Who was it that you waited to get advice from?

A. Mr. Alley.

Q. He was there all the time, wasn't he?

A. Yes.

Q. Why did you wait two years to get that advice from him?

A. Waiting for the approval of it before posting it.

Q. You waited two years to get his approval?

A. I haven't said that I waited two years.

Q. Did you?

A. I said if it was two years, 1936 and 1937, then I waited two years for that purpose.

Q. Now, Mr. Anderson, you know whether it was two years or not, don't you?

A. No, I don't.

Q. Don't hedge with us; you know now, don't you?

A. I don't know whether it was 1936 or 1937; I told you I thought I held up postings for two years.

Q. Now, don't you know?

A. I don't.

Q. Your memory is an absolute blank on that question?

A. It is not. To the best of my memory I did hold up two years, but which two years I don't remember.

Q. Let's just assume that your memory has not failed you entirely and that you did hold it up for two years,—now that wouldn't be a violent assumption, would it?

A. No.

Q. So then for two years you held up making these entries because you wanted to get advice from Mr. Alley who was there daily in the office; is that your explanation?

A. Mr. Alley maintains an office in West Palm Beach.

Q. He was in the office daily, wasn't he?

A. No.

Q. He was in the office weekly, wasn't he?

A. He was not.

Q. How often did you see him?

A. Oh, on many occasions.

Q. And those many occasions over the period of two years,—you had no occasion during those two years to see Mr. Alley to get advice from him; is that your explanation?

A. I merely requested authority to post my books and waited for authority, and when it was given to me I posted my books.

Q. I see. Then you asked for authority and they didn't tell you for two years; is that the idea?

A. If that is the case, yes.

Q. If it is the case; don't you know?

A. I am not admitting that I wanted two years before posting the books. I said there was a possibility that there were two years posted at one time, and if I am given sufficient time I could check my records and find out about that.

Q. That is a rather unusual bookkeeping custom, is it not?

A. What do you mean by unusual bookkeeping practice?

Q. To delay two years with reference to posting your books.

A. Yes.

Q. And the only explanation is, as I understand it, that you asked Mr. Alley for advice as to how you

should post it and then he delayed for approximately two years in giving you that advice, and therefore you delayed in making the entries; is that your explanation??

A. I can only repeat—

Q. Just tell me is that your explanation? Answer that yes or no.

A. I can't answer that yes or no. As I said before, if there were two years posted—

Q. You know there were two years, don't you?

A. I don't. I will admit that if there was any delay in posting of the entries in the books of the Seminole Boat Company for any period, that it was due to the fact that I was waiting for advice or authority to post it in the books.

Q. And it took them two years apparently to decide how they wanted them posted?

A. I can't answer that.

Q. As a matter of fact you have dodged here several times; isn't that a fact; that is the fact, isn't it?

A. It is not. I am not saying that I didn't wait for two years and then have my records contradict me.

Q. We will be liberal; we won't hold you to "exact two years"; we will say approximately two years. Will that help you any?

A. No, it wouldn't be of any help.

Q. Now then, Mr. Anderson, your recollection about the actual facts of the posting for this period of time is quite hazy, is that right?

A. Yes.

Q. Then how do you know that you didn't post for three years during that time?

A. For the reason that my records before me indicate that I did not.

Q. How do you know that 1935 or 1934 was not included in that hiatus period?

A. For the simple reason that it was the first year that I closed out the books of the Seminole Boat Company, and I discussed the depreciation rates with Mr. Riley for that year.

Mr. Underwood:
What year was that?

The Witness:
I was answering for the year 1934.

Q. For the year 1934 you discussed some depreciation rates for practice with Mr. Riley before you made your entries?

A. That is correct.

Q. Then you made your entries for 1934?

A. Correct.

Q. Am I right in the understanding that at approximately the same period you made your entries for the entire year 1934, is that right?

A. I don't understand the question.

Q. My understanding is that the posting of your Seminole Boat Company's record was a sort of skip and stop proposition. That is, you would post them for a considerable period of time, and then allow a period to elapse and then you would post them up again?

A. Yes, sir.

Q. Did you post for the entire year 1934 at one time; can you tell me that?

A. May I have my journal entry, please?

Q. Certainly.

A. Yes.

Q. Then for the year 1935 when did you do your posting there; what is your best recollection?

A. That year was divided. I posted the period of January 1, 1935 to April 30, 1935 sometime after April,

1935, a short period of time; the exact period of time I don't know.

Q. You posted up to that time and the balance of 1935 was posted at one time probably in 1936?

A. In 1936, yes.

Q. Then there was this hiatus of approximately two years covering the years of 1936 and 1937. Now during that hiatus period you didn't wait to make the entries in the Palm Beach or Bessemer properties' Books for the same period, did you?

A. In those periods I merely recorded the checks and entered the receipts on the cash books, having never posted the general ledger or the records of the Palm Beach Company.

Q. You mean these disbursements in those years, which amounted to substantial sums of money, were carried in suspense in the records of Palm Beach Company as far as permanent ledger records are concerned?

A. I couldn't answer that question because I didn't keep the records.

Q. You were in charge of the records of the Palm Beach Company?

A. I was not.

Q. Weren't you the bookkeeper for Palm Beach Company?

A. The books of the Palm Beach Company were kept in the northern office.

Q. Didn't you keep some books there?

A. I kept the running accounts only.

Q. And that is all you kept?

A. That is all I kept.

Q. You didn't have any ledgers there in Palm Beach as to the Palm Beach Company or Bessemer Properties?

A. I did since the year 1937.

Q. All right; 1937 was one of those "Suspense" years; how did you reflect these expenses in your ledger ac-

counts during 1937; for instance, you didn't hold those in suspense, did you, until you got advice from Mr. Alley?

A. I will have to refer to the accounts to see if the Phipps Realty Company reimbursed me for those years. I cannot remember the account. The general procedure was that all charges for "Account Seminole Boat Company" by Bessemer Properties were reimbursed by Phipps Realty Company.

Q. Now is there any difference between the journal record there for the year 1935, for instance, and that of 1936 and 1937?

A. Is there any difference?

Q. Yes.

A. As to what?

Q. As to their general nature.

A. There should not be.

Q. Is there; you have them.

A. I will have to examine them to see.

Q. Do so.

A. They are generally in the same form.

Q. What I am trying to get at is this: How can you refer to these journal records and say that 1935 was posted definitely at a certain time and you cannot give the same information with reference to 1936 and 1937? Will you enlighten us on that subject?

A. Due to the records as posted here, they indicate clearly that the posting for the year 1935 was a separate date, also coupled with my knowledge of the setting up of the depreciation for the year 1934; and the year 1935 indicates from the postings that it was posted separately; 1936 and 1937 are very similar in posting, and I can remember 1938 because it was recent postings.

Q. What is it with reference to 1935 from which you draw the conclusion that 1935 was posted prior to 1936 and 1937?

A. It has come to my memory since looking at the postings in the journals that at the time of the first journal entry here, at the time of the purchase of the Seminole, we prepared an entry to determine liability at that time, and it was afterwards that I was informed that Mrs. Guest would bear one half of the expenses from the first of the year.

Q. That was posted at the end of 1935?

A. No; it is a split journal entry; it was posted for two periods.

Q. How do you know that that was posted at any particular date?

A. Because I prepared it and posted it.

Q. You prepared and posted others, didn't you?

A. I did, yes, and I have an incident to refresh my memory on due to the fact that at that time Mrs. Guest bought a one half interest in the Seminole, and for that period I prepared the journal entry and posted it and determined the liability.

Q. You are talking about postings you made up to April, 1930. How do you know the postings for 1935 were made in 1936?

A. Those postings were made probably in the first part of 1936, to the best of my knowledge.

Q. Probably, but you don't really know.

A. I won't say definitely, because I haven't had any occasion to determine that.

Q. Did you get the authority from Mr. Alley at this—at the time you made the postings for the year 1935, which you stated you made early in 1936, you got the information from Mr. Alley then as to how to make these postings, did you?

A. Let me refer to this (book) and I will tell you.

Q. All right.

A. I believe, to the best of my knowledge that the journal entries for 1935 were posted early in 1936, but

under what circumstances and conditions I do not recall.

Q. Then after that posting you probably waited for about two years before you made any other postings, is that right?

A. I probably waited, yes.

Q. Now, then, as I understand it, your reason for the delay of about two years was to get an answer from Mr. Riley as to how they were to be posted; right?

A. That is correct.

Q. Now then would you mind pointing out to me what the substantial difference is between your postings for the latter part of 1935 and the ones for 1936 and 1937 that would cause you to have any especial advice; I refer particularly to the accounts here designated "Medical Expense" and the "John Thomas Expense".

A. Assuming that I had authority for the posting of the latter part of 1935, I would have secured the same before posting 1936; giving me authority to post the latter part of 1935 would not give me authority to post 1936.

Q. They are identical character of items?

A. Generally speaking they are.

Q. You still waited for two years to frame the—

A. I do not admit that I waited two years.

Q. I know that, and I don't think that is a violent presumption, is it?

A. All right.

Q. Now there hadn't been anybody that came down to you and suggested "We might be taking testimony pretty soon in this case and we had better get these books in shape"?

A. They did not.

Q. You are sure about that?

A. I am positive.

Q. That's fine. Now then you have a summary here summarizing these books from the organization of the

Seminole Boat Company to its substantial demise when the boat was burned in 1935 and from then on; would you mind telling me during that periol of time, the entire period, how much Mr. John S. Phipps contributed?

A. According to the books?

Q. I want the facts.

A. I can't give you the facts other than the books.

Q. How is that?

A. I base my statement on the books.

Q. All right.

Mr. Underwood:

What is the period?

Mr. Botts:

From the beginning to the demise of the Seminole Boat Company.

Mr. Underwood:

What do you mean by "demise"?

Q. To the present time.

A. My statement I prepared doesn't cover the present time.

Q. Up to what point does it cover?

A. June 22nd, 1935.

Q. From the beginning and up until that period what was the contribution, please, of Mr. J. S. Phipps and Mr. H. C. Phipps and Mrs. Guest individually?

A. Mr. J. S. Phipps $13,665.63, Mr. Henry C. Phipps $12,440.72 and Mrs. Guest $1,224.90.

Q. Now since that time the stockholders or either of them as far as you know have not contributed officially and irrevocably anything to the Seminole Boat Company, is that right?

A. To the best of my knowledge they have not.

Q. Palm Beach Company during that period has disbursed how much and charged the same to the Seminole Boat Company?

A. I will have to refer to the records to give you those figures.

Q. Do it.

A. I do not have them before me.

Q. This summary of yours doesn't cover that?

A. It does not.

Q. Could you from these books?

A. I can give you the items.

Q. If you will give us the items maybe we can total them.

A. Do you wish the net amount?

Q. I would like to have the various items, if you don't mind.

A. Do you want them individually?

Q. Yes; give us the individual items and then the totals.

A. For the year 1935, $4,003.55; for the year 1936, $7,952.81; for the year 1937, $1,008.00 and for the year 1938, $615.00 and $300.00.

Q. Total?

A. $13,879.36, less $950.00 representing sale capital assets "Prigg Boat", being the price as set up on the books of the Seminole Boat Company.

Q. As I understand it, these net amounts, totaling slightly over $13,000.00, are charged on the books of the Palm Beach Company against Seminole Boat Company.

A. They were, yes; but whether these were reimbursed to us by cash by Phipps Realty Company, I will have to refer to the books to give you an answer.

Q. So far as you know that amount has not been reimbursed indirectly from the stockholders of the company as yet?

A. I don't know whether it has been reimbursed or not.

Mr. Botts:

That is all.

By Mr. Matteson:

Q. You have not ever received any pay from the Seminole Boat Company, have you?

A. I have not.

Q. Your employment has been entirely with the Palm Beach Company and its successor company?

A. Yes.

Q. I understood you to say that you have so many accounts that you did about four times as much work as bookkeepers in the Miami office?

A. No, I did not mean to infer that; they have a bigger volume of work, and it requires more employees.

Q. In other words, this matter of the Seminole Boat Company's books was just some additional work to what you already had?

A. Yes.

Q. You spoke of your recollection about 1935 being fixed by the transfer of certain disbursements from H. C. Phipps to Mrs. Guest. Do I gather from what you stated that you had made a charge to H. C. Phipps and that you had to change it?

A. I was instructed to.

Q. You were instructed to change it?

A. At first I was instructed that Mr. H. G. Phipps would pay in one half of the expenses to the date of sale; later I was informed or instructed that Mrs. Guest would assume the one half of the expenses from the first day of January, 1935.

Q. Did you in the first instance make up a journal voucher showing the charge of this expense to H. C. Phipps?

A. I will have to refer to that journal.

Q. The one that you have here now shows that it is charged to Mrs. Guest, but from what you said I rather

gather that you may have made up one charging it to H. C. Phipps.

A. Before the journal is prepared we make up a working paper.

Q. You have this voucher here, voucher number 96, which shows the charge to Mrs. Guest and Mr. J. S. Phipps. What I am asking you is whether you had previously made up one like this which was necessary for you to discard and substitute this.

A. No, the journal vouchers were actually prepared.

Q. This voucher 90 for 1934, has that been recopied since it was first made?

A. No.

Q. Have any of these documents been recopied since they were first made?

A. Not to my knowledge.

Q. Are these supposed to be the original sheets as originally prepared, is that right?

A. That is correct.

Mr. Matteson:

That is all.

Re-Direct Examination.

By Mr. Underwood:

Q. Mr. Anderson, you have stated that there was a time when some payments were held up and not posted for a period; that is correct, is it?

A. Yes, sir.

Q. Although they had been paid by the Palm Beach Company, is that correct?

A. Yes.

Q. Now were other items held during that period that were not posted in the books of the Seminole Boat Company after you got your advices from Mr. Alley; in other

words, were you holding up other items in addition to those which you later posted in the books of the Seminole Boat Company?

A. Do you mean to infer that of the items I was holding that some were eliminated and not posted on the books of the Seminole Boat Company?

Q. Yes.

A. Yes.

Q. Do you remember how you posted those other items when you were finally given instructions?

A. I don't recall now.

Q. Let me ask this to refresh your recollection: Did you post these items as legal expense against the account of John S. Phipps?

A. I hesitate to say because I don't recall.

Q. Do you remember what the question was that caused the delay in posting certain items during certain periods?

A. The question was whether they were legitimate charges for Seminole Boat Company.

Q. As I understand it, you do not now remember how you posted the other items that you were instructed not to put in the books of the Seminole Boat Company?

A. No, I do not.

Q. Now, Mr. Anderson, I would like to get from you a picture of these books as they existed at the time of the fire. As I understand it, all of the journal vouchers in Exhibit "Y" had been made long prior to the fire, the last one being dated in November, 1929.

A. Yes.

Q. Which is the last voucher in Exhibit "Z" that was made prior to June 24, 1935?

A. To the best of my knowledge number 96, for the period of April 30, 1935.

Q. Can you tell me definitely whether or not that journal voucher was made up and entered in this book or this file prior to June 24, 1935?

A. To the best of my knowledge it was.

Q. What date does it bear?

A. To the best of my knowledge, June 22nd.

Q. You can read that on it?

A. Yes; I presume I posted it the day that I made it.

Q. I was not asking you about posting these figures in the ledger. I was asking you about the making up of the voucher itself, these two sheets of paper which are dated June 22, 1935, and bearing voucher number 96. When, with reference to the date June 22nd, were those pages of paper typewritten?

A. On that date.

Q. Was or was not these two sheets of paper a physical part of the records of the Seminole Boat Company on the morning of June 24, 1935?

A. They were.

Q. Would it be possible for you to go through the ledger and pick out the entries that were made in that book on or before June 24, 1935?

A. Yes.

Q. Perhaps, I can cover that by general questions. I notice that these sheets in the ledger have two columns headed by the word "date". What is the date that is entered in these books, the date when the expenses are incurred or the date that the entry is made?

A. The date when the entry is made.

Q. Is it a fact that every entry in this book that bears date before June 24, 1935, was in this book on that date?

A. It was.

Q. Now, you were asked, Mr. Anderson, about the initialing of the voucher number 103. Will you tell me the circumstances of that?

A. I recall looking at it and I said, "Well, this hasn't been initialed; I had better initial it".

Q. Do you remember saying anything when you did it?

A. I believe I said something but I don't recall the comment.

Q. Did anybody tell you to do it?

A. No; free will.

Q. Do you remember where that occurred?

A. In my room at the hotel.

Q. It was my room, wasn't it?

A. Yes, it was your room.

Q. Were you sitting on a little settee?

A. Settee, yes.

Q. In front of the desk?

A. That is right.

Q. And that was the evening those books were delivered to me or to my room by Mr. Matteson's messenger?

A. Yes. I believe that Mr. Riley was the one that commented when I initialed it.

Mr. Matteson:

Do you remember what he said?

The Witness:

No, I don't.

Q. Now, you were asked about your voucher 102. Do you remember whether when you put your initials on that it was at the same time or previous?

A. That was the previous day.

Q. You did that previous to the date of the voucher?

A. It should have been the same day.

Q. What is your recollection of that; I want your recollection and not what it should have been.

A. That it was the 30th of September, 1938.

Q. I notice another voucher here, number 96, bearing date June 22nd, 1935. That voucher doesn't seem to have any initials on it at all, is that correct?

A. That is correct.

Q. So it is not unheard of that vouchers are made up an filed without being initialed?

A. That is correct.

Q. Did you at any time go to this voucher file for the purpose of initialing the vouchers that had not been initialed?

A. No. I had my pencil in my hand and I noticed that the initials were not on it; I just glanced at it, and I noticed the initials were omitted and I said, "I had better put it on here."

Q. You did it spontaneously?

A. Yes, without considering it.

Q. Without previous discussion?

A. Correct.

Q. Is that the fact?

A. That is correct.

Q. Now about these other journal vouchers, Mr. Anderson; there has been so much cross examination on them that I am not quite clear about one or two things: Voucher 97 bears date December 31, 1935; is that the date through which the records go or is it the date when the journal entry was made?

A. That is the date through which the records go.

Q. What is your best recollection as to when that was made up and put in the file?

A. To the best of my recollection it was put in the files in the early part or the first of the year 1936.

Q. Now there is some question in the minds of some of us about the purpose in sending your duplicate vouchers, with the supports, to New York, and the purpose of the Boulevard Mortgage Company doing the same thing. Will you tell me what the purpose of that was?

A. Because the books of original entry were in that office.

Q. Just what do you mean by books of original entry? To us lawyers I think it means something else.

A. It is books of account, books in which the corporation shows its profits or losses.

Q. You do not mean that those are the books in which the entry is first made in point of time?

A. No.

Q. For expense incurred by the Palm Beach Company the books which you kept there are those which in point of time the original entries are made, is that correct?

A. That is correct.

Q. I would like to have it clear how these expenses incurred on behalf of the Seminole were posted in the books at Palm Beach.

A. Merely on a memorandum account headed "Seminole Boat Company."

Q. They are actually charged as accounts receivable from Seminole Boat Company, is that right?

A. That is right.

Q. When is that charge made with reference to the issuance of the checks in payment of these expenses?

A. As approximately as close to the date of the checks as possible.

Q. You were asked whether or not the supporting data for the vouchers were retained in New York and I think you said that was true of the Palm Beach Company. Do you know whether that is true of the Boulevard Mortgage Company's expenses?

A. I don't know.

Q. You were not testifying as to that company?

A. I was not.

Q. Mr. Anderson, I note that journal vouchers 90, 91 and 92 and 93 bear pen and ink date "12/31/34". Are those your figures?

A. They are.

Q. What does that date indicate?

A. That is the year for which the voucher covered.

Q. Look at journal voucher 92. Is that made with reference to the books of any other company or is it made solely for the purpose of the Seminole Boat Company?

A. Solely for the purpose of the books of the Seminole Boat Company.

Q. How about voucher 93?

A. That is made solely for the books of the Seminole Boat Company.

Q. How about 94??

A. That is made solely for the books of the Seminole Boat Company.

Q. No other company involved?

A. No other company involved as far as that journal itself is concerned.

Q. These we have just talked about are made up solely as a part of the records of Seminole Boat Company?

A. That is correct.

Q. No other purpose served by them?

A. No other purpose whatsoever served by them.

Q. How about 95?

A. The same.

Q. How about 96?

A. The same.

Q. How about 97?

A. The same.

Q. Tell me whether or not that is true of the balance, 98 to 103, inclusive.

A. It is.

Q. What was the purpose of making up those journal vouchers?

A. To record the expenses and happenings of the Seminole Boat Company on their books of entry.

Q. It was put to you that these were entries of transactions that had already been closed. Will you tell me whether or not that is true of the Seminole Boat Company prior to the time these journal entries were made?

A. I don't believe I am qualified to state whether or not they were closed entries at the time these journal vouchers were prepared.

Q. Will you tell me whether or not entries in account books generally are made to record transactions that have already taken place?

A. Except that way.

Q. That isn't true exclusively of those journal vouchers of the Seminole Boat Company?

A. No.

Q. Or the ledger accounts?

A. No.

Q. Will you tell me whether or not entries in the books of the Seminole Boat Company recording its liability to others was for the purpose of recording that liability?

A. Yes.

Q. Will you tell me the names of the persons in the office at Palm Beach in 1935 as well as you remember those who had desks in the office, those who had office employment as distinguished from those on the outside.

A. Mrs. McDougall, Mr. Gorham, myself and Mr. Riley.

Q. Have you omitted the stenographer?

A. I can't recall whether we had a stenographer at that period or not.

Q. How many sets of books did you keep there at that time?

A. Memorandum records and running accounts for the Palm Beach Company, the Seminole Boat Company, Ocean Island Corporation, Beach and Pool Operating Corporation and Lakeworth Company.

Q. How about Boca Raton Company?

A. We didn't keep the books of the Boca Raton Company.

Q. How long of each day has Mr. Phipps been in the habit of spending in the office when he comes in?

A. Anywhere from five minutes to an hour or two.
Q. Has it been his practice to stay there all day?
A. I never knew him to.
Q. Who is the elder Phipps, H. C. or J. S.?
A. Mr. H. C. Phipps.

Mr. Underwood:
That is all.

Re-Cross Examination.

By Mr. Botts:
Q. Just to complete the record would you mind taking a pencil and writing on that pad "Seminole Boat Company?
A. Do you wish "company" spelled out or abbreviated?
Q. Just "Co."
A. (Witness complies.)

Mr. Underwood:
Suppose you write your name on there.

The Witness:
As I sign my signature?

Mr. Underwood:
Yes.

The Witness:
(The witness complies.)

Q. Write it a couple of more times down below there, if you don't mind.
A. (Witness complies.)

Mr. Botts:
You can just file this as Mr. Pilkington's next exhibit.

(Thereupon the paper upon which the witness made notations at the request of Messrs. Botts and Underwood was marked Pilkington's Exhibit number 10.)

Mr. Botts:
That is all.

Re-Cross Examination.

By Mr. Matteson:

Q. Mr. Anderson, I want to be clear about this. You say now that on voucher 103 you wrote your initials night before last, is that right?

A. That is correct.

Q. On voucher number 102 you wrote it approximately the date it bears at the top of it, which date is September 30, 1938?

A. To the best of my knowledge, yes.

Q. Is that the fact or is it not the fact?

A. To the best of my knowledge.

Q. Well, Mr. Anderson, did you write the one on the second page within the last two days?

A. I did not.

Q. You are positive of that?

A. I am.

Mr. Matteson:
If your Honor please, I would like to ask a privilege here. Night before last when I had these books in my possession I made a very careful record of the initials appearing on the various sheets, and I have this record in my hand at the moment, and I would like to have it marked for identification and then I would like to entrust it to the stenographer.

The Court:
How do you want it marked?

Mr. Matteson:
For identification.

(Thereupon the document produced by Mr. Matteson above referred to was marked Libelants' Exhibit 109 for identification.)

Mr. Underwood:
May it be agreed that that paper has been in the Court-room the entire day?

Mr. Matteson:
Yes; it was in my valise and I slipped it out after the witness testified with respect to the initialing of these sheets, and that is the first time I had seen it today.

The Court:
All right. Does that conclude Mr. Anderson's testimony?

Mr. Underwood:
Yes.

Mr. Botts:
I think so.

The Court:
We will adjourn until 9:30 Monday.

(Thereupon an adjournment was taken to 9:30 A. M. Monday, May 15, 1939.)

Monday, May 15, 1939, 9:55 o'clock A. M.

(Hearing was resumed pursuant to adjournment: and discussion was had as to calling of handwriting experts.)

2134 MR. JAMES F. RILEY, JR., was recalled as as witness on behalf of Respondents, and further testified as follows:

Direct Examination.

By Mr. Underwood:

A. Mr. Riley, have you found the original bill of the Palm Beach Service Station, covering gasoline for the month of June, 1935?

A. Yes, sir.

Q. Is that the paper?

A. Yes, sir.

Mr. Underwood:

I offer that in evidence.

Mr. Matteson:

If your Honor please, I haven't any objection to the bill as a bill, as it was rendered by the Palm Beach Service Station, but there are some writings on there that haven't been referred to, and I object to those.

Mr. Underwood:

I will prove those.

(Said paper was marked Respondents' Exhibit 4-I for identification.)

Q. Mr. Riley, towards the bottom of this exhibit I see the words "Less Seminole Boat Company Chg." In whose handwriting is that?

A. In my handwriting.

Q. When did you write that?

A. I wrote that when I checked the bill and found that one of the tickets was a charge against J. S. Phipps.

Q. "O. K. J. F. R." who wrote that?

A. I wrote that.

Q. And towards the left of the bottom, check number 486, who wrote that?

A. I think Mr. Gorham wrote that.

Q. And below that, "Pd."—standing for paid, I presume, 7-22-35, who wrote that?

A. I believe that is Mr. Gorham's writing also.

Q. Was "July 1, 1935" on there, and "J. S. Phipps" at the top, on there, when you received the bill?

A. Yes, sir.

Q. And the ink entries of dates and amounts of gasoline, and dollar figures, were they on there when you got the bill?

A. Yes, sir.

Q. Who made the subtraction of 2.19 from 24.86?

A. I did.

Mr. Underwood:

I offer it in evidence.

Mr. Matteson:

No objection.

(The said paper previously marked for identification, was admitted in evidence and marked Respondents' Exhibit 4-I.)

Q. Mr. Riley, I show you a check; will you tell me whose check that is?

A. That is Mr. John S. Phipps' personal check for—

Q. What is the amount?

A. $22.67.

Q. Do you know what that was paid for?

A. That was paid for that statement there that I just identified.

Q. Did that payment include the amount of $2.19 charged to the Seminole Boat Company?

A. No, sir.

Mr. Underwood:

I offer this check.

Mr. Botts:

No objection.

(Said check was admitted in evidence and marked Respondents Exhibit 4-I-1.

Q. I show you a Palm Beach Company triplicate voucher; will you tell me what that is for?

A. That is for the charge to the Seminole Boat Company, 2.19; in payment of the ticket for that amount dated June 24, 1935.

Q. That is the payment of the balance to the Palm Beach Service Station?

A. Yes, sir.

Q. Have you telegraphed for the duplicate and the paid portion of the original?

A. Yes, sir.

Q. They haven't come yet?

A. No, sir.

Mr. Underwood:

I offer the triplicate.

Mr. Matteson:

No objection.

(The said paper was admitted in evidence and marked Respondents' Exhibit 4-I-2.)

2141 MR. ROLAND A. SCHLAPPI, as a witness on behalf of Respondents, was sworn and testified as follows:

Direct Examination.

By Mr. Underwood:

Q. What is your full name?

A. Roland A. Schlappi.

Q. And what is your business?

A. Why I guess engine repair work, mostly.

Q. Where do you live?

A. West Palm Beach; I live Kelsey City now,—my home.

Q. How long have you been familiar with gasoline motors?

A. Ever since about 1907.

Q. What sort of experience have you had with gasoline engines?

A. Pretty near all kinds; repairing, from bottom up.

Q. Have you taken down and reassembled them?

A. Yes, sir.

Q. And in what sort of vessels have you had to do with gasoline engines?

A. Why mostly smaller vessels, about 85 feet.

Q. Have you had experience with gasoline engines in other places than boats?

A. Aviation service during the war.

Q. What was your experience with gasoline engines there?

A. Well, I was mostly trouble shooter, going out, fixing up forced landings, stuff like that.

Q. How much of the time since 1907 have you been doing that sort of work?

A. Well, I have been doing it practically all the time.

Q. What was your first employment on the Seminole?

A. Why, I went as engineer, my first employment.

Q. Do you remember when it was?

A. It was in August, I think it was 1930.

Q. And who talked with you before you were hired, at that time?

A. Captain Bryant hired me.

Q. Did anybody else talk to you before you were hired?

A. Not on that trip.

Q. Now from 1930 on down to the time of the fire in 1935, did you work again on the Seminole from time to time?

A. Yes, sir.

Q. And do you remember about how many different times?

A. About three different times.

Q. And on the other occasions, who engaged your service?

A. Well, Mr. Riley would notify me to come down and get her.

Q. Did you ever talk with Mr. J. S. Phipps about your employment on the Seminole, just before you were employed?

A. No, sir.

Q. Did he ever hire you?

A. No, sir, never.

Q. Was your employment on the Seminole always as engineer?

A. Yes, sir.

Q. Now what kind of motors did she have?

A. Two Wintons, six cylinder, 120 horse.

Q. Are you familiar with those motors?

A. Yes, sir.

Q. How were they started?

A. By air.

Q. Tell us what was necessary to do, to start those motors?

A. Well, you had to prime them first. Through the pet cocks in the cylinder head.

Q. How many pet cocks were there?

A. Six on each motor.

Q. One in each cylinder?

A. One in each cylinder.

Q. Did you have to prime each pet cock?

A. Yes, sir.

Q. Can you identify that little thing?

A. That is one of them.

Q. Is that one of the pet cocks from the Seminole?

A. Yes.

Q. Removed from her since the fire?

A. It looks like it.

Mr. Underwood:

I offer that in evidence.

Mr. Matteson:

No objection.

(The said pet cock was admitted in evidence and marked Respondents' Exhibit 4-J).

Mr. Botts:

Did the witness say this was one, or like the one? I didn't understand.

A. That's one of them.

Q. Where were the gasoline tanks situated with respect to the engine?

A. Well, they was in a bulkhead just forward of the motors.

Q. How many were there?

A. Four.

Q. Will you tell me whether or not there were any pans below the gasoline tanks?

A. They were set in trays.

Q. Do you know what the trays were made of?

A. 3/16 sheet metal; not sheet metal, iron.

Q. Do you know what the gasoline tanks themselves rested on?

A. Well, they was cushioned in the tanks on wooden stringers.

Q. You mean that wooden stringers were in the pans?

A. In the pans.

Q. And the gasoline tanks themselves rested on those?

A. Yes, sir.

Q. Now will you describe the method by which the gasoline tanks were filled with gasoline?

A. Well, there was a reservoir right across the top,—two inch reservoir—two inch brass pipe and the filler runs back about six feet and come up over the back of the engine room deck.

Q. Where did it come out on deck?

A. It come out just alongside of the hatchway you come out of the engineroom.

Q. Alongside of the engineroom hatch?

A. On the back of the engine house deck.

Q. About how far above the deck did that protrude?

A. About eighteen inches.

Q. What sort of a fitting was there where that pipe went through the deck?

A. Just a deck plate.

Q. Just what do you mean by a deck plate?

A. Well, a plate come down over the pipe and screwed down onto the deck.

Q. Do you know whether any gasoline could get through that opening if spilled in the course of filling?

A. No, sir; it was put there to protect water leaks and stuff, you know.

Q. Did you ever see anything drip through that opening?

A. Not a bit.

Q. Now where did that pipe run in the engineroom after it passed through the deck?

A. Well, it run forward to a manifold that went in the tank.

Q. A manifold ran athwartships across the bulkhead?

A. Right across the front of the tanks.

Q. How did it get from the manifold into the tanks?

A. Well, there was a globe valve, a big two inch globe valve,—I wouldn't say a globe valve, but a big valve, and you could fill any tank you wanted to. The way it went in, you filled your first tank quicker than you did the rest, it looked like.

Q. Each tank had a valve?

A. Yes.

Q. So that you could fill any combination of tanks at a time?

A. Yes; you did that so you could equalize it; put a filter on it,—a tank filter.

Q. What gauge or gauges did you have in the engineroom to indicate the quantity of gasoline in the tanks?

A. Had a gauge that went right up to the bulkhead,—a glass gauge.

Q. Where did that feed from?

A. It fed out of the feed line manifold.

Q. And how high was that as compared with the height of the tanks?

A. It was to the top of the tanks.

Q. How was that secured?

A. It was secured with brackets, that the glass gauge set in; and there was rods on each side of the gauge, to hold the gauge.

Q. And will you describe for us the fitting where the glass gauge was connected with the manifold?

A. Well, it was a kind of a T-type fitting, with a union on the top of it; a union nut, and your glass went in there and packed with wicking, and pulled down on it.

Q. Did that ever leak?

A. Never did.

Q. Was there any vent on the gasoline tanks?

A. Yes, vent—they was all connected at the four tanks and went out the side.

Q. Which side?

A. The port side.

Q. Where did the vents leave the tanks?

A. They left right out of the top of the tank and come down the port side and went on top of the gun'ale,—gunwale.

Q. Do you know how thick that pipe was?

A. It was half inch pipe.

Q. Did you ever have any trouble with that vent?

A. No, sir.

Q. Do you know whether the tanks were secured in that compartment??

A. Well, I don't know just how they was secured; I know I was out in pretty rough weather with them and never had any trouble, no leaks or anything on the trip.

Q. When was that?

A. That was when we carried her up to Ft. Lauderdale in August.

Q. Of what year, do you remember?

A. 1930.

Q. Have you ever been in that compartment where the tanks were?

A. It was pretty hard to get in there before—you would have to take that bulkhead apart, part of the bulkhead loose, to get in there.

Q. Did you ever get in there?

A. No, sir.

Q. Did you ever see, then, how the tanks were secured?

A. No, sir, I didn't.

Q. From your observation on the boat can you tell us whether or not they were secure?

A. Why—

Mr. Botts:

I object; he stated that he does not know, and necessarily any explanation he could give would be a conclusion. I object on that ground; and he has answered the question.

Mr. Matteson:

I think he has already answered the question as well as he is able to do it.

The Court:

He might have some information on that. If it is subject to the objection, why then I will consider it that way. I overrule the objection.

(The last question was read.)

A. Well, I don't know just how they was secured.

Q. Did you ever see any signs of their shifting?

A. No signs at all?

Q. What sort of weather have you been in, in that boat?

A. We went up outside from Miami to Ft. Lauderdale, a pretty heavy northeaster, and pretty near a trough sea, and she would go pretty far both ways; she was high on top of the water.

Q. Do you mean that she would roll?

A. Yes.

Q. Did you have any difficulty with your tanks on that occasion?

A. Not a bit.

Q. Did you ever see any signs of those gasoline tanks leaking?

A. No, sir.

Q. How could you investigate to see whether those tanks were leaking?

A. Why, you could,—there was a hole about that big around; you could look in around the fittings through the bulkhead.

Q. Indicating about six inches in diameter?

A. Yes.

Q. That was where? Where were those holes?

A. That each feed line come out of, from the tanks.

Q. What could you see when you looked in there?

A. Why, you could see the tray,—the bottom of your tray just in front.

Q. Did you ever see any drippings from those tanks in those trays?

A. No, sir, and I never smelled any either.

Q. What kind of batteries did she have?

A. She had Edisons.

Q. How many?

A. 100 cell battery.

Q. Where were they?

A. They was up on the starboard side.

Q. In the forward starboard corner of the engineroom?

A. Yes, sir, right up against the bulkhead, in two tiers.

Q. One above the other?

A. One above the other.

Q. How much current did they provide?

A. 110 volts.

Q. What was the condition of those batteries in 1935?

A. They was in good condition.

Q. Did you have any trouble with them that year?

A. Not a bit.

Q. Now there was some auxiliaries in addition to the two main motors. Will you tell me what they were?

A. Well, she had a main generator motor.

Q. Where was that situated?

A. It was on the port side, just on the port of the port motor.

Q. Between the port motor and the port side of the boat?

A. Yes, sir.

Q. And how was that operated?

A. By gas.

Q. Where did the gasoline come from?

A. Come out of the main feed line,—the main reservoir feed line.

Q. The main tanks?

A. Yes, sir.

Q. Did you have a bilge pump?

A. Yes, sir.

Q. How many did you have?

A. Had one hand pump and one electric motor driven pump.

Q. Where was the motor driven pump?

A. It sits on a bench right in front, right up against the front bulkhead.

Q. There was a bench on the forward bulkhead?

A. Yes, sir.

Q. In the forward port corner of the engineroom, there was a little toilet?

A. Yes, sir.

Q. And that bench ran—

A. Ran towards the center of the boat, from there.

Q. How far over did the bench run?

A. Not quite to amidships.

Q. What was there amidships?

A. There was a desk.

Q. What was to the right of the desk.

A. The batteries.

Q. How close was the desk to the battery shelves?

A. About eighteen inches.

Q. That bilge pump motor rested on that shelf you have told us about?

A. It rested on that shelf.

Q. Did you have a sanitary pump or pumps?

A. Had sanitary—they fit right under the battery trays on the floor.

Q. How many were there?

A. Two.

Q. How were they driven?

A. Electric motor.

Q. Both electric motor?

A. Yes.

Q. Did you have a fresh water pump?

A. Yes, sir; they was both the same; one a sanitary and one a fresh water.

Q. One of these that you speak of under the batteries, was a sanitary, and the other was a fresh water pump?

A Yes, sir.

Q. Where was the fresh water tanks?

A. They was in the forward part of the boat, under the deck.

Q. In the bilges?

A. Yes, sir.

Q. And did you have anything in the nature of an emergency lighting motor?

A. Had a small universal motor for emergency.

Q. Where was that situated?

A. It was in under this bench under the bilge pump.

Q. Was that electrically driven?

A. No, sir; that there, you have to have the generator,—gasoline.

Q. That was a gasoline driven motor?

A. Yes, sir.

Q. To provide electricity in emergency?

A. Yes, sir.

Q. Where did that get its gasoline supply?

A. Out of the main tank line.

Q. The line that ran from the main manifold, in some way?

A. Yes, sir.

Q. Now let's talk about this gasoline manifold. When the gasoline line came out of the tanks, how did it run?

A. The pipe run all the way across, and it come out with a globe valve,—or a valve, out of each tank; and then there was a T made up with unions.

Q. Was there a valve at each tank?

A. Yes, sir.

Q. How big was that gasoline manifold line?

A. It was quarter inch.

Q. What was it made of?

A. Brass pipe.

Q. After you got to the starboard end of that manifold line, what did the line do?

A. To the starboard end?

Q. Starboard end.

A. It has a draw-off valve there; it was connected on there and come back to the center of the boat, with two drain-valves.

Q. You mean that after the manifold line ran across the four tanks, it doubled back?

A. Yes, sir.

Q. And came back towards amidships again?

A. Yes, sir.

Q. And on the end of that line that doubled back, you say there were two valves?

A. Yes, sir.

Q. Now, how was that line supported, from the time when it doubled back?

A. It was supported through the desk legs, I imagine; bulkheaded right down to the floor in each side, and the pipe was supported through there.

Q. Those legs to the desk, did they go down to the floor, or back to the bulkhead?

A. They was regular solid boards, nailed right down.

Q. And what did the gasoline line that led to these draw-off valves, do, about those legs?

A. It was supported by them?

Q. Was the line held to the legs by brackets, or did it pass through the legs, or how was it fitted?

A. Put through the legs, put right through the legs.

Q. The line went through the legs?

A. Yes.

Q. How far from the port legs were the valves? How much pipe extended beyond the port leg until you came to the valve?

Q.[A.] Between six and eight inches; there wasn't any more than that. There was just enough so you could get anything under there to draw gas.

Mr. Underwood:

Do you have those exhibits,—the valves and pipes and things?

The Witness:

That drain pipe was enlarged.

Q. Which drain pipe?

A. The one that went through the desk.

Q. What size pipe was that?

A. Half-inch.

Q. The manifold itself, you say, was one--quarter inch?

A. Yes.

Q. And both were brass pipe?

A. Yes.

Q. Now the valves where the lines come through the bulkhead right from the tanks, did you ever have any trouble with those valves?

A. No.

Q. Did they leak?

A. One was just put on there for emergency, that extra one.

Q. I am not talking at the moment about drain valves. I am talking about the valves right at each tank where the manifolds come through the bulkhead; those valves never leaked?

A. No.

Q. Now we will talk about the two draw-off valves. Can you remember what kinds of valves those were?

A. I am not sure what kind they were; they were either Crane or Lunkenheimer; they both look so much alike, and I worked on so many boats.

Q. Do you remember what size they were?

A. Half-inch valves; one of them was fixed so you could put a three-quarter connection on there if you wanted to.

Q. Rollie, I show you these two valves which are marked Libelants' Exhibit 11. Do you recognize these?

A. Yes, sir.

Q. Are these the drain valves from the Seminole?

A. Yes.

Q. Did you ever have any trouble with those?

A. No, sir.

Q. Did they ever leak?

A. No, sir.

Q. About how far was the right-hand end of this two-valve assembly from the desk leg?

A. That wasn't far—not very far, because you could just get a can under there, one of these regular filler cans.

Q. Could you tell us about how many inches it was, or if you can't, just tell us so.

A. That whole business stuck out there between eight and ten inches; that was a long time ago.

Q. Now, where did the feed lines for the motors leave the manifold?

A. They left right under the edge of this bench that came across ther for the port hole.

Q. Where did the starboard line leave the manifold?

A. It come out on the right side of the desk.

Q. Which way did these lines lead?

A. Down under the floor and up through the carburetor.

Q. Now was there any trap in these lines?

A. The trap was right next to the manifold.

Q. Between the manifold and the floor?

A. Yes; it was pretty close up to the manifold itself.

Q. Was there any other fitting between the trap and where the line led through the valve?

A. The valves to shut off the gas on the motor.

Q. How many sets of valves?

A. One to each motor.

Q. One on each feed line?

A. Yes.

Q. What was in the bottom of that trap that was in the feed line to the starboard motor?

A. It was a plug.

Q. Do you remember what kind of a plug?

A. No, I don't; some of them were hard and some of them were flat and solid.

Q. What was in the bottom of the trap that was in the feed line of the port motor?

A. A union connection?

Q. What kind of a connection?

A. Well, it was copper tubing, a copper tubing feed line.

Q. Where did that run?

A. It runs to the small motor there, that emergency motor.

Q. That is the one that was beneath the bench?

A. Yes.

Q. There wasn't any plug in that port trap?

A. No, sir.

Q. Now where did the feed line to the generator motor leave the main feedline?

A. I left right on the port tank, right on the end of the port tank.

Q. You mean at the port end of the manifold that runs across the front of all four tanks?

A. Yes.

Q. How did they run?

A. It run right direct under the floor and came up right at the front carburetor, the port carburetor.

Q. What was that line made of?

A. Copper tubing.

Q. A line of copper tubing?

A. Yes, sir.

Q. Did you have backfire arrestors there?

A. Yes; they was in the mouth of the carburetor.

Q. On each motor?

A. On the two main motors.

Q. Was any part of these motors and feedlines painted?

A. The manifolds was all painted black.

Q. How about the feedlines from the manifold?

A. Down to the floor they was all painted.

Q. Were they painted where they come up through the floor to the carburetors?

A. Yes.

Q. Are they painted below the floor?

A. No.

Q. How about the motors themselves, were they painted?

A. Yes.

Q. What color was the paint on the motors?

A. A light grey.

Q. What color was the paint on the feedlines?

A. Black.

Q. You were on the Seminole on a cruise in the spring of 1935, were you not?

A. Yes, sir.

Q. During that time what examination did you make to see whether there were any leaks in all of this gasoline equipment?

Mr. Matteson:

I object to that. He has not said he made any examinations. Let the witness testify.

Mr. Underwood:

I will withdraw that question and ask another one.

(By Mr. Underwood):

Q. Tell us first Rollie, whether you ever made any examinations during that last cruise, to the leaving of the boat at Pilkington's,—whether you made any examinations of these gasoline tanks and feedlines?

Mr. Matteson:

I object to that as leading.

The Court:

I don't think it is leading. The objection is overruled.

A. I cleaned them all up and painted them right down here at Royal Palm Docks, and repaired them.

Q. What else did you do, if anything, about these lines during the time you were on her that year?

A. Well, I didn't have any trouble with them; they were packed good and tight; oiled the valves is about all.

Q. How often did you look at these lines?

A. Quite often.

Q. Well, how frequently does that mean, Rollie?

A. Well, every time we went to draw gas you would look at them pretty much.

Q. How about when wou were not drawing gas?

A. Well, if you don't smell no gas or anything, I don't think it is necessary to examine them every day.

Q. When you looked at those feedlines and manifolds and so forth, tell us what you found.

A. They were in good shape.

Q. Did you find any leaks in that feedline or manifold?

A. Not in the feedline.

Q. Did you find any leak anywhere there?

A. I had a leak in the union on the filler pipe one time.

Q. When was that?

A. That was when we were gasing up to go to the keys.

Q. What year was that?

A. 1935.

Q. What did you do about that?

A. Well, I got a fellow that was filling on a gas boat—I got his wrench—he came over there with me and we tightened it; it took the two of us.

Q. When was that?

A. That was when we were filling to go to the Keys.

Q. That was at the Royal Palm Dock?

A. Yes.

Q. The time that you spoke of going to the Keys, was that in the spring of 1935?

A. Yes.

Q. Tell us how near the place where the filler pipe came through the deck that that leak occurred?

A. Just about half way between each of the—between it and the tanks.

Q. And where was the leak?

A. It was right in the ground-seat union, where the unions connected together.

Q. There was a union in that line between the place where the filling came through the deck and the filling manifold, is that right?

A. Yes.

Q. And that leak was there?

A. Yes.

Q. From that time on did you have any trouble with that union?

A. No, sir. I stopped them from filling, and he came along with the wrench, and we fixed it up.

Q. Did you fill more after that?

A. We finished filling after that.

Q. Now was there any leak at that union after you fixed it and while you were completing the filling?

A. No, sir.

Q. How close to the deck head or the ceiling of the engineroom was that filling line at that place?

A. Now, I wouldn't know—I wouldn't know just exactly how close to say.

Q. Just approximately.

A. I would figure it was about ten inches. I didn't pay too much attention to it.

Q. Was or was not the filling line at that place above the level of the tops of the gasoline tanks?

A. Yes,—no, it wasn't, because the filler lines went in—

Q. Was or was not that place above the level of the place where the filling lines went into the tanks?

A. I imagine it was; it run kind of on a slant, like that.

Q. Which way was the slant?

A. Towards the tank. You see, the tanks are about that much higher, much higher from the bottom of the tank than the reservoir.

Mr. Botts:

Indicating about four inches.

Mr. Underwood:

That is right.

Q. About how far from the tops of the tanks was it where the filling lines went in to the tanks?

A. From the tops of the tanks?

Q. Yes.

A. About that far (indicating).

Q. Is that the distance you just mentioned?

A. Yes.

Q. Now apart from the leak that you mentioned in the filling union, did you ever find any other leak?

A. No, sir.

Q. Did you know the difference, Rollie, between a seep, weep or leak?

A. Well, some people call them seeping and some weeping; just where you have a sign of a leak—

Q. Did you ever see anything like that in the engine-room of the Seminole?

A. No.

Q. Did you ever smell any gasoline vapor in the Seminole?

A. No, sir; only when we were drawing or priming the motors.

Q. Now where was the main switchboard located?

A. On the back bulkhead between the two motors.

Q. How did the wires run from the battery to the main switchboard?

A. Through a regular conduit.

Q. Now where was the first switch that had to be closed in order to put electricity from the batteries on the switchboard?

A. The first switch to be pulled was on the starboard side of the bottom of the board.

Q. You say "starboard" side, Rollie, but I notice you used your left hand.

A. Well, the starboard side of the boat.

Q. That would be your left?

A. Facing the switchboard would be on the left.

Q. Was it high or low, on the switchboard?

A. It was on the lower corner.

Q. When you closed that switch how far did that put electricity on the board?

A. It just puts it on the board.

Q. How much of the board did it put it put it on?

A. It put it up to your charge and discharge switch.

The Court:

You will have to speak a little louder. I cannot hear you.

Q. Where was that switch?

A. It was right in the center of the board.

Q. When you closed or opened that switch, Rollie, show us which way you moved your hand; I mean was it vertical or horizontal?

A. It was horizontal, the discharge and charge switch was.

Q. Now the first switch that you spoke about down in the lower starboard corner, was that horizontal or vertical?

A. It was vertical; you threw it up and down.

Q. Going back to the charging and discharging switch, which way was the charging position?

A. The charging position you threw it to the right,

Mr. Matteson:

Let the record show considerable thought and delay in answering.

Mr. Underwood:

I think the record will probably show that as to this witness about a great many witnesse. Is there anything wrong about that; is there any criticism of the witness, if so, please state it.

The Court:

Suppose we proceed. I think it is rather difficult to read into the record anything in regagrd to that particular answer; it is difficult to characterize it; it is a different situation, but I think we had better proceed without any comments at this time.

(By Mr. Underwood):

Q. Rollie, what do you call this switch that was at the lower starboard corner, the first switch that you use to put electricity on the board?

A. The main switch.

Q. After you close the main switch, then which switch do you have to close to get electricity on your field switches for lighting?

A. You have to throw it on the discharge side.

Q. And that you indicated would be thrown to the left as you face the board.

A. That is a long time to remember.

Q. Tell us your best recollection.

A. Well, as near as I recollect we threw it to the left.

The Court:

If you want to read in the record there, Mr. Matteson, that it was with some hesitation that he answered some question, you can do so.

Mr. Matteson:

I do not care to encumber the record because the witness is before you and makes his own impression, so it is not necessary to encumber the record.

The Court:
All right.

(By Mr. Underwood):

Q. Where did the electricity go when you closed that switch on the discharge side?

A. It went up to your field switches.

Q. By "field switches", tell us what you mean.

A. Well, those four different compartments and stuff on the boat.

Q. Lighting switches?

A. Yes, sir.

Q. What was the uss of this charge and discharge switch?

A. Well, when we were using the generator you would have to throw it to the opposite side.

Q. To the opposite side?

A. Yes.

Q. Which way would the current flow when you closed it on the charge side?

A. It would flow into the battery room.

Q. What type of switches were those on the board?

A. Some people call them "throw-switches" and some people call them "knife switches".

Q. Were they covered in anyway?

A. No, sir.

Q. How long have you been on boats that were operated by gasoline motors?

A. How long have I been on them?

Q. Yes.

A. Well, I worked on a lot of them, but I never made an actual business of working on them, working on them as engineer.

Q. What do you mean by "not working on them as an engineer"?

A. Well, an engineer generally takes a steady job and works on a boat. My business generally—by business was mostly repairing and stuff like that.

Q. Have you seen switches on other boats during the course of that business?

A. Yes.

Q. Can you tell us what type of switch was in general use in 1935?

A. Mostly knife switches on the switchboard?

Q. Enclosed in any way?

A. No, sir.

Q. Have you used the switches on the Seminole?

A. Yes.

Q. And this last time you were aboard of her, in the spring of 1935, what was your experience with these switches in using them?

A. Well, they worked all right.

Q. Did you see any sparks?

A. Well, you broke—when you pull a switch you make very much of an arc in changing from generator to discharge side, you know.

Q. You are referring to some particular switch?

A. That is the discharge and charge switch.

Q. How about the main switch?

A. Well, after you break your discharge and charge switch, why you would pull your main switch out without making an arc.

Q. How about the field switches?

A. They would make a little arc when you break them or throwed them in.

Q. How about the closing of these switches, do they make any arc then?

A. Well, nothing like it does when you are pulling them away.

Q. Will you describe what happened when you closed these switches?

A. If you closed a switch quick you will hardly notice any arc at all.

Q. Did you ever see any sparks in closing these switches?

A. Not enough to speak of.

Q. Now, what ventilation was there in the engine-room?

A. There was two big cowl ventilators that went up through the deck, right off the front main motor.

Q. What windows were there?

A. There is a window in the engineer's bedroom, and on the side, on the port side.

Q. What was there on the starboard side?

A. There is a hallway that went through the quarters; there is a door that opens into the engineroom; it is more of a door than a window, because it opened out into the engineroom.

Q. When you left her the last time at Pilkington's how were the cowl ventilators left?

A. They were left open.

Q. How were the windows left?

A. The one on the outside of the boat was left open, the screen door—the screen was all that was closed on it.

Q. How did that window open; in what direction?

A. It opened right up to the top of the boat; you lifted it right straight up.

Q. Was it opened on hinges?

A. Yes, sir.

Q. How was the window from the alleyway to the engineroom left?

A. It just swung out against the side, against the side of the shelf.

Q. When you left the boat at Pilkington's the last time how was that window left?

A. Well, that window, as well as I remember, was open.

Q. Do you remember the windows in the alleyway, from the alleyway to the outside of the boat?

A. No, sir, I don't.

Q. Do you know anything about those windows?

A. I don't know whether they were open or not.

Q. When you left her at Pilkington's, how did you leave the engineroom hatch?

A. Let it down and locked it.

Q. How about the skylight?

A. The skylight was always open on that boat.

Q. When you left it at Pilkington's the last time, how was it left?

A. It was open; there was a screen in the skylight to keep anything from going down in there.

Q. Now one witness in this case has mentioned some gooseneck vents that were on deck. Will you tell us how many of those you knew about?

A. I know there was some along each side of the boat; I couldn't say how many there was; they run about ten feet apart, it looked like; I never counted them.

Q. Do you know where they led?

A. No, I don't.

Q. Have you been in the bilges of the Seminole?

A. Yes, sir.

Q. How could you get into the bilges from the forward part of the boat?

A. There was a big hatch right in the hallway; you pulled the rug back and lifted it up on the side, and walked right down the steps.

Q. How much room was there in the bilges in the forward part of the boat?

A. I would say about four feet.

Q. What was kept in the bilges there?

A. Water tanks.

Q. Anything else?

A. Water tanks and the anchor chain.

Q. As you went aft from that place, did you come to any bulkhead?

A. You come to a bulkhead just behind the water tanks.

Q. Where was that with reference to the gasoline tanks?

A. It was about between eight and ten feet forward.

Q. The bulkhead was eight or ten feet forward of the gasoline tanks?

A. Yes, sir.

Q. How far down did that bulkhead go?

A. Right down to the bilges.

Q. Was there any way you could go through that bulkhead into the bilges?

A. No, sir.

Q. And could you get in the bilges abaft that bulkhead?

A. There is a manhole plate right under the desk.

Q. In what?

A. In the bulkhead beyond the tanks.

Q. What was the type of that?

A. Square.

Q. When you went through there where could you go?

A. Go up to the forward bulkhead, up to that bulkhead, and your steering device and all was set in there.

Q. Now the engineroom floor, what was that made of?

A. Wood.

Q. What did it rest on?

A. It rested on girders and wood springers, too.

Q. How could you get in the bilge in the engineroom?

A. You could lift it up—take the whole floor right up in the engineroom,

Q. How big in sections was the floor?

A. Well between the engines was just one section wide and two sections long; two hatches.

Q. How about the balance of the engineroom?

A. In front you could lift it up—right in front of the engine there is a hatch right in front—

Q. How much space was there between the wooden floor of the engineroom and the bottom of the bilge, amidships?

A. I would say about eighteen inches; it was so flat that it didn't make much difference.

Q. Now on the starboard side of the engineroom what was there, if anything, underneath the floor of the alleyway?

A. There was no floor under that; it was all pipes for your water-manifold and the different manifolds and stuff.

Q. Was there another wall or bulkhead between the space under the alleyway and the engineroom?

A. No.

Q. That was open?

A. Yes.

Q. There was a bulkhead across the after-end of the engineroom, was there not?

A. Yes.

Q. How far down did that go?

A. Went right down to the girders, and they came across.

Q. Could you pass through that bulkhead?

A. No, sir.

Q. How wide was the bulkhead; was it as wide as the boat or did it stop short?

A. It stopped right in the alleyway.

Q. If you got into the space under the alleyway how far aft could you go before you got to a bulkhead that stopped you?

A. Well, that bulkhead under the alleyway was across, but it wasn't all the way up.

Q. So that the after engineroom bulkhead went all the way across the engineroom?

A. Yes.

Q. And continued across to the starboard side of the boat beneath the passageway?

A. Yes.

Q. How could you get in the bilges abaft that engine-room bulkhead?

A. You had to go up along this alleyway and into the first stateroom, and behind that bulkhead you lifted up a hatch on either side.

Q. Where did that take you?

A. Took you right into the bilge where your air tanks and stuff was.

Q. Now when you got down in the bilges there how far aft could you go?

A. You could go back to right under the galley or kitchen.

Q. What stopped you there?

A. A kind of bulkhead.

Q. Could you get through that bulkhead?

A. Yes.

Q. Pardon me.

A. Yes.

Q. You could go through that bulkhead?

A. Yes.

Q. Tell us how you could get through that bulkhead.

A. You got through in the center between the shafts.

Q. What was there?

A. Stuffing boxes where your driving shafts went out.

Q. Was there any bulkhead after that one?

A. No, sir; I am not sure of that.

Q. Do you remember any now?

A. I know you had to go down there to get to your stuffing-boxes to tighten them up; I am pretty sure there wasn't no bulkhead in there.

Q. Can you tell us how many of these bulkheads, if any, were watertight?

A. There wasn't any of them watertight.

Q. In the spring of 1935 what kind of work were you doing before you were employed on the Seminole?

A. I was fishing.

Q. Who talked to you about working on the Seminole that spring?

A. Mr. Riley called me up and asked me if I wanted to go down to meet Captain Baker and take the Seminole down to Miami.

Q. Who was it that hired you?

A. Mr. Riley.

Q. Did you talk to Mr. Phipps about that?

A. No, sir.

Q. Did you discuss anything about how much you were to be paid?

A. No, sir—yes; wait a minute. I think I asked him for $8.00 a day.

Q. Who was it that you asked?

A. Mr. Riley.

Q. Did you agree with him on a figure?

A. Yes.

Q. Did you ever have any discussion with Mr. Phipps about the rate?

A. I never talked very much to Mr. Phipps at all.

Q. Now after you were hired for the Seminole, where did you join the boat?

A. At Fort Lauderdale.

Q. Who was Captain of her?

A. Captain Baker.

Q. Where did you go with the boat from there?

A. We brought it to the Royal Palm Dock.

Q. How long did you stay on her at that time?

A. Eighteen days—let's see—I was there overhauling her 18 days.

Q. What were you doing on during that time?

A. Well, I tore out a generator motor and repaired it, cleaned and oiled, and took oil and stuff out of the big motors, and put new gaskets on them all around.

Q. Do you remember anything else that you did at that time?

A. Scraped and painted.

Q. Scraped and painted what?

A. Her motors.

Q. Do you remember anything else that you did at that time?

A. Well, I took her out on a trial trip a couple of times.

Q. How much of the gasoline feedlines did you see during that period?

A. I saw them all during that period.

Q. Did you observe any leaks during that time?

A. No, sir.

Q. Any weeping or seeping?

A. No, sir.

Q. Do you remember how you got paid for that time?

A. I got paid for a whole bunch of work at one time that spring.

Q. I show you a paper which is a part of Exhibit 3-U, voucher Number 8032. Can you tell me, Rollie, whether that is the top half of the check that you got for that work?

A. Yes.

Q. Now you have spoken of 18 days. I show you an item on there "Seminole Boat Company, 18 days at $1.50".

A. That was when I was eating at the restaurant.

Q. That $1.50 covers your food, is that right?

A. Yes, sir.

Q. It says at the top, "Seminole Boat Company, 22 days". Can you tell me what those 22 days were?

A. That was the same time I was working on her.

Q. Did you work on her 22 days?

A. I couldn't say I worked 22 days. I came down and took her to the Boatyard down there on trip, and that "18 days" was when I was eating at the restaurant there.

Q. Where was the boat at that time?

A. At the Royal Palm Dock. I came down one day and took it out to the Coconut Boat Yard, Coconut Grove Boatyard, and then the next two or three days I took her back; I guess that is where the 22 days comes in.

Q. I notice on here "bus fare, five trips at $1.20".

A. Yes.

Q. Can you tell me what that covers?

A. That is when I was coming back and forth to haul her out.

Q. While we are talking about this, I notice a charge on there, "Mr. J. S. Phipps Boats, 31 days at $5.00". Do you remember what that work covered?

A. That was on the Iolanthe.

Q. Did you work on the Iolanthe during that spring?

A. Yes, sir.

Q. I see a charge here "Mrs. F. E. Guest Boats, 7 days at $5.00". Can you tell me what that is?

A. I went to Bimini; that was on the Iolanthe, too.

Q. And the other charge on there is "Mr. J. S. Phipps Boats, one day at $8.00". Do you know what that is?

A. I don't quite remember.

Q. Who kept your time?

A. Why, I generally kept it, and then I went to the office and reported it.

Q. To whom?

A. To Mr. Riley.

Q. Who worked out how much you were to get?

A. Well, we would come to an agreement—we came to an agreement on that one when we went to the Keys that time.

Q. After you reported your time to him what happened?

A. Why, he just made it up that way and gave me a slip of paper and I carried it to Mr. Anderson and he would fix it up and give me a check.

Q. Now in that last spring when you were on the Seminole, in 1935, did Mr. Phipps give you any orders or instructions?

A. No, sir; I always took my orders off of the Captain.

Q. Did you see Mr. Phipps in the engineroom of the Seminole that spring?

A. He was in the engineroom one time while we were laying at the Royal Palm Dock, about a week or two before we went to the Keys.

Q. How long was he in the engineroom?

A. About ten minutes.

Q. And what did he do there?

A. He just came in and looked around and said everything looked good and walked out.

Q. Was there any discussion between you and him as to anything about the engineroom?

A. Not a bit.

Q. Did you know Abel?

A. Yes, sir.

Q. Do you know where he was when you were on that cruise to the Keys in the spring of 1935?

A. He was with us on the Clip.

Q. Was he in charge of some boat?

A. He was in charge of the day boat; the name of the boat was The Clip.

Q. Did he have anything to do with the Seminole on that trip?

A. No, sir.

Q. When you took the Seminole from Fort Lauderdale to Miami with Captain Baker did Abel have any part in that?

A. No.

Q. And when the Seminole was at the Royal Palm Dock that spring did you see Abel in Miami at that time at all?

A. Yes; he came down with the boat.

Q. With what boat?

A. With the Clip, and waited around there four or five days for orders, and then he took it and went back to Palm Beach.

Q. Was he on the Seminole to do any work in the way of employment while you were on her at all that spring?

A. No, sir.

Q. Had he been on the Seminole previous to that time, do you know?

A. For work?

Q. At all?

A. He was on the Seminole when we had it up on the dock there—when we had it at the dock there.

Q. Where?

A. Up at Palm Beach.

Q. Do you know what year that was?

A. It was the year before we went to the Keys; I guess it was in 1924; we were doing some work on the bilges there; I guess it was in 1934.

Q. Did he do some work on the Seminole?

A. No, sir, not outside of getting material or something like that.

Q. I am speaking of Abel; did he do any work on the Seminole?

A. No, sir.

Q. Not while you were there?

A. No, sir, not while I was there.

Q. What were you doing on the Seminole at that time?

A. Fixing up the water pipes and stuff around different places; putting in new bolts.

Q. Had Abel, as far as you know, had any instructions in the method of using the switchboard on the Seminole?

A. Yes, sir.

Q. Tell us what you know about that.

A. I showed him where to throw the switches to get a circuit.

Q. When was that?

A. When we had her up at Palm Beach there.

Q. What was your purpose in that?

A. Well, he just wanted to know and I showed him.

Q. Was he doing any work on the boat at that time?

A. No, sir; he was a kind of fellow who would take your orders and get your stuff if you wanted anything, material, or anything like that.

Q. Getting back to this cruise in the spring of 1935, where did the party leave?

A. The party left at Lower Matecumbe.

Q. Where did you go from there?

A. Came up to Miami. You mean when they got off the boat?

Q. After the party left the boat at Matacumbe where did the Seminole go?

A. We came up here to the Royal Palm Dock that night.

Q. What did the crew do there?

A. Some of us went to Lauderdale.

Q. Some of the crew left at Miami?

A. Yes.

Q. How many of you went to Lauderdale?

A. The cock, Elliott Bryant and myself and Captain Baker.

Q. When did you get to Fort Lauderdale; that is, how long did you stay in Miami?

A. We were held up on account of fog a little while; it must have been nine o'clock before it cleared up.

Q. You mean in the morning or evening?

A. In the morning.

Q. Of the next day?

A. Yes.

Q. Then you went to Lauderdale?

A. Yes, sir.

Q. About what time did you get to Fort Lauderdale?

A. About 3:30.

Q. Where did you have your lunch that day?

A. We had lunch at the mouth of the river, just before starting up to Fort Lauderdale.

Q. Where was the boat when you had lunch?

A. We just run her up in a little slip there, just before turning the river; just run her up in there and left the motors running.

Q. Did you get any instructions about what to do with the boat before leaving her that day?

A. No, sir; I did it before, though.

Q. What was the situation as to gasoline in the tanks as you were going up the river that day?

A. There was very little gasoline in them.

Q. How about the motors; how did the motors behave on the way up to Pilkington's that time?

A. They behaved all right outside of one of them got weak on gas.

Q. When you got to Pilkington's where did you put the boat?

A. Left it out there on the outside of the dock, on the south side of the slip.

Q. When you got there how much gasoline showed in the gauge?

A. Didn't any show in the gauge.

Q. How close to the manifold was the top of that tee-fitting out of which the glass part of the gauge led?

A. Well, it would not be over one inch above the main manifold.

Q. Could you see any gasoline in that gauge at that time?

A. No, sir, you couldn't see hardly any when we stopped down there to eat.

Q. When you left her at Pilkington's could you see any?

A. No, sir.

Q. When you stopped the motors that day, can you tell us how you did it?

A. Yes, sir. We shut off the feed-line valves and let them die out.

Q. Which valves do you refer to as shutting off?

A. The feedline from the trap.

Q. You mean the valves below the traps?

A. Yes, sir.

Q. What was the effect of that?

A. Well, that is the way—we made a practice of shutting them off—she had a deep under-water exhaust, and if you cut your switches you are liable to run her—you are liable to let her roll back and fill your motors full of water.

Q. Tell us what else you did in the way of getting the engineroom ready to leave?

A. Well, I shut off all of the overboard connections, valves and stuff.

Q. What else?

A. We flushed all of the toilets and pulled all of the switches.

Q. What else?

A. Painted the copper or brass fixtures with lacquer, to keep them from corroding.

Q. What else did you do, Rollie?

A. I did most of the painting and covering that stuff going up the straight canal; I did that while I was traveling.

Q. What else did you do after you got to Pilkington's?

A. Wiped the motors off and put oil in her plugs, and rolled them over a few times.

Q. When had the drain-valves, these two that are before you there, last been used prior to the time that you got to Pilkington's that day?

A. I used them here at Royal Palm Dock that day, while we were over at the Royal Palm Dock.

Q. For what purpose?

A. Took some gas out and put it in Captain Baker's guide boat. He said that his boat was full when he carried it to the dock here, and he wanted it full, and we wanted to get "shed" of all of that gas that was in the tank, as much as I could, because it wouldn't work good when it gets old that way.

Q. When you finished that what did you do with those valves?

A. Shut them off good.

Q. From that time on did you observe any leak or seep or weep at these valves?

A. No, I didn't.

Q. Will you tell us whether or not you looked at these valves again that day?

A. I always took and run my hands around the top of it and under the bottom to see that they were shut off.

Q. What else did you do there?

A. Right there at the dock?

Q. Yes; do you mean Pilkington's or the Royal Palm Dock?

A. Royal Palm Dock.

Q. What did you find?

A. That they were tight.

Q. When you left the boat at Pilkington's how did you leave these valves?

A. Shut off, just the same as they were.

Q. How about the valves at the tanks themselves, the four tank valves?

A. Everything was shut off.

Q. Who shut them off?

A. I did.

Q. When did you do that?

A. After the motors had stopped.

Q. How tight did you shut them?

A. I shut them just good and tight.

Q. Were you in the bilges at all that day?

A. I was all through the bilges cutting off my overboard connections that day.

Q. Tell us where you were in the bilges; you have told us about the bulkheads and what was in the bilges in the various places,—how many of these different compartments were you in?

A. I was in all of them.

Q. Did you smell any gasoline in any of these bilges?

A. No, sir. And to cut off the deep wafer suction cock for the circulation of your motors you had to lift the floor board to get down to where it comes through the hull.

Q. Where was that, Rollie?

A. There was one on each side, right outside the motors.

Q. That is in the engineroom space, one on the outside of each motor?

A. Yes.

Q. I was asking you about bilges; I would like to be clear just whether or not you were near the bilges on that last day.

A. Yes, sir, I was.

Q. Did you see any gasoline in any of those bilges?

A. No, sir.

Q. Smell any?

A. No, sir.

Q. Did you see any leaks or weepage or seepage any place that day?

A. No, sir.

Q. Now did you have a gasoline can in that engineroom?

A. Yes—

Q. Like that?

A. Yes, sir.

Mr. Matteson:
What exhibit is that?

Q. Exhibit 13. Did you have one like that in there?
A. Yes, sir.
Q. Does that look like the one they had?
A. It looks just like it.
Q. How did you leave that gasoline can?
A. Setting right on the end of the bench there.
Q. Was there anything in it?
A. No, sir.
Q. Which bench do you refer to?
A. The one on the forward bulkhead.
Q. Where the little motor was?
A. Yes, sir.
Q. How about oil and grease, or rags, things of that sort? Tell me anything you have in mind about that, on that day.
A. That was all throwed overboard, all but one can of oil, and I set it out on the dock, set it out through the window.
Q. Did you have any cans with oil in them, in the engine room?
A. Only new oil, sealed cans.
Q. About how many cans of that were there?
A. Well, I wouldn't be sure; maybe six or seven.
Q. How big were they?
A. Five gallon cans.
Q. What kind of oil was it? I don't mean, the brand; was it cylinder oil?
A. Cylinder oil.
Q. Did you leave any in the engine room, any oil cans that had been opened?
A. No, sir.
Q. Did you leave any rags in the engineroom?
A. No, sir. There was about a half a bale of new waste, I took and set it right up on top of the toilet.

Q. Had any part of that been used?

A. No, sir, never been out of the bale.

Q. Now in what condition did you have the batteries that day?

A. They was all full, in good shape.

Q. Had you experienced any shorts or grounds in the Seminole that year?

A. No, sir; I didn't have a ground in it on the trip.

Q. How about ashore?

A. No, sir, I didn't have any.

Q. Had you ever had any shorts on the Seminole?

A. Did on a spot light, one year.

Q. What year was that?

A. I fixed it when they had it at Palm Beach.

Q. Was that 1935, or some other year?

A. '34.

Q. What do you mean by spot light?

A. Upon the deck of the boat.

Q. A search light?

A. Search light.

Q. Up around the pilot house?

A. Yes, sir.

Q. After you fixed it, did you have any trouble with it?

A. No, sir.

Q. About what time did you leave the Seminole that last day?

A. We left pretty close to six o'clock.

Q. And did you leave it alone, or with somebody?

A. Why, if I remember right, Captain Baker and the cook was waiting on his car to come when we left.

Q. Whom do you mean by, we?

A. Bryant and myself.

Q. Elliott Bryant?

A. Yes, sir.

Q. And how did you get back to Palm Beach?

A. Mrs. Pilkington carried us to Ft. Lauderdale; we caught the bus from there.

Q. And you left Pilkington's yard about what time?

A. I imagine it was about six o'clock.

Q. Did you have anything to do with the Seminole's keys that day?

A. No, sir, only to unlock the lock to the engineroom.

Q. Did you handle the keys that day?

A. I don't—I think I did; the lock was locked onto the pipe guard; I think I handled the keys to unlock the lock.

Q. What kind of a lock was it?

A. One of those kind of bicycle padlocks, those long shank.

Q. A long shank on it, you say?

A. Yes, sir.

Q. What was the padlock used for?

A. It locked down on the hatch, engine hatch.

Q. After you used the keys to unlock that lock, what did you do with the keys?

A. Well, I don't know whether Elliott Bryant took them, or the cook, to lock up the silver and stuff.

Q. How many keys did you have, do you remember?

A. I believe there was four keys on the ring.

Q. You say, on the ring; what kind of a thing was it that held the keys together?

A. It was a piece of hard string, used for a ring.

Q. Was there anything else on that string besides the keys themselves?

A. No, sir.

Q. Do you remember a tag of any sort?

A. Well, there was no tag on it then.

Q. Are you sure who you handed the keys to?

A. No, sir, I am not.

Q. Did you take off any keys from that ring before you delivered the keys up?

A. No, sir.

Q. Now from the time you left the boat that day, were you on her again before the fire?

A. No, sir.

Q. What was the first you knew about the fire?

A. I was called up Tuesday evening about four o'clock, and they asked me to come down to show them where the holes was in the boat.

Q. Who asked you that?

A. Mr. Riley; so they could pump her out.

Q. Did you go down there?

A. Yes, sir.

Q. About what time did you get there?

A. I went down there between six and six-thirty.

Q. That was the day after the fire?

A. The day after the fire.

Q. And what did you do that evening?

A. Why I showed Mr. Holm where the openings was in the boat, and where to plug them up, so as to stop the water from coming in.

Q. Did you go aboard the boat?

A. Yes, sir.

Q. What was her situation when you got there?

A. She was sunk.

Q. Was there any pumping done that night?

A. They pumped it out that night.

Q. About what time did you begin pumping, do you remember?

A. Well, the tide was still up, when we got the holes plugged; and we waited there quite some time for it to get low; and I would say, eight or nine o'clock.

Q. Do you remember what time the pumping stopped that night?

A. Between one and two, I guess.

Q. That would be Wednesday morning?

A. Yes, sir.

Q. What was the situation of the boat at that time?

A. She was afloat.

Q. Was there any water in her, still?

A. Yes, sir, there was some, on account of coal and stuff laying around, you couldn't pump it much without cleaning it out.

Q. On account of what lying around, Rollie?

A. Ashes and wreckage and stuff.

Q. Do you know or remember whether the water was at that time down as low as the floor, the wooden beams in the engineroom floor?

A. It was just about with them.

Q. Do you remember how thick those beams were?

A. No, sir.

Q. Could you give us any idea of how thick they were?

A. Do you mean the girders,—the steel girders, or the wood?

Q. The wood.

A. No, I haven't.

Q. Did you see any gasoline in the Seminole that night?

A. No, sir.

Q. Did you see any oil, or smell any gasoline or oil, anything of that sort?

A. Well, the smell of oil all over the place.

Q. By all over the place, what place do you mean?

A. All over the boatyard itself, all over the basin.

Q. When pumping stopped that night, was anything still burning?

A. There was some of those posts burning on top.

Q. You mean, the posts that had been part of the shed?

A. Yes, sir.

Q. Anything else?

A. No, sir,

Q. Did you see any gasoline leaking anywhere that night?

A. Yes, sir, I saw plenty of gasoline leaking, but it was on the motor we was pumping out with.

Q. Where was that?

A. It was on a barge, a little barge setting alongside of the Seminole.

Q. Who provided that motor, do you know?

A. I think the man's name was West.

Q. What did you see there?

A. There was a young fellow running that motor for him.

Q. What did you see?

A. Well, there was a pet cock on the tank, and the motor was on very poor foundation, and it shook the pet cock loose on the tank, and there was gasoline running out of that.

Q. How long did that last?

A. It didn't last long, because I saw it.

Q. What was done about the pet cock?

A. Closed it off.

Q. Who did that?

A. We did—he did. I told him—that young fellow; I never did know his name.

Q. You refer to the young fellow who was running the pump?

A. For West.

Q. Did you see any other gasoline leak that night?

A. No, sir.

Q. Did you see anything that looked like a spring of gasoline or anything else in the Seminole that night?

A. There was water running out of a pipe that had broke off. The water mixture.

Q. Which pipe was that?

A. The pipe that was broke off on that.

Q. You mean the pipe that these two valves, Exhibit 11, were broken off of?

A. Yes, sir.

Q. What was running out of there?

A. Well, it was a mixture, mostly water, see. The boat sunk, and when the tanks filled up, when she come up the water, naturally run back out.

Q. Where did you see that running from?

A. Well, from the top of the engine hatch you could see it.

Q. And where did you see the liquid that was running out of this pipe?

A. Right in under,—in about the middle of the boat.

Q. How much of that pipe was visible above the water at that time?

A. Six or eight inches.

Q. Could you see the end of it off which those two valves broke?

A. Yes, sir.

Q. Was that above the surface of the water at the time you speak of?

A. Yes, sir.

Q. Did you see anything that looked like a bubbling up of gasoline or any other substance from the surface of the water, in the Seminole?

A. No, sir. In fact you couldn't see much around there that night nohow.

Q. Because of what?

A. Dark, and raining; only had a spot light,—a flash light.

Q. What was the condition of things in the engine-room, generally?

A. Pretty bad wrecked up.

Q. You mean there was a lot of debris in there?

A. Yes, sir.

Q. Now how long did you stay there that night,—Tuesday night and Wednesday morning?

A. I stayed there all night.

Q. Where did you sleep that night?

A. On a big barge that was on the north side of the shed.

Q. A steel barge with tracks on it?

A. Yes, sir; this boy and myself stayed there.

Q. You mean the boy that had been running the pump?

A. Yes, sir.

Q. Did you go aboard the Seminole the following morning?

A. We did later on in the day; went in for breakfast, and when we come back it was raining, and after the rain let up we went aboard.

Q. Did you observe the wooden stringers on which the motors rested at that time?

A. Yes, sir.

Q. What was their condition?

A. They was charred a little, but not burned too bad.

Q. How about the wooden floor boards of the engine?

A. In the center they was burned out—pretty much burned out.

Q. By "in the center" what do you mean?

A. In between the motors—

Q. How bad—go ahead and finish.

A. Right next to the generator motor there was some of the floor still there.

Q. How bad on the starboard side of the starboard motor?

A. It was pretty well gone.

Q. How about between the forward end of the motors and the forward bulkhead?

A. It was pretty well gone.

Q. Did you see the remains of the switch board that day?

A. Yes, sir.

Q. What was its condition, and where was it?

A. It was laying right down betwen the two motors, kind of catercornered between the two motors.

Q. Was it all in one piece?

A. No, sir, it was broke.

Q. In many pieces, do you recall?

A. No, sir, it wasn't so you couldn't put it together.

Q. Did you observe about the positions of the switches on that board at that time?

A. Well, there was—the switches—generator switch, discharge and charge switch, had been inserted, because one part of the knife was inserted to turn it.

Q. On which side?

A. On the discharge side.

Q. Did you find the main switch or any part of it?

A. No, sir.

Q. Did you see any of the field switches, the lighting circuit switches?

A. Yes, sir, found those.

Q. What position did you find those in?

A. They was all open, hadn't been closed at all.

Q. There is a piece of switch some place; do you remember that little brass piece? * * *

Mr. Botts:

Here you are, Mr. Underwood. * * *

Q. Now, Rollie, I show you a piece of brass or copper, marked Exhibit 18; do you recognize that?

A. That's it, a piece of one of the switches, all right; the knife.

Q. Could you say which switch that came from?

A. No, sir. There was a switch like that on the generator side, to cut the generator circuit together; and your main switch if big like that.

Q. That might be a piece of either?

A. It could be a piece of either, because there was two switches just alike, just about the same location, on each side of the board.

Q. Rollie, here is a piece of funnel, Exhibit 14. Did you have anything like that on the Seminole?

A. Yes, sir.

Q. Does that look like anything you had on the Seminole?

A. Yes, sir.

Q. I show you this instrument, Exhibit 17; did you have anything like that on the Seminole?

A. Yes, sir.

Q. Can you recognize what that was?

A. That's the drain trap.

Q. Where was that situated?

A. Set—this one set right under the corner of that bench against the forward bulkhead.

Q. Was this on the port or the star board line?

A. This was on the port line.

Q. Now there is one piece of pipe that ends up in a valve.

A. Yes, sir.

Q. See that? Where did the line run from out of that valve?

A. That runs in the feed to your port motor.

Q. Now this other piece—is that a valve? It is a T with a plug, isn't it?

A. No, sir, this year runs up on your bulkhead, and there was a mechanical gauge for filling, but it never did work. There was a regular disc.

Q. You mean, a round gauge?

A. Yes, sir.

Q. With a hand in it that is supposed to move back and forth?

A. Yes, sir. I don't remember just how they checked it, but it never did work, anyhow. This pipe run right up to the top of the tank and back into the gauge.

Q. You mean from the T that is in this other segment of this Exhibit?

A. Yes, sir.

Q. A disc gauge ran?

A. Yes, sir.

Q. Where did the line go from the end of this piece?

A. It went to your next tank.

Q. I show you another piece, Exhibit 2 I believe it is; do you recognize that?

A. No, sir. (Examining Exhibit.)

Q. Is that the same style or type of pipe and fittings that you had on the Seminole?

A. Yes, sir.

Q. Can you tell whether that came from the Seminole?

A. I can't just place where that did go.

Q. Well, we will pass that for the time being; it may come to you as you look at it; put it down there. Where did you sleep on the Seminole?

A. On the port side in the back, next to the bulkhead.

Q. In what sort of a place?

A. Well, it was about four and a half foot on the bottom, and it widened up over the engine—over the port engine, to about six or seven foot.

Q. That little space was right in the engineroom?

A. Yes, sir.

Q. But separated by walls; right?

A. Yes, sir; it sit out over about half of the generator motor.

Q. Now you have told us that there were valves in each of these feed lines beneath the traps. Were there any other valves in those feed lines between there and the carburetors?

A. No, sir.

Q. Were any valves back by the carburetors?

A. No, sir.

Q. Was there any connection between the bilge pump and the gasoline tanks, or the gasoline feed lines?

A. Bilge pump?

Q. Yes.

A. No, sir.

Q. Was there any method of pumping gasoline from the tanks of the Seminole into anything else, by means of a pump?

A. No, sir, not rigged up to do it.

Q. You mean you could have rigged it up?

A. Oh yes.

Q. Now what was the condition, from your observation, of the conduit in which the wires ran in the engineroom?

A. Well, they was all pretty well exposed, they looked good.

Q. Which was exposed?

A. Conduit.

Q. You could see the conduit?

A. Yes, sir.

Q. What was it made of?

A. That is below deck. Now I didn't see it on top of the deck.

Q. I am speaking, Rollie, about the conduit in the engineroom.

A. It was good in there.

Q. What was the condition of your carburetors in that last string?

A. Carburetors was in good shape.

Q. Did they leak?

A. No, sir.

Q. You have told us how you turned the engines off on that last occasion. From your experience with that boat, what gasoline would that leave in the carburetor end of the line?

A. It would leave a little, it would be, after you got below your jets, why it would leave a little in the bottom of your bowls.

Q. Would there be any gasoline in the carburetor?

A. Yes, a little bit.

Q. Was there any electric light in the space underneath the gasoline tanks?

A. Yes, sir.

Q. Where was that?

A. It was right in the middle of the space that was under there.

Q. What was that space used for?

A. That was used to store fittings—oil.

Q. How often did you go in there?

A. Quite often, if I wanted a fitting, or anything.

Q. Did you use that light?

A. Yes, sir.

Q. How was the light rigged up?

A. It was in a regular socket.

Q. How did the wires get to the socket?

A. They was run over there with regular box like thing, regular conduit arrangement.

Q. The wires were in the conduit up to the light socket?

A. Yes.

Q. In your experience, when you went under there, did you ever smell any gasoline under there?

A. No, sir.

Q. Did you ever see any gasoline leaks while you were under there?

A. Never did.

Q. Was it possible to use any part of the batteries while you were charging the other part?

A. No, sir. Do you mean, separate them?

Q. Yes.

A. No, sir, they was all—

Q. All in line?

A. In line.

Q. Now that spring, while you were in the boat, how many times did you take gasoline?

A. One time.

Q. Where was that?

A. Royal Palm Dock, here.

Q. Do you remember how much you took?

A. No, sir.

Q. Do you remember how—I didn't mean to interrupt you.

A. I might be mistaken as to that, because, I believe I took the gasoline to demonstrate it to a party, a time before.

Q. What do you mean by the time before?

A. Well, we was demonstrating it to a person that figured on buying it, and put some gas in then.

Q. This time you speak of, how much gasoline did you take?

A. I don't remember; I filled the tank right up to where the gauge read 2180 gallons.

Q. Filled them practically full?

A. Yes, sir.

Q. How were they when you left the Royal Palm Dock on the cruise?

A. They was full.

Q. Now on that cruise, what was that gasoline used for?

A. It was used for the guide boats and operation of the big boat.

Q. How many guide boats did you supply with gasoline from the Seminole?

A. Three.

Q. How was that done?

A. Through that can there, mostly.

Q. Filled the can?

A. Yes.

Q. Precisely where did you get the gasoline to fill that can?

A. Out of these two valves.

Q. Indicating Exhibit 18. What did you do with the can after you filled it?

Mr. Botts:

Excuse me, you call it the wrong Exhibit number. This is 13—no, this is 11.

Q. Just change it. What did you do with the can after you filled it?

A. Set it down under there under the bench.

Q. I mean after you filled the can, how did you get the gasoline to the small boats?

A. Well, out through the window, most of the time.

Q. The port window?

A. Yes, sir.

Q. Was there any other fitting on these valves, when you used the valves to fill the can?

A. Well, when the tank was pretty well full, we used a hose; but when they got down to level with the window, why you had to use cans to fill them.

Q. When you speak of using a hose, where did the hose run from, and where to?

A. Right out through the window.

Q. Directly from the outer valve, through the window, out into the small boats?

A. Yes, sir.

Mr. Underwood:

That is all.

Cross Examination.

By Mr. Matteson:

Q. Mr. Schlappi, I want to be sure I clearly understood you about that filling line. As I understand it, starting from the filling end, it came down through the deck in the vicinity of the after part of the engineroom, is that right?

A. Yes, sir.

Q. And on the port side?

A. On the port side.

Q. And then it stood about eighteen inches, did you say, above the deck?

A. Yes, sir.

Q. And then how far below the deck did it extend on the bottom side?

A. Well, I wouldn't be sure, maybe eight or ten inches. I am not sure of that.

Q. Well, I don't want anything exact, but I just want to get as clear a picture as I can. Your recollection is, about ten inches?

A. Yes, sir.

Q. Then I take it that where it came down through the deck, was that in the room—within the engineroom?

A. Yes, sir.

Q. At ten inches below the deck, it turned at right angles and ran forward, is that right?

A. Yes, sir.

Q. That would be along the port side of the engine?

A. Just about over the generator motor.

Q. Well, the generator motor would be about the middle of this room, athwartships?

A. No, sir.

Q. What is that?

A. On the side of the boat.

Q. Well, I know, but the room was on the side of the boat, wasn't it?

A. Yes, sir.

Q. And the room came from the side of the boat, and part way over the port engine?

A. Yes, sir.

Q. What I was asking was, whether the filling pipe came down about the middle of that room.

A. Just about.

Q. Just about? And then ran forward through that room?

A. Yes, sir.

Q. And through the forward wall of that room?

A. No, it didn't go through the bedroom or living quarters at all. It started right at the living quarters.

Q. Started right at them; so the filling pipe would come down just forward of the forward end of that room, is that right?

A. Yes, sir.

Q. And then it ran from there to the forward bulkhead of the engine room?

A. Yes, sir.

Q. How long would that piece of pipe be?

A. I wouldn't say over eight feet.

Q. It was two inch pipe?

A. Yes, sir.

Q. Now was it one piece of pipe from the point where it began, eighteen inches above the deck, down to the point where it made the right angled turn?

A. Yes, sir.

Q. And how was that turn made? What was the nature of the connection there?

A. Elbow.

Q. What kind of an elbow?

A. A regular two inch brass elbow.

Q. Threaded connections on both ends?

A. Yes, sir.

Q. Where was this leak that you discovered during the trip?

A. Just about the middle of the pipe, in the union.

Q. There was a union in the middle of the pipe?

A. Yes, sir.

Q. The pipe was in two parts, and joined together in the middle with a union?

A. Yes, sir.

Q. So instead of being one piece eight feet long, it would be two pieces four feet long, or approximately that?

A. Yes, sir.

Q. Joined with a union?

A. Somewhere about that.

Q. Was there anything supporting that pipe, between the elbow and the point where it joined on the filling manifold?

A. There was a strap—I don't know whether it was on the front side of the union or on the back side; a regular strap come down from the girder, supporting it.

Q. There was a strap supporting it?

A. Yes, sir.

Q. By a strap, you mean a piece of iron?

A. Bolted to the girder. You see the top of the engine house is iron.

Q. Then wrapped around the pipe, and fastened?

A. Yes, sir.

Q. —back to the principal part?

A. Yes, sir.

Q. What kind of a union was this?

A. A ground-seat union, two inch brass.

Q. It was a good union, was it?

A. Yes, sir.

Q. Well now, tell me how soon after you started to fill, did that leak appear there?

A. It started pretty quick.

Q. Well, I understand now that you say you took gasoline two different times.

A. Yes, sir.

Q. The time you filled up the tank, was that the time, just before you started on the trip to the Keys?

A. I filled them up then.

Q. How much did you put in at that time?

A. I don't remember the amount.

Q. Well now there was a previous time when you had put in gasoline in the tanks, wasn't there?

A. Yes, sir.

Q. Did you fill the tanks up at that time?

A No, sir.

Q. How much gasoline did you have after you finished that first time?

A. Well, I don't remember.

Q. Were the tanks half full or quarter full? Have you any idea?

A. No, sir, they wasn't half full.

Q. Somewhere between a quarter and a half, would you say? Is that as near as you can come to it?

A. I would say, a quarter.

Q. Now tell me about discovering the leak; how did you discover that?

A. Well, I went in there to adjust the valves, so as to equalize the tanks, see, and it was dripping down.

Q. From the union?

A. Yes, sir, just a drip.

Q. Steady drip?

A. Yes.

Q. And you fixed that by tightening the union, is that right?

A. Yes, sir.

Q. You say it hadn't leaked before?

A. No, sir. Well, it hadn't leaked the year previous to that.

Q. It did leak the first time you filled it in '35?

A. Yes, sir.

Q. Is that right. Let me get this straight; was this leak discovered the first time you pit in gasoline, or the second time?

A. The first time.

Q. The time you put in the smaller quantity?

A. Yes, sir.

Q. I understood you, in answer to questions before, to say you went ahead and filled the tanks up after the leak was tightened; does that refresh your recollection on that?

A. I went ahead and finished putting in gas.

Q. Well, wasn't it the time you filled them up? I just want to get your recollection.

A. No, I am not sure whether it was that time or the time before.

Q. When you think of it now you are not certain about it; is that it?

A. Sir?

Q. As you think of it now, you are not certain of which time?

A. I won't say for sure; it is too long to remember that.

Q. Well, how do you account for the union springing a leak?

A. I don't know, not unless it was kind of a vibration from the deck or something, might have caused it. They will do that, but very little. It was a brass union with clean thread, anyhow.

Q. You say vibration does sometimes cause things like that to happen?

A. Yes, it would.

Q. Do you remember how many turns you took to tighten the union?

A. It didn't take a turn, even; just held one side of the union with one wrench, and put it on the nut and pulled down on it.

Q. Did you take half a turn?

A. Just about; not over half turn; between a quarter and a half.

Q. What did you take the turn out on?

A. On the nut.

Q. On the nut of the union?

A. Yes, sir.

Q. Now the switchboard, Mr. Schlappi, do you suppose you could draw a diagram of the switchboard for us, to show the location of the different switches on it?

A. I am a very poor draftsman.

Q. Well how big was the switchboard?

A. Oh about like that.

Q. You are measuring from your hand to the other end of the table?

A. Yes, sir.

Q. That would be close to four feet, wouldn't it?

A. No, sir; about four feet wide; it wasn't quite as wide as that.

Q. That distance you estimate about four feet, is the horizontal width, is that right?

A. No, sir, that is the vertical.

Q. That is the vertical dimension?

A. Yes, sir.

Q. Up and down?

A. Yes, sir.

Q. And how wide was it?

A. About three feet.

Q. About four feet up and down and three feet across?

A. Three and a half to four feet up and down, and three foot across, would make it pretty close.

Q. Well now, on this switchboard, suppose we draw on here the shape; I will make it a little longer this way. Would that be approximately the shape of it?

A. Yes, sir.

Mr. Botts:

Suppose you write the measurements in there; write top and bottom on there.

Q. I will put top up at this end, is that right?

A. Yes.

Q. And bottom at this end. And then we will say three and a half feet across?

A. Three feet tall.

Q. Three feet across, I will write three feet, giving the dimensions that way; and three and a half to four—was that what you said?

A. Yes, sir.

Q. Three and a half to four feet in the other direction. Now can you place in the corner where you said was the main switch?

A. Right in this corner, right there.

Q. Did that move up and down or horizontally?

A. It moved up and down.

Q. Up and down; how far up from the bottom would it be,—I mean the central poles.

A. That would be six inches from the bottom.

Mr. Underwood:

Let the witness do the marking of the paper.

Q. See if you can mark on that.

A. Something about in here.

Q. Now you have drawn two parallel lines to indicate the switch.

A. It was a double knife switch.

Q. Double knife switch. Now which is the hinged end of the two blades?

A. This is the hinged end here.

Mr. Underwood:

Indicating the bottom—

Q. Let's just make a big dot there.

Mr. Botts:

The dots indicate the hinged end?

A. Yes, sir.

Mr. Underwood:

May we draw a line here and indicate that main switch. (Drawing arrow line to indicate.)

Q. Is that a double throw switch or is it only an open and closed position?

A. It is open and closed position.

Q. So the hinges are at the bottom?

A. Yes, sir.

Q. And the contact points are at the top, is that right?

A. Yes, sir.

Q. And you say the length of the points are at the top, is that right?

A. Yes, sir.

Q. And you say the length of the blades was about six inches? Did I understand you right?

A. No, they was about—I said they was about six inches from the bottom.

Q. How long were the blades?

A. About four.

Q. About four inches?

A. Three and a half or four.

Q. Now where was the charge and discharge switch located?

A. Set right in here. (Drawing). Right in the center of the board.

Q. That was a double throw switch, wasn't it?

A. Double throw; two to your contact, and two over here; and here is your hinge of the switch there.

Q. You might make a little dot there. Now in which position have you indicated the switch?

Mr. Botts:

Excuse me, let's get these points identified. This is in a closed position, one way, and over there would be a closed position the other. Suppose you get some identification points there.

Mr. Matteson:

That is what I am going to ask now.

Q. Have you indicated the switch as being in the discharge position or the charge position?

A. That is in the charge position, I am almost sure; I am not too sure; that is in the forward position.

Q. And if the switch were thrown over to make contact with the points to the left, it would then be what?

A. Discharge.

Q. Is that what you had in mind?

Mr. Botts:

Yes. Suppose you make an H at the point where the hinge of the switch was; and then put C and C for the contact points of the switch.

Mr. Underwood:

We understand that. Would you rather have the witness do it? It doesn't make any difference. * * * Put an H over the hinges, C over the contact points to the charging end; and a D over the contact point at the discharge end.

(Thereupon the hearing was recessed to be resumed at 2:15 o'clock p. m. of the same day.)

Miami, Florida, 2:15 P. M., May 15, 1939.

Afternoon Session.

The Court:

You may proceed.

2219 Thereupon: ROLAND A. SCHLAPPI a witness produced in behalf of the respondent Phipps, resumed the stand and was examined and testified further as follows:

Cross Examination (Cont'd.)

By Mr. Matteson:

Q. Now, Mr. Schlappi, we have two switches on this diagram of the switchboard in the engineroom. Before we leave this charge and discharge switch I wonder if we can indicate that in some way. Suppose you draw a small box around it in some way.

A. (Witness complies.)

Q. I have drawn an oblong line around the marks that you have made here and an arrow from it to the words "charge and discharge switch"; is that right?

A. Yes, sir.

Q. What other switches were there on this switchboard?

A. There was a group of switches up on top here, all the way across the board.

Q. Indicating above the charge and discharge switch?

A. Yes.

Q. How many were there of those switches?

A. I don't exactly remember.

Q. Five or six or can you give us any idea?

A. Between ten and a dozen, to all of the quarters in the boat.

Q. Were they in a single line across the top?

A. Double line; here to here; they were in a straight line but they were separated right in the center.

Q. There was a series of them, one above the over, at each side of the switchboard, is that right?

A. Yes.

Q. About how many on each of these sides?

A. I imagine there were five or six on each side; it was the same number of on side.

Q. How big were those switches?

A. Just small double knife-switches, about two and a half or two inches high.

Q. Did they come down on each side of the charge and discharge switch or were they all above the level?

A. They were all above the level.

Q. The way we have this spaced here (referring to diagram) it would not look to me that there was room for that many switches.

A. It may be a little bit high here, but there was room for them to come right across like that (pointing) up here, way up here to the places you wanted lighted; the names of the quarters was up here, the places you wanted lighted.

Q. Over this switchboard was a label?

A. Yes; the label was all in one panel, and there was stamped on the panel "searchlight, engineroom, boss' room", and things like that. For all the staterooms there was a switch for each one.

Q. A switch for each stateroom?

A. Yes.

Q. Now you have drawn two horizontal lines there. Is each one of these supposed to represent one switch?

A. No, sir; all of those switches came in here (indicating) just like that, and set right close together. See? They were just about one inch apart; just small switches.

Q. What do you call the piece going across horizontally?

A. That is just the line that the switches was in.

Q. Was each switch entirely separate from the other one?

A. Yes, they were insulated separate.

Q. There wasn't any electrical connection between them at all?

A. The ground on the inside of the board was on each one, and they naturally would be to save wiring.

Q. Then this horizontal line that you have down here does not indicate anything except the location?

A. Just the location.

Q. Do you remember the locations of any switches for any particular parts of the boat?

A. No, I don't remember just the locations. I know the searchlight switch was on this side.

Q. Indicating the left side?

A. Yes; it may have been in the middle or off to one side.

Mr. Botts:

May I suggest for the record that we let each of these lines indicate the several switches or something of that kind?

Mr. Matteson:

I will draw an arrow pointing to each of these horizontal lines. I will say "line of separate switches".

A. They just run in a straight line, but they were separated here in the middle a little bit.

Q. How far was the charge and discharge switch from the top of the panel?

A. Just about pretty near to the middle of the board, but not quite; that could have been a little bit lower, but it was pretty close right up there (indicating on diagram).

Mr. Underwood:

I take it that there is no intention to draw this to scale?

Mr. Matteson:

No, sir; it is just a representation.

Q. In other words, we have that charge and discharge switch a little bit too high?

A. Yes, sir.

Q. It was nearer the middle of the board?

A. Yes.

Q. Slightly above the middle?

A. There was a circuit-breaker down here and that would about equalize the distance from the center of the board for them two.

Q. So that the charge and discharge switch, plus the circuit-breaker, were just about the center of the board?

A. Yes, sir.

Q. Was that the way it was?

A. Yes.

Q. What was this circuit breaker?

A. It was there in case your generator stopped; it protected your current and there would be no short or anything.

Q. Was that a sort of automatic switch?

A. Yes, sir.

Q. What other switches were there on the board?

A. They had a switch similar to this on the—

Q. Similar to the main switch?

A. Yes; about the same location; that generator switch was just about the same size.

Q. That is the generator switch?

A. Yes, sir.

Q. I will draw—first I will write "generator switch" with an arrow pointing to what you have just drawn. Were there any other switches on the board?

A. Yes. There was the Frigidaire switch in the center; that had a sort of knife-switch, and then the sanitation and fresh water pump. That was right down at the bottom of the board and the switch for the frigidaire was in the middle.

Q. Will you draw those in for us?

A. Yes. This is a single-throw knife-switch about here, and here is your frigidaire switch, and you pull that right straight out, shove it out.

Q. That is the frigidaire switch?

A. Yes. These are regular button switches here that you turn on and off; shut them off one way and on the other.

Q. Those are represented by the little circle?

A. Yes; one was for salt water pump and the other was fresh water.

Q. Which was which; do you remember?

A. I think this was the salt water pump on the right-hand side.

Q. Is that (pointing) the salt water pump?

A. Yes.

Q. And the other was the fresh water pump?

A. Yes, sir.

Q. I will draw an arrow there and write "fresh water". Do we have all the switches on the board now?

A. No, sir.

Q. All right.

A. The circuit breaker comes right here about like that.

Mr. Botts:

Mark that "circuit breaker".

Mr. Underwood:

You can write that right inside there.

Q. "Circuit breaker"; is that right?

A. Yes. Here is a switch on this board for your auxiliary and small emergency generator, and this is a double-throw right here (indicating).

Q. Now you have indicated here (I will draw a box around it as before) the auxiliary generator switch, is that right?

A. Yes, sir.

Q. That had charge and discharge ends the same as the main charge and discharge switch?

A. Yes, sir.

Q. Did the ends correspond with the charge on the same end as the other one?

A. I don't know; I don't remember that. This is a double throw switch; it didn't have any charge or discharge on it. You used this same switch for that, after you pulled this generator switch off, and you used this switch here to throw your circuit in there to the small generator; that is the way it was.

Q. Why did you have to have two ends to it?

A. They were just on there; I imagine that's the way it was made up. There was another switch in there to use for starting this generator motor over here at the—

Q. Where was that?

A. That sat right up in here at this switch. I don't remember whether they laid in a line at the top of each other; I think they laid in a line to each other on the top. That switch should be here and one here (indicating).

Q. What were these switches?

A. One of them was to start this big generator.

Q. And the other?

A. Was to throw your circuit further on this generator up to this switch.

Q. Did you tell us about one additional switch or two?

A. One.

Q. And that was for starting the auxiliary generator?

A. Yes.

Mr. Underwood:

Auxiliary or main?

The Witness:

Main.

Q. For starting the main generator?

A. Yes.

Q. And that was just to the right of the auxiliary generator switch?

A. Yes, sir.

Q. Can you indicate that there?

A. Yes, if I can rub this out.

Q. You mean the drawing you made of the auxiliary generator switch?

A. Yes.

Q. Yes; you can change it any way you like?

A. (Witness indicates on drawing.)

Q. I will rub this out a little better for you.

A. (Witness indicates on drawing). Here is a switch over here. They are both double throw switches but we never used to throw but one of them.

Q. Now this is the auxiliary generator switch (indicating)?

A. Yes, sir.

Q. Is that right?

Q. What is this (pointing)?

A. That is a switch used for starting the big generator.

Q. Shall we call that "generator starter"?

A. Yes.

Q. Now have we got it complete?

A. Well, we had volt meters and ammeters up across here.

Q. How many volt meters were up there; volt meters and ammeters?

A. Four.

Q. Were they equally spaced across the top?

A. They were spaced like that in a kind of circle like.

Q. You have drawn four circles across the top to indicate the four meters, is that right?

A. Yes, sir.

Q. Now is it fairly complete?

A. Yes. There is a bus bar in here; it sets right in there.

Q. What is a bus bar?

A. Why, that regulates the voltage.

Q. Where there is resistence?

A. Yes, sir.

Mr. Underwood:

Mark that.

Q. Does that represent it?

A. Yes, sir.

Q. I will mark that "bus bar".

A. That's kind of out of my—that is right to the best of my memory.

Q. Well, we won't hold you to exactness on it?

A. It may be above there.

Q. You have indicated it at the side of the charge and discharge switch, but you say it may have been above it, is that right?

A. Yes.

The Court:

Put a question mark at the end of it.

Mr. Underwood:

Why not write across the top there "ammeters and volt meters" and then draw a line from each of them?

Mr. Matteson:

All right.

Mr. Underwood:

I think it is understood that the doubt in the witness' mind is not as to whether there was a bus bar but the doubt is as to the location?

Mr. Botts:

That is correct.

A. There is a bus bar and rheostat on the side, too.

Q. What shape are they?

A. Round.

Q. Circular?

A. Yes, sir.

Q. Are they on the switchboard?

A. Yes, sir.

Q. Are you drawing it there?

A. That slipped my memory; it was a long time ago, but it was here on this side of the board.

Q. How big was that?

A. Just about four and a half inches in diameter.

Q. Round?

A. Yes.

Q. Just draw a circle about where you think it was and we will put a question mark after that, if you are not sure.

A. I am under the impression it was under this switch.

Q. Under which switch?

A. Under this switch or on the side; I think it was under this switch.

Mr. Botts:

As I understand, it was there at the righthand side of the circuit breaker or under the main generator switch?

A. This rheostat was on the righthand side.

Q. As you face the board?

A. Yes. You better put a question mark after that too.

Q. We will mark that "rheostat".

Mr. Botts:

Put a question mark there with reference to the location and not as to the existence of the rheostat.

Q. Then there was a light at the upper lefthand corner of the board to throw light on the switchboard?

A. Yes. When you contact this switch or that switch this light went on automatically; that is the only one we didn't have a switch on.

Q. When you contacted the main switch and the discharge switch the pilot light went on?

A. Yes; right here; it came out from the front of the board like that.

Q. I will draw an arrow pointing to that and say "Pilot light". Now is it complete?

A. Yes.

Q. According to the best of your recollection?

A. According to the best of my recollection?

Q. Yes.

A. Yes.

Q. How far was it from the floor up to the bottom of the switchboard?

A. Up to the bottom of the switchboard?

Q. Yes.

A. I would say about four feet; something like that.

Q. I will draw a line from the bottom of the switchboard downwards and another horizontal line which I will mark "floor". You said it was how many feet?

A. I will say four feet. You had to climb up on a ladder to get to these top switches.

Q. You mean the switches to the different quarters?

A. Yes, sir.

Q. What sort of a ladder did you have?

A. A regular steel ladder.

Q. Was that ladder fixed in place?

A. Yes, bolted in place.

Q. You would have to climb a portion of the way up that ladder to reach the room switches?

A. Yes, sir.

Mr. Matteson:

I offer this drawing in evidence.

The Court:

Let it be admitted.

(Thereupon the drawing above referred to was marked Libelants' Exhibit number 110.)

Q. I think you said something about wooden stringers under the floor of the engineroom. Will you explain to me what those were?

A. They was just on top of the girders to fasten the floor down; for the hatches to set on.

Q. By hatches you mean the floor boards?

A. Yes; they were made like regular hatches, you know, that lift up.

Q. The girders are a part of the steel structure of the hull?

A. Yes.

Q. Did they run fore or aft?

A. They run crossways.

Q. Athwartship?

A. Some of them run crossways and some run forward, too.

Q. Are they all the same height above the bottom of the vessel?

A. No. Those on top are the end members.

Q. These cross-members go above those that run fore and aft?

A. Yes, sir.

Q. So the wooden stringers would have to set on the cross-members?

A. Yes.

Q. What was the size of these wooden stringers?

A. I don't recollect what size they were.

Q. Were they 2 by 4, or bigger or smaller?

A. They were heavier than 2 by 4s.

Q. How were they fastened in place, do you know?

A. You know the engine-bed timbers was lengthways.

Q. I have not come to those yet. These fore and aft timbers were floor supports and they fastened on top of the cross-members—how were they fastened?

A. They were fastened on top like this.

Q. Now we are down to the wooden stringers; you said they went on top of the cross-stringers?

A. I don't know how they were fastened. I never taken any particular notice of it.

Q. You said the engine supports were wide?

A. Yes, sir.

Q. How big were they?

A. Well, they run from pretty good size, they were wide forward and they slanted down to the line of the shafts, and they must have been built up to about 6 x 12 in the front end and they tapered down.

Q. So that at the after end of the engines they would not be as thick as at the forward end, is that right?

A. Yes, sir.

Q. How many of them were there for each engine?

A. Two; one on each side.

Q. You mean one fore and aft support under each side of the motor, under each side of each motor?

A. Yes.

Q. When you left the ship in Ft. Lauderdale did you take up the floor boards or did you leave those in place?

A. I cleaned up all of the oil and stuff.

Q. They floor boards lifted up, they were removed, is that right?

A. Yes, I had to lift them to shut off the water valves.

Q. I was asking you when you left the boat whether they were in place?

A. Yes, they were in place.

Q. So you had to lift them up and you replaced them, is that right?

A. Yes.

Q. You spoke of a place which you said you could look through and look into the trays that the tanks sat in. Is that space shown on this exhibit, Respondents' Exhibit 4?

A. Is that tank 4?

Q. No; that is the number of the exhibit?

A. Yes, you could see right down in here in the tray; that tank has been raised up here. You see this valve came right above the center and floated up.

Q. As it was before the fire the valve would have been just nicely centered in the opening, is that right?

A. Yes, sir.

Q. So this picture indicates that the bottom of the tank has been raised up by the fire or explosion, is that right?

A. Well, the water might have floated it up.

Q. Or something?

A. Yes.

Q. Then if that tank were down in place so that the valve was centered under the hole, the bottom of the tank would be below the bottom of the hole, would it not?

A. Yes.

Q. Do you recognize this picture as a picture of the valve of number 1 tank, that is, the port tank, as it was after the fire?

A. Yes; it looks very much like it. There is the shelf.

Q. What is this bracket that appears to the left?

A. That is what that bilge pump sat on.

Q. That was on the port side of the bulkhead right next to the outlet, is that right?

A. Yes.

Q. And that same bracket is shown in this other photograph, Exhibit 9, just to the left of the mark "number 1", is it not?

A. Yes, sir.

Q. The arrow from number 1 points to the opening through which the valve to the number 1 or port tank came, is that right?

A. Yes, sir.

Q. And that shows the entire bracket?

A. Yes, sir.

Q. Towards the starboard side from the one we have been talking about; were these the two brackets that supported the shelf?

A. Yes.

Q. Over at the starboard side in this same picture

A. Yes.

Q. And the bilge pump was on that shelf?

A. Yes.

Q. Over at the starboard side in this same picture there are a couple of shelves or brackets, or what is left of them, sticking out. Were those the shelves that the batteries were on?

A. Those were the battery shelves, yes.

Q. What is this that is apparently under the batteries?

A. That is the fresh and salt water sanitary pumps.

Q. Those were underneath the shelves where the batteries were?

A. Yes.

Mr. Botts:

Suppose you mark those on that picture?

A. I don't know whether that is true or not, but that is my recollection. This is the salt water pump here. I can see it good now, and the fresh water pump sat right here.

Q. Towards the starboard side?

A. Yes.

Q. I will mark that "salt water pump". The arrow now points to the salt water pump, is that right?

A. Yes, sir.

Q. And the fresh water pump was toward the starboard side from that?

A. Yes, sir; sitting right in a line with it.

Q. As this picture is taken it would be behind the salt water pump?

A. Yes, sir.

Q. This dark spot on the picture indicated by an arrow and the line "A", is that the opening into the space under the tanks?

A. Yes, sir.

Q. How big was that opening?

A. I could crawl through it pretty easy.

Q. How big was it?

A. I would say between 18 and 20 inches.

Q. Square?

A. Yes, sir.

Q. Now between the shelf that was on these brackets and the shelves that held the batteries, did I understand there was another table or desk there?

A. There was a regular desk there.

Q. What did that consist of?

A. It consisted of a table and a slate to write on.

Q. I am trying to get a picture of the desk; was it flat like a table?

A. No, it was on a slant.

Q. On a slant?

A. Yes, sir.

Q. How big was it; how big was the top?

A. Just about two feet square.

Q. How high was it above the floor?

A. Just about like this.

Mr. Underwood:

Indicating a little above your belt, three and a half to four feet?

A. Yes, sir.

Q. Outside of the top of it it was like a shelf; what else was there to it?

A. Nothing but a drawer underneath.

Q. Then did it have legs?

A. No, it was built right straight from the floor.

Q. The front of it was solid?

A. No, the sides of it was solid; it was built right straight up.

Q. That is, the sides were?

A. It was full-sized sides.

Q. The sides were as wide as the table was deep, is that it?

A. Yes, sir.

Q. And they were solid from the floor right up to the shelf?

A. Yes, sir.

Q. You say this drain line that came over from the starboard side was supported where it passed through holes in these sides?

A. Yes, sir; came right to this side over here; right through this side.

Q. Then the drain valves would be between the shelf on which the bilge pump rested and the port side of the desk, is that right?

A. Yes, that is right.

Q. How much space was there between that shelf and the port side of the desk?

A. Well, there wasn't too much space; I would say a foot.

Q. About one foot between them?

A. Yes.

Q. Room enough for these gasoline cans to go in between them?

A. It was so much higher that you don't or didn't have to bother about that; you see this shelf was higher than the desk, too; this drain was below the top of the shelf.

Q. It was below the top of the shelf on which the bilge pump stood, is that right?

A. Yes, sir.

Q. So when you put the cans under the valves to draw off some gasoline, it could go in under the edge of that shelf?

A. Yes.

Q. Directly over this opening through this bulkhead through which you crawled to get under the tanks, I notice some bolts in that plate; what was fastened on the bolt there, do you recall?

A. The ship's clock was up there; that was right over the desk; that is where it was, too.

Q. These four bolts that you see here, are they what held the ship's clock in place?

A. Well, it was on a big mahogany panel.

Q. These four bolts are what held the panel?

A. Yes.

Q. What is this motor that appears in this picture, Exhibit 9, which appears to be more or less under the desk on which the bilge pump sat?

A. That is the auxiliary motor setting under there.

Q. That is the auxiliary generator?

A. Yes, sir.

Q. We noted in this picture the round opening through which the outlet valve of the number 1 tank came. Can you see us here also the other openings indicated by the numbers 2 and 3?

A. Yes, sir.

Q. Are those openings for the number 2 and number 3 tanks?

A. I can see that one all right; those must be back in that other "slip".

Q. It is in the shadow there?

A. Right.

Q. And the forward one would be over in the shadow at the right of the picture where nothing shows clearly, is that right?

A. Yes, sir.

Q. Now turning to Libelants' Exhibit 6, this shows the tops of the tanks, does it not?

A. Yes, sir.

Q. And I see that they come up pretty close to the top of the bulkhead around that part (indicating)?

A. Yes, sir.

Q. What was right over the top of those tanks; was the floor of the deck above pretty close to the tops of the tanks?

A. There was pretty heavy truss work overhead for lifting the hatches and stuff, and it run the full length of the engineroom.

Q. What space in the ship was over this tank compartment, do you know?

A. Well, there was a steel passageway bolted right down—

Q. I don't quite follow you on that. There was a steel plate all over the top of the engineroom?

A. Yes, sir.

Q. Did that cover the tank compartment, too?

A. Yes.

Q. So these tanks as shown in this picture came up within a few inches of the steel ceiling that was over the two compartments, is that right?

A. Well, that truss work I believe that came over—

Q. What do you mean by truss work?

A. To hold up the steel plates that go on top.

Q. Sort of members to hold up the steel plate?

A. Yes.

Q. In this picture, Exhibit 9, the vent line is indicated by this arrow with the words "Vent Line"?

A. Yes.

Q. And this shows that the vent line out of the middle of the top of each tank, and that the line then led aft and joined a common line that ran over to the port side of the ship, is that right?

A. Yes, sir.

Q. And that vent line was a half inch line?

A. Yes, sir.

(Recess.)

Q. I show you this picture, and ask you if you recognize that as being a picture of the wreckage of the forward part of the Seminole, from the tank space, looking forward.

A. Yes, sir; the water tank is here.

Q. That shows the water tanks under the floor on the starboard side?

A. Yes, sir.

Q. In this picture, can you show us where that athwartships bulkhead was that you said separated the bilge from the forward part?

A. Here it is right in there; in behind this water tank here. Just back of this water tank about two foot.

Q. I will draw an arrow indicating water tanks; and the after end of this water tank comes almost to the bottom of the picture, does it?

A. Yes.

Q. So that the bulkhead that you speak of would be just aft of that?

A. Yes, sir.

Q. And were there other tanks on the port side of the ship?

A. Water tanks, yes, sir.

Q. Water tanks on the port side of the ship, opposite this one that I have marked?

A. Yes, sir.

Q. And there was a space between the water tanks, running forward and aft?

A. There was a big tank sitting there, too.

Q. A big tank in there, too?

A. Yes.

Q. Well, can you show us in this picture approximately where that hatch was that you said you lifted up to get down between the tanks?

A. The hatch was sitting right along in here, about the edge of these tanks.

Q. That would be just at the forward end of—

A. Of these tanks.

Q. —of the tanks on the starboard side, right about there?

A. Yes, sir; that hatch was right there.

Q. Right where?

A. Right there.

Q. Well, will you put your pencil down on the picture so I will see where you are pointing?

A. Right there is the site of it.

Q. Right there? (Writing on Exhibit with pen.)

A. Yes, sir.

Q. I draw a second line, with an arrow, and the word, hatch, as I did the first time, and I will make a wavy arrow through the other line that I drew, to show that it is crossed out.

A. Yes, sir.

Q. And that is about where the hatch was?

A. Yes, sir.

Q. And that was forward of the bulkhead that separated the forward bilge space from the engineroom and tank bilge space, is that right.

A. You see when you come by this section here, you come back to the center of the boat again; your hall and staterooms on both sides. Here is where you went through there and turned to come up through the center of the boat.

Mr. Matteson:

I will ask to mark this photograph as an Exhibit.

Mr. Underwood:

When was it taken?

Mr. Matteson:

It was taken last year, sometime.

Mr. Underwood:

1938?

Mr. Matteson:

Yes.

Mr. Underwood:

I have no objection to it as portraying conditions when it was taken, in 1938, or the general structural conditions that time would not change.

(Said photograph was received in evidence and marked as Libelants' Exhibit number 111.)

Q. Here is another picture that was taken about the same time, and shows the upper part of the bulkhead supporting the engineroom from the tank compartment, does it not?

A. Yes, sir.

Q. And there we have the round holes at the top of the bulkhead. Are those the holes through which the filler pipes went?

A. Yes, sir.

Q. Would you point to me the holes through which the filler pipes went?

A. There is one that don't belong there. This one here is a filler pipe; this was a filler pipe, here.

Q. When you say there is a filler pipe, we will mark that with an X.

A. And this one, and that one.

Q. And this one?

A. Yes, sir.

Q. Do you see the fourth one?

A. No, sir, there is something hanging over it.

Q. It would be approximately here, is that right?

A. Yes, sir.

Q. I have made four X's to show the four filler pipe lines: Is that right?

A. Yes, sir.

Q. The one at the starboard side being covered up by some object?

A. Yes, sir. They come right straight and parallel from the bottom right on up; all of the holes in the center of the tanks, and in line.

Mr. Underwood:

This was taken in 1938.

Mr. Matteson:
Yes.

Mr. Underwood:
On the boat which was partially sunk, I take it?

Mr. Matteson:
That is correct.

Mr. Underwood:
I have no objection to it, on the same terms as the previous one.

(Said photograph was admitted in evidence and marked as Libelants' Exhibit number 112.)

Q. Now, Mr. Schlappi, picking up this exhibit number 2, have you been able to identify that yet?

A. I have not; not the way it is burned up.

Q. Of course it has been apparently deformed by being through the fire.

A. Yes, sir.

Q. This valve that is on it, was that similar to the valves that were on the tanks,—outlet valves?

A. That is the same kind of valve, all right.

Q. Same kind of a valve as shown in Libelants' Exhibit 4, is that right?

A. Yes, sir.

Q. Now these valves came out through the holes in the bulkhead, and then they were joined together by one long combination of parts, is that right?

A. Yes, sir.

Q. Could it be that when this was straightened out, it was the connection on one of the tanks, and a combination of pieces of pipe which was part of the manifold line? You would have to bend this piece around, I assume, where it has apparently been bent out of shape.

A. This has been made up—

Q. How is that?

A. Is that just as it come out of the fire?

Q. That is what the witnesses have testified. Is that the kind of pipe that was used to make up the manifold line?

A. Yes, sir, the same sized pipe.

Q. Same type of connections?

A. Yes, sir.

Q. And the same type of valve?

A. Same type of valve.

Q. Did you use that type of pipe for anything else in the engineroom except the gasoline feed line and connections?

A. I had a primer rigged up to the bilge pump and the salt water tank, of that size pipe; but I don't remember whether it was brass or galvanized iron.

Q. Well, I take it that, except for its deformity, this could be a part of the manifold line?

A. It looks like some of it.

Q. Now I take it that this exhibit number 17, you do recognize?

A. Yes, sir; that there was on the port motor.

Q. Now beginning up here at this connection, which is at the upper part of the trap, coming out at an angle here, what did that fasten to?

A. Back to your main feed line.

Q. To the main feed line?

A. Yes, sir.

Q. Would there be a T in the main feed line, and then a nipple to connect with this union outside the trap?

A. No, sir.

Q. What?

A. I swear I don't remember.

Q. Was this underneath the desk?

A. Yes.

Q. So that you wouldn't see it very readily, very often?

A. Well, if it wasn't underneath the desk, it was underneath the end of the bench.

Q. Underneath the end of the bench?

A. Yes, sir.

Q. So you can't recall just how it was connected up?

A. No, sir. It would have to made up with unions to make up the pipe.

Q. Well now, you are speaking of the manifold line and all the way across?

A. Yes, sir.

Q. You say you would have to have a union in each series of pipe connections?

A. Yes, sir.

Q. Between these two tanks?

A. Yes, sir.

Q. But now as I understand it, this contrivance that I hold in my hand was hitched into the manifold line somewhere?

A. Yes, sir.

Q. Well, what I am trying to get at is, what it was hitched into; and I asked you if there was a connection in the manifold line with a nipple connecting with this union on the strainer.

A. I don't remember just how that was.

Q. You don't remember how that was? This short connection on the strainer, is the part that was connected to the manifold line in some way, is that right?

A. If it was connected up right, it would be.

Q. Well, coming out of the opposite side, and fastened lower on the strainer, is another series of connections. Now what did they lead to?

A. This here looks like the main feed line pipe here.

Mr. Underwood:

Indicating the one that ends in a valve.

Mr. Matteson:
That is right.

Mr. Underwood:
The straight piece.

Q. You call this piece of pipe that comes out of the lower part of the strainer,—a short piece, threaded on both ends,—you call that a nipple?
A. Yes, sir.
Q. Then that comes into a union, doesn't it?
A. Yes, sir, a T.

Mr. Botts:
A-T. It is not a union.
Q. T connection. And then at right angles apparently running downward there is another nipple, union, nipple, and a valve?
A. And a valve.
Q. Is that right?
A. Yes, sir.
Q. A reducer and a valve, is that right?
A. A reducer, quarter to three eighths.
Q. Which end is the three eighths? Does it get bigger as it goes down, or smaller?
A. There is a reducer there too, isn't there?
Q. In the opposite end?

Mr. Underwood:
Indicating the open end of the valve?

Q. Indicating the open end of the valve, yes, sir; so there was a reducer on each end of this valve, is that right?
A. From the looks of it, there was. This is the port feed line here.

Q. I will come back to that in just a minute. This part that now terminates with a valve, you say that was the feed line to the port engine?

A. Yes, sir.

Q. Now then, going back to the connection again, we have a line of pipe coming out with another T and some more pipe. Now what did those connections lead to?

A. These here?

Q. Yes.

A. They led on across to the next tank, to another T, and the other drain trap on the starboard motor connection at that feed line,—at the number 2 tank, would be the way you have it.

Q. We started out with this contrivance by saying that the small connection on the port side of the strainer, connected to the manifold line; is that right?

A. Yes, sir.

Q. That is, to the manifold line connecting with all four tanks?

A. Yes, sir, with all four tanks.

Q. Then at the top of this strainer, if all the valves were open, you would have a supply of gasoline available from all four tanks, is that right?

A. Yes, sir.

Q. Now going back to this connection at the far end of the thing, what do you say that connected with?

A. It went to a fuel gauge that didn't register.

Q. Oh yes, I remember; that was the old fuel gauge that didn't register?

A. Yes.

Q. And then the pipe continues beyond that; where did that go?

A. It went over to the next drain, the next filter.

Q. Over to the next filter?

A. To the starboard motor.

Q. And what was the purpose of connecting two filters?

A. I don't know they figured it out, but that's the way they was.

Q. They connect at the upper half or the lower half of the filters?

A. I don't remember that.

Q. You just remember that it did connect with a filter on the other line?

A. It connected with a filter on the other line; there was two filters just alike, they both come inside of the filter. I imagine they figured one filter would catch it from either side.

Q. The bottom of this filter part of this combination Exhibit 17 was a threaded connection apparently?

A. It was the male end of a tube union in there.

Q. And where did that lead?

A. It led to the carburetor of the auxiliary motor.

Q. Then you mean that the little auxiliary motor was fed from the bottom of this filter, is that right?

A. Yes, sir.

Q. So that, as I understand the purpose of this filter, it is that water or impurities will collect in the bottom of the filter, is that right?

A. That is right.

Q. So in this case, instead of collecting in the bottom of the filter, they were immediately fed to the auxiliary, is that right?

A. You got it; that's the way it was, all right.

Q. And this filter was connected up with the other filter?

A. Yes, sir.

Q. So apparently it would take care of both of those, is that right?

A. Yes, sir.

Q. Now you say the other filter has a place at the bottom for some sort of connection too, did it not?

A. It had a plug in it.

Q. It had a plug in it; that is what this strainer contrivance is intended to have?

A. That is what it is supposed to be.

Q. That is what it is supposed to do is that right?

A. Yes, sir.

Q. Referring to the valve part of this assembly, again, there is a reducer on the pipe end of the valve,—pipe of the valve, and I think you said there are the remains of a reducer that has been broken off of the other, is that it?

A. It looks like a piece of it.

Q. Now the only purpose of using reducers at each end of this valve, would be to make use of a valve that wasn't the right size for the pipe line, is that right?

A. Yes, sir.

Q. I think that you said that it was necessary to prime the engines when you started them?

A. Yes, sir.

Q. Why is that?

A. Well, you use so much air, and such a long ways from the carburetor through one of them,—your carburetor was installed right on the back of the motor and the manifold runs the full length, and it took a lot of air to get juice to them; and when you give three or four shots of air you wouldn't have much air left; that is the reason you prime them.

Q. You had air tanks in which you compressed air, and you started the motors by opening the valves so that the air was admitted to the cylinders and started the motor turning over, is that right?

A. Yes, sir; you had a cam shaft to open to the right position.

Q. And you say your air tanks were of such capacity that, to turn them over more than three or four times, you would run out of air; is that it?

A. Well, it would cut your air down pretty fast. You prime them, and use them not over two cylinders, why they would go.

Q. You prime them, they start right away, is that it?

A. Yes, right away; there is the idea.

Q. And that is the way you always started the motors?

A. That was the way I always started them.

Q. And you got the gasoline to prime the motors with, out of this drain valve?

A. Yes, sir.

Q. When you drew it out of the drain valve, what did you draw it into, when you used it for priming purposes?

A. A regular brass squirt can; hold about a quart, each one of them.

Q. You would unscrew the top of the can and hold the opening under the spigot or what do you call it?—under the valve?

A. I generally got it when they was filling the boat up; just stick the can right down in there.

Q. That is when you were drawing gasoline for the boats, in the big can?

A. Yes.

Q. Then you could fill your squirt can by immersing it in the can full of gasoline, is that right?

A. Yes, sir.

Q. So you kept a squirt can of gasoline available for priming, is that right?

A. You generally used just about a squirt can for each motor, to prime them.

Q. Well, in any event, that is what you did do?

A. Yes, sir.

Q. Where did you keep the squirt can when it wasn't in use?

A. I had a brass tray setting right on the desk.

Q. What other purposes did you use this gasoline drain valve for?

A. That is all, just to get gas.

Q. Well, to get gas for the fishing boat, and to get gas to prime the motors?

A. Yes, sir.

Q. Did you have occasion to get gas for any other purpose?

A. No, sir.

Q. On this trip that you took down to the Keys, the vouchers are here I believe, which show the amount of gasoline that you purchased. Do you recall that it was 1540 gallons at the time you started out? This voucher number 2929 of the Boulevard Mortgage Company, shows the payment for 1450 gallons of gasoline, charged on April 4th, and under it is invoice for Bay Supply Company, showing 1540 gallons of gasoline purchased on April 4th. Does that refresh your recollection about that. Is that approximately the amount that you got on April 4th when you started for the Keys?

A. Well, have they got one there for 500?

Q. Yes, we have another one here for 500. Here is one, an invoice dated February 27, for 500 gallons. Do you recall that?

A. Yes, sir, that's the first lot put in.

Q. 500 on February 27 was the first lot, and the 1540 on April 4th was the second lot, is that right?

A. Yes, sir.

Q. Do you recall going to Ft. Lauderdale for the Seminole about the 26th of February, was it—of 1935?

A. No, sir, it was the first of February.

Q. Are you sure about that?

A. I am pretty sure it was the first of February. That's a long time ago. It was in February, but just what date why I don't remember. I thought it was right around the first of the month, either the first of February or the first of March.

Q. I see by the bill of Captain Pilkington for storage on the Seminole for February 1935, that a full month's charge of $50 was made and paid. Does that bring to your mind whether or not it was near the end of February that you left Ft. Lauderdale?

A. Close to the first of March, then.

Q. Were you going to add something to that, Mr. Schlappi?

A. No, sir.

(Discussion between counsel.)

A. It was the first of March.

Q. I show you, Mr. Schlappi, this letter, which is marked as an exhibit,—Respondents' Exhibit F; copy of a letter to Captain Pilkington, authorizing him to turn the Seminole over to Willie Baker, and it is dated February 23, 1935. Does that bring anything to your mind about the date that you left there?

A. No, sir; I believe it is nearer the end of the month than that.

Q. Nearer to the end of the month than that?

A. Yes, sir.

Q. Sometime between February 23 and the end of the month, is that right?

A. Yes, sir.

Q. Now did you buy any gas at Ft. Lauderdale before you left for Ft. Lauderdale?

A. I got 5 gallons of fresh gas to prime her with.

Q. Five gallons?

A. To prime the engines with. The gas that was in the outfit wouldn't start.

Q. There was gas in her then, was there?

A. Yes, sir.

Q. And you got 5 gallons of fresh, to prime her with?

A. Yes, sir.

Q. And after you got started, you had enough gas to get to Miami?

A. Yes, sir.

Q. Do you remember how much gas showed in the tanks at that time? I mean when you got to Ft. Lauderdale and tried to start the engines?

A. When we left Ft. Lauderdale?

Q. Yes.

A. Right close to 300 gallon.

Q. That is when you left Ft. Lauderdale towards the end of February, 1935?

A. Yes, sir.

Q. Now, do you recall about this trip to the Keys? Was it February 4th,—I mean April 4th, that you started out on that trip?

A. It was right around there, close to that.

Q. It was April 4th that we just saw that you bought the 1500 gallons of gas.

A. We left at one o'clock in the night; whether it was the 4th—late at night.

Q. One o'clock that night, or one o'clock at night.

A. One o'clock in the morning.

Q. And was that the 5th of April, or can you tell us what date it was?

A. I can't remember. That is about four years.

Mr. Matteson:

If your Honor please, Mr. Underwood and I were trying to figure out the day that she left, and one of the exhibits, WW contains a bill of the Florida East Coast Hotel Company for storage of the Seminole at the Royal Palm Dock, which shows that she was charged for wharfage for April 1st to 5th, inclusive. So from that it would appear that she must have been there on April 5.

Mr. Underwood:

So it seems to me.

Q. Now, Mr. Schlappi, we have figured it out here, the Seminole must have left Miami the early morning of the 6th, and returned sometime on the 15th or 16th of April, 1935.

A. She left after midnight for Matecumbe.

Q. How long did it take her to get to Matecumbe, can you tell us?

A. Right around ten hours.

Q. And did you go right through to Matecumbe?

A. Yes, sir.

Q. How long did you stay at Matecumbe?

A. Why they picked up a party on the small boat and brought them out. We didn't stop at Matecumbe,—didn't go into dock at Matecumbe.

Q. A party came out on the small boat?

A. Yes, sir.

Q. Then how long did you stay there? Did you stay there any length of time, or go right on?

A. Just run down long enough for them to get aboard.

Q. And where did you proceed from there?

A. Down to Bahia Honda.

Q. And how long did it take you to get there?

A. Four and a half to five hours.

Q. And what did you do when you got there?

A. Come to anchor and laid three or four days there.

Q. And where did you go from there?

A. Went over through old Spanish channel to Harbor Key.

Q. How long did it take you to get there?

A. I am not sure of the time; it took quite some time.

Q. Well, about, not exactly necessarily.

A. We left about nine o'clock, and it was very close to three, as well as I can remember, when we got through there.

Q. About six hours?

A. Yes, sir.

Q. Is that coming towards Miami or going away?

A. That is going away.

Q. And where did you go from there?

A. We fished over there a day or two, and we come back to Bahia Honda.

Q. How long a trip is that?

A. About the same length of trip as the one going.

Q. About six hours?

A. Yes, sir.

Q. And then where did you go?

A. Started back towards Miami then.

Q. How long a trip is it back to Miami from there?

A. From Bahia Honda? About thirteen or fourteen or fifteen hours.

Q. What fish boats do you supply gas to?

A. To two small Prigg boats; a 200 Sterling petrel. We had too small Prigg boats, and then had this Clip with a 200 Petrel.

Q. It was the Clip that had the 200 engine in her?

A. Yes, sir.

Q. What kind of engines did the two Prigg boats have?

A. One of them had a model A Ford marine, converted; and the other had a Chrysler. The Chrysler run about 90 horse-power,—marine type.

Q. Now how much gasoline did you supply the Clip?

A. How much would we supply her?

Q. How much did you supply her, and when?

A. I don't believe we filled her over twice.

Q. And how much did you give her each time?

A. About 100 gallons, maybe a little more or less.

Q. And the Prigg boat with the Ford motor, how much gasoline did you give to her?

A. Put in 5 gallons every day.

Q. Five gallons every day?

A. Yes.

Q. And you were gone about ten days, is that right?

A. Yes, sir.

Q. Whose boat was that?

A. Belonged to Captain Baker.

Q. The Prigg boat with a Chrysler motor in her, how much gas did you give her?

A. About 10 gallons a day.

Q. And that was for about ten days?

A. Some days maybe 5; I believe you would be safe in saying 10 gallons a day.

Q. Ten gallons would cover it, is that right?

A. Yes, sir.

Q. From your information, how much gas did you use for your generators, a day?

A. Generator? It would run around,—that big generator run around six or seven gallons a day.

Q. And if you used the small one, you would be using a substitute for the big one, I take it?

A. I never used it.

Q. How long a trip is it from Miami to Ft. Lauderdale?

A. Not so long; but up the river, pretty near as long going up the river as it to Ft. Lauderdale.

Q. Is it a two hour trip, or a three hour trip?

A. For that boat? Pretty close to five hours.

Q. Is that all the way up to the yard?

A. Yes, sir.

Q. Some part of that I suppose you would be going at slow speed, is that right?

A. Yes, slow speed, and backing up, all kinds of work, getting up that river.

Q. You spoke about putting some gasoline in Captain Baker's boat at Miami. Have you included that in what you told us about giving her 5 gallons a day?

A. Why I put some in her at the dock.

Q. Put some in at the dock; how much?

A. I filled her up; I don't remember exactly.

Q. How many cans full of gas did you put in her?

A. I don't remember.

Q. His Prigg you said was the one with the Ford motor?

A. Yes, sir.

Q. How much do her tanks hold?

A. I didn't even know that.

Q. Did you put more than two cans in her at Miami?

A. Yes, put more than two cans in her.

Q. Three?

A. I don't know whether I put three or four.

Q. Three or four would cover it, is that right?

A. Yes, sir.

Q. And when I speak of cans, I am speaking of cans like this one here.

A. Yes, sir.

Q. They are 5 gallon cans, aren't they? Isn't that a 5 gallon can?

A. Yes, sir.

Q. You say that when you stopped for lunch at Ft. Lauderdale, you kept the engines running?

A. Yes, sir.

Q. Well you say you were low on gas then?

A. Yes, sir; I told the Captain, when he told me to come up for lunch, I said I better cut them down; but he says he could get aboard to us if she run out.

Q. You were taking a chance on running out of gas?

A. Yes, sir.

Q. Between there and the yard, is that right?

A. Yes, sir.

Q. That would have pretty inconvenient, wouldn't it, to run out of gas between there and the yard?

A. We had a small boat there, to get it with.

Q. I meant to ask you about this Exhibit 17; I think you said that the fixture in the bottom of the primer which led to the small auxiliary, was a copper tube pipe?

A. Yes, sir.

Q. And there was another feed line that was copper tubing, too, wasn't there?

A. The big generator.

Q. The big generator had a copper tube feed line, is that right?

A. Yes, sir.

Q. Did you ever use a hose for filling a boat alongside?

A. When the tank was fairly full.

Q. Did you ever hitch it up to the bilge pump?

A. No, sir.

Q. You said that you could do that?

A. I could have connected it up.

Q. You never did that yourself?

A. No, sir.

Q. There was no—was there any permanent connection between the feed line and the motor?

A. No, sir, there was no connection at all made for it.

Q. What sort of a hose did you use?

A. Through a regular garden hose.

Q. And that would screw right on it?

A. The three-quarters.

Q. —this valve that is marked Carne 125, just like you hitch a garden hose on the faucet at your home, is that right?

A. Yes, sir; rubber washer on it.

Q. I want to ask you about this room in the engineroom; the floor of the room was above the height of the main motors, is that right?—the room in the engineroom, too, that was built into the engineroom?

A. It was pretty near as high as this ceiling.

Q. The floor of the room was above the top of the motor, was it?

A. No, sir.

Q. Below the tops of the motors?

A. Below the base of the motors.

Q. It came all the way down, almost to the floor of the engineroom?

A. Yes, sir.

Q. It was almost as tall as the engineroom?

A. I don't understand just how you mean.

Q. How many steps did you have to go up from the engineroom floor, to get into that room?

A. To the engineer's room?

Q. The engineer's room, yes.

A. It was up pretty near even with the bench level,—the floor was.

Q. How much above the floor of the engineroom was that?

A. A good three and a half foot.

Q. And where was the door?

A. That was in the—right up against the skin of the boat, facing the bow of the boat.

Q. Was it in the forward end of the room?

A. Yes, sir.

Q. And at the side of the boat?

A. Yes, sir.

Q. Was there any other opening between the engineer's room and the engineroom, except the door?

A. That is all, and a window from outboard.

Q. And the window from outboard?

A. Yes, sir.

Q. Was that in the engineer's room?

A. One of them was.

Q. One of them was in the engineer's room, and one of them was outside of the engineer's room?

A. Yes, sir.

Q. The one that was outside of the engineer's room, led right into the engineroom itself?

A. Yes, sir.

Q. The other one just came into the engineer's room, is that right?

A. Yes, sir.

Q. And between the engineer's room and the engine room, there was just a door connecting the two; is that right?

A. Yes, sir.

Q. What was the first year that you worked on the Seminole? In 1933, did you say?

A. It was '30.

Q. 1930?

A. I am pretty sure it was.

Q. What month of the year was it?

A. August.

Q. Where was the Seminole at that time?

A. She was stored at Pilkington's.

Q. And how long did you work on her there?

A. We took her out, went down in her, took her down here to Miami and worked on her that night and had some of the staterooms changed over, and went to the Keys the next day.

Q. You say that was in August, 1930?

A. Yes, sir, I am pretty sure it was '30. It was in August, I know.

Q. Did Mr. Simmon have anything to do with the boat at that time?

A. No, sir, I never hear of him. I don't know.

Q. You never heard of Mr. Simmon, is that right? Never had anything to do with him?

A. No, sir.

Q. I want to get this straight. I hold in my hand the file of Pilkington bills for storage, and it appears a full month's storage was charged on the Seminole in August, 1930, and a full month in September, 1930; a full month in October, 1930.

A. It was in August that we was out.

Q. And for twenty days in November, 1930. Are you sure about your dates?

A. Yes, sir. It was in August.

Q. Mr. Underwood and I have been checking as to the times that she was out from Pilkington's yard, and in 1930 it appears that she didn't leave the yard until November 20; is that right?

Mr. Underwood:

That is according to my notes.

Q. And then she was out until April 20, '31?

Mr. Underwood:
That is right.

Q. And then she wasn't out again during '31, but she was out for a period beginning in March '32, and again a period in August '32. Now could it be August '32 you are talking about?

A. I must have lived two years too fast. It was in August, that is the only time I was on her, in August.

Mr. Underwood:
She wasn't out in August '33; she wasn't out in August '34; according to the bills.

Q. The only month that I can find that she was out in August, was in 1932.

Mr. Underwood:
That is according to my understanding too.

A. Well, that is the only time I was on her, was in August, that first time I was on her.

Q. That is the first time you were on her?

A. Yes, sir.

Q. Now according to my notes she wasn't out in '33, but she was out for a period in April '34. In April '34. Were you on her at that time?

A. She was carried to Palm Beach in '34.

Q. What is that?

A. She was carried up to Palm Beach in '34.

Q. Was that in April?

A. She was out until April, wasn't it?

Q. From sometime in March to sometime in April.

A. I didn't carry her up there that same trip; some fellow engineered it over here, and after they got up here why he left the boat and they come and got me.

Q. Here is a voucher that seems to show that you were paid in April, 1934 for a period from April 2nd to April 21; twenty-one days.

A. Yes, sir.

Q. And did you work during that period of twenty-one days, on the Seminole?

A. Yes, sir.

Q. And that was at Palm Beach?

A. That was Palm Beach.

Q. But somebody else brought her up to Palm Beach from Pilkington's yard that time, is that right?

A. Yes, sir.

Q. Well, was a trip made in her at that time?

A. Just brought her back to Ft. Lauderdale from Palm Beach.

Q. She just lay up there for that period and then was taken back, is that right?

A. Yes; outside of a couple of nights out on the Lake.

Q. Now the next time that she was out was in February, 1935, which was the last time she was out, that you have been telling us about; is that right?

A. Yes, sir.

Q. So that was three times that you worked on the Seminole, is that right?

A. Yes, sir.

Q. And when you left the Seminole, why did you lock the hatch?

A. Well, I generally locked it, I understood they give the keys to Mr. Pilkington; I never saw anything like that.

Q. You understood when you locked it that the keys were going to be given to Captain Pilkington, is that right?

A. Yes. Said to lock it up, and I don't know who give him the keys, I never saw it.

Q. Now was there a car that was expected to take you to Palm Beach from Pilkington's after you got through?

A. No, sir.

Q. You had to go by bus?

A. Mrs. Pilkington took Bryant and myself to Ft. Lauderdale and we caught the bus.

Q. What bus did you get?

A. The seven o'clock bus.

Q. One thing that you said that I didn't understand; you said one of the engines got weak on gas, going up to Ft. Lauderdale.

A. It did, on reverse; when we was making the last turn, it skipped two or three times.

Q. It didn't stop?

A. No, it just acted like a listing of the boat or something might have caused it.

Q. Well, I suppose there may have been water in the gasoline, might'nt it?

A. I never did have any water trouble with it, the time I was on it.

Q. I mean, assuming that it wasn't—that you hadn't had any previous experience with it; I mean, all you say was that the motor did some spitting, is that it?

A. Yes; as we was making the last cove there, right at the dock, you might say, and it cut me down slow, why she worked all right.

Q. Well, water in the gas does cause that spitting sometimes?

A. It does, I know.

Mr. Matteson:

That is all I have.

By Mr. Botts:

Captain, when you were running on this trip down to Matecumbe, and another trip to Mahia Honda and so on, did you run your motors wide open, or were you just running at a cruising speed?

A. Ran very good in deep water; a lot of times slowed down in shallow water, on account of you wouldn't hold

it down dragging a heavy boat like that. Generally ran about 3 to 5.

Q. You mean 3 to 5 revolutions?

A. Yes; 450 was maximum.

Q. And what the gasoline consumption of those two motors, per hour, can you tell us, running at the speed of about 3 to 5?

A. Well, I never have checked it. Right around 35 to 37 gallons an hour, for the generator and the two motors. I never did check the two motors alone; I didn't have no way, much.

Q. Referring, Captain, to Libelants' Exhibit 4, which shows the valve and pipe line coming out through a hole in the bulkhead; that pipe line that shows to be broken off, in that photograph, is the pipe line that went from, I believe you said, the number 1 tank, to the manifold; is that correct?

A. Yes, sir; that is the number 4 tank.

Q. Number 4 tank?

A. It is number 1 tank coming from the port side of the boat.

Q. Now this would be the number 4 tank, then?

A. Yes, sir.

Mr. Underwood:

He said number 1 tank coming from the port side.

Q. This is the tank that has been referred to as the number 1 tank, that is what I am getting at.

Mr. Underwood:

That is correct, I believe.

Q. Now if that valve was centered in this hole, then the rivets at the bottom of the tank, which appear through the hole, would have been below the level of the hole, would they not?

A. Yes, sir.

Q. Can you tell us how far it was from the line of the face of that bulkhead, back to the tank? Was it directly up against the tank?

A. It was fairly close, about an inch, right through where it come out at the widest place.

Q. Then a person looking through that opening, with the tank in normal position, really couldn't see any of that riveting, could they?

A. You could see just in front,—around the front part.

Q. Just a very few inches?

A. Yes.

Q. Then there was a metal pan of some kind under all of the tanks, as I understand it?

A. Yes.

Q. Do you know whether it was one pan under each tank, or one pan for all of them?

A. Two pans; two tanks set in one pan.

Q. Two tanks for each pan, and that was a metal pan of some sort?

A. Yes.

Q. What kind of a metal did you say it was?

A. 3/16's—

Q. 3/16's iron pan?

A. Yes.

Q. And how high were the edges of that pan—as it was turned over to make a pan shape, do you know?

A. About four to four and a half inches.

Q. This pan, as I understand it, rested on the support, and then inside the pan, as I understand it, there was some wooden—

A. Cushions for them to sit on.

Q. For the tanks to sit on. Well, then, the only point at which you could examine those tanks was through these little holes in the bulkhead, is that right?

A. Yes.

Q. And you couldn't see any part of the bottom of the tanks, could you?

A. No, sir.

Q. And a very few inches along close by the hole, of the riveted side of the tank; is that correct?

A. Just see around the edges.

Q. Now did I understand you correctly, that when the batteries were being charged, that you couldn't get lights in the staterooms or elsewhere in the boat? Is that correct?

A. I misunderstood you.

Q. That is what I wanted to get straight.

A. You could have, whenever you was charging, you could have your lights any where.

Q. Well, then, the lights would burn when the batteries were being charged?

A. Yes, sir.

Q. And it wasn't necessary for this charge and discharge switch to be turned over to the discharge side in order for them to get lights?

A. No; you had to throw it on the charge side to charge.

Q. Yes, I understand that; but you could get lights throughout the boat whether it was being charged or whether it was thrown over to the discharge side, is that right?

A. Sure.

Q. I thank you. Now you stated, I believe, that you had seen and had occasion to examine the switch arrangement on numerous other boats during the course of your experience; and that these switches were normally knife switches?

A. Yes, sir.

Q. And do you know whether or not these switch boards are normally in the enginerooms or elsewhere in the boat?

A. Most of them is in the engineroom; pretty nice boats, most of them have them.

Q. Now as I understood you, you stated that when this charge and discharge switch,—when it was thrown from the discharge position over towards the charge position, there would normally, or very often at least, be a spark or arc caused?

A. If you say, charging,—your generator was running. If your generator wasn't running, why you would put it over on the charge side, and there wouldn't be no spark.

Q. But if your generator was not running, and the switch was over on the discharge side, and you should open it, then there ordinarily would be a spark?

A. There would be an arc.

Q. I understood you to say that if the connections weren't perfect there might be an arc also when you pulled the switch, but not as light, is that right?

A. Not as heavy.

Q. Not as heavy; There might be an arc caused when you would either close or open the switch, is that right?

A. Yes, sir; you could throw the switch quick, you can't see it, it is so light.

Q. But if you would throw it in slow, it would be more apparent to the eye, is that the idea?

A. Yes, sir.

Q. The same thing would be true in closing this main switch, or opening that, would it not? That there might be an arc caused by—

A. If your switch wasn't on discharge it would be no spark.

Q. Suppose the charge and discharge switch was thrown over to discharge, and then your main switch was opened or closed, then there would be an arc there, would there not?

A. Not if you had the rest of your switches off. There is only one circuit, and that is on your pilot light. It will

make a little arc, but I never noticed much arc. Putting the switch in,—always taking it away, is what does it.

Q. There is a greater arc. However, if the switches were a little out of line, so that one contact reaches a little sooner, there would more likely be an arc than otherwise, would there not?

A. Yes.

Q. Now, Mr. Schlappi, I understood you to say that your normal method of stopping these motors was to turn off these various gasoline valves from the tanks, or manifold, is that right?

A. The feed valve.

Q. The feed valve?

A. On the feed line.

Q. As I understand it, referring to Libelants' Exhibit 17, that the valve here below the—

A. Trap.

Q. —and with the handle broken off, was one of the cut-off valves for your feed lines?

A. Yes, sir.

Q. And you would normally cut those valves off and leave the spark, or ignition on, and let the engine run until the gasoline was exhausted?

A. Yes, sir.

Q. The purpose of that being to do what?

A. On account of water,—the exhaust being under water so deep, and a kickback as you shut your switches, and you have a little carbon and a little heat, a lot of times that would kick back maybe three or four times; it would just pull the water right through your exhaust valve into your cylinder, if she does.

Q. You don't have any particular recollection at this time of how you actually shut them off at this time? You are merely testifying that that was your custom, and from that you meant that you did it the same way on this occasion, is that it?

A. That was my custom all the time.

Q. And you wouldn't say at this time that you have any recollection, one way or the other; you just think you did it, because you always did, is that right?

A. I did it.

Q. All right. Now in referring to this flow from the draw-off,—I believe you call it the draw-off pipe, that you saw when you were pumping out the Seminole, you said that what you saw flowing out was a mixture; is that right?

A. Yes, sir.

Q. Well now, it was a mxiture of what?

A. Water.

Q. And gasoline?

A. Water and old oil and stuff. I don't know whether there was any gas in it. It smelled like old, burned oil; or could have been some gas.

Q. I see.

A. Oil or gas will flow to the top of the surface of water.

Q. Now you have told us about four motors in the engineroom;—two main motors, the main generator motor and the auxiliary generator motor?

A. Yes, sir.

Q. Was there any other motors aboard the Seminole anywhere?

Mr. Underwood:

You mean electric?

Q. Electric, no; gasoline motors?

A. There was a winch motor.

Q. That was up forward?

A. Yes.

Q. Where did that motor get its gasoline supply?

A. From the tank in the bow of the boat.

Q. How large a tank was it, do you know?

A. Between 5 and 7 gallons.

Q. Just a small tank?

A. Yes, sir.

Q. How was that tank normally filled?

A. Through a three-quarter inch plug.

Q. What I am talking about is: did you normally fill these cans and carry them up there and pour it in there like you fill the fishing boats?

A. Yes, sir.

Q. I believe you said there was a kerosene tank aboard. Where was that kerosene tank?

A. I don't believe they asked me about that.

Q. I thought they asked you about that?

A. He didn't ask me about that but there was a kerosene tank aboard.

Q. Where was that located?

A. Up over the starboard motor, the main motor.

Q. How big a tank was that?

A. 55-gallon.

Q. Do you know whether that was full when you left Miami or not?

A. No, it wasn't full; that was used for cooking.

Q. How much kerosene did it have in there, do you know, when they left?

A. I don't remember.

Q. Did the kerosene from that tank flow by gravity to the galley for use in cooking, or was it drawn off and carried up?

A. You didn't have to carry it. They had a pressure tank back there for that.

Q. You filled up a can and carried it back to the galley as you needed it?

A. Yes, sir.

Q. Now you said that you examined the bilges, I believe, on your way up to Pilkington, or was that after you reached there?

A. I examined the bilges and was cleaning them out going up.

Q. Was there much water in the bilges?

A. No; just where the water pump would throw grease and stuff on them, and hit down there and make greasy spots.

Q. How about water; how much water?

A. There was no water to speak of. You could sit down in the bilges—

Mr. Underwood:

And not get wet?

A. Yes.

Q. Now referring to Libelants' Exhibit 17, this trap and the connections that fasten to it, do I understand that this trap was located above the engineroom floor and underneath this shelf that you mentioned?

A. Yes.

Q. How far was this trap above the engineroom floor?

A. It would be close to 18 inches.

Q. Then the broken off valve attached to it was also above the floor?

A. Yes, sir.

Q. The gasoline from that point, was it connected to the carburetors above or below the floor?

A. Beneath the floor.

Q. It ran down to—

A. Straight through the floor and then back the carburetor.

Q. What distance was it from the trap to the carburetors; how many feet of pipe was carried down underneath the floor that way?

A. Between 10 and 12 feet.

Q. Now that would include the piping for both motors or for just one?

A. Just one.

Q. Then for both motors there would be double that?

A. Yes.

Q. So there was something like 20 feet of the gasoline lines that were underneath the floor boards?

A. Yes.

Q. Now how large did you say this squirt can was?

A. Pretty close to a quart.

Q. You said it would take almost a can full to prime each of the engines?

A. Yes.

Q. When you were getting ready to start you would use one squirt can and then you would fill that can and use it on another?

A. No, I had two of them.

Q. You had two?

A. Yes.

Q. Now about this garden house that you have described as being used to take gasoline out of the tanks into the various fishing boats, you say that was screwed on to the bottom of this draw-off valve?

A. Yes, sir.

Q. You carried this hose out through the window, did you?

A. Yes.

Q. How high or what distance above or below the level of the window sill was the lower part of this draw-off valve or the connection?

A. I would say that draw-off valve was a good two and a half feet below the window sill; more than that maybe.

Q. At any rate, it was far enough below so that when this hose was hooked on there the hose would naturally go down in a curve and up?

A. Yes.

Q. So that from the lower part of the hose to where it went through the window sill was probably as much as three feet?

A. Yes. You couldn't use the hose when it got "half gone".

Q. Now then do you remember how many times you used this garden hose to fill up the boats when you were down on this trip?

A. No, I don't.

Q. When you would finish using the garden hose you would then disconnect the hose until you were ready to use it the next time, I take it?

A. They used it for washing the decks down, too.

Q. They used it for water then?

A. Yes.

Q. How would you drain the gasoline out of that hose when you had been running gasoline overboard?

A. Put it on a water spigot and ran it out.

Q. When you unscrewed it wouldn't there be some gas that drained back into the engineroom?

A. Just from the lower part——you see it ran right back into the can, and you lifted the hose up and run it overboard.

Q. You would either drain it back into the can or run it overboard, so there would be only a small quantity of gasoline that would drain into the engineroom, is that right?

A. Yes.

Mr. Botts:

I think that is all.

Re-Direct Examination.

By Mr. Underwood:

Q. What would you do with that gasoline that ran back—

A. Run it into the can.

Q. What did you do with it then?

A. Taken it up and put in the boat.

Q. Did it go into the bilges?

A. No, sir.

Mr. Underwood:
That is all.

Re-Cross Examination.

By Mr. Matteson:

Q. In this picture which has been marked Exhibit 4-B, do you see the drain line that these valves were attached to?

A. That's the drain pipe all right.

Q. You are satisfied now that this point I am pointing to is the drain pipe?

A. Yes, sir.

Q. I have drawn an arrow pointing to the pipe and at the end I have written "drain pipe"; is that right?

A. Yes.

Q. Do you also notice (when we were speaking of the section of the manifold line 0 that that seems to be in place there?

A. Yes.

Q. Do you recognize that?

A. Yes.

Q. That is it right there, isn't it?

A. Yes.

Q. Is that where the arrow is pointing to?

A. Yes.

Q. I will mark that "section of manifold line".

Mr. Underwood:
All right.

Q. All right, on this other photograph, Exhibit 4-A, do you see the drain line running across there?

A. Yes. This was taken a little closer.

Q. Taken closer to the line?

A. Yes. That looks like the feedline pipe here.

Q. Suppose we mark it on this picture, too.

A. That is it.

Q. This white one here—I will draw an arrow in this margin here—that is the drain line, is it?

A. Yes, sir.

Q. And this other one, which is not quite clear, that is a piece of the manifold line, is it?

A. Yes.

Q. I notice this bill of "Dade Supply" dated April 5, 1935, shows, in addition to the 1540 gallons of gasoline supplied to the Seminole, 83 gallons of gasoline charged to the "Seminole and owners". Do you know what boat that 83 gallons of gasoline was for?

A. It was all charged to the Seminole Boat Company.

Q. It says "charge to Seminole and owners".

A. I don't know, unless that filled the Clip up here at the dock before they left. I didn't have anything to do with filling of the Clip when she left the dock. I never got any little batches of gas line that.

Q. That wasn't for the Seminole?

A. No.

Mr. Underwood:

The voucher simply says "small boats".

Q. Just another thing: you worked on the Iolanthe at times?

A. Yes.

Q. Who employed you when you worked on the Iolanthe; who made the arrangements with you?

A. Mr. Riley?

Mr. Matteson:

That is all.

Re-Cross Examination.

By Mr. Botts:

Q. How did you start the motors for the generator; by this same "pressure or compressor arrangement"?

A. Started it with the battery juice.

Q. Did you have a starting motor?

A. Why, on the generator the—the generator had juice through it.

Q. It all acted as a starter?

A. Yes.

Q. In other words, when it was reversing it would act as a starter?

A. Yes, sir.

Q. You said these batteries were 100-cell batteries?

A. Yes.

Q. Was there more than one of them?

A. Yes; there was 100 cells.

Q. Yes but I thought you meant that each battery had 100 cells?

A. No; the batteries connected up is from one cell to the other.

Q. It is a whole series?

A. Yes.

Q. You don't know how many plates in each cell?

A. No, I don't.

Mr. Botts:

That is all.

The Court:

Do you have a question?

Mr. Underwood:

I have about 15 or 20 minutes.

The Court:

I suppose we had better carry it over to tomorrow. We will adjourn until 9:30 tomorrow morning.

(Adjournment taken to 9:30 A. M., May 16, 1939.)

United States District Court Southern District of Florida. Miami Division.

Charles Coryell, et al, Libelants,
against
George J. Pilkington and John S. Phipps, Respondents.

In Admiralty No. 122-M-Adm.

Deposition taken on behalf of the respondent, John S. Phipps, at the office of Messrs. Burlingham, Veeder, Clark & Hupper, 27 William Street, New York City, April 19, 1939.

Appearances:

Messrs. Loftin, Stokes & Calkins, Ray C. Alley, Esq., Messrs. Burlingham, Veeder, Clark & Hupper (Mr. Underwood) for the respondent, John S. Phipps.

Messrs. Batchelor & Dyer, Messrs. Bigham, Englar, Jones & Houston, (Mr. Matteson) for the libelants.

It is stipulated that the testimony may be taken by a stenographer, signing, filing and certification being waived, stenographer's fees to be taxable.

2292 ANTHONY SCHINIGOI, being duly sworn and examined as a witness for the respondent, John S. Phipps, testified as follows:

By Mr. Underwood:

Q. Mr. Schinigoi, where do you live?

A. 113 Constitution Street, Bristol, Rhode Island.

Q. And you came down here from Bristol today to testify in this Seminole matter?

A. Yes.

Q. What is your business?

A. Master mariner in the summertime—mariner in general.

Q. How long have you been going to sea in boats—small boats?

A. In small boats, since 1918.

Q. What has been your regular work in the summertime for the past several years?

A. Master mariner, in Rhode Island.

Q. What did you do—what kind of boats?

A. 45-foot Dawn.

Q. In the wintertime, what has your work been for the past several years?

A. Steward.

Q. And that is in the south?

A. In the south, yes.

Q. Have you ever worked on the Seminole?

A. Yes—1935.

Q. That was the year in which she burned?

A. Yes, sir.

Q. Had you ever worked on her before that year?

A. No, sir.

Q. How did you come to get employed on the Seminole?

A. Through Captain Baker on the Mollie O.

Q. Were you steward on the Mollie O?

A. Yes, sir.

Q. How did you come to go over to the Seminole?

A. Well, Mr. Phipps hired Captain Baker to take charge of the Seminole, and in order to do that he had to lay up the Mollie O, so he took all the crew of his boat on the Seminole.

Q. You say that Mr. Phipps hired Captain Baker. Do you know of your own knowledge who made the arrangements with Captain Baker?

A. Why no.

Q. Where did you join the Seminole?

A. At Miami.

Q. At the Royal Palm Dock?

A. Royal Palm Dock in Miami.

Q. Who all went over to the Seminole from the Mollie O?

A. Captain Baker, Clyde Baker, a deckhand by the name of Sig, and myself.

Q. About how long did you stay on the Seminole that time?

A. I would say about between ten days and two weeks —I think it is nearest to ten days than two weeks.

Q. Did you go on a cruise?

A. Yes, went down the Key, changed places all the time.

Q. What was your job on the Seminole?

A. Steward—cook and steward.

Q. Do you know about how many people there were in the yachting party?

A. Well, to give the exact number it is pretty hard for me, because I wasn't mostly with the party, but I should say it was an average of seven—at different times, between seven and eight people.

Q. Do you remember the names of some of the people who were there?

A. Well, Mr. Phipps.

Q. Which one do you refer to?

A. That is the worst part of it—just call him Phipps down there.

Q. There was at least one Mr. Phipps?

A. There were two Mr. Phipps.

Q. Do you remember the names of any of the others?

A. I believe there was—

Q. Mrs. Guest?

A. Mrs. Guest.

Q. About how many members of the crew were there—I mean just on the Seminole?

A. Not counting the guides?

Q. Not counting the guides.

A. About six.

Q. Were there any other boats that went along with the Seminole?

A. Yes, there was three or four guide boats.

Q. Did you have anything to do with getting the Seminole ready for that cruise?

A. Yes.

Q. Tell us what you did?

A. Well, we cleaned up all the staterooms, made up the beds, and put out the draperies and stored her with food and supplies.

Q. During that time, did you have occasion to go down into the bilges of the boat at all?

A. Yes, I had to go down once to get some of the blankets that were stored away on the forward part of the boat.

Q. You mean the blankets were stored down in the bilges?

A. Down in the bilges.

Q. What did you find the condition of the bilges to be from your observation at that time?

A. Well, you couldn't ask for no better, just as clean and dry as could be.

Q. Did you smell any odor of any kind down there on that occasion?

A. Not of any kind.

Q. Did you have any work to do in the engineroom of the Seminole at any time?

A. No.

Q. Were you ever in the engineroom?

A. Once.

Q. When was that?

A. After the party left, we were taking the boat from the Key to Miami, I went down for about half an hour in the engineroom.

Q. What was the purpose of that visit?

A. Curiosity.

Q. On that cruise, did you know R. C. Abel?

A. Yes.

Q. Was he on that cruise?

A. Yes.

Q. Do you know what his job was?

A. He was running one of the fish boats.

Q. Where did the party leave the boat?

A. I believe it was lower Matacumbe.

Q. Did any of the crew leave the boat down there too?

A. Well, if you call the butler and the second man from the house the crew—them two left.

Q. When you told me there were about six in the crew, did you include those?

A. No, I didn't include anybody else but the actual crew.

Q. After the party left at lower Matacumbe, where did the Seminole go?

A. The Royal Palm Dock in Miami.

Q. What happened to the crew there—did any part of the crew leave?

A. Well, yes.

Q. Who didn't leave—who stayed on after Miami?

A. The engineer, Captain Baker, one of the sailors and myself.

Q. That makes four?

A. Four.

Q. On the way up from lower Matacumbe to Miami, about how long a trip was that?

A. I would say about twelve hours—ten to twelve hours.

Q. Did you know at that time where the boat was going?

A. Well, we knew we were going to Miami.

Q. Did you know at that time that you were going on further than Miami?

A. No, sir.

Q. What did you do about the staterooms of the boat, if anything, during that time?

A. Well, cleaned them up and laying them up.

Q. Just what did that involve—what did you do?

A. Well, stripped the beds from the soiled linen and folded up the blankets and put them in drawers, covered up the beds again with the bedspreads, and cleaned up the bathrooms, swept the floors.

Q. How much of that work did you get done in the staterooms by the time you got to Miami?

A. The staterooms was all finished.

Q. Do you remember how long you lay over in Miami?

A. It was overnight.

Q. Where did you go from there?

A. Went to Fort Lauderdale—Pilkington Boatyard in Fort Lauderdalt.

Q. Were those four men that you have named aboard on that part of the trip?

A. Yes.

Q. That is the captain, the engineer, one sailor and yourself?

A. Yes, sir.

Q. About what time of the day did you arrive at Pilkington Boatyard?

A. It must have been around 2 or 2:30—between 2 and 2:30.

Q. In the afternoon?

A. In the afternoon.

Q. I don't suppose you remember what day it was?

A. No, that is quite hard to remember.

Q. Where did you leave the boat—at Pilkington's?

A. A little dock they had outside of the shed.

Q. When you got alongside, I would like you to tell us what you did in order to leave the boat, before you left her?

A. Well, I went to see that all my work is done, see that it has the proper ventilation, see that the windows are open enough for ventilation, close the venetian shutters so that the sun and rain wouldn't come in.

Q. Did you go into the engineroom at any time on the day you left the boat at the yacht basin?

A. Not exactly—just put my head through the window in the hall to see—well, just to see that everything is all right.

Q. You mean you looked in but you didn't physically go in?

A. No, I just looked in.

Q. You said something about the windows and the ventilators in the staterooms. The only staterooms are on the lower deck—there were no staterooms on the upper deck, were there?

A. Except the captain's room, I think you call that a stateroom.

Q. Just the captain's room?

A. Yes.

Q. Let's talk about the staterooms that were on the lower deck. Tell us just what you did with the windows in the staterooms on the lower deck.

A. Well, after I had them all cleaned up, I pulled the windows two-thirds up, which left an opening about 6 to 8 inches, and I pulled these venetians shutters.

Q. The windows, you say you pulled up—you mean they were the kind of window that dropped down into the bulkhead?

A. Yes.

Q. Into the wall?

A. Yes.

Q. How did you leave those windows?

A. Two-thirds up—one-third open.

Q. You have spoken of a venetian shutter. Describe for us just what you mean by that.

A. It is sort of a slat work at a 45-degree angle, overlapping each other, and permanently made fast to a square frame.

Q. You mean the thing slides up and down as a unit?

A. Yes.

Q. Will the slats change their angle?

A. No.

Q. They are fast?

A. They are fast.

Q. How did you leave those?

A. Way up so that the rain wouldn't come in or the sun, and spoil the furnishings.

Q. Do you remember whether there were any windows in the alleyway that ran alongside of the engineroom?

A. Yes, two.

Q. Did you do anything with those windows?

A. The same thing.

Q. How did you leave those?

A. Two-thirds up, with this shutter in front of them.

Q. How about the windows in the crew's quarters aft of the enginercom?

A. They all was the same way—two-thirds up and these shutters in front.

Q. Did you do all that yourself?

A. All myself.

Q. Who was the last man off the boat, if you remember?

A. Myself.

Q. Tell us what you did the last few minutes before you left the boat.

A. I went through the boat to see everything was like it should be, I took my bag, put my few clothes in it, I locked the door, I walked in the upper deck and handed the key over to the captain and I went ashore.

Q. On that last look around, were you up forward on the lower deck where the passengers' staterooms were?

A. Forward and aft.

Q. On that occasion, did you look at those windows?

A. Every one.

Q. How were they?

A. The window I know I left at two-thirds up, and of course with the shutter on, you could only see the shutter.

Q. Did you look in the engineroom on that occasion?

A. Well, I was just passing by and I looked in. I hooked a window—well, I felt that the window was hooked, between the passageway and the engineroom.

Q. How did you leave that window?

A. Hooked open.

Q. Did you notice whether the window on the other side—the port side of the engineroom—was open or closed or how?

A. There is one thing that I really—I couldn't answer for sure. Maybe at that time I noticed they was open, but being away from my department I didn't pay really any particular attention.

Q. You mean that now you can't tell us for sure whether it was open or shut or how it was?

A. I believe if I see that window closed I would have passed a remark or maybe opened it myself.

Q. When you looked in the engineroom on that last look around, did you smell anything?

A. No, sir.

Q. Was there any odor of gasoline?

A. None whatsoever.

Q. Did you hear anything dripping?

A. No, sir.

Q. Did you see anything dripping?

A. See nothing out of the usual.

Q. Between the last look around that you made and the time you turned the keys over to Captain Baker, was there anybody else in that part of the boat?

A. No, sir, everybody was ashore.

Q. And when you handed the keys to Captain Baker, what did you and he do after that?

A. As far as I remember, we went in the car—the car was waiting for us.

Q. Did either of you go back on the Seminole again?

A. No, sir.

Q. What had become of the engineer and the sailor?

A. They left ahead of us because they were bound to Palm Beach, and their car came before ours.

Q. You mean they had already gone when you left the boat?

A. Well, not very long ahead, I would say maybe ten or fifteen minutes ahead.

Q. But by the time you locked the door and left the Seminole, they had gone?

A. They had gone, yes.

Q. And the door you locked, did I understand you to say that was the after door?

A. That was the after door.

Q. On the lower deck?

A. On the lower deck.

Q. Tell us about these keys that you gave Captain Baker—about how many were there?

A. There were several keys, I could say between four and six—they were tied up on a string with a little paper tag on it, or a stick of wood which I presume had a name on it.

Q. Were they all tied together on one string?

A. They were all tied together on one string.

Q. Did you see what Captain Baker did with those keys?

A. No, I did not notice.

Q. Where did you get your pay for that trip?

A. Captain Baker.

Q. Did you have any dealings with John S. Phipps at all?

A. No.

Q. Or any of the Phippses?

A. No.

Q. Or Mrs. Guest?

A. No.

Cross Examination.

By Mr. Matteson:

Q. Were you paid by Captain Baker by cash or by check, do you remember?

A. By cash.

Q. Were you paid for this particular trip, or were you just paid the wages you got as steward of the Mollie O?

A. No, just for this particular trip.

Q. When did he pay you, if you remember?

A. After we came back from Miami, from Fort Lauderdale.

Q. How long after, do you remember?

A. The following morning.

Q. How long were you on the Seminole altogether?

A. I should say between ten days and two weeks—maybe it was twelve days, something like that—between ten days and two weeks.

Q. Were you paid at the same rate on the Seminole that you were on the Mollie O?

A. Same.

Q. So Captain Baker just paid you ten or fourteen days salary?

A. Yes.

Q. Based on your monthly rate?

A. Yes, based on my monthly rate.

Q. Had you been paid for your time on the Mollie O before that?

A. Yes.

Q. Before you went on the trip on the Seminole?

A. Well, we got paid as a rule at the end of every charter.

Q. Was the Mollie O under charter at the time you were transferred to the Seminole?

A. Yes.

Q. What happened to that charter?

A: I believe it was an opening between charters, and that is the time that Captain Baker went on the Seminole—took the Seminole out.

Q. You say there were two Mr. Phipps that were on this trip?

A. Yes.

Q. How do you recognize the difference between them—is one an older man and one a younger man, or how is it?

A. Mr. Phipps—the one that I believe was the owner of the Seminole—I know him a little more because he chartered the Mollie O the year before, and the other Mr. Phipps seemed a little different, he was quite deaf—and that is the difference between the two.

Q. I think you said it was Mr. Phipps who arranged with Captain Baker to have the crew transferred over onto the Seminole?

A. No, I didn't say that.

Q. Well, you said that Mr. Phipps had arranged with Captain Baker, and then you said that you didn't know that of your own knowledge.

A. I said that I believed that Mr. Phipps hired Captain Baker—not the crew.

Q. Who was it told you that—was that Captain Baker?

A. Yes, talking with me—him and I.

Q. Where was this place where the blankets were stored in the Seminole?

A. It was between the port and starboard staterooms forward—

Q. Can you show on this chart (indicating)?

A. About here is a hatch that you lift up, or was really a hatch that lifts up and a ladder to go down.

Q. That is in this companionway in the forward part of the ship, between the staterooms on the port side and the staterooms on the starboard side, and about in the position where the word "Passage" appears on this blueprint (Exhibit A for identification), is that right?

A. Yes.

Q. You say that there was a hatch that lifted up in the floor of that passageway?

A. Yes, a section of floor came right up.

Q. How big was that?

A. I would say about 3 by 6 feet.

Q. What was down there after you lifted up the section of the hatch?

A. The bilge—a ladder to go down and a bilge.

Q. What do you mean by a bilge?

A. The bottom of the boat.

Q. Were there some boards or some parts partitioned off?

A. Well, no, there was open space—concrete—and you could see the water tanks underneath.

Q. The place where those blankets were—was that on top of the water tanks?

A. No, right on the bottom of the boat.

Q. Where was this concrete that you speak of?

A. Between timbers.

Q. It was concreted in between the timbers?

A. Yes.

Q. Did the concrete cover the timbers?

A. Quite well.

Q. Could you see the top of the timbers through the concrete?

A. Yes, the iron girders.

Q. So in this section under this hatch that lifted up, the bottom was filled in with concrete between the girders?

A. Yes.

Q. And it was on this concrete the blankets were laid?

A. Well, wrapped up in paper.

Q. Wrapped up in a bundle?

A. Yes.

Q. How big was the bundle?

A. Enough to hold six or eight blankets.

Q. How big a bundle would that make?

A. Oh, about 3 cubic feet.

Q. 3 cubic feet would be a foot square and 3 feet long.

A. Then that would be wrong—I am not much good in English mathematics—I would call it a yard in each direction.

Q. You mean a yard long and a yard wide?

A. And a yard high.

Q. A package that size would hold more than six blankets, wouldn't it?

A. I hardly think so.

Q. How many blankets were there in the package?

A. About six or eight blankets—good blankets—good heavy woolen blankets.

Q. When you lifted up the hatchway, were there floor beams that went across the opening?

A. There was something to walk on—the center of the boat as far as the tank—I couldn't say whether it

was wooden boards or part of the keelson—I couldn't say that.

Q. You are speaking now of the space down under the floor?

A. Yes.

Q. You say you could walk in there?

A. Yes—oh yes.

Q. You couldn't stand up in there?

A. Not very well, but by stooping down you could walk.

Q. How high would you say it was from the top of the steel girders at the bottom of the vessel up to the floor?

A. I would say close to 4 feet.

Q. When this hatchway—whatever it was that you lifted up—this section of the floor—when that was in place it rested on the floor beams, I presume.

A. Yes.

Q. And when you lifted it up, the floor beams were still there.

A. Yes, sir, there were floor beams in there.

Q. I suppose there would have to be to hold the section of the floor in place.

A. What I mean, there were two beams dividing the hole in three sections—the opening.

Q. This hole was divided in three parts by the two floor beams that were in the opening?

A. In the opening, that is right.

Q. So that the length of the hole would be three spaces between floor beams?

A. Two or three spaces, I just couldn't—I know there was some obstruction in there because I couldn't get the bundle out, I had to force it through, now whether it was one or two I couldn't quite—I know I had to force the bundle to get it out of there.

Q. In this space down here, there were tanks on each side of it, were there?

A. I believe I only saw the water tanks amidships.

Q. See if I get what you mean: This passageway seems to be just about amidships between the sides of the vessel, is that right?

A. Yes.

Q. Now, you open up the section of this passageway and look down—where do you see the tanks?

A. Aft.

Q. And did the tanks come across the amidship section of the vessel?

A. Yes.

Q. So that this space would be blocked of at the after end by a tank, is that right?

A. Yes.

Q. On each side of the space toward the side of the ship, were there tanks there?

A. I couldn't say because I didn't walk back of that.

Q. Did you go down in the space?

A. I went down to get the blankets.

Q. You never yourself went down in the space?

A. To get the blankets, yes.

Q. You needed a lot more than six or eight blankets for the boat, didn't you?

A. Yes, but a lot came from the house. That was originally the blankets that was part of the equipment of the boat.

Q. You say some blankets were brought from the house?

A. Yes.

Q. What house was that?

A. From Palm Beach. The butler brought them—which house he took them from I don't know—the butler brought them on board.

Q. Weren't some of the blankets stored in the staterooms?

A. Yes, in the drawers. If I remember right, the blankets I took out of the bilges we used for the crew;

the ones in the drawers were used for the staterooms; and then the extra blankets came from the house or some house, were used also in the guests' staterooms.

Q. What was the name of the butler?

A. I can't remember, we used to call him by his first name.

Q. What was that first name, do you remember?

A. No, sir, I couldn't remember. Maybe a couple of months after I could remember.

Q. You can't remember it now?

A. No, sir, I never saw him since.

Q. How did you know there were blankets in this place?

A. I was told.

Q. Who told you?

A. The captain.

Q. What was the name of the sailor that went up to Fort Lauderdale with you—was that Bryant or was it Sig?

A. Bryant.

Q. You spoke of being a master mariner. Do you hold a master's license of any kind?

A. Operator's license.

Q. Motorboat operator's license.

A. Yes.

Q. You don't hold any license from the Steamboat Inspection Service?

A. No.

Q. When you say you had experience as a mariner, you mean in boats of the type of this 45-foot Dawn cruiser you speak of?

A. I started in 1907, ocean liners.

Q. What sort of work did you do on ocean liners?

A. A little bit of everything, mariner, fireman and coal passer, steward, cook, messboy.

Q. What do you mean by mariner?

A. Anybody that goes to sea.

Q. You mean a sailor?

A. Well no, anybody that goes to sea—the captain is a mariner and the engineer is a mariner.

Q. And the coal passer?

A. The coal passer is a mariner—that covers the whole branch.

Q. When you said you worked on ocean-going vessels as a mariner, what did you mean by that?

A. Well, that would cover all the departments.

Q. When you said mariner, you just meant those other capacities that you named specifically, is that right—coal passer, fireman, steward?

A. Instead of covering the whole individually, I just called it mariner.

Q. Did you ever work as a sailor?

A. Yes.

Q. Never as an officer?

A. No.

Q. You said Abel was on one of these fishing boats?

A. Yes.

Q. Was that the Clip?

A. I believe it was, although it is pretty hard for me to remember the name, but there were three or four, every one had a different name, but I believe it was the Clip that was the biggest.

Q. When you stopped at Miami on the way to Fort Lauderdale, did you take on any gas there, do you know?

A. No.

Q. You say you don't know when you got to Miami that you were going to Fort Lauderdale right away?

A. No, we didn't know then.

Q. When did you find that out?

A. The same afternoon.

Q. How did you find that out?

A. Through the captain's orders.

Q. Where is the galley on the Seminole?

A. A little aft of amidships.

Q. That is the room on the starboard side in the after section of the ship on the lower deck?

A. Yes.

Q. And is marked "Galley" on this blueprint (Exhibit A for identification), is that right?

A. Yes.

Q. What kind of a stove did you have?

A. It was an iron stove burning kerosene.

Q. Using kerosene for fuel?

A. Yes.

Q. Did you cook the meals for the crew and for the passengers as well?

A. Yes.

Q. Where were the passengers' meals served?

A. Up in the diningroom.

Q. That is on the after part of the deck?

A. After part of the deck.

Q. The room that is marked "Saloon" on this blueprint?

A. "Saloon", that is right—"Dining Saloon".

Q. How were the dishes transferred from the galley up to the saloon?

A. There is a dumbwaiter here in the crew's pantry, carry up stores to the dining room pantry.

Q. That is, this dumbwaiter is in the pantry which is right opposite the galley on the lower deck?

A. Yes.

Q. You were telling us about the way you left the windows, and you said you left them about a third open?

A. Yes.

Q. How tall are those windows?

A. I believe they are about 24 or 28—maybe 30 inches.

Q. You haven't any way of estimating except by your rough guess?

A. Rough guess, yes.

Q. Whatever their height was, they were about a third open?

A. About a third open, they were open, I would say, 6 or 8 inches—mostly 8 inches, I would say.

Q. If they were 24 inches high, 8 inches would be a third?

A. Yes.

Q. If they were 30 inches high, 10 inches would be a third, is that right?

A. Well, it is quite hard, when you close a window, to say whether it was 8 or 10 inches. I don't think any of the windows would be equally open anyhow, maybe more or less.

Q. Your best estimate is they were open about a third?

A. About a third open, that is what I do on every boat when I lay it up.

Q. The door that you locked, I think you said, was this one at the after end of the house on the lower deck?

A. Yes, that is the last door I locked.

Q. Did you lock any other doors?

A. The doors in the deckhouse—three of them.

Mr. Underwood:

Indicating the social hall as it appears on the upper deck of Respondents' Exhibit A for identification.

Q. Did the same key fit all those doors?

A. No, those has Yale locks.

Q. That is the doors in the social hall?

A. In the social hall and the captain's room.

Q. Have Yale locks?

A. Yes, Yale locks. The door here has a regular house key.

Q. Old-fashioned house key?

A. Yes.

Mr. Underwood:

Indicating the after door on the lower deck.

Q. Did the same Yale key fit all three doors in the social room and the captain's cabin?

A. I couldn't say, because them Yale locks you only snap the lock and it is closed.

Q. You didn't have to use a key for that at all?

A. No, sir.

Q. So the only key you had any use for was the key to the after door on the main deck?

A. The after door on the main deck—on the lower deck.

Q. Did you have a key to the doors in the social hall, do you know?

A. Well, there was a bunch of keys when I locked that door, I guess there were four or five or six keys.

Q. You don't know whether one of them was the key for those doors or not?

A. I presume they was.

Q. But you don't know?

A. No, I don't know.

Q. You didn't try it?

A. No.

Q. Where did you get the keys?

A. There were some hooks on the inside of this lower deck door where the key was hanging.

Q. A board with a lot of hooks on it?

A. A board with a lot of hooks on it?

Q. A separate hook for each key?

A. No, they all was in one bunch, and the other hooks were used for different things, maybe a towel or whisk-broom or something like that.

Q. What time did you leave Fort Lauderdale that night, do you know?

A. I believe between 4:30 and 5.

Q. Who drove you to Miami that night?

A. I don't know, the Biscayne office sent a car for us.

Q. Was there a driver with the car?

A. Yes.

Q. You don't know who that was?

A. I don't know who that was.

Q. Have you worked for Mr. Phipps or any of his companies since this time?

A. No, sir. You mean since that time?

Q. Since that time.

A. No, sir.

Q. Whom are you working for now?

A. At present?

Q. Yes.

A. Nobody. I am starting tomorrow for Mr. Hilton—Vincent K. Hilton.

Q. Is he in Bristol?

A. No, he is in Clearwater Beach, Florida.

Q. Working up here?

A. Starting to fit out his yacht.

Q. What is the name of his yacht?

A. Teddy III.

Q. Where is she?

A. At Bristol, Rhode Island.

Q. When was it that anyone got in touch with you first to ask you about what you remembered about laying up the Seminole—how long ago was that?

A. I think it was a couple of months. I read in the paper about an explosion—Captain Baker wrote me a letter here that on my way south I stop in the office and see Mr. Reynolds. That is the first time I been interviewed.

Q. Did you make a statement at that time?

A. Well, it was practically the same questions I been asked now.

Q. Were you asked about the keys to the boat at that time?

A. Yes, I am quite sure.

Q. Were you asked about the windows of the engineroom at that time?

A. Yes.

Q. And was a memorandum made of what you said at that time?

A. Yes.

Q. You are quite sure you were asked about the keys and the engineroom at that time?

A. I am quite sure.

Q. You didn't have any responsibility for the engineroom, did you?

A. None at all.

Q. Anything that you observed with respect to the engineroom was just curiosity?

A. Just curiosity, yes.

Q. The engineer left before you did?

A. Yes.

Q. And it was his job to see that the engineroom was all right?

A. That is right.

Q. How did you happen to notice this window in the alleyway when you left the ship?

A. Because we always try to keep that window open to give ventilation in the engineroom, and at the time we were running she used to swing and bang, and I happened to reach my hand to see that she don't blow back, shut off.

Q. Where was this hook that you spoke of?

A. Back of the partition in the engineroom.

Q. That was a hook on the inside of the window?

A. Yes.

Q. How did this window open and close—did it go up and down or swing on hinges?

A. On hinges.

Q. Where were the hinges?

A. On the forward part of the frame.

Q. They were at the side of the window then?

A. At the side, yes.

Q. None on top?

A. No.

Q. And you say the window was open and was hooked to something?

A. There is a regular iron hook to hold it.

Q. Then as the window opened it could swing inwards and in a forward direction, is that right?

A. That is right.

Q. And when it was fastened in the open position, in what position would it be—I mean what direction would the window be pointed?

A. Forward.

Q. Be pointed forward?

A. Yes.

Q. Then as I get it from what you say, this window in its ordinary position has the hinges on the forward side, and from there the window goes in an aft direction?

A. The window opens to the right.

Q. When it opens it goes all the way around to 180 degrees?

A. Yes.

Q. And fastens to the side?

A. Fastens to the side.

Q. So this hook that you speak of would be the width of the window away from the opening that the window ordinarily fitted in, wouldn't it?

A. Please repeat.

Q. I say, when this window opened and swung all the way around so it was against the side, then this hook would be on the forward end of the window?

A. Not necessarily.

Q. I am asking you.

A. No, it was amidships, you can reach it from the inside, from the companionway you can reach in and hook it.

Q. How far forward was it of the window opening?

A. About a foot.

Q. How wide was that window?

A. Around 3 feet.

Q. About 3 feet wide?

A. About 3 feet wide.

Q. How was the hook—on the top or on the bottom?

A. On the bottom.

Q. As you stood in the pasageway, how high was this window above the deck—how high would it come on you?

A. Well, it would come about this (indicating).

Q. About the height of your arm when you stand with your arms folded?

A. Yes.

Q. About 4 feet?

A. Roughly 4 feet, yes.

Q. Did you know when Schlapei left, the engineer?

A. I didn't see him leaving—we say good-bye on the boat, when he left the boat.

Q. Where was he the last time you saw him?

A. Maybe fifteen minutes before I left the boat.

Q. Where was he at that time?

A. Going through the after deck from his—taking his clothes out of the crew's quarters.

Q. Have you any definite recollection of how many keys there were in that bunch that you handed to the captain?

A. I couldn't say for sure just how many—there were several keys.

Q. And the only key that you know what it was the key to was the key to the after door, is that right?

A. Yes.

Q. They were fastened together with a string?
A. With a string.

Re-Direct Examination.

By Mr. Underwood:

Q. Is there any connection or relation between Mr. Phipps and Mr. Hilton?

A. No, sir.

Q. I am not clear about your answers to Mr. Matteson's question about whether you took any gasoline at Miami on your way north to Pilkington's. Did you say you did not take any gasoline or that you don't know whether you took any gasoline or not?

A. Well, of course I was there all the time and I didn't see any gasoline coming on board.

Q. So that you mean to say—

A. They could have come without my knowledge.

Q. But so far as you know, none was taken?

A. None was taken.

Tuesday, May 16, 1939, 8:30 o'clock A. M.

(Hearing resumed pursuant to adjournment of the previous day.)

2324 MR. ROLAND A. SCHLAPPI, resumed the witness stand and further testified, upon:

Re-Direct Examination.

By Mr. Underwood:

Q. Rollie, you told us yesterday about a leak in the filling line which was repaired. I would like to know just where that leak was. It was in a union, I understand.

A. Yes, ground seat union.

Q. Now there are several places that leaks might be in the valve; it might be up in the ground seat, or it might be in the threads. I would like to know just which one of those several places was leaking.

A. It was in the seat itself.

Q. Now approximately what was the distance from the manifold line down to where the feed lines passed through the floor of the engineroom?

A. It was between eighteen inches and two feet.

Q. As I understand it, in that space there was a trap and a valve.

A. Yes, sir.

Q. How did the feed lines fit as they passed through the floor board?

A. They went down through a hole.

Q. How did they fit in the hole?

A. Pretty snug.

Q. And from that point there was an L where the leads met aft of the motors, is that right?

A. Yes, sir.

Q. How were those feed lines arranged, from that L back to the place where they turned up again to go to the carburetor? Did they lay on anything or up against something, or how?

A. Well, they laid on the members,—wooden members.

Q. The beams?

A. Yes, sir.

Q. How were they secured there?

A. Why, I didn't notice that.

Q. Do you have any recollection as to that?

A. No, sir.

Q. Yesterday, your attention was called to this voucher 8032, which is part of Exhibit 3-U. I would like you to tell me if you can, which of those six items covers

your wages for the time you were on the Seminole on the cruise and took her up to Pilkington's to lay her up.

A. I think that thirty-one days come in there; twenty-two days repair work on her.

Q. What was your rate of pay when you were repairing the boat, as you were in February and March at the Royal Palm Dock?

A. $8.00 a day—

Q. And subsistence?

A. Yes, sir.

Q. What was your rate of pay as an engineer when you were operating the boat on a cruise and up to Ft. Lauderdale?

A. $5.00.

Q. I am not quite clear whether your testimony yesterday brought out how you left the two stop valves in the feed lines that were below the carburetors when you left the boat at Pilkington's. How were those valves left?

A. They was closed.

Q. And how far were they closed?

A. Tight as you could shut them.

Q. Something was said yesterday about it being possible to turn the electric lights while the batteries were being charged.

A. Yes, sir.

Q. Will you tell me where that electricity came from for the lighting circuits when the charging and discharging switch was closed on the charging side?

A. Well, it went right through the line, through the batteries, the feed lines too.

Q. Went to both?

A. Yes, sir.

Q. Now if your charging and discharging switch was closed on the charging side, could you get any current on the field switches with the generator idle?

A. No, sir.

Q. That generator would have to be running?

A. Yes, sir.

Q. Now you have told us something about an arc in the operation of the knife switches. I would like you to tell us a little more about that. Just what sort of thing was it, that it looked like, how big was it, what did it do?

A. Well, I say that you get a fairly good sized arc when you throwed the switch, pulled it.

Q. When you opened it?

A. Opened it; and when you closed it, very little.

Q. What did that very little arc look like? How big was it?

A. Why you could hardly notice it in the daytime.

Q. Can you compare it in size with some object?

A. Why, I don't know just how to go about it. Just like a flash of a pinhead or something; no flash to it, either.

Q. Well, how long, in time, would that last?

A. Just the time it touched, is all.

Q. When that occurred, what became of this little thing that you saw?

A. It just happened right on the switch.

Q. Did it go anywhere else?

A. No; no break to it or nothing, just an arc.

Q. Was there any spark that fell, that you ever saw?

A. No, sir.

Q. What was the condition of the knives and the points on that switchboard when you laid her up at Lauderdale?

A. They was all in good shape.

Q. Was there any corrosion on the points or the knives?

A. No, sir.

Q. You told us yesterday about the gasoline tank for the windlass and motor. Did you ever observe any leak there?

A. No, sir.

Q. What kind of a tank was that?

A. It was an ordinary galvanized tank, riveted tank.

Q. You mean round, or circular?

A. Well, round cylinder.

Q. Same shape as the main tanks?

A. Yes, sir.

Q. When did you last see that?

A. Why, I noticed it when we filled the tanks.

Q. Do you remember when that was?

A. I don't remember whether I filled it on the trip or not. It was only used a little bit.

Q. How close did you come to that tank when you were in the forward bilges, getting ready to leave here, to Pilkington's?

A. I wasn't in there.

Q. I didn't hear you.

A. I wasn't in close to it.

Q. Is that in a separate compartment?

A. Yes, sir.

Q. What sort of a separation is there between that and the compartment where the water tanks are?

A. Well, there is a regular steel bulkhead right—it is about seven feet long, seven feet back of the bow, cut off, and it is sitting in this compartment.

Q. Do you know whether that is a water tight bulkhead?

A. No, I don't.

Q. Do you remember how far down it went?

A. It went to the bilge of the boat, all right.

Q. Did it stop at the frames or did it go down to the skin of the ship,—or do you remember?

A. I never noticed.

Q. Now this kerosene tank in the engineroom, what was the arrangement for getting kerosene out of that tank?

A. There was two draw valves the same as that, only a little larger I would say; I think it was three-quarter.

Q. How many valves did you have to open to get kerosene out?

A. Two.

Q. Did you observe any leak there?

A. No, sir.

Q. Did you smell any kerosene in the engineroom?

A. No, sir.

Q. Now you told us yesterday about two squirt cans that you used for priming the motors. How did you leave the cans?

A. Well, empty, outside of cleaning them out.

Q. When did you last use them?

A. Priming here at the dock the morning we left to go to Ft. Lauderdale.

Q. Did you refill them after that?

A. No, sir, never shut the motors.

Q. Where were those two squirt cans left?

A. They were sitting in a brass tray on the top of the desk.

Q. Were they left there?

A. Yes, sir.

Q. You have been on a good many gasoline driven boats, haven't you?

A. Yes, sir.

Q. In your experience, is there any such thing as a special type of gasoline valve?

A. Well, I haven't noticed any special, on the boats I have been on. A good seat valve is all I ever noticed.

Q. In your experience, is there any particular angle that is better than any other for the contact between the plug and the seat?

A. Why, I have always liked a 45 degree angle with a pretty good face to it.

Q. What is your opinion as to the utility or the value of a needle type plug seat and seat valve?

A. Well, it wedges, and you will eventually cut a ring on your valve itself.

Q. What happens when you do that?

A. Well, they leak, it keeps cutting in all the time.

Q. Have you had that experience on a valve,—a needle valve?

A. With a needle valve on carburetors, I have had it.

Mr. Underwood:

That is all.

Re-Cross Examination.

By Mr. Matteson:

Q. Mr. Schlappi, this tank in the forward compartment was used to operate the anchor windlass, was it?

A. Yes, sir.

Q. And you used that fuel supply every time you raised your anchors, is that right?

A. Yes, sir.

Q. I understood you to say that you did anchor several times on this trip.

A. Yes.

Q. In April '35. So it was used on that trip, wasn't it?

A. Yes.

Q. You say you don't recall whether you had occasion to fill it on that trip or not?

A. It only used very little gas, only used a few minutes to hist anchor.

Q. But you don't recall whether you actually filled it on that trip or not?

A. Well, I didn't fill it on that trip. I filled it—I don't recall whether I filled it on the trip or here, but usually we get things ready before we leave.

Q. You think you did fill it either before you left here—

A. Before.

Q. —or on the trip. Before you went on the trip, that would be at Miami just prior to April 5, 1935?

A. Yes.

Q. With regard to these squirt cans, I take it you used them at Miami on the morning of the day you started for Ft. Lauderdale?

A. Yes, sir.

Q. Did you use all of the gasoline that was in them at that time?

A. Used practically all of it; until it squirts air.

Q. Then you put them on the tray?

A. Yes, sir.

Q. And is that the last thing that you did with them?

A. Yes, sir.

Q. There is one object in the engineroom that hasn't been identified, Mr. Schlappi, and I would like to know what it is. It shows in this picture that I show you here. I call your attention to this object on the after bulkhead of the engineroom, apparently aft of the port engine. You see what I am referring to?

A. Yes.

Q. Can you tell us what that is? Here is the magnifier if you want it.

A. That is the rheostat, for lowering and raising the voltage.

Q. Well, was that on the switchboard then, or to one side of it?

A. No, sir, that was to one side, to the port side of it; or the right hand side looking at it.

Q. Then yesterday in making up this diagram of the switchboard, Libelants' Exhibit 110, you put a circle on the switchboard, you put a question mark after it at the time?

A. Yes.

Q. Indicating, rheostat?

A. Yes.

Q. Now do I understand that the rheostat was not on the switchboard, but was at one side of it?

A. Yes, there was one on that, that was used for sensitive adjustments.

Q. The one on the switchboard was used for sensitive adjustments, is that it?

A. Yes, sir.

Q. And then you had a larger one at one side of the switchboard, is that it?

A. Yes, it fit off, that was separate from the switchboard.

Q. Then we will call this one the big rheostat, is that right?

A. Yes.

Q. I will just put an arrow on this picture pointing to it, and at the top I will write, big rheostat.

Mr. Matteson:

I offer that as Libelants' Exhibit 113. This is a photograph that was taken in late '38 or early '39.

Mr. Underwood:

I have no objection to it, so far as structural matters are concerned that wouldn't be changed by the lapse of time.

(The said photograph was admitted in evidence and marked Libelants' Exhibit 113.)

Mr. Matteson:

That is all.

Mr. Botts:

No questions.

Re-Direct Examination.

By Mr. Underwood:

Q. Just one thing I am not clear about, Rollie. Where was this windlass engine with reference to the deck? Was it above or below the deck?

A. It was above the deck.

Q. And where was the gasoline tank?

A. It was below the deck, in the hatch that you went into this compartment, right in there.

Q. How did you feed it?

A. It was fed by an auto pulse

(Thereupon the witness was excused and released subject to call.)

2335 MR. JOHN S. PHIPPS, as a witness on behalf of Respondents, was sworn and testified as follows:

Direct Examination.

By Mr. Underwood:

Q. What is your name?

A. John Shaffer Phipps, J. S. Phipps I am known by.

Q. Where do you live?

A. I live in Palm Beach, Florida.

Q. What is your business, Mr. Phipps?

A. Well, I have retired from active business; I have no more to add to that.

Q. When did you first acquire any interest in the Seminole?

A. In 1915.

Q. From whom?

A. From my brother, H. C. Phipps.

Q. And how much of an interest did you acquire at that time?

A. I bought a half interest.

Q. Now from that time on did you ever buy any more than a half interest in the Seminole?

A. No.

Q. Now there came a time when the Seminole Boat Company, a corporation, was organized. What did you do with your half interest in the Seminole at that time?

A. I exchanged—when the Seminole Boat Company was organized?

Q. When it was organized?

A. That is right. I exchanged my half interest in the Seminole for a half of the common stock—or half of the stock of the Seminole Boat Company.

Q. Have you ever owned any more than half of the common stock of the Seminole Boat Company?

A. No.

Q. Now prior to the formation of the corporation, how were the expenses of the maintenance and upkeep,—the overhead expenses of the Seminole, divided between you and your brother?

A. He paid half and I paid half; the maintenance and upkeep?

Q. That is right.

A. He paid half and I paid half.

Q. How were the expenses of the operation of the boat, when you took her out on a trip, borne?

A. If I took her out a trip for myself, then I paid all the expenses. If he took her out on a trip why he paid. If we went together, I suppose they were divided, I don't remember that.

Q. Now after the formation of the corporation, how were the expenses of maintenance and upkeep paid for and arranged?

A. They were paid by the Seminole Boat Company.

Q. And how were the expenses of operations borne?

A. The expenses of the operation were the same way, they were borne by the charter party. If I were using the boat I would pay for it; if my brother were using it he would pay for it.

Q. Now, Mr. Phipps, have you had any education or training as an engineer?

A. None at all.

Q. Or as an electrician?

A. No.

Q. What do you know about gasoline motors?

A. I don't know anything. Well, I have had an automobile.

Q. Do you know what is under the hood of your automobile?

A. I don't, no.

Q. Have you ever operated the motor of a motor boat?

A. Operated it. I have held the tiller, but I never started it.

Q. Have you ever removed—

A. I don't think I have held the tiller. I have been in a motor boat.

Q. Have you ever removed or installed a spark plug?

A. Of course I have held the tiller of an outboard,—no, I never changed a spark plug.

Q. Have you ever taken a motor down and put it together again?

A. No.

Q. Have you ever had any part in installing a gasoline feed line?

A. No.

Q. Or gasoline tank?

A. Installing or stalling?

Q. Installing.

A. No.

Q. Do you know anything about gasoline tanks or feed lines?

A. No.

Q. Prior to the formation of the corporation, where did you get your information as to what work should be done on the Seminole?

A. From the Master of the boat.

Q. And following the formation of the corporation, were you consulted as to any work that should be done on the Seminole?

A. I don't remember any, no.

Q. Now I would like to ask you about the origin of this corporation; how did that come about?

A. Well, Hawkins, who represented the family interest in Miami, Roy Hawkins, said that Baker thought he could make money if we charted the Seminole and if he had charge of it. He had a boat of his own, but the Seminole was a larger and better boat, and he thought he could make some money for us if we incorporated the Seminole and used it for charter parties.

Q. And with whom did you confer about that?

A. I conferred with my brother.

Q. Was any decision reached?

A. I conferred with my brother and he thought it was a good idea, and we formed the corporation.

Q. What was your purpose in forming the corporation?

A. My purpose was to try to get some money. Baker thought he could charter the boat for about six months of the year. Prior to that time we used it very little, I don't know how much, without refreshing my memory; but the boat was idle a great part of the time; and Baker thought he could use it a great part of the time and could get charter parties for the boat.

Q. Did you have any understanding at that time as to the use of the Seminole by the stockholders?

A. Well, that was what we understood; Baker said he would charter the boat, and we more or less agreed that while he had the boat chartered, of course we wouldn't attempt to use it. If there were no charter, and no charter was contemplated, then we could use it.

Q. And by "we" whom do you mean?

A. I mean my brother or myself.

Q. Now following the formation of the corporation did you have anything to do with making decisions about work that was to be done on the Seminole of any kind?

A. I was never asked for any decisions.

Q. Now coming down to the year, 1935, do you recall considering the possible sale of the Seminole?

A. Yes.

Q. How did that come about and what was done?

A. Well, Roy thought it would be a good idea to sell the Seminole; he had an offer for it, an offer of $5,000.00. He said,—I asked how much he could get for it; he said "I can get $5,000.00"; and that is all he could get. So I talked to my brother, we met together, and he said he thought it was a good idea, that he would sell his share. I wanted to talk to my wife before I decided, so I went home and discussed it,—and with my sister Mrs. Frederick Guest. Then Mrs. Guest said "If you will keep your share,—your share of the Seminole, your half of the Seminole, I will buy Hal's half.

Q. Hal is your brother?

A. Hal is my brother; H. C. Phipps. And I said "Well, if you care to go on, I will keep my share and you take Hal's or buy Hal's"; and we so notified Roy Hawkins and he refused the sale.

Q. Now do you recall the purchase of the Prigg boat early in 1935?

A. Yes.

Q. How did that come about?

A. I don't know whether we had—what do you call it?

Q. Tender?

A. I don't know whether we had a tender; if we had, it wasn't any good. Anyhow, Roy said he knew of a Prigg boat that would make a good tender for the Seminole; and he showed it to me. It looked like a nice boat, the price was reasonable, and I said "Well, Roy, if you buy the boat, you will either buy it for the Seminole, if Mrs. Guest wants it; if not, I will take it for myself." That's how the boat was bought. I then told my sister about it and she asked if it was necessary for the Seminole. I said it would be very good. She says, "Well, then, she would like to have it bought for the Seminole—the Prigg boat.

Q. Did you have any conversation with Mr. Hawkins about that?

A. Oh yes.

Q. Give him any instructions?

A. Oh yes. Of course I notified Roy then that it belonged to the Seminole and not to me personally.

Q. What did you tell him as to who would authorize its purchase?

A. Well, I suppose it was charged to the Seminole Boat Company.

Q. As to who authorized the purchase.

A. Oh, I told him that Mrs. Guest and I had decided to have the Prigg boat for the Seminole.

Q. Do you recall being on a cruise on the Seminole in April 1935?

A. Yes,—in April?

Q. Yes.

A. Yes.

Q. What was the original arrangement for that cruise, and how did it come about?

A. Well, I think originally I was going out with Starke and with my brother.

Q. Who all was going on that cruise?

A. I think, Roy Hawkins, and Lehmann, my brother Hal, my brother Howard, and myself. I discussed that with the family, they were very sorry, they were going on a fishing trip. So I says "We will see if we get a charter on the Seminole, and go off on the Seminole". And I told Mrs. Guest about it, I said, "The Seminole is not chartered, I would like you to go with me, but I want it to be my party."

Q. Who was on the Seminole?

A. I told you who were on Starke's boat.

Q. What did you do then about the operating expenses on that cruise?

A. I paid them all.

Q. I show you, Mr. Phipps, a memorandum; do you recognize that?

A. Well, those are my initials, my o. k. on it.

Q. O. K. J. S. P. opposite the figure 1384.47, are your initials?

A. Those are my initials.

Q. You wrote the o. k.?

A. Yes.

Q. Do you happen to recognize the handwriting that begins with the word, divided?

A. Well, I would say that is my handwriting.

Q. What does it say?

A. This charter of Yacht Norman for seven days, Captain Starke, divided three weeks; H. C. P., Howard Phipps and J. S. P., $1220.

Q. The ink part of that—

A. I put that in.

Q. You wrote that?

A. Yes.

Q. Down here in pencil there appears, Mr. H. C. P. says three ways.

A. That is Ralph Patterson.

Q. R. A. Patterson, you recognize that handwriting and those initials?

A. Yes, that is one of the secretaries in the office.

Q. How soon after the cruise in April 1935 was this presented to you for your o. k. and o. k.'d by you?

A. I don't know, but I should think very shortly. Isn't it dated?

Q. Well, the instrument does not appear to bear any date, except it bears—

A. It says April 30.

Q. Do you have any recollection as to just when you o. k.'d that?

A. No.

Mr. Underwood:

I offer this in evidence.

(Without objection said paper was admitted in evidence and marked Respondents' Exhibit 4-K.)

Q. How much of that $1384.47 did you pay Mr. Phipps?

A. Oh, I paid it all.

Q. And how much of the $1220. did you pay?

A. I paid a third.

(Discussion had between counsel.)

Q. Are these expenses, Mr. Phipps, the total, the 1300 odd dollar figure, the expenses of the Seminole on that trip?

A. They are.

Q. When that trip was in prospect, what if anything, Mr. Phipps, did you have to do with the engagement of Captain Baker?

A. I had nothing to do with it, except Roy Hawkins, who was acting for the boat company, engaged the crew

and asked me if I liked Captain Baker; and I had him before, I said "Yes, I like him very much."

Q. Did you have anything to do with fixing the rate of pay at that time?

A. No, sir, nothing.

Q. Did you have anything to do with the selection of the engineer?

A. No.

Q. Or any member of the crew?

A. Nobody, not even the cook.

Q. Did you issue ay instructions to anybody during that cruise about the maintenance or upkeep of the boat?

A. No, sir.

Q. At the end of the cruise did you give any instructions as to what was to be done with the Seminole when the party left?

A. No. We all picked up and left. You mean, me, when you say the party?

Q. Yes, you and your guests. Now there has been some testimony in this case, Mr. Phipps, about payments that have been made to John Thomas, who was on the Seminole when the fire began. When did you first learn of those, and what have you had to do with them?

A. Well, I knew, but it must have been sometime later, I don't know how long later, that John Thomas' hospital bills had been paid, by somebody that was given some money; the Seminole Boat Company had taken care of that end of it.

Q. Were you consulted about that before the payment began?

A. No, I have never been consulted. They told me yesterday they have been continued.

Q. What is your best recollection as to when you were first consulted with reference to those payments. how long after the fire?

A. Oh, I don't know, at least a month I suppose, but I don't know. I wasn't consulted, but I must have been told later; it must have been a month or more, longer.

Q. There has also been some testimony in this case about payments to the widow of Captain Abel. Do you remember whether you were consulted about that before that payment was made?

A. Yes, I was.

Q. Did you know John Thomas, the man who was with Abel?

A. No, I never had seen him, at least I don't know to my recollection that I have ever seen him. I wouldn't know him if he came in the room.

Q. Did you have anything to do with employing him for any work?

A. Not that I remember.

Q. You knew Abel, did you not?

A. Very well.

Q. In whose employ was Abel during the time preceding the fire?

A. Abel was in my employ from time to time, taking care of the Yacht Iolanthe and the fishing boat the Clip; but from time to time he would be used by other members of the family, and by the other corporations; and I gave Roy permission to use him, and he did use him; and when he was so used he was paid by whoever was using him.

Q. Where were you when this fire occurred on the 24th of June, 1935?

A. I was in New York.

Q. Did you at that time have any plans for coming to Florida at any time in the near future?

A. No.

Q. Were you planning a fishing trip at that time?

A. Oh, I was planning to go to Grand Cascapedia in Canada. Then I planned to go fishing, as I usually go, salmon fishing, and I went on the 25th.

Q. You left New York on the 25th?

A. Yes.

Q. For Canada?

A. For Canada, yes.

Q. Now in salmon fishing in Canada, do you use glass bottom buckets or any of the kind of fishing gear that you use in Florida waters?

A. No.

Q. Do you recall, since the formation of the corporation, having presented to you for approval, and bills in respect to the Seminole for maintenance or upkeep or anything of that sort?

A. No. What was that question please?

(The question was read.)

A. No. For approval, is what you said, isn't it?

Q. Yes.

A. No.

Q. Now what was the practice as to the payment of bills incurred for the Iolanthe and the Clip?

A. The Iolanthe was my own boat, and all bills were o. k.'d or no expense was incurred before I approved it. That is generally speaking. And all bills were ok.'d before they were paid, for the Iolanthe or the Clip.

Q. How about the Clip?

A. The same way, they were my fishing boats.

Q. Now was Mr. Riley ever your secretary?

A. No.

Q. Did you ever tell anybody that he was?

A. No.

Q. Did you ever tell anybody that he was your representative?

A. No.

Q. Or your agent?

A. No.

Q. Now some question has been raised here as to why the stockholders of the Seminole Boat Company continued to make payments on behalf of the Seminole, although the stock was non-assessible. I would like you to tell us your reason for that.

A. Well, if we didn't make the payments I suppose the boat would have been sold; and anyway the payments were for something we had used, I presume, on our trips. The bills were always paid,—will you repeat the question please.

Q. Well, from the time of the formation of the corporation, expenses were incurred for the upkeep and maintenance of the Seminole?

A. Well, I didn't catch that.

Q. From time to time, and the records show that the stockholders made good deficits incurred by the corporation. I would like you to tell us what your purpose was in continuing to make good those deficits from year to year.

A. Well, we formed the corporation to charter the boat, and we thought we would make a profit out of it; and also we thought if that continued we might use it from time to time.

Q. Mr. Phipps, I show you a letter dated March 20, 1934, which has been marked Libelants' Exhibit 46.

A. Who are the Libelants?

Q. The other side. Did you ever see that letter before?

A. (Witness examining letter.) Never.

Q. Did you at that time give any instructions to Mr. Hawkins to write such letter?

A. No.

Q. Or anything in connection with such letter?

A. No. I think he made a mistake there, I don't know.

Q. Now do you know how the Seminole Boat Company's bills were paid, from the time of the formation of the corporation down to the time of the fire?

A. My brother paid half and I paid half of the expenses.

Q. I mean, Mr. Phipps, the details of where the money came from in the first instance, and how it was paid.

A. Oh it was paid by the Seminole Boat Company.

Q. And do you know of your own knowledge how the checks were drawn and issued, and by whom?

A. No, I don't.

Q. Have you ever been familiar with that procedure?

A. No.

Q. Mr. Phipps, there is in evidence here a certificate of enrollment and yacht license of the Seminole dated in 1923, which does not appear to bear your name except that it says in the body of the document "John S. Phipps, citizen of the United States, sole owner of the vessel called the Seminole". Did you ever see such a document before?

A. No.

Q. Did you have anything to do with the enrollment and license of the Seminole at that time?

A. No.

Q. I show you similar document dated in November, 1924; which does not appear to bear your name except in the body of the document, where it says substantially the same thing. Did you have anything to do with that?

A. No, sir, I never saw either before. I had nothing to do with them.

Q. Is it correct that you were the sole owner of the Seminole at those times?

A. No.

Q. When you first acquired an interest in the Seminole, did you remember what the power was that propelled her?

A. Steam.

Q. What did you have to do with the elimination of the steam plant and the installation of the gasoline plant?

A. Well, my brother and I thought it would be more convenient to have gas instead of steam. All we had to do was tell Mr. Robinson in the office,—this is before any incorporation, a long time ago,—what we did, we told Mr. Robinson to see what the steam—what a gas engine would be, suitable for the Seminole, and to remove the steam plant and put what he decided to go, in.

Q. Did you have anything to do with the layout of the gasoline tanks and feed lines?

A. I couldn't, I don't know anything about that—I didn't.

Q. Did you visit the Seminole during the work of changing from steam to gas?

A. No. I don't remember where it was done.

Q. Did you observe any part of that operation?

A. No.

Q. Something has been said about the use of hour pennant on the Seminole. Will you tell me whether or not you ever instructed anybody to fly your flag on the Seminole?

A. I never did.

Q. Do you recall ever seeing it flown?

A. I don't remember that it was.

Q. When you went on a cruise accompanied by fishing boats,—cruise with the Seminole, do you know where the fishing boats got their supply of gasoline?

A. From the Seminole.

Q. Do you know how they got it?

A. No.

Q. Do you know that there was any method by which gasoline could be drawn off from the tanks in the engine room?

A. Oh no, I thought it was pumped from the deck. I really didn't look into it. Are you sure it wasn't pumped from the deck?

Q. I am afraid I can't answer the question, Mr. Phipps, I am not allowed to. Mr. Phipps, I show you Libelants' Exhibit 24, document headed at the top, E. A. Wright, and then some other words; did you ever see that document before?

A. No.

Q. Or any document resembling it?

A. No, I don't remember it.

Q. Do you know anything about—

A. I haven't seen it.

Q. Do you know anything about the rules of the Bureau for the Prevention of explosion and fire on motor boats?

A. No.

Q. Did you ever hear of those rules?

A. No.

Q. Did you ever hear of the rules of the National Fire Protection Association?

A. No.

Q. Did you know there was such a thing?

A. No.

Q. Did you ever hear anything about the rules—

A. The insurance company?

Q. Did you ever hear anything about the rules of Lloyd's in reference to yachts?

A. No.

Q. Did you know there was such a thing?

A. Yes; I don't know about the rules, but I knew there was Lloyd's.

Q. What does Lloyd's mean to you?

A. Lloyd's Insurance Company.

Q. Do you recall ever being at the yacht basin at Ft. Lauderdale, operated by Captain Pilkington?

A. What was that question, please?

Q. Do you recall ever being at the yacht basin at Ft. Lauderdale, operated by Captain Pilkington?

A. Yes.

Q. How many times, do you recall being there?

A. Well, I was there two or three years before Pilkington was there, I think, first, when Mr. Corey was there.

Q. I am speaking about your possible visits to that place in connection with the Seminole.

A. I was there.

Q. And how many times do you recall being there?

A. Twice.

Q. Can you fix the year of either of those visits?

A. No. Once with Riley.

Q. And on the other occasion did you go with anyone?

A. With Mrs. Phipps.

Q. Now, let's take the occasion of the visit with Mrs. Phipps. Did you have any discussion with Captain Pilkington at that time?

A. No.

Q. Do you remember what boat you visited?

A. I should think it was the Iolanthe, but I am not sure. I don't remember at all. It must have been on the Iolanthe, and on the Seminole, but I don't recall.

Q. Now take the visit with Riley, did you have any conversation with Captain Pilkington?

A. No.

Q. Did you discuss with him anything about the storage rates for the Seminole?

A. No.

Q. Or the Iolanthe?

A. No.

Q. Or the Clip?

A. No.

Q. Did you introduce Riley to Pilkington as—

A. No.

Q. Did you tell Pilkington that Riley was your secretary?

A. No.

Q. Did you tell Pilkington that Riley represented you?

A. No.

Q. Did you tell Pilkington that you were the owner of the Seminole?

A. No.

Q. Did you tell Pilkington to take orders from nobody but Riley?

A. No.

Q. Did you tell Pilkington that Riley was your agent?

A. No.

Q. Did you tell Pilkington that Riley would be down to visit the Seminole at any particular interval of time?

A. No.

Q. Or that he would be down to visit the Seminole at all?

A. No.

Q. Do you recall a trip north that the Seminole made in the summer of 1929?

A. Yes.

Q. What was the occasion of that trip?

A. Well, I thought it might be useful—my father was a very old man, and I thought that if I sent the boat up there in the hot summer that he would enjoy trips up and down the Hudson, so I sent it up there for that purpose. I sent it up or it was taken to Port Washington; I think that is the place.

Q. What was the condition of your father's health at that time?

A. He wasn't very well; I think he was 89 years old. What date was that?

Q. That was in 1929.

A. Can I ask Mr. Layman?

Q. No; we want just your recollection.

A. I know he was a very old man and not very strong, and I thought it would be very good to take trips on the Hudson, so I sent the boat up, hoping that he could use it.

Q. Did you consult with anybody else before you did that?

A. I consulted with Mrs. Guest. I think Mr. H. C. Phipps was abroad.

Q. To whom did the Seminole belong in 1929?

A. In 1929? When was the Seminole Boat Company formed?

Q. Do you remember when the Seminole Boat Company was formed?

A. It was formed about that time, about 1928 or 1929. I think they had a record of that before.

Q. From the time of the formation of the Seminole Boat Company to the time you transferred your interest in it in exchange for stock, did you ever again become the owner of the Seminole?

A. No.

Q. Do you remember an engineer named Brown who worked on the Seminole?

A. Yes.

Q. Did you ever have any discussion with him as to engineering work in the engineroom of the Seminole?

A. No.

Q. Do you remember his ever asking your approval for making any changes in the engineroom?

A. No.

Q. On whom did you rely as far as your interest in the boat went at that time for information as to what should be done?

A. What year was that?

Q. That was in 1927, or the early part of 1928, before the formation of the corporation.

A. Captain Nelson, I presume, or whoever was Captain of the boat would tell me what was needed on the boat,

Q. Now in 1929 following the formation of the Seminole Boat Company did you ever ask Captain Bryant to take charge of the Seminole?

A. No.

Q. Do you remember having any conversations with Captain Bryant about any needs for the Seminole?

A. No.

Q. Did you ever give him any instructions about anything to be done in the engineroom?

A. Was he captain then?

Q. I will ask you to assume that Captain Bryant was Captain of her at this time in 1929.

A. No, I never gave him any instructions about the engineroom at any time.

Mr. Underwood:

That is all.

Cross Examination.

By Mr. Matteson:

Q. Mr. Phipps, you have been shown this certificate of enrollment of the Seminole in the year 1923, when it was enrolled under an affidavit that you were the sole owner of the vessel at that time. Now, you say you don't know anything about that.

A. Well, I wasn't the sole owner; I never saw the enrollment—I never saw that paper before this minute.

Q. Did you have anything to do with this arrangement of enrolling?

A. No; I never heard of it until just now.

Q. You knew the boat had to be enrolled, didn't you?

A. You mean in the Yacht Club?

Q. No.

A. I really don't know anything about that.

Q. That is a formality with the United States Government?

A. I think the Captain took care of that; I don't know whether it had a number; I never saw that paper before, and I never gave Captain Nelson authority to do it. I suppose that if he had come to me and told me, I would have not put myself down as sole owner, because it wasn't correct.

Q. I understand that the matter of this kind was left to Captain Nelson, is that right?

A. Entirely, I suppose; I never saw it before.

Q. You left it to him to comply with government formalities necessary?

A. Yes, I presume—

Q. This is the document that gave the boat its official number, is it not?

A. I don't know.

Mr. Underwood:

We object to that; it speaks for itself, and the statutes and regulations speak for themselves, and Mr. Phipps has already testified.

Mr. Matteson:

I won't press that question, if your Honor please.

The Court:

All right.

The Witness:

You want to press it?

(By Mr. Matteson):

Q. I don't think it makes any difference.

A. All right.

Q. How do you know that the boat had to have an official number; you knew that, didn't you?

A. No.

Q. You didn't know about that?
A. No, I didn't.
Q. You didn't know that?
A. No, I didn't.
Q. Apparently this document was arranged by Captain Nelson. Now I want to ask you if you have any explanation to give us as to how Captain Nelson got the impression that you were the sole owner of the Seminole?

Mr. Underwood:
I object to that as calling for the operation of the mind of Captain Nelson.

The Court:
I think the question is all right.

A. Read the question.

(Thereupon the preceding question was read by the Reporter as above recorded.)

A. I don't think he had that impression.
Q. You just volunteered the statement, Mr. Phipps, that you didn't think that Captain Nelson had that impression. Now, to correct that impression, I call your attention to the fact that Captain Nelson made a sworn statement at that time to that effect. So it could not be very well that Captain Nelson had that impression at that time, could it?

Mr. Underwood:
I object to that; it is speculative and argumentative, and calls for the operation of another person.

The Court:
I think that objection is well taken, Mr. Matteson.

(By Mr. Matteson):

Q. Was Captain Nelson the Master of the boat at that time?

A. Yes.

Q. Did you have conversations with Captain Nelson with respect to the requirements of the Seminole?

A. I don't remember.

Q. You never had any conversation with him at all?

A. Not about this enrollment.

Q. I am not talking about the enrollment.

A. Yes, I talked to him, of course; he was my captain.

Q. Isn't it a fact that you are the one that he consulted with at that time with respect to anything that was required for the Seminole?

A. No.

Q. Did your brother have anything to do with Captain Nelson as the master of the Seminole, as far as you know?

A. Just as much as I did.

Q. Now, Mr. Phipps, I call your attention to this second certificate which was filed a year later, in 1924, and also by Captain Nelson and in which there is again a sworn statement that you were the sole owner of the Seminole at that time. Can you give us any explanation of how Captain Nelson had that impression at that time?

A. I don't know; personally, I don't think he had that impression.

Q. Do you recall signing this document which is headed "Answers to Interrogatories", at the end of which is an affidavit that you signed?

A. Yes; that is my signature. May I read the thing; I don't know what it is all about.

Q. Surely. I was going to call your attention to some parts of it.

A. (Reads paper.) I know nothing about the engine-room. You better not put this down.

Mr. Underwood:

Everything that you say, Mr. Phipps, is going to be put down, so please don't speak anything except in answer to questions.

A. All right.

Q. Is that correct?

A. That is correct.

Q. You have finished reading that document?

A. Yes.

Q. And all of the statements in that document are correct, are they?

A. According to my best knowledge and belief. I swore to it, so I am sure they are.

Q. I assume you read it more carefully at the time you swore to it.

A. I presume I did.

Q. Of course, there are some answers that are answers to questions that do not appear in the document itself.

A. Yes.

Q. But at the time you of course compared the answers with the questions, I assume?

A. I don't remember.

Q. Anyway, you were quite certain that everything in it was quite correct when you signed it?

A. Yes.

Q. You still say so?

A. To the best of my knowledge and belief.

Q. I call your attention to "Answer 1-I, in which it is stated that the Seminole was registered at only one club until 1921; it was registered in the name of Henry C. Phipps; from 1922 to 1932 it was registered in the name of John S. Phipps; since 1932 it has not been registered at any club". That is a correct statement, is it not?

A. I was told that it was registered—I would like to speak to my attorney; I think it was registered. I

am on the witness stand, and I understand it was registered with the New York Yacht Club, but I don't know what year that was. I don't know what clubs these were that I referred to in this thing.

Q. The answer starts out with the statement that the Seminole was registered at only one club.

A. I can't tell; I said that whole statement is true and I believe it is true.

Q. And that was the New York Yacht Club?

A. I wouldn't say it was; I believe it was, because my brother and myself were members of it.

Q. Both you and your brother were members of the New York Yacht Club?

A. Yes.

Q. And still are?

A. No, we both resigned.

Q. When was that?

A. I don't know. I guess you can get the record on that.

Q. Since 1932?

A. I wouldn't guess.

Q. This statement says that it was registered in your name.

A. It is easy to verify it. Get the New York Yacht Club register and it will be easy to find out.

Q. And the Seminole Boat Company was incorporated in 1928, was it not?

A. Either in 1928 or 1929, somewhere in there; someone will have to give me the figures, because it is hard from me to remember the years; I think it was 1928 or 1929.

Q. If we are correct in that, Mr. Phipps, the Yacht Seminole remained registered with the New York Yacht Club as your personal yacht until 1932?

A. I don't say that; I don't know whether it was registered with the New York Yacht Club at that time or not.

Q. Registered with some Yacht Club?

A. Well, it says so in that statement. I don't know what the club was in connection with that.

Q. Getting back to the conversion of the Seminole from steam to gasoline; was Captain Nelson the captain of the boat at that time?

A. Yes.

Q. Who arranged for the work to be done?

A. Captain Nelson.

Q. You left that entirely to him?

A. Yes.

Q. Do you know whether he did most of the work himself or whether he employed a shipyard to do it?

A. I don't know.

Q. Wasn't a good deal of the work done right in Palm Beach?

A. I don't know; I didn't ask where it was done; I don't know where it was done.

Q. You have no recollection at all about that?

A. I have no recollection except that I know it was changed.

Q. Did you give Nelson any instructions as to how the work should be done?

A. No.

Q. Did you tell him anything about how much it should cost?

A. No.

Q. I suppose you paid the bills, did you?

A. I presume so; I don't know; I must have, however.

Q. At least your share of them?

A. Yes; that is, my brother paid half and I paid half.

Q. That was somewhere back of 1924?

A. Yes.

Q. When you paid these bills, Mr. Phipps, I assume that you saw them and approved them before you paid them?

A. No.

Q. What is that?

A. No, I didn't see them.

Q. You mean to say that you paid the bills without seeing them?

A. They were okayed in the office and then I would pay them.

Q. Okayed by whom?

A. By whoever was my secretary; by Mr. Robbins.

Q. Was Mr. Robbins your secretary at that time?

A. He was there at that time, yes.

Q. Was he in Palm Beach?

A. No.

Q. Where was he?

A. At that time I don't know.

Q. I mean when Mr. Robbins acted as your secretary.

A. In New York.

Q. He was in New York?

A. Yes.

Q. I mean when Mr. Robbins acted as your secretary.

A. In New York?

Q. He was in New York?

A. Yes.

Q. Has he always been in New York?

A. Well, I don't know.

Q. I mean since he has been working for you, Mr. Phipps, has he always been in New York?

A. Well, I am wondering about that; I can't answer yes or no; he might have been down here one winter at Palm Beach, but I have no definite idea about it; I just couldn't tell you.

Q. Is Mr. Robbins your secretary now?

A. No.

Q. When did he cease to be your secretary?

A. When he took over the real estate department in New York.

Q. What do you call your real estate department?

A. Henry Phipps estates.

Q. Is he in charge of that organization?

A. He is second in charge.

Q. Does he have something to do with the Phipps Realty Company?

A. No. Now, that would be hard to say. The Phipps Realty Company, I believe—I think the Phipps Realty Company owns Henry Phipps Estates. I am not sure about that, unless I looked at my books.

Q. Does Mr. Robbins represent your family interests in New York?

A. To some extent.

Q. Mr. Hawkins represents your family interests in Miami, does he not?

A. In Miami, yes.

Q. And before him Mr. Scott?

A. Yes.

Q. And when Mr. Scott was here was he the superior officer of Mr. Hawkins?

A. Yes.

Q. So that he would take his instructions from Mr. Scott; wouldn't he?

A. How is that?

Q. He would take his instructions from Mr. Scott; Mr. Hawkins would take his instructions from Mr. Scott, would he?

A. Yes.

Q. Now, getting back to the organization of this corporation, you say—

A. Which corporation?

Q. The Seminole Boat Company. You say that that was organized because you wanted to charter the Seminole, is that right?

A. Yes, because I wanted to go in the business of chartering the Seminole.

Q. You and your brother were of the same mind about that?

A. We discussed it and agreed.

Q. And you owned equal shares of the Seminole at that time?

A. That is correct.

Q. So you caused the Seminole Boat Company to be organized, did you not?

A. I didn't; we did it together.

Q. The two of you together?

A. Yes, the two of us; we owned it together and we decided it would be a good idea.

Q. And you took equal shares of the stock of the Seminole Boat Company?

A. Yes, sir.

Q. So that if the boat was chartered and made a profit you would receive equal shares of the profits, is that right?

A. Yes.

Q. Is that right?

A. Yes.

Q. Now if you and your brother had wanted to do so you could have chartered the Seminole without organizing a corporation, couldn't you?

A. If I and my brother wanted to charter the Seminole, yes we could.

Q. So far as the profits were concerned the result would have been exactly the same, wouldn't it?

A. I don't think so.

Q. Well, if you had chartered the boat jointly between you, you would have shared the profits equally, wouldn't you?

A. We would have had the detail of the business, and my brother and I didn't want to have the chartering of the boat; it was a continuous thing; the boat was always for charter.

Q. Had you had the details of the management of the Seminole before that?

A. No.

Q. And your brother hadn't either, had he?

A. No.

Q. Everything with respect to the Seminole had been taken care of by your family representatives?

A. No; by the captain.

Q. And by your Mr. Robbins to some extent?

A. Will you read that. I don't quite understand it.

(Thereupon the preceding question was read by the Reporter as above recorded.)

A. Well, I think, until the Seminole Corporation was formed Mr. H. C. Phipps and I gave orders about the Seminole.

Q. And you wanted to be relieved of that detail, was it?

A. It was a business. Mr. Hawkins suggested that we put the Seminole in a corporation and charter it and continue to charter it.

Q. Now the point I am making, Mr. Phipps, is that you could have done exactly the same thing without organizing a corporation, couldn't you?

A. We wouldn't.

Q. You wouldn't?

A. No.

Q. But you could have?

A. I suppose legally we could have.

Q. And the result would have been exactly the same?

A. No.

Q. The final result would have been the same?

A. No, it would not.

Q. Perhaps I do not make myself clear: if you chartered the boat as individuals you would share the profits less the expenses?

A. Yes.

Q. And being joint owners of the stock of the corporation, each owning 50% of the stock of the corporation, you would share the profits that the corporation made in the same way, wouldn't you?

A. Yes, but we wouldn't make as much profit. Is that what you are trying to get at?

Q. So that the principal difference that was made by the organization of the corporation was that the names of yourself and your brother did not appear as charterers of the vessel, is that right?

A. Say that again.

Mr. Matteson:

Will you read the question?

(Thereupon the preceding question was read by the Reporter as above recorded.)

A. No; that is not right.

Q. Mr. Scott, the president of the corporation, was your family representative in Miami at that time?

A. That is correct.

Q. And as such you could call on him to take care of your personal business matters, couldn't you?

A. Yes, and for all members of the family.

Q. And that was true of Mr. Hawkins also?

A. Yes.

Q. You could call on him for your personal business when you required it?

A. Yes.

Q. And that was also true of Mr. Alley in Palm Beach?

A. Yes.

Q. So that if you had wanted to go into the charter business personally you could have called on these three men to take care of the detail for you, couldn't you?

A. No, we could not.

Q. You have stated, Mr. Phipps, that you were never called upon to make decisions with respect to the repair and maintenance expenses of the Seminole. Now Mr. Hawkins testified here, as I recall it, that when he was looking out for the Seminole he had a mental limit of $500.00 as to what he would expend without consulting with you, and that on one or more occasions he did consult with you when the contemplated expense exceeded that amount. Do you recall that?

Mr. Underwood:

If your Honor please, I object to the question as not a fair representation of Mr. Hawkins' testimony.

Mr. Matteson:

If you will show us or point out in what respect it is incorrect—

Mr. Underwood:

Mr. Hawkins' testimony was that it came to a point above which he didn't want to go on his own responsibility, that he consulted both stockholders.

Mr. Matteson:

Perhaps I inadvertently left that out.

Mr. Underwood:

You left it out.

Mr. Matteson:

If that is the only objection, we will correct that. Add the words "and your brother"' in each instance. Now will you read that question as amended, Mr. Reporter?

(Thereupon the question, as amended was read by the Reporter as follows: "You have stated, Mr. Phipps, that

you were never called upon to make decisions with respect to the repair and maintenance expenses of the Seminole. Now Mr. Hawkins testified here, as I recall it, when he was looking out for the Seminole he had a mental limit of $500.00 as to what he would expend without consulting with you and your brother, and that on one or more occasions he did consult with you and your brother when the contemplated expense exceeded that amount.")

Q. Do you recall that?

A. That makes a lot of difference. I don't know anything about any such limit. If there had been major changes in the boat he would have consulted me and would have consulted my brother too.

Q. Do you recall that he did on more than one occasion so consult you?

A. On one or more occasions there were some major repairs that he did consult me on.

Q. Mr. Riley testified here that in similar manner he had a mental limit of about $300.00, and that when any expense was contemplated of more than that amount he would and did consult with you and your brother on one or more occasions and obtained your approval. Do you recall that?

A. No.

Q. You don't recall Mr. Riley ever asking you for your approval of an expenditure of $300.00 or more on the Seminole?

A. No.

Q. You don't say that he didn't do that, do you?

A. Well, I don't remember his ever doing it. If he said he did it, I believe him, but I don't remember him ever doing it.

Q. Well, Mr. Phipps, it is true, is it not, that for several years before the fire Mr. Riley did have charge of the Seminole.

A. No.

Q. Well, there is—

A. He may have represented the Seminole Boat Company, but he never had charge of the Seminole through me; I never delegated the management of the Seminole to him.

Q. I was trying to make the question general, Mr. Phipps; whether you gave him instructions or not, you know that he was in charge of the Seminole?

A. I wouldn't say that he was; I don't know of him being in charge of the Seminole.

Q. And you were consulted by Mr. Hawkins when he got an offer to sell the boat for $5,000.00?

A. Yes.

Q. He came to you and asked you your approval of that sale, is that right?

A. No. He said that he had an offer of $5,000.00 and thought it would be a good thing to sell the boat. Is that what you mean?

Q. Yes.

A. All right.

Q. Did he ask you for your approval of the sale?

A. And I said, "I didn't know".

Q. His speaking to you was for the purpose of obtaining your approval or disapproval, was it not?

A. He wanted to know if I was willing to sell the Seminole for $5,000.00 I think you must say "we", because I couldn't sell the Seminole.

Q. I think Mr. Hawkins said that he spoke to each of you.

A. Very likely he did; I am sure that he must have.

Q. But he did speak to you as far as your interest was concerned?

A. Yes.

Q. Now after this corporation was formed, as I understand it, you did have the right to use the boat when

you wanted it, assuming that she wasn't chartered to someone else?

A. Or a charter was being negotiated.

Q. Well, I take it that if a charter was being negotiated—

A. I would have taken the money.

Q. What?

A. I would have chartered it.

Q. At least, you would have approved it; you would have preferred to do that.

A. If a charter was negotiated I would rather charter it than to take it myself.

Q. But outside of that you did have the right to use the Seminole when you wanted to?

A. Yes.

Q. And when you wanted to do that you called Mr. Hawkins or Mr. Riley and told them that you wanted to use it?

A. Yes.

Q. This trip that you made in April, 1935, the trip to the Keys, the last trip, how did you arrange for the use of the Seminole on that trip?

A. I asked Hawkins—well, I don't know, because—

Q. You spoke to Mr. Hawkins, is that right?

A. I am only guessing about it; I don't know how it was arranged; certainly it was arranged if nobody else had the boat.

Q. Isn't it a fact that you communicated with Mr. Hawkins at that time and told him that you would like to use the boat?

A. I communicated with somebody who had charge of the Seminole.

Q. You don't recall who it was?

A. I don't know; I presume it was Hawkins.

Q. Is there any doubt in your mind that it wasn't?

A. Well, just as much doubt as it was not; it could have been Hawkins.

Q. Now on these occasions when you did make use of the Seminole you paid the operating expenses?

A. Yes.

Q. And that is all you paid, isn't it?

A. The operating expenses of the charter party of the trip, yes.

Q. Of the charter?

A. Of the charter.

Q. You paid nothing for the use of the boat?

A. I paid nothing for the use of the boat, no, except it really came to paying for the use of the boat, because I paid the men on the boat; I paid the men that were on the boat; I paid their wages and it was that much advantage to the company, that much gain to the company.

Q. Well, as a matter of fact, Mr. Phipps, except when the boat was in use she had been laid up practically continuously at Fort Lauderdale, had she not?

A. I don't know. Is that so?

Q. You don't know that?

A. No, I don't.

Q. You don't know that she had been laid up at Fort Lauderdale practically continuously from 1931?

A. I knew she had been laid up at Fort Lauderdale, but I don't know that it was continuously; I don't recall how many charters she had during that time.

Q. Do you know that she had no charters after 1931?

A. No.

Q. Do you know that she only left Fort Lauderdale four times after 1931?

A. No.

Q. You didn't know that?

A. No.

Q. You made a trip on her to the Keys in August, 1932, didn't you?

A. Is that the last trip? I get mixed up in these dates, I am sorry to say.

Q. No. There was a time in August, 1932 when a trip was made to the Keys.

A. If you will tell me who was with us, I will tell you whether I went. Couldn't you assist me in that?

Q. I will try to assist you. Mr. Riley produced here yesterday a list of groceries which he bought for the trip in 1932 and, as I recall his testimony, he said that you wanted to make a trip and he got the boat at Fort Lauderdale and stocked her up with groceries, and those were the groceries in August, 1932. Does that recall anything to your mind?

A. Well, if he said it, it is so.

Q. You have no recollection of that?

A. I couldn't pick them out; if it was a trip, tell me what we did at the time and I will be able to tell you probably.

Q. In connection with the use of the Seminole you keep bringing in the word "charter". There was no document signed, was there?

A. I think, for the sake of the company and my partner or my family that it was an advantage for either one of us to use the Seminole, because it relieved the other of any expense during the time it was laid up, or whatever it was, and it was the same as a charter. I do not draw any distinction between a charter and this, except I don't think there was any charter form drawn up.

Q. When you use the word "charter" it is because in your mind the arrangement was the equivalent of a charter?

A. Not only that, but that was the business of the Seminole Boat Company to charter the boat.

Q. It was the business of the Seminole Boat Company to charter the boat to make money, wasn't it?

A. Yes.

Q. And they couldn't make money by letting you use the boat for nothing?

A. Yes; they could save money.

Q. In any event, there was no document or charter or anything in writing about the use of the boat?

A. I don't remember any document being signed. It may have been in the records; have you asked for it.

Q. If there was one, Mr. Phipps, I guess we would have seen it long before now.

A. All right.

Q. With reference to this last trip, in April, 1935, I understand Mr. Hawkins consulted with you as to whether Captain Baker should be employed as captain for that trip, is that right?

A. He asked me if Baker would be satisfactory as captain of the boat. Hawkins was collecting the crew, and he asked me if Baker would be satisfactory, and I had had Baker before, and I said it would be entirely satisfactory.

Q. There is another statement in these answers to interrogatories that I want to verify from you, Mr. Phipps, and that is found in Answer 7-B, which is this sentence right here (pointing).

A. May I read the whole thing?

Q. Yes; sure.

A. That is correct.

Q. That is a correct statement?

A. Yes.

Mr. Matteson:

Now, I will read into the record just this part of it.

Mr. Underwood:

Read it all.

Mr. Matteson:

No; I am going to read part of it. "R. C.—

Mr. Underwood:

If your Honor please, this is a single whole answer to one question. I don't think the record should be put in piecemeal, I think we should have the whole of it, if we have any part of it.

Mr. Matteson:

It is a part of the record anyway.

The Witness:

It is only ten lines.

Mr. Matteson:

There are four sentences in the paragraph, and I am asking the witness about one complete sentence.

The Court:

Just let the question be completed, and then make your objection.

(By Mr. Matteson):

Q. I am reading you the following sentence found in this answer: "R. C. Abel was in Respondents' employ at a monthly wage, working generally in connection with Respondent's fishing boats, except upon occasions when his services were employed by another who paid his wages for such period". Is that a correct statement?

A. That is a correct statement.

Mr. Underwood:

I object to that on the ground that it does not include the entire answer to the question propounded in the interrogatories.

The Court:

Let me see it.

Mr. Matteson:

If your Honor please, Mr. Underwood is trying to force me to—

Mr. Underwood:

I am trying to force you to be fair.

Mr. Matteson:

I resent that statement. This is a cross examination of the witness, and if he wants to testify about the other matters he can do so in answer to your questions.

The Court:

Where are the questions in connection with the interrogatories?

Mr. Underwood:

Shall I read them to you?

The Court:

Are they in the record?

Mr. Underwood:

They are all attached to the libel. I can find them for you.

Mr. Matteson:

I have a set here, if your Honor please, in which the questions and answers are opposite each other.

Mr. Underwood:

They are 7-A and 7-B.

The Court:

Now, Mr. Phipps, Mr. Matteson (you can just be seated) quoted from your answer under this heading 7-B.

Do you understand that he quoted the question. Now, Mr. Reporter, will you read the question to him. You look at this and the Reporter will read the question to you.

(Thereupon the Reporter read the preceding question as follows: "I am reading you this complete sentence found in this answer: 'R. C. Abel was in Respondent's employ at a monthly wage, working generally in connection with Respondent's fishing boats, except upon occasions when his services were employed by another, who paid his wages for such period' ".)

The Court:

Now, don't answer that. The question of Mr. Matteson thus far was the quoting of this which you see here is a part of your answer. Now he is going to proceed and ask the question. Now listen to the rest of the question.

Mr. Matteson:

Read it.

(Thereupon the preceding question was read by the reporter as above recorded.)

The Court:

Now he asked you was that a correct statement. Now, Mr. Phipps, I call your attention to this fact that your attorney has made an objection that in the quotation from this answer to 7-B the entire matter was not quoted. Wait a minute; I am explaining it to you. Now, I am calling your attention to what was the question. Just read right here, beginning at 7-A. B, C, D, E and it goes over on the other page to F. Now then, Mr. Phipps, you will be allowed to answer that question, but in so doing

you may, if you wish, read the entire answers that you gave, beginning with 7-B, and going on down.

The Witness:

Is this something I have signed; is this my testimony; what is this paper; is this something that I said was true?

The Court:

Isn't that your signature right there?

The Witness:

Yes, that is my signature.

The Court:

I will explain this to you: These were interrogatories which were propounded to you when the suit was instituted and the interrogatories were these, beginning right there (pointing).

The Witness:

And these are my answers?

The Court:

Those are your answers over your signature.

The Witness:

Yes, that is correct. May I just read my answer?

The Court:

You will have to answer his question, and in so doing you may read both the question and answer; you may read what the entire question was and what your answer was.

Mr. Matteson:

If your Honor please, I call attention to the fact that my question did not in any way relate to June 24, 1935.

and I would like to make it clear that my questions specifically exclude that date.

The Court:

The witness can take that into consideration, too.

Mr. Underwood:

Something else has transpired that I think you should have in mind perhaps before you rule on the question, and that is that when that interrogatory was first propounded Mr. Phipps made answer to it in these words: To 7-A he answered "Yes". To 7-B he answered: "R. C. Abel was not in Respondent's employ in any capacity on June 24, 1935."

Following the filing and serving of these answers exceptions were taken to them, and as you will remember, your Honor, they were argued here, and the exceptions to that answer was sustained, and Mr. Phipps was ordered to make a full and complete answer, which he later did, and which is now in the form presently before you. The Libelants asked for that answer and it was given, and they never took exception to it; they never moved to strike any part of it out as surplusage or as not being responsive, therefore, I urge that if any part of this is to be put to the witness, it ought to be put to him as a whole.

The Court:

The witness can answer the direct question. He can incorporate any other part of the answer that he wishes to.

Mr. Underwood:

I have no objection to Libelants putting to the witness the same question again as included in the interroga-

tories, but if they call his attention to any part of one answer, I think it only fair that he be asked about the entire answer, because it is all a part of the answer which has been considered proper and responsive up to this moment.

The Court:

Don't you think that by calling Mr. Phipps' attention to that entire answer, that the point is covered?

Mr. Underwood:

I think the question should embody the entire answer, and I don't think it should be broken up piecemeal.

Mr. Matteson:

It seems, if your Honor please, that we are getting involved here and are wasting time, so I am going to withdraw this question and get at it in a different way.

The Court:

All right.

(By Mr. Matteson):

Q. Mr. Phipps, I want to ask you if it is the fact that in the year 1935 Mr. R. C. Abel was generally employed by you on a monthly wage, working generally in connection with your fishing boats, except upon occasions when his services were employed by another, who paid his wages for such period; is that the fact?

A. Isn't that the same question you just asked me?

Q. I am not referring to any document now at all. I am asking you whether that is a fact as I have stated it. If you want to refer to any document, you can do so, but I am not asking you to do it.

A. Read the question again. I am very sorry, but I want to be sure. Will the stenographer read the question again?

(Thereupon the preceding question was read by the Reporter as above recorded.)

A. I don't know; I am really confused about it.

Q. Would you like to have the question read to you again?

A. No; go ahead; I don't know. Give me another question.

Q. Well, Mr. Phipps, if you are confused about this one, we will read it to you as many times as you would like and give you all the opportunities you wish to consider it.

A. I don't know how long Abel was employed by me at that time. I do not know that when Abel was in my employ he was also employed by others, and Riley had authority to use him for others, that is, for my relatives or brothers or some of their parties, or for some of the corporations, and he did so use him, and when he did so use him they paid him, and while he was using him he was no longer my servant; he was their servant, and his time was paid by those who used him. Is that what you want?

Q. That is exactly what I want. Then, if I understand it correctly, except at such times when Mr. Riley appointed him to do something else, that Riley had authority—

A. That is not correct; Riley had permission from me to use him that way.

Q. And except when he was so used he was employed by you?

A. Well, I wouldn't say whether that is true or not, because I don't know the period of how long a period he was employed; he may have been employed only a short time. When he was on the Iolanthe he was employed by me, and also when he was on the Clip. If he went on the Clip on a fishing trip with Townsend Martin, Townsend Martin would pay for the time that Abel worked for him.

Q. Well he did work for you continuously through 1934 and 1935, except at such times as Riley required him for someone else?

A. Or when somebody else required him. I don't think it was always Riley; in fact, I am quite sure it wasn't.

Q. If anyone else than Riley wanted him, I suppose they would have asked you?

A. No, it was a family affair, and they would take him.

Q. With your permission?

A. They would take him and they would pay him; Riley would send them a bill for it.

Q. I show you this document here, Mr. Phipps: do you recognize that handwriting on this note here?

A. That is my handwriting. Who is that addressed to

Q. Well, it is written on a bill of Captain Pilkington's.

Mr. Underwood:

Dated August 31, 1932, referring to fishing boats and the Iolanthe, without any mention of the Seminole on the paper; is that correct?

Mr. Matteson:

That is correct.

(By Mr. Matteson):

Q. My inference, Mr. Phipps, is that it was directed to Mr. Riley, but that may not be correct, so I am asking you.

A. This is my handwriting, and I believe this is my okay "J. S. Phipps", and this is a bill from Pilkington, and I presume I thought it was pretty high.

Q. Who was that note addressed to?

A. It is addressed I presume to Riley, because that is his initials on there.

Q. You intended that note to reach Mr. Riley?

A. I didn't want him to pay the bill before seeing if he could get a reduction. It was a bill for the fishing boat and the Iolanthe, and it has nothing to do with the Seminole.

Q. That bill has nothing to do with the Seminole?

A. No.

Q. Well, in your note you asked him to see if he could get a reduction on the Iolanthe and the Seminole, didn't you?

A. Well, they had overcharged me on the Iolanthe, and I thought he was overcharging the company on the Seminole. I thought it was a pretty stiff price he was making.

Q. Did you ever tell Captain Pilkington that you thought his price was pretty stiff?

A. No.

Q. I understand that you remember two occasions when you visited Pilkington's yard?

A. Yes.

Q. Was one of those prior to this trip in August, 1932; do you recall?

A. I don't recall the dates at all; I don't know that there was a trip in 1932. Will you show me that there was a trip in 1932?

Q. I think that appears from the records.

A. All right.

Q. You were there with Mr. Riley on one occasion?

A. Yes.

Q. Did you have any words at all with Pilkington on that occasion?

A. Shook hands with him.

Q. You know the gentleman, don't you?

A. No, I don't. He said, "How do you do"; I really don't know; I am quite sure that I shook hands with him, and then Riley went off and talked to him.

Q. In the course of that conversation was there a conversation when the three of you were present?

A. No.

Q. There were no words passed while the three of you were together, is that your recollection?

A. You mean about the weather or anything?

Q. About anything.

A. I don't remember about any conversation.

Q. And you say there was no conversation in your presence with respect to rates of storage?

A. That is correct. You mean a conversation between Pilkington and Riley?

Q. Yes.

A. That is correct.

Q. And there was no conversation between Pilkington and Riley with reference to rates in which you took part?

A. No.

Q. Or in which you contributed anything at all?

A. No; that is correct.

Q. Or in which you said anything bearing on rates?

A. Not that I remember.

Q. And that relates to the other boats that you had there as well as the Seminole, does it?

A. I don't remember discussing anything with Pilkington.

Q. You don't remember saying anything to Pilkington about rates on the Iolanthe?

A. No.

Q. Or on the Clip?

A. No.

Q. Or on all three boats lumped together?

A. No.

Q. Do you recall going into the engineroom of the Seminole at the Royal Palm Dock when she was lying here in March or April, 1935?

A. No.

Q. You say you didn't go into her engineroom there?

A. I don't recall going into her engine room.

Q. Do you recall any occasion on which you ever went into her engineroom?

A. I recall twice.

Q. When were they, do you recall?

A. I went in with my brother to look at the new engines when they were installed.

Q. That would be back in the early 20's?

A. That was sometime ago. The second time I don't think I went down in the engineroom; I looked in the engineroom to see if they could put a fisherman in there to sleep. I had quite a large crew of fish boats with me on the trip, and I wanted to find out if we could put another man in the engineroom and I think one man slept in the engineroom, but I am not sure about the man sleeping in the engineroom.

Q. Those are the only two times you remember being in the engineroom of the Seminole?

A. Yes. I don't think I was in that time. I may have been, but I don't know how I got there.

Q. Were you at the Coconut Grove Boatworks when the Seminole was there in March, 1935?

A. Yes.

Q. Do you recall visiting there?

A. Yes.

Q. Did you go on board her that time?

A. Is that the time when the rail was broken. There was an accident around there, wasn't there?

Q. I am talking about the time just prior to this last trip to the Keys in 1935.

A. I don't know whether it was that time or not, but I have been to that yard to see the Seminole.

Q. What was the occasion of your going there then?

A. I think there was an accident to the boat, and I was waiting to go off on a charter. I was sitting there on

the deck waiting for the boat, and they said they had an accident; that the boat was down here at the place that you mentioned.

Q. Coconut Grove Boat Yard?

A. Isn't that near the aviation field?

Q. Yes.

A. Yes, they said it was down there, and I said, "goodness, I hope you get this fixed quick, because we are sitting out here waiting for a trip".

Q. And that's the only time you visited the Seminole at the Coconut Grove Boatworks?

A. That is the only time I recall.

Q. You were not there in 1935, as near as you recall?

A. I don't recall it, no. Was that in 1935, the time I mentioned?

Q. No; I think not.

A. Oh, I don't know.

Mr. Matteson:

I think that is all at this time, if your Honor please.

By Mr. Botts:

Q. I believe that you stated that you were at the Pilkington Boatyard on only two occasions?

A. Those are the only two that I recall.

Q. It is possible that you might have been down there casually on other occasions that you do not recall, is that it?

A. It is possible.

Q. Yes. Now do you recall who introduced you to Captain Pilkington, or how you became acquainted with him?

A. I don't remember.

Q. You don't know then whether you were acquainted with him before you made these trips or whether you met him on those trips?

A. My impression was I didn't know him before I made the trip.

Q. Then you don"t know who introduced you, or how that came about?

A. No.

Q. Now before the Seminole Boat Company was organized, when you and your brother, Mr. H. C. Phipps were the owners, as I understand it, the ordinary expenses for upkeep, storage, repairs, anything of that sort, you and your brother each contributed 50 per cent of that expense?

A. Yes.

Q. And that if either of you took the boat out on a trip, the other not being a member of the party, that the person who made and was responsible for the trips, paid the entire expense of that trip. Now am I correct in my understanding that those expenses included the time of crews or employees on the boat, as well as the expenses for food and so forth?

A. I think that would depend.

Q. All right, sir.

A. It would depend, whether the crew was gotten for that special trip, or whether there was a crew already on board.

Q. I see. In other words, if it should happen that you were maintaining regularly, members of the crew, then those regular salaries would probably have been treated in the same category as repairs, or storage?

A. Well, I really don't know the distinction. I don't know that there is much distinction.

Q. If you gathered a crew for that particular trip, then all the expenses of that crew were treated as a part of the expenses of that trip and paid for by whichever one of you actually used the boat?

A. Correct.

Q. Now when these various bills—and I am speaking now still of the time prior to the incorporation of the corporation,—when these bills, such as storage and ordinary repair and upkeep,—when those were presented, my understanding is that either your secretary or the representative of your family corporation down here, would disburse these regular and ordinary expenses; is that correct?

Mr. Underwood:
May we have the time fixed, your Honor?

Mr. Botts:
I fixed the time; prior to the incorporation of the Seminole Boat Company. Now read the question.

A. I think I have it in my head; I am trying to think what the answer is there. You better read the question again.

(The question was read.)

I will say, yes. Well, wait a minute:

Q. All right, sir, go ahead and make any explanation you want to, sir; I am not trying to cut you off.

A. I don't say they would be paid before our o. k. was on them, because I have forgotten just the course; sometimes we ok'd bills and sometimes we didn't. Now if it was something,—I am talking, before the corporation; if it was something that was ordered by them for me, and they knew I had ordered it, or had to have it, he would pay the bill and then send it to me. But usually I o. k.'d my bills and Mr. H. C. did, too.

Q. Now suppose the boat was put in storage, we will give for example, and you knew the boat was in storage

and had authorized or approved that situation, then when the bill would come in they probably wouldn't come to you and say "Mr. Phipps, do you want us to pay this bill for storage?" They would ordinarily go ahead and pay that sort of thing, wouldn't they?

A. I wouldn't say that. They often sent them to New York.

Q. And in New York—

A. I would like to see them, or Mr. H. C. Phipp would see them.

Q. Or your secretary?

A. He wouldn't o. k. them.

(Thereupon hearing was recessed until 1:45 o'clock p. m. of the same day.)

Tuesday, May 16, 1939, 1:55 o'clock P. M.

Afternoon Session.

2397 (Hearing resumed pursuant to the noon recess; the witness MR. JOHN S. PHIPPS, resumed the stand upon cross examination continued:)

By Mr. Botts:

Q. Do I understand you then, Mr. Phipps, that prior to this incorporation you personally superintended the entire details with reference to the Seminole in the payments of its bills?

A. I didn't—what did you say, supervised the details? I didn't supervise the entire detail; but my brother and I never paid the bills unless we approved them. That's before the Seminole Corporation was formed.

Q. Yes. Then as I understand it, prior to the formation of the Seminole Boat Corporation, no bill for the Seminole was ever paid unless it had the personal approval of either you or your brother; am I right?

A. No, no; because—you might just as well say that about the Iolanthe and the Clip. They were our personal property, and we did o. k., the same as we would o. k. the bills for the Clip and the Iolanthe, and the bills wouldn't be paid unless we o. k.'d them, but I wouldn't say they never had been paid, but I don't think it is probable, because I don't think people have the right to pay them.

Q. Well, I will put it this way: Except perhaps for some isolated and unusual occurrence, no bill was ever paid for the boat Seminole prior to the corporation being formed, unless it had the personal approval of you or your brother, is that correct?

A. No. I would say that in the ordinary course of business, the bills were o. k.'d by my brother and myself.

Q. All right; and were not paid until you had o. k.'d them, is that right?

A. I wouldn't say that. They very likely did pay some few bills, because they had ordered the goods and wanted to keep my credit good, I suppose.

Q. I tried to take care of that situation by injecting the thought that, except in some unusual or isolated circumstance, you or your brother approved and paid the bills; is that right?

A. Well, I don't think so because we were very often away from home; perhaps we gave authority, but I am only guessing, I don't know,—to pay certain bills. But before the Seminole Boat Corporation was formed, those boats were our personal property, and just the same, as I would usually o. k. the feed for my horse, because he had to be fed. But in the ordinary course, all bills that were chargeable to my brother and myself for our boats, were o. k.'d by us; just as I understood—

Q. That was the ordinary thing?

A. I should think so, yes.

Q. And in the large majority of cases, that was the routine that was followed?

A. I wouldn't know; I don't know.

Q. You don't know?

A. No, I don't know. I only know that that was my custom and my wish.

Q. And you don't know whether it was followed or not?

A. Not entirely, no.

Q. Now I believe you have stated that you don't recall the exact date when the Seminole Boat Corporation was formed; but assuming it was late in the year, 1928,—which I understand to be a fact?

A. Yes.

Q. Isn't it true that Mr. Hawkins had been looking after the boat Seminole for some months prior to that time?

A. Before the Seminole Corporation was formed?

Q. Yes, for we will say six months to a year, in that vicinity.

A. Well, I wouldn't say so. It would depend very much on where the Seminole was at the time.

Q. Well—

A. And if the Seminole were in Palm Beach, I suppose Mr. Riley would keep in touch with the Seminole and bring the biils to me, to look after. I don't know where the Seminole was, at just the date you refer to. I don't want to pin anything on Hawkins particularly.

Q. Well, we are not trying to pin anything on Mr. Hawkins, we are just trying to find out. Mr. Phipps, I think counsel won't object to my saying that it is in evidence that beginning, I believe it was in April of 1928, the Seminole was—or approximately that time, the Seminole was in storage at Pilkington's.

Mr. Matteson:

July.

Q. I was thinking it was early, earlier than that; and that Mr. Simmon or Simon, I don't remember which way they pronounce it, actually looked after the details through authority from Mr. Hawkins—was it Mr. Scott?

A. I don't know.

Q. Mr. Scott or Mr. Hawkins, I am not sure which. Now they didn't submit the bills at that time to you for your approval, did they?

A. Oh, yes. You are talking before the Seminole was incorporated?

Q. Yes.

A. Oh, yes, sir; I think the bills were then sent to Palm Beach, when we were there, for our approval.

Q. And the bills for July and August storage, for instance, for the year 1928, prior to the incorporation, you think those were sent to you?

A. Haven't you got them?

Q. I believe that they are in evidence.

A. I don't want to say yes or no, because I don't know.

Q. All right then, you don't know. That is the point I am getting at, Mr. Phipps.

Q. I should think that they had my o. k. on them; that's what I think, or Mr. H. C. Phipps' o. k.

Mr. Underwood:

We have the bills for July and August, here.

Q. All right, sir; there seems to be a bill for July; does that have your o. k. on it, or that of your brother?

A. No. That's mine, the other is my brother.

Mr. Underwood:

The witness refers to—

Q. The bill from Pilkington dated July 31, 1928.

Mr. Underwood:

Witness points to the two lines under the words "Distribution".

Q. J. S. Phipps, 29.1, H. C. Phipps, 29.16.—Now then neither you nor your brother o. k.'d that bill, did you?

A. I don't see it on there.

Q. And I refer you to the bill for August 31, 1928 for the Pilkington storage, and ask you if either you or your brother o. k.'d that bill.

A. No, the distribution is the same though.

Q. The distribution is there, I understand that.

A. 42.15 and H. C. Phipps 42.15. But I don't see it on here. Have you any that have the o. k.?

Q. I couldn't answer you Mr. Phipps; they are here and I don't remember much more about that than you do. But I think there are a relatively few, but how many or how few I wouldn't want to say. Now then, after the corporation was formed, as I understand it, whenever there was a deficit in the ordinary and usual expenses of storage, repairs, upkeep and so forth, that was just as these storage bills I have just shown you, divided equally between you and your brother; is that true?

A. Whenever there was a deficit, yes.

Q. Now then the routine was approximately this, was it not: That the bills would be paid either by the Boulevard Mortgage Company or the Palm Beach Company and then the disbursing Company would be reimbursed by you and your brother; is that correct?

A. Well, did the Seminole have its own bank account?

Q. You mean the Seminole Boat Corporation?

A. Yes.

Q. I don't mind answering your question; it is in evidence that up until sometime—I have forgotten the exact date, perhaps in 1931, I believe, it did have a bank ac-

count, at which time the bank account was closed; and that while it had a bank account, if there was a deficit, that deficit was made up by a check from the Boulevard Mortgage Company or the Palm Beach Company, as the case might be, to the Seminole Boat Company, and thus disbursed. But after that bank account was closed, the disbursements were made either by the Boulevard Mortgage Company or the Palm Beach Company. Now are you not familiar with that deal?

A. I don't remember how the disbursements were made. Let's see, what was I going to say? I don't know how the disbursements were made, but annually or in some long periods, when they were built up, then we would reimburse the account. Is that what you wanted to know?

Q. That is what I am trying to get at, that in the first instance it would be paid by someone other than yourself, but ultimately you and your brother reimbursed the disbursing company for these deficits.

A. If there was a deficit.

Q. Yes, sir, when there was a deficit.

A. And not necessarily promptly.

Q. I understand that. So that the situation was this: That before the corporation was reimbursed, you and your brother directly absorbed any deficit, is that right?

A. Why, I don't know what you mean by, directly absorbed.

Q. Well, you, each of you paid your half of it, didn't you?

A. Perhaps once a year.

Q. Well, I mean eventually. I will put it this way. That prior to the incorporation, you and your brother periodically absorbed such deficit as there might be; is that right?

A. I think that is correct.

Q. And subsequent to the incorporation, you and your brother periodically absorbed such deficits as there might be; isn't that true?

A. I think that is true.

Q. And the only distinction in the method would be, that, prior to the incorporation, the bill was paid either by the Boulevard Mortgage Company or the Palm Beach Company, or perhaps some other of your family corporations, and reimbursement made to this disbursing corporation; and after the incorporation, it passed through the hand of one more of your corporations, to which the Seminole Boat Company, and that's the only difference, isn't it?

A. No, that is not correct.

Q. Will you point out wherein our assumption is not correct?

A. Before the corporation was formed, the Seminole Boat Corporation was formed, as I said, my brother and I paid the bills, and I should think more promptly, because—anyway before we always,—I won't say always; we usually, or we should have put our initials, o. k. on the bills. Now whether that was always done by us, I don't know, but that was our intention, and that is what we usually do with our bills at home. After the incorporation was formed, I felt I had nothing to do with it until the end of the year, or the end of a certain period, and then my brother and I, or my sister and I, would pay the deficit 50-50.

Q. But in respect to its ultimately being paid by the individuals, first you and your brother, and later you and your sister, the only difference in method of payment, other than perhaps o. k.'ing the bills was—

A. But that was a big difference.

Q. All right, we understand that difference, and I am getting at another point now: That in the first instance the bills would be paid, we will say, by Boulevard Mort-

gage Company,—part of it; and part of it by the Palm Beach Company; and periodically you and your brother would reimburse that company. That is the way it was done, wasn't it?

A. Well, it was paid by somebody, and we would reimburse them.

Q. And after the incorporation, it was also paid by somebody, and you reimbursed them, wasn't it?

A. Well, that depends. We wouldn't reimburse them if we didn't know—the difference is that before the corporation was formed I was much more careful; I looked into it just the same as I would about the Iolanthe or my boat or anything that I had to pay,—or my butchers' bills, I go through the items. After the corporation was formed I left it entirely to them directors of the corporation, what they should order, what they should pay. I don't think they ever asked me. You said they had a limit of $500.00. I don't remember their asking me for approval. Now you want to know the difference and I am trying to tell you.

Q. Go ahead.

A. So that there is a difference. Perhaps periodically or some months, if there was a deficit, and my brother and I were the owners of the stock of the corporation, or my sister and I were the owners of the stock, we would pay, in proportion to our ownership, which was 50-50, each owning a half interest.

Q. And in one instance—then the only difference would be a deficit would occur, with your approval and you would pay it and in the other instance a deficit would occur without your approval and you would pay it? Is that the difference?

A. That is not the way I looked at it. In one case I would look over the items; in the second case, if there was a deficit, I wouldn't look to see where the deficit arose, I didn't have anything to do with it. I had entire

reliance anyway—the directors, or the management of the Seminole Boat Company made all those payments and if they told me that the Seminole was in the red and they needed some cash, my brother and I would pay it, because we were the stockholders; and what would happen if we didn't pay it? The boat would be put up for sale, wouldn't it. Just imagine what would happen.

Q. That would be whether you or the corporation were the owner, isn't that true?

A. Yes, and that is why at certain times,—but when we were the owners we looked into the figures; and when we weren't owners except stockholders, we left it to the directors of the company. And they say that they had a limit of $500.00, or some limit, I don't know, because I haven't looked at those items at all, I don't recall the items that they paid, except the storage items which you showed me this morning; I know of those.

Q. But in either instance, you and your brother absorbed the deficit, didn't you?

A. Now we weren't responsible, but we did pay it. Isn't there a difference there?

Q. Well, you did pay it, anyway?

A. Well, I think so; I think our credit is all right. But I don't know, that is supposition.

Q. Now then as I understand it, after the Boat Corporation was organized, save for the detail of paying this deficit, you had nothing to do with it; is that right?

A. I think that's right.

Q. And you were not consulted, as I understand it, at all, about what it might do or might not do, am I right?

A. Well, you mean about a charter?

Q. Let's take the question broadly as it was asked.

(The question was read.)

A. That is correct.

Q. Then when you testified this morning with reference to this Prigg boat, that you notified Mr. Hawkins that you and your sister,—to use your exact words, had decided to have the Prigg boat for Seminole, that was an exception to the rule, was it?

A. To what rule? To buy the Prigg boat? But I didn't make the rule, that they didn't buy anything; there was a limit. But Hawkins told me that the Seminole needed—or told Mrs. Guest—no, told me, said "The Seminole needs a tender, and there is Prigg boat for sale which I think would be very suitable." I saw the Prigg Boat—you don't want to hear it?

Q. Yes, I want to hear it; I am listening with great interest.

A. I saw the Prigg boat, and I told Hawkins that if the Seminole Company didn't want it I would take it. And I asked my sister if the Seminole Company wanted it and she said yes, and then I told Hawkins that it belonged to the Seminole Boat Company.

Q. Then in that instance, you and your sister, being then the stockholders, definitely decided what the Seminole Boat Company would do, didn't you?

A. Well, I think in that case; I call that rather major; I forget what it cost, but in that case he was free to ask us. If we had to have a tender for the Seminole, we would have to buy it for the Seminole in order to charter; I mean, if the Seminole was short of equipment, the man would go ahead and buy the equipment necessary to make a charter; I saw the boat, but I think it was a superficial thing to ask me if I wanted it.

Q. Did the corporation make any report to you as one of its stockholders of what it had done?

A. You mean, the minutes?

Q. No; make any report of its business transactions.

A. Not necessarily.

Q. Well, I mean, did it ever?

A. As a report?

Q. Written or verbal.

A. I don't know of any.

Q. As I understand it the principal and only business of the Seminole Boat Company was to charter the boat Seminole for profit?

A. That's right.

Q. Now then along in these years, 1931 and '32 and '33 and '34, you and your brother paid quite substantial deficits of the Seminole Boat Company, did you not? Running into a good many thousand dollars?

A. No, I don't know; but I tell you if I did, there was a good reason for it. Do you remember 1930 and '31 and '32 and '33? You couldn't charter a boat; they would give it to you.

Q. Now then—well, did you pay substantial deficits?

A. I was very disappointed and so was Baker; so was Mr. H. C. Phipps; I believe we were all disappointed.

Q. I assume that is true, but the question I asked you was this, and these explanations we have already had, if you will pardon me for saying so, if you will just listen to the question I ask and try to confine your answer to that; and then I don't mind your making any explanation you want. Now the question is that during these years, during each year, maybe once or more during the year, substantial deficits for the Seminole Boat Company were paid by you?

A. I don't know.

Q. Were you ever made aware that never after April 1st, 1930 was a single penny paid into the Seminole Boat Company for charter or otherwise, except from contributions from you and the other stockholders?

A. Why, I didn't know.

Q. You didn't know that?

A. No. It sounds foolish, but I didn't know; I didn't watch those accounts. They were taken care of by people I trusted.

Q. That is exactly what I am trying to get at.

A. How do you mean, you are trying to get at? They were taken care of. I am a stockholder in that company; I have good officers, good directors, and if they couldn't make the boat pay, if they spend out moneys for me—

Q. You and your brother, while you were the stockholders, indicated the persons who you desired to act as officers and directors of that company, didn't you?

A. Yes.

Q. And as a matter of fact, these persons that you nominated whether formally or informally, were the managers and assistant managers of your offices and properties here, isn't that true?

A. Of all the family offices.

Q. Well, I am referring to your family generally.

A. You mean, my brothers and sisters?

Q. Right.

A. They were the officers of the properties.

Q. And as such were merely your nominees; that is true, isn't it?

A. No, I don't think so. Well now, let me think about that: We as stockholders, selected those directors and officers; in that way they were our nominees.

Q. And you knew of course that these directors, serving at your suggestion, would, in respect to the Seminole, do exactly what you and your brothers desired them to do, didn't you?

A. Well, I hoped they would, but I didn't know what was in their minds.

Q. Well, you knew that they would, didn't you?

A. How do I know? Do you know what the directors or officers of any company will do? I trusted them.

Q. I can answer that question, if you want me to.

A. No, that is all right.

Q. As a matter of fact, if these men whom you and your brother selected to officer and direct this corporation, owned exclusively by the two of you,—if you and your

brother directed them to do anything and they didn't do it, you would have gotten somebody else in their place, wouldn't you?

A. No, not necessarily. They would do the right thing, and if there was something I didn't like, they would still do the right thing; they were independent, is what I wanted to convey to you.

Q. Now then do you—

Mr. Underwood:

May he finish?

A. They were independent, they were officers of the company and responsible to the company; they spent money for the company, and we were the stockholders. Now if they did something that we didn't approve, we wouldn't necessarily fire them; because they would likely have a good reason for doing it.

Q. Now that was not the question I asked.

A. Well, I am sorry.

Q. I asked if you and your brother, while you were the stockholders, directed these officers to do something, with reference to the Seminole and they didn't do it, you would have gotten someone else in their place, wouldn't you?

Mr. Underwood:

If your Honor please, I object to that as argumentative, speculative, already covered.

The Court:

Well, in a way I am inclined to agree with you; but it is cross examination. I don't want to unduly go over it and over it, but I think it would be wrong to sustain the objection so I overrule it.

(The last question was read.)

A. Unless they had a very good reason for not doing it.

Q. And you would have decided whether they had a good reason or not, wouldn't you?

A. My brother and I together would decide whether it was a good reason. Well, I can't imagine their not doing it without a good reason.

Q. I can't either. Now as a matter of fact, Mr. Phipps, didn't they, with considerable frequency, discuss the Seminole with you?

A. No. I didn't know,—you told me the Seminole had been idle four years; I didn't know it was four years.

Q. Wasn't there ever one occasion when they wanted to have a general overhaul of the motors, that they consulted you and your brother about that—or one or either of you?

A. No, I never heard of such occasion.

Q. You never heard of such a thing?

A. No; and in that case they would have gone ahead; and if I told them not to, still they might do it anyhow. Well, let's not go into argument.

Q. Now then, if I am wrong in my dates, please correct me, but my recollection is that this morning you stated that you became aware of the fact that they were paying John Thomas' hospital bills approximately a month, as I recall it, after the accident. Am I right?

A. Well, I might have said—I said a month or some considerable time. It wasn't immediately after the accident, but I became aware that they were paying them.

Q. And you approved those payments, did you?

A. Yes.

Q. Do you know whether these payments were called to the attention of your brother?

A. Oh yes.

Q. And he approved of them?

A. Oh yes.

Mr. Underwood:

Do you mean his brother or sister, Mr. Botts?

Mr. Botts:

I beg your pardon.

Q. I mean your sister.

A. The other stockholders.

Q. Now were you advised before you approved these payments, of the circumstance or circumstances under which Mr. Thomas met his injury?

A. I read something about it, or perhaps I was told; I have forgotten. I knew he was injured, I don't know how he was injured, I don't know where he was injured, but likely it was told me.

Q. Well, you were aware at the time when you approved these payments, that Mr. Thomas was injured?

A. Yes.

Q. In the explosion said to have happened on board the boat Seminole, were you not?

A. Well, I don't know whether he was injured in the Seminole or whether he was injured when he was outside the Seminole, among a whole lot of boats blowing up. I know he was injured at the time.

Q. Did you know for what purpose he was present at the scene of the fire?

A. I was told afterwards.

Q. You were told that he went down there to have a look at the Seminole for some purpose, were you?

A. No; I knew nothing about his going, perhaps that is why I didn't know anything about it for some time afterwards. But before I left Palm Beach I wanted a rope net put on the back of the Iolanthe; and I don't know whether I told Riley or whether I told Abel or who I told, but anyhow, I wanted a rope net on the back of the Iolanthe, and the one that was on the back of the Seminole was the kind I wanted.

Q. Exactly.

A. I didn't know this man Thomas was going down to see the Seminole, or I didn't ask him to do the work; in fact I had never known nor seen Thomas, to the best of my knowledge, but I heard afterwards that he had gone down and was injured.

Q. Well, you knew that Thomas was the man that Mr. Riley or someone for you, had arranged to put this rope with screen or whatever it was, on the Iolanthe?

A. I was told so.

Q. Yes. All right. You had been so informed, prior to the time,—or was that subsequent to the time that you authorized these payments?

A. Oh, it was at the time I authorized the payments.

Q. Then you knew when you authorized the payments that Thomas was the man with whom arrangements had been made to make these installations on the Iolanthe, is that right?

A. Thomas is the man; I think he was at Palm Beach—a Palm Beach man.

Q. Well, anyway, Thomas was the man who was trying to see what kind of a net it was, for the purpose of installing something similar on the Iolanthe?

A. Yes, sir.

Q. And you were informed that that was the reason for his presence in the vicinity of the Seminole, and resulting in his injury; is that right?

A. Since—I say, it was silly for him to go down at all. He did go down; whether he went down for a joy ride or to look at the Seminole, I don't know, but he did go down, and he was injured.

Q. All right. Now then you have stated that you approved the payment of, I believe it was $5,000.00, to the widow of Captain Abel?

A. Yes.

Q. And as I understand it, the continuing payments that have been made from time to time to Mr. Thomas, have been with the approval of yourself and your co-stockholder; am I right?

A. No.

Q. You haven't approved those payments?

A. I didn't know they were going on.

Q. You didn't know it.

A. No.

Q. Well, have you repudiated those payments?

A. No. I only heard about them last night; I was told that they were making payments to him; I didn't know it.

Q. And you approved then the payment of the hospital bills?

A. Yes.

Q. He didn't—that—

A. That was later on, when they told me the story, as I said before, I approved some payments for Thomas, several days after the accident; and I was told that they were hospital bills and medicine.

Q. You are aware now of the approximate amount of those bills, are you?

A. No.

Q. Well, anyway, you have approved the hospital bills and doctors' bills and those kindred bills?

A. You mean to say that I approved them before they were paid? I don't think I did.

Q. No.

A. After they were paid, oh, yes.

Q. Now then, have you approved these payments to Thomas in addition to his hospital and doctors' bills?

A. Have I approved these bills—

Q. These additional payments of $125. a month for a while, and $75. a month for a while? Have you approved those payments?

A. No, but I do approve them, but—

Q. You approve them now?

A. Yes, I approve them.

Q. And you expect in due course to reimburse the disbursing agent for your pro-rata share, is that right?

A. Unless the disbursing agents get it from some other source. They won't now, of course.

Q. No, I don't think they will, either. So the point I was getting at, you want to give us to understand that you approve and confirm those payments, and not repudiate them? That is what I am getting at.

A. Well, I really haven't seen those payments; now that I have been asked about that, I would like to look at them.

Q. Well, as I understand it, you said a moment ago you had approved them.

A. I approved of the hospital bills. Now wait; I haven't seen these bills except some long time after the injury, I approved those. But the accident, not any amount, I said "take care of him, take care of his hospital bill and things like that." I didn't know about these other bills; I haven't approved them nor disapproved them; I haven't repudiated them. They tell me he is getting something every week.

Q. I understand it is every month. I understood you to say just a moment ago that you do approve those payments.

A. Well, now that you have been talking to me, I would like to look at them; there might be something screwy about them, something unusual. Why are you asking me if I approve them?

Q. I just want to know.

A. I would like to look at them before I answer.

Q. Assuming that they have been payments to John Thomas since the date of the fire, over and above his doctors' and hospital bills and so forth, of $125. a month for a time, and $75. a month for the balance of the time,

up until at least March of this year; have you got a copy of that list that Mr. Underwood furnished here?—now here is the ledger of the Seminole Boat Company, showing—I call your attention to this, for 1937 and 1938. John Thomas, $75. each and every month.

A. Now I would like to know really what is the matter with Thomas; I would like to see him, before I say I approve it. Wouldn't you want to?

Q. I think that is not unreasonable. Well now then do you want us to understand Mr. Phipps, that these payments to John Thomas, over and above his hospital and doctor bills, and similar bills, which I will ask you for the moment to take my word, are shown to aggregate above $3500.—disbursed by the Palm Beach Company and charged to the Seminole Boat Company, I would like for you to tell me whether I am to understand that these payments were made without any authority, in any manner, way, shape or form, from you, or without your approval.

A. Now I want to make sure that I have the right answer to this. If you mean the original bill, that I did approve; but if you mean bills since then, I didn't know about them. And if it was for the Seminole Boat Company, it is up to the officers of the Seminole Boat Company.

Mr. Botts:

Would you mind reading him the question? I don't believe the witness understood it.

(The last question was read.)

A. Without my knowledge,—if you add that, I will say, yes.

Q. Assuming that Mr. Riley and Mr. Alley, for the Palm Beach Company, have disbursed approximately

$3500. in payment to John Thomas over and above medical and hospital attendance, do I understand you to say that those are without your approval?

A. They are.

Q. When you ascertained, which I understand was only a day or two ago, that these payments had been made, did you criticize Mr. Riley and Mr. Alley for making those payments?

A. I only ascertained that this moment; I didn't know; I heard that they had paid something, but the amounts, I had no idea what the amounts were until you read them out to me.

Q. Well, when you found out they had been making any of these payments, did you criticize them?

A. No.

Q. As a matter of fact now, didn't you tacitly approve those payments?

A. No; I didn't know anything about the payments.

Q. When you learned about them, didn't you—

A. Well, I have only learned the amount this last moment, when you showed me the books. Before that I heard they were paying John Thomas something, but I don't know whether it was $5. a week or what it was.

Q. How long ago was it that you heard they were paying John Thomas something?

A. Last night.

Q. And they didn't even tell you then, the amount?

A. No.

Q. Well, did you approve that,—those payments?

A. Why, I didn't say yes or not.

Q. All right. Did they tell you, Mr. Phipps, that they had made payments totaling more than $7,200. to or for the benefit of John Thomas, on account of hospital bills, doctors' bills, and these additional payments, and have not taken one scratch of a pen from John Thomas by way of release or otherwise? Did they tell you that?

A. No.
Q. Do you approve or disapprove that?
A. Well, I don't know; I don't know the facts.

Mr. Botts:
Have you got that release for me yet?

Mr. Alley:
I have a reformed copy of it. I don't have the original.

Mr. Botts:
You are satisfied that it is an accurate copy, are you?

Mr. Alley:
Yes.

Mr. Botts:
May I see it?

(Informal recess for two minutes was taken, following which the preceding testimony was read.)

Q. If Mr. Alley has testified that he did make those payments, and has taken no receipt, release, or anything of that kind, do you approve that or disapprove it?

Mr. Underwood:
I think if your Honor please, I object to that. I think he has covered that. It is argumentative. His state of mind today is unimportant on the issues in this case.

The Court:
I am inclined to agree with that. I think you have covered that; I mean, that particular question. I think this question of approval or disapproval is a repetition. • • •

Q. I understand that when you went down on this fishing trip down at—

A. Which fishing trip, please?

Q. The last one, in April of '35; that you knew that the various fishing boats were being supplied with gasoline from the tanks of the Seminole.

A. That is correct.

Q. As I understand it, you said you thought it was pumped?

A. Well, really I don't know how it was supplied; but that was my thought, if you would have asked me.

Q. Well, you knew then that in some method they were drawing gas from the tanks of the Seminole and delivering it to these various boats?

A. Well now, I don't know whether it was drawn from the tanks of the Seminole, or whether it was drawn from a drum on the deck of the Seminole. I really don't know.

Q. You didn't see any drum on the deck of the Seminole, did you?

A. Well, I didn't look for one, I never thought of it. But I think it probably could be, in fact it might well have been, because we have taken drums,—extra gas, that way; that is my recollection; sometime ago. So I wouldn't know how that was. I did know the Seminole supplied the fishing boats with gas; how they supplied it I don't know. It might just as well have been from a drum on the deck, or pumped out from below by a pump and put in, or perhaps direct from the pump into the boats; I don't know.

Q. You saw the fishing boat come alongside and get gas, did you?

A. No, I didn't. I don't recall of seeing it. Of course they did, but I don't recall seeing it.

Q. You knew they did, but you don't at this time recall the actual circumstances; is that the idea?

A. I never recalled the circumstances, because I know the boats got gas from the Seminole, but I believe they were using gas when I was asleep, I don't know, or perhaps at night. I don't remember there being gassed, but you asked me if they got gas from the Seminole. That is the only place they could get it from.

Q. Now my understanding is that in the first instance the bills for the Seminole were o. k.'d by your private secretary, Mr. Robbins?

A. What time are you speaking of, please?

Q. Early before the corporation.

A. Before the incorporation? They were paid by him?

Q. I think you said that they were approved by him, but I want to get that straight.

A. Robbins has been with me for perhaps twenty years; he has approved a lot of bills for me. But you will have to place the time. I wouldn't know who would approve them.

Q. Well, there was a time when Robbins approved these bills; that is what I am getting at?

A. Yes, that is correct.

Q. Now then what I want to ask—

A. What bills do you mean, please?

Q. Bills for the Seminole. You tell me.

A. I don't know what you are referring to.

Q. I want you to tell me what bills from the Seminole he did approve.

A. I don't know.

Q. Any bill that he did approve, was paid, is that the idea?

A. Yes.

Q. All right. Now then, after a time, down at Palm Beach, while your various boats were there, Mr. Riley stepped into the situation in that respect largely the same as Mr. Robbins had previously occupied, did he not?

A. No.

Q. He didn't?

A. No. Mr. Riley had entirely a different position in Palm Beach than Mr. Robbins in New York. Mr. Riley used to buy and sell real estate for me, he manages my real estate in Palm Beach now; and he was doing the same service for me as Paul Scott or any of the people in our organization, as we said before; Roy Hawkins, and others.

Q. Well, didn't Mr. Riley look after a great deal of the detail of approving accounts for you in connection with your boats and your properties as well?

A. What time are you speaking of, please?

Q. Well, we will say in the last five years.

A. That is after the Seminole Boat Company was formed?

Q. Yes.

A. Well, I don't believe the Seminole was up there in the last five years, was it?

Q. Now I am away, just a little bit, from the Seminole.

A. He does do that, in regard to the Clip, shall we say,—or am I not to mention boats? But the Clip he pays,—I am not sure, but anyway he would look after the Clip and talk to me about the Clip.

Q. And the same with reference to the Iolanthe?

A. I haven't got the Iolanthe.

Q. I mean, while you owned the Iolanthe?

A. Well, that is so many years ago since it was at Palm Beach; I don't think it was; I think the Iolanthe was really managed by the Captain of the Iolanthe. I don't think Riley ever had anything to do with it.

Q. Now Mr. Phipps, you spend a substantial proportion of each year at Palm Beach, do you not?

A. I do, yes.

Q. Are the officers of the Palm Beach Company, in Palm Beach or West Palm Beach?

Mr. Underwood:
Office or the officers? I didn't hear.

Q. The offices.

Mr. Underwood:
The structure?

Q. The structure in which their headquarters' offices are.

A. Well, I don't believe there is a Palm Beach Company now; I think it is called Phipps Properties.

Q. I think they say it is the Bessemer Properties.

Mr. Underwood:
It is clear in the record; it is the offices in Palm Beach.

Q. The offices that your companies occupy in Palm Beach County, are located in the city of Palm Beach, are they not?

A. Yes.

Q. Do you give as much attention to the detail of the operation of those companies down there as you do to the payment of your bill for your butcher, as you have indicated a while ago?

A. No, I don't.

Q. You give more attention to the payment of your butcher, than you do the operation of your business?

A. I do, yes, sir. I have practically retired from business, Mr. Botts; I try to relieve myself as much as possible.

Q. And you have a private office however, in the headquarters building at Palm Beach, haven't you?

A. It is not a private office, but I usually used it; my brother has used it if he is there, or my sister would use it. But there is one room that I generally sit in. It is not my office.

Q. There is no office assigned to you?

A. No office assigned to me, no.

Q. There is no office assigned to your brother?

A. No.

Q. Aren't there two private offices there that are reserved primarily for the use of you and your brother?

A. No. Well, I say, we are there so seldom, in the office it would be a waste.

Q. And you—

A. I want to modify that; I go there every week, two or three times a week, but I don't spend long periods in the office. Is that what you want?

A. That is what I was trying to ascertain. Mr. Phipps, I have just been handed what we will assume is a correct copy of the release executed by Mrs. Abel, on the payment of the $5,000. and we will treat that as if it was the original, because I am sure that it is accurate.

A. May I read it?

Q. Yes, certainly.

A. Do you want me to read it all?

Q. Just as much as you like of it.

A. That is all right with me; that is all right as far as I am concerned.

Q. Do you know whether you have reimbursed the Palm Beach Company for this payment or not?

A. I never saw that before.

Q. You stated, I believe, that you approved the payment to Mrs. Abel before it was made.

A. Yes, but I never saw that release.

Q. Did you reimburse the Palm Beach Company for any portion of that, or the Bessemer Properties, whichever corporation made the disbursement, for any portion of that $5,000.00 outlay?

A. I don't know.

Q. If it was done it was a routine matter there in your accounting department, is that right?

A. Well, I approved of the gift; perhaps you will find that I have okayed it and they paid it, but I never saw the bill for it; I approved the gift to Mrs. Abel, yes.

Q. The point I am trying to get at is: do you know whether or not one of these periodical periods of reimbursement came around and you reimbursed the disbursing authority for this expenditure, do you know?

A. I don't know.

Q. You may or you may not have?

A. I won't say; I don't know.

Q. Then if you have not done it, Mr. Phipps, you will do it in the future, of course, I take it?

A. I think so. I haven't seen any checks to—

Q. Now, Mr. Phipps, with reference to these payments to John Thomas, referring now to that portion of them which you say you approved, that is, the hospital and doctors' bills. You have not yet reimbursed the disbursing authority for those either, I take it?

A. Do you know? I don't know.

Q. I don't.

A. I don't.

Q. Now you spoke of the amount paid to Mrs. Abel as a gift. Would you mind telling us into what category you place the payments to John Thomas?

A. Well, I haven't placed John Thomas at all, except I didn't feel that I was under any legal liability to pay it, but I felt sorry for the man, just the same as another. For Mrs. Abel I was very sorry for her and it was a gift, and I didn't know I had received that release.

Q. What about the payments to John Thomas; did you treat them as a gift?

A. Well, I never had thought of it; I would say that the hospital part was a gift certainly; it was the reasonable and kindly thing to do. Now, I didn't do that because I thought I was going to be sued or was under any legal liability to pay that. It never was brought to my attention and I never thought I was liable.

Q. As far as you know no legal demand was ever made by John Thomas?

A. Never; not to my knowledge.

Q. John Thomas had never worked for you, had he?

A. No, I had never seen him.

Q. You didn't know him?

A. No.

Q. Can you give us any reason then why you would authorize the making of these payments, running into this considerable amount, to a man towards whom you now disclaim any responsibility?

A. Well, I thought he had awful bad luck. He really wasn't on my business when he was hurt. You know more about "agency" than I do. He wasn't on there to carry out any orders. I don't know what Thomas is; is he a carpenter or sail maker or something in Palm Beach? I just don't know. In other words, he went down there and was hurt. There were two people hurt; one was John Thomas and one was Abel, and I felt a moral obligation to help them. That is as much as I can tell you.

Q. You felt a moral obligation because the fire originated on your boat?

A. I did not. I don't believe it, and that is another point or question. I have heard so many theories about the origin of that fire and I don't think it is clear at all that it came from my boat.

Q. Without any feeling of responsibility you made these payments to John Thomas?

A. That is correct.

Q. You said, however, that you felt a moral responsibility.

A. I felt a charitable responsibility. How would you say it? I felt sorry for Mrs. Abel.

Q. I would rather not answer that question.

A. She was a school teacher; she lost her husband; her husband was a nice fellow; he was a friend of mine and I had been fishing with him.

Q. That is with reference to Mr. Abel?

A. All right.

Q. Now I am talking about John Thomas. Did you owe any legal responsibility to him; did you feel any legal responsibility to him?

A. Absolutely none.

Q. You felt no legal responsibility but you made these payments, as I understand it, as a sort of moral responsibility?

A. Not moral; I really made these as a charitable responsibility. The man was down there in the hospital and he was badly hurt. I didn't know that that amounted to so much, but I approved of the hospital bills and the medicines; I didn't know what they did amount to, but it wasn't very much, was it?

Q. About $3500.00.

A. Hospital bills?

Q. Hospital and doctors' bills.

A. I didn't appreciate that at all. I never saw Mr. Thomas, but I will sometime; I would like to talk to him about it.

Mr. Botts:

That is all.

(By Mr. Matteson):

Q. I want to ask you just a few questions: did you personally pay any of this $5,000.00 that was given to Mrs. Abel?

A. Not that I know of; that might have been paid, but I didn't know about it.

Q. You personally didn't have anything to do with that?

A. No, but I approved that payment because I was asked.

Q. Did you approve the charging of it to the Seminole Boat Company?

A. I don't think that I did—Oh—I think that is where it belongs.

Q. In this release that was made I notice—

A. If the boat belonged to the Seminole Boat Company I don't think I would have to pay the whole thing; I think my sister and the other stockholder would have to pay a share of it anyway.

Q. I see. You personally, as well as your sister, are named as parties released in this release, isn't that the fact?

A. I never saw it before.

Q. You see your names there, don't you?

A. I read it just now and I think it is all right, but I think that is the first time I have seen it.

Q. It does release you personally, among others?

A. I don't know.

Mr. Underwood:

I object to that unless the document goes in; it speaks for itself. If Mr. Matteson wants to question about that document, the document should first go in.

Mr. Matteson:

All right; I will put it in.

Mr. Underwood:

Can we agree on the persons who are named as being released?

Mr. Matteson:

I think we can, but perhaps the shortest thing is just to mark this as an exhibit.

The Court:
Let it be admitted.

(Thereupon the release above referred to was marked Libelants' Exhibit 114.)

(By Mr. Matteson):
One more question, Mr. Phipps, please: you spoke of the management of the Iolanthe being with the captain.
A. Yes.
Q. Who was the Captain?

Mr. Underwood:
At what time?

A. I had a number of captains.
Q. What captains were you referring to when you answered?
A. Any captain.
Q. Who have those captains been?
A. I would not like to say without refreshing my memory. I really don't know whether Abel was a captain or whether Bryant was a captain. I think I had a number of captains at different times.

Mr. Matteson:
That is all.

Mr. Botts:
That is all.

Re-Direct Examination.

By Mr. Underwood:
Q. Mr. Phipps, there is just one subject about which I want to ask you a question or two, and that is the

registering of the Seminole with the New York Yacht Club in your name. When did you first find out that the Seminole was registered in the New York Yacht Club in your name?

A. Last night.

Q. Did you have anything to do with its being registered in your name at any time?

A. I don't remember.

Mr. Underwood:

That is all.

Re-Cross Examination.

By Mr. Botts:

Q. Wait a minute. In these interrogatories to which you swore, Mr. Phipps, did you say that you didn't know that was the fact?

A. Show me, please. Did I say I was a member of the New York Yacht Club?

Mr. Underwood:

This interrogatory doesn't say "New York Yacht Club".

Mr. Botts:

Doesn't it?

Mr. Underwood:

It does not.

Mr. Matteson:

Here it is.

The Witness:

"The Seminole was registered at only one club until 1921; it was registered in the name of Henry C. Phipps;

from 1922 to 1932 it was registered in the name of John S. Phipps; since 1932 it has not been registered at any club".

By Mr. Botts):

Q. What club were you referring to there?

A. I must have been referring to the New York Yacht Club, because that is the only club—oh, I have been members of other yacht clubs. I was a member in the—I have been a member of several yacht clubs.

Q. When you signed these answers to interrogatories you knew what yacht club you were talking about, didn't you?

A. I don't know what I had in mind; I don't know how I happened to do that. I don't know why I said it was registered there. If you want me to be frank, I didn't know it was registered in the New York Club.

Q. Do I understand, Mr. Phipps, that these answers were prepared by someone else and submitted to you and that you casually read them over and signed them; is that the way it came about?

A. No.

Q. You either knew or you didn't know, Mr. Phipps; now, Mr. Phipps, did you know when you signed those what yacht club you were referring to?

Mr. Underwood:

If your Honor please, I think this cross examination is unintentionally somewhat unfair, because of the Court's ruling when these interrogatories came up; the Court ruled that Mr. Phipps was required to give certain information which wasn't at the time within his knowledge. I think perhaps your Honor will recall that we took exceptions to a number of these interrogatories (I don't remember now which ones). Our exceptions were overruled and Mr. Phipps was required to make answer, and persons on his behalf investigated the facts and—

Mr. Botts:

Do you mean to suggest that Mr. Phipps didn't know what yacht clubs he belonged to?

Mr. Underwood:

I think this line of cross examination is unfair.

The Witness:

I belonged to several yacht clubs; perhaps I can refresh my memory. I don't belong to any yacht clubs now that I know of.

Mr. Botts:

I do not see anything unfair about asking a man to tell the source of his information that he has sworn to.

The Court:

I think that he can answer the question. Read the question.

(Thereupon the preceding question was read by the Reporter as above recorded.)

A. If I was referring to—I must have been referring to the New York Yacht Club because that is the only club that I should think—it is the fact that I was referring to the New York Yacht Club; I had forgotten that that was in there, and the last time I saw this I was surprised to find the "New York Yacht Club" in there; it just escaped my memory. When I read that I knew the Seminole was registered in a yacht club at one time, because the Seminole flew the New York Yacht Club flag.

Q. Then you have been aboard the Seminole when she has flown the New York Yacht Club flag?

A. Yes.

Q. And you knew at that time that you were a member of the New York Yacht Club?

A. I don't know what time that was; I haven't been a member for a good many years, and Mr. H. C. Phipps has not been a member for a good many years.

Q. Well, I guess you were mistaken when you said that you didn't know until last night.

A. I will admit that it surprised me; it just escaped my memory. I was not trying to deceive you in any way, but when I was told that it was registered in the New York Yacht Club I was surprised in my own mind.

Q. As to matters of that kind, happening sometime ago, your memory is not entirely trustworthy sometimes, is that right?

A. I would not like to say that, but I am afraid that it might be sometimes with all of us. I sometimes make mistakes, I am sure.

Q. And—

A. Just go ahead and ask me.

Mr. Botts:

I think that is all, Mr. Phipps.

Mr. Matteson:

Nothing further.

Mr. Underwood:

That is all.

(Witness excused.)

2438 WILLIAM P. BAKER was called as a witness in behalf of the Respondent Phipps, and having been first duly sworn, was examined and testified as follows:

Direct Examination.

By Mr. Underwood:

Q. What is your full name?

A. William P. Baker.

Q. Where do you live?

A. 428 S. W. 23rd Road, Miami.

Q. What is your business?

A. Boatman.

Q. How long have you been following the sea?

A. Thirty-five or thirty-eight years.

Q. You say your business now is boatman?

A. Yes.

Q. What kind of boatman are you now?

A. I am in the charter boat business.

Q. How long have you been in that business with your present boat?

A. Since 1930, about nine years.

Q. What type of boat is your present boat?

A. It is a house-boat.

Q. What are her dimensions?

A. 65 by 20, I think.

Q. Is that your year-around employment now or are you employed otherwise at sometime in the year?

A. I go on another boat in the north in the summer.

Q. By whom are you employed in the summer?

A. By Judge Brower in New York.

Q. How long have you been employed by him?

A. Ten years.

Q. When did you first have anything to do with the Seminole as a part of her crew in any way?

A. In 1928, I guess, or 1927.

Q. I take it that the year is a little indefinite in your mind?

A. 1927 or 1928 is when I first went on the Seminole.

Q. What was your employment on her at the beginning?

A. Captain.

Q. Were you employed on her at times subsequent to that?

A. Yes.

Q. Were you employed on her for any continuous length of time?

A. One year at one time, and two years at another time.

The Court:

You will have to speak louder.

The Witness:

About two years one time.

Q. And following that, how often?

A. Just over short periods.

Q. From time to time?

A. From time to time, yes.

Q. You were captain of her on her final trip in the spring of 1935?

A. Yes, sir.

Q. Are you familiar with the layout in a general way of the gasoline tanks in the Seminole?

A. Yes, in a fair way, I guess.

Q. Did you ever serve as engineer on her?

A. No, sir.

Q. Can you tell me what there is beneath the tanks of the Seminole?

A. Well, there was a drain pan under there, an iron drain pan that had a wooden base under it for those tanks to set in.

Q. How many such pans were there?

A. Two; two tanks to each set of pans; four tanks in all.

Q. Do you know whether or not there was any way for any liquid that might collect in these pans to get out?

A. Yes, they had drains.

Q. How did they drain?

A. The one on the starboard side I know had a three-eighths inch galvanized pipe running out of there and running overboard.

Q. How do you know that?

A. We traced it one time. The one that came out of the port side, I never saw that one; I never had occasion to go in there.

Q. How did the two pipes that you speak of compare in size?

A. Both the same, I think; both three-eighths inch galvanized pipes.

Q. You traced the starboard one but never the port one?

A. Never the port one.

Q. Were you in the engineroom of the Seminole on that final spring trip of 1935?

A. Yes, sir.

Q. What did you do down there in the way of inspection, if anything?

A. Several times I was in the engineroom; on the last trip that we are talking about? You see I was on her that last trip about ten or twelve days, I guess.

Q. Do you remember being on her before that year?

A. Yes, I went up to Lauderdale and brought her out of Lauderdale.

Q. Where to?

A. Miami.

Q. On that occasion were you in the engineroom?

A. Yes, sir.

Q. On these two occasions what did you do in the way of making any inspection of the Seminole?

A. I naturally would go in the engineroom and with the engineer we would inspect the pipes and lines and wires and so forth.

Q. What did your inspection of the gasoline equipment disclose?

A. It never disclosed anything that I thought in my mind was any way out of reason; there was never any leaks that we could ever find.

Q. Did you observe any leaks anywhere in that gasoline system?

A. One time we overhauled a pipe that was leaking when we were filling gas.

Q. When was that?

A. 1935; on that last trip.

Q. Where was the boat?

A. At the Royal Palm Dock.

Q. That is the only leak you know about?

A. Yes.

Q. What type of switches was there on the Seminole?

A. Open knife switches.

Q. From your experience will you tell me whether or not it is customary for boats of that class to have that type of switch in the engineroom?

A. On all boats that I have been on it is customary, and always on all small boats.

Q. The evidence shows, Captain Baker, that there was a drain line for gasoline in the engineroom of the Seminole, with two valves on the end; do you remember that?

A. Yes.

Q. From your experience with boats of that class, will you tell me whether or not that is customary.

Mr. Matteson:

It seems that I will have to object to that. I do not think any amount of custom can justify an unsafe practice. I object to the question as to whether it is customary or not.

The Court:

Well, I think he can give his experience. I will overrule the objection.

A. Yes, that is customary on all boats I have ever been on; I never have been on a boat where you couldn't get gas out of the tanks in the engineroom.

Q. Is there any reason why on the Seminole that it is important to have a source of gasoline supply apart from the thought of supplying fishing boats?

A. Getting gas for priming your engines and supplying the fish boats; that is all I know that gas is taken for.

Q. Assume that your motors stall and stopped and you were near a lee shore, would there be any need to have a supply of gasoline readily available in the engineroom?

A. Yes; those engines need priming at all times.

Q. What would be the reason for that; I mean the reason for the needing of the supply of gasoline.

A. To prime the engines with.

Q. What ventilation or ventilators did the engineroom of the Seminole have?

A. She had two fourteen inch cowl ventilators through the boat deck to the engineroom, and it had eight two inch pipes with goose necks coming out of the bilge, and up alongside of the engineroom.

Q. Where did they come out of the deck?

A. Right at the engineroom deck there; it was raised about six inches above the main deck.

Q. What windows did she have?

A. She had one window in the port side that went right outside, and one on the starboard side that went into an alleyway.

Q. From your experience, Captain, did you ever observe any lack of proper ventilation there?

A. No, sir.

Q. Have you had occasion to go to the Seminole at Pilkington's and take her out of storage?

A. Several times.

Q. On those occasions do you remember when you went into the engineroom?

A. I always went in the engineroom.

Q. What have you observed on those occasions about the ventilation in the engineroom?

A. In storing a boat we always leave these windows open, and when there was cowl ventilators it always seemed that there was ample ventilation there at all times.

Q. In your employment on the Seminole who was it that had the dealings with you that resulted in your engagement?

A. Mr. Hawkins mainly.

Q. Did you ever receive any instructions or were you ever employed by Mr. Phipps?

Q. Do you remember Mr. Scott?

A. Very well.

Q. Did he ever participate in that?

A. Yes, sir.

Q. Anybody else?

A. Not as to my employment, no, sir.

Q. Coming down to the cruise of 1935, who was it that made the arrangements with you?

A. Mr. Hawkins.

Q. What was done about the crew?

A. I was down on the Keys on my small boat, and a part of the crew that was on the Seminole was on her

when I brought her down from Ft. Lauderdale; the engineer was still on; I don't know whether Bryant was there or not, but Bryant was on the trip, and I took the balance of the crew off of my boat.

Q. You provided some of the crew?

A. Yes. I provided five of the crew myself off of my boat.

Q. I take it that you do not know who made the arrangements for the others?

A. No.

Q. Do you remember what members of the Phipps family were on this cruise?

A. Mr. and Mrs. John S. Phipps and Mrs. Amy Guest, and the younger Guest, the boy; what is his name—the son—Winston, I think.

Q. During that cruise did you receive any instructions from Mr. J. S. Phipps of any character?

A. Nothing more than any charter would; we operated where they wanted to go, and that's all; just regular charter instructions.

Q. Did he give you any instructions as to the condition of the boat?

A. No, sir.

Q. Did he give you any instructions to any part of the engineroom?

A. No, sir.

Q. Where did the party leave the boat?

A. Lower Matecumbe.

Q. Did anybody give you any instructions at that time as to what to do with the boat?

A. No, sir.

Q. Do you remember anybody who was on that cruise who wasn't a member of the Phipps family?

A. There were several; Mr. Hawkins was on there at one time and Mr. Layman was on there.

Q. Did you get any instructions from either of them as to what to do with the boat?

A. Only from Mr. Hawkins to bring her back to Miami.

Q. Did he tell you anything else at that time?

A. Not that I remember.

Q. Did you later get any further instructions as to what to do with her?

A. Yes.

Q. And from whom did they come?

A. From Mr. Hawkins.

Q. What were they?

A. To take the boat to Ft. Lauderdale and lay her up.

Q. Did you get any instructions from Mr. John S. Phipps about laying the boat up in any respect at that time?

A. No, sir.

Q. Did anything occur on your way to Lauderdale with reference to the gasoline supply?

A. Well, we knew we were short of gas when we left Miami, but we thought we could make the storage shed, and when we stopped at noontime to get lunch for the four of us on the boat, we didn't stop altogether. I told the engineer to stop and he said she was pretty low in gas, and I insisted on stopping, and I told him I could stop at Ft. Lauderdale and put in gas if necessary, and he said that he thought he had enough to make the shed.

Q. Did you experience anything else on that occasion on the way up to Pilkington's basin?

A. One of the motors started quitting, started cutting up, and the engineer called me and told me that I had better handle her as fast as possible. I was handling her on one engine anyway, because one of them he thought was out of gas.

Q. What did you do about it?

A. Just operated one engine; that's all. I didn't use the other engine. I didn't "ring" the other engine at all. I don't know whether it stopped or whether it was running when we cut it off; I just don't know.

Q. About what time of the day did you arrive at Pilkington's basin?

A. Around 1:30 I would say.

Q. What did you do in the course of getting the boat ready to leave there during the balance of the time you were there?

A. We shut off the valves; shut off all water valves, shut the valves all the way off; I did that. I looked in the engineroom, forward and aft and the rest of the crew was all busy doing pretty much everything that "belonged" to be done.

Q. What part of the bilges in the Seminole did you go into that day?

A. I was all through her from stem to stern.

Q. What was the condition of those bilges?

A. Her bilges was always clean; the Seminole was a steel hull boat; she was very easy to keep clean, and she was kept clean at all times.

Q. Did you find any liquid of any sort in those bilges?

A. No.

Q. Did you smell any gasoline any place in that boat?

A. No, sir.

Q. Were you in the engineroom that afternoon?

A. Yes.

Q. What did you observe in the engineroom?

A. In laying up a boat I always take it as my responsibility for the final word, and I would always go and look over everything that I could see, and especially the gas lines and switches and so forth, and so on, as I always do when she is laid up.

Q. What did you observe about the gasoline lines?

A. All of the gasoline lines were closed when I was there, and I personally tightened every one; I put my hands in every one and tightened every valve that was in the line.

Q. The record shows that there were four tanks, each of which had a valve.

A. Yes.

Q. Did you examine those valves?

A. Yes.

Q. How did you leave them?

A. All shut tight.

Q. The record shows that there were two valves by which gasoline could be drawn off. Did you examine those valves?

A. Yes.

Q. How did you leave them?

A. Closed.

Q. The record also shows that there were two valves, one in each motor line, designated traps; did you look at those?

A. No, sir.

Q. Who was the last person out of the engineroom that day?

A. I was.

Q. Did you observe the switches on the switch board at that time?

A. The lights were left on in the engineroom. We left the lights on so that I could see, and then I went over and pulled off the switches, the main switch; that was the last thing I did when I came out of the engineroom.

Q. Did you observe the glass gasoline gauge in the engineroom at that time?

A. Yes, two or three times that afternoon I looked at it.

Q. What did it show?

A. Nothing.

Mr. Botts:

I can't hear you; what did you say?

The Witness:

Two or three times I looked at it because I was anxious to see how long the gas would last.

By Mr. Underwood:

A. I am speaking of the time when you left the engineroom for the last time that day. Did you look at the gasoline gauge at that time?

A. We always measure the gas when we leave; it is always checked up and put in the log book. When we leave the boat we always check up to see how much was left in the boat at all times.

Q. What did you see as to the gasoline gauge at that time?

A. There was none showing whatsoever.

Q. How was the port window in the engineroom left at that time?

A. The port window was open.

Q. How about the starboard window?

A. That was open.

Q. Do you remember about the skylight?

A. No, sir, I couldn't say about that skylight; I don't remember whether it was open or not; I don't remember whether it was left down or shut at that particular time.

Q. How did you get out of the engineroom on that occasion?

A. I climbed up the ladder, the iron ladder.

Q. Through the hatch?

A. Through the hatch.

Q. Was anything done about that hatch after you got on deck?

A. It was locked.

Q. Who locked it?

A. The engineer locked it and gave me the key.

Q. How many keys did you give you?

A. He gave me one.

Q. What did you do with that key?

A. I put it with the—I had three more and I put them all together and brought them down to Mr. Hawkins at his request in Miami.

Q. When did you give those keys to Mr. Hawkins?

A. The next following morning.

Q. Do you remember whether they were separated or held together?

A. All held together on a piece of string.

Q. Now, Captain Baker, the record shows that there were two windows in the alleyway that ran along the starboard side of the engineroom. Do you recall how those windows were left when you all left the boat that day?

A. The Seminole had, besides the windows and the screens, Venetian shutters, I would take it; there were Venetian shutters, which were left about three-quarters up, I would say, all over the boat.

Q. How were the windows themselves left?

A. They were down, I think, all over the boat.

Q. Now by "down" just what do you mean?

A. That means they were open.

Q. They go down into a recess in the wall?

A. Yes, down into a recess in the wall.

Q. Did you have any conversation with Captain Pilkington that afternoon?

A. Yes, I had a little when I got off the boat.

Q. What was that conversation?

A. I told him that I was leaving the boat there and that those windows was half down, and if it came a rain (it looked like it was going to rain—that afternoon) that I wanted him to make sure that the boat was shut up. He said he couldn't put her under the shed that day, but would in a couple of days—

Q. Where did you leave the boat?

A. Left her at his dock, in front of his house, but not under the shed.

Q. Not under the shed?

A. No, sir.

Q. Did you observe any signs in Captain Pilkington's basin at any time with respect to gasoline?

A. No, sir.

Q. Were you ever advised by Captain Pilkington at all with reference to gasoline in respect of the laying up of the boat?

A. No, sir.

Q. For how many years have you in this vicinity laid boats up for summer storage?

A. Every year.

Q. For how many?

A. I would say twenty years anyway.

Q. What has been the practice as to draining tanks of the vessels being laid up for summer storage of gasoline?

A. I never personally drained the tanks in them.

Q. On the previous occasions that you laid the Seminole up?

A. Yes.

Q. Did you ever drain her tanks?

A. Never.

Q. On your own boat do you ever drain the tanks?

A. No.

Q. Do you know whether people generally drain the tanks or not?

A. There is an insurance clause in there which says you are supposed to drain them, but I know of no boats that entirely drain the tanks when they have generators on them; they leave the gas for operating those generators.

Q. These cowl ventilators that come up through the engineroom; from what place were they trimmed?

A. Trimmed?

Q. Turned.

A. On the boat deck.

Q. Out in the open, you mean?

A. Yes, sir.

Q. What time on that last occasion did you leave the Seminole; what time of the day?

A. About six o'clock.

Q. Did anybody leave with you?

A. There was four of us there; two of us came to Miami and two went to Palm Beach.

Q. I think you said that early in the year 1935—perhaps it was February—that you went up there and brought the Seminole to Miami.

A. Yes.

Q. Did you buy any gasoline to bring the Seminole to Miami?

A. I think the engineer got five gallons of gas going up? I am positive that he did get five gallons to start the motors with.

Q. Do you remember whether there was any gasoline in the tanks when you boarded the Seminole on that occasion?

A. Yes.

Q. Do you remember about how much?

A. Three hundred, I think.

Q. You mean three hundred gallons?

A. Yes.

Q. Was that showing the gauge?

A. Yes, sir.

Q. Can you tell us how that gasoline gauge was constructed; describe for us, first, the glass part itself.

A. It was a regular steam type boiler gauge with an extra heavy glass, with rods on the side.

Q. Where did those rods fit with respect to the glass part of the gauge?

A. In front of the gauge.

Q. What was their purpose?

A. To protect that gauge.

Q. Did they protect it?

A. They were still there the last time I saw it.

Q. What did you do with the log books of the Seminole when you left her in 1935?

A. Put them in the safe.

Q. Where was the safe?

A. In the Master's room—the Captain's room.

Q. Now, Captain Baker, getting back to 1929, I show you a document which has been marked Exhibit "CC"; is that your signature?

A. Yes, sir.

Q. Did you ever make a contract with the Seminole Boat Company?

A. Yes, sir.

Q. Following the making of the contract what did you do in a general way with the Seminole?

A. She was for charter as a charter boat.

Q. What did you do about that?

A. I don't know just what you mean.

Q. Did you make any charters?

A. Yes; I made several charters; I had four or five charters that winter.

Q. Who was it in the general course that made the charters?

A. I did.

Q. Who collected the charter hire?

A. I did.

Q. Did you account to anybody for that?

A. I used to account to the office mostly; mostly to Mr. Simon, who was in charge of the office up there.

Q. How long did that continue, do you remember?

A. It continued through 1930.

Q. Do you remember any charters after that?

A. No, sir; not at that particular time.

Q. Following 1930, do you know anything about chartering the Seminole?

A. I wasn't always on her; in a general way I had my own charter boat, but I would get off of her and go on the Seminole when we got a charter; several times I have been with Mr. Phipps and Mr. Moylan, of the Purity Baking Company in Chicago.

Q. Have you offered the Seminole for charter since 1930?

A. Yes, sir.

Q. During the time that you were on the Seminole what did you do about the upkeep and the maintenance of the boat insofar as authority to do things?

A. I had authority to do things, and I had an account with the Seminole Boat Corporation that I used to draw on and put money back in. As the money would come in I had that account that I could draw on.

Q. During this time who was it that decided on things you needed?

A. I did.

Q. Did you consult anybody about any of those things?

A. Usually I consulted Mr. Scott. If there was any major things I would go to Mr. Scott with them.

Q. Did you ever discuss these things with Mr. Phipps at that time?

A. No, sir.

Q. Now, Captain Baker, you have told us that you have been operating gasoline driven vessels for quite a long time. Do you know anything about any special valve for gasoline lines?

A. No, sir.

Q. Have you any opinion as to which is better, composition or ground seat valves?

A. Well, the composition seat, if it is well looked out for, is absolutely perfect. Ground seat valves (if they get anything under them) will leak, but a composition one is as good as the other, as far as I know; that's all I know.

Q. Do you remember whether the motors of the Seminole had backfire arrestors?

A. Yes.

Q. Did they?

A. Yes.

Q. When you were on her in 1935, did you experience any short circuits or any grounds in the electrical system?

A. No, sir; none was reported to me.

Q. Did you observe any?

A. No, sir.

Q. In 1935, did you see enough of the bilges in the bottom of the Seminole to be acquainted with the condition of the conduits in which the wires laid?

A. Yes.

Q. What was the condition of the wiring conduits?

A. Yes. In 1929 we put in new conduits from the batteries to the rheostat which was all the way across on the switch board.

Q. I am asking you about the condition of the conduits as you observed them in 1935.

A. They had been put in between—someone had worked on them during my absence; somebody put those in and they were in fair condition in 1935.

Q. Did you do anything in your experience on the Seminole about her electric wiring in the staterooms and above the engineroom compartment?

A. In 1929 we took off all the molding and examined all the wires that we could get to in the molding of the staterooms and the deck house and the dining room and so forth; all that we could get at.

Q. Was any part of that renewed?

A. Yes; some of it was renewed but very little.

Q. When the job was finished how did you leave it?

A. It was pretty good, I guess; I didn't have no trouble with it.

Q. From that time on did you have any trouble with it?

A. No, sir.

Q. Who did the work, what persons?

A. I helped and the engineer, Jack Otter, at that time did the majority of it.

Q. You mean the crew of the boat?

A. Yes, sir.

Q. Captain, it appears that the Seminole's gasoline filling line was bigger than the vent pipe?

A. Yes.

Q. Have you had any experience with that situation on other boats?

A. Yes; all tanks are vented on all boats; I don't know of anyone that has the same size filler-pipes as the vents.

Q. Which is usually the smaller?

A. The vents.

Mr. Underwood:

That is all.

Cross Examination.

By Mr. Matteson:

Q. Mr. Baker, you did some chartering of the Seminole in the early part of 1929 and again in the early part of 1930; is that correct?

A. Yes, sir.

Q. To whom did you charter the Seminole in 1929; do you recall?

A. We did to Mrs.—

Q. Was that Ann Murdock?

A. Yes.

Q. How long did she have it?

A. About two and one half months.

Q. That was the only charter that you made in 1929, was it?

A. Yes.

Q. All right; how about 1930?

A. Yes.

Q. To whom did you charter her in 1930?

A. In 1930 to Mr. Moylan and I chartered it to Mr. Alstaire McIntosh.

Q. Those are the only two?

A. No; there is another one; there is one more.

The Reporter:

What did you say?

The Witness:

There is one more. You will have to excuse me, because in my business I have to talk very low.

By Mr. Matteson:

Q. Is that all?

A. There is one more, but I can't remember who it was just now. In 1929, at the stock crash, the boat was too big for charter business.

Q. So you had two charters that you can't remember in 1930?

A. Yes.

Q. And one in 1929?

A. Yes, sir.

Q. According to the ledger account here the last item on account of charter hire of the Seminole was April 1, 1930; is that about the time that you remember?

A. Yes.

Q. When was the Seminole put in storage in 1930, do you recall?

A. Sometime in April, I think, or the first of May.

Q. That was about June, wasn't it?

A. I think it was sometime in May.

Q. Then she was in storage until late November that year, wasn't she?

A. I can't recall all of these dates; I took the Seminole in and out so many times, on so many different occasions that I can't recall the dates. I went up and got her many times; whenever she was ordered out I would go up and get her.

Q. I was trying to figure out about how many times it was.

A. I am just trying myself; I know there was at least four times that I went up there and got her and brought her out.

Q. Four times?

A. Yes.

Q. And each of those four times she was out for a short period?

A. Yes; in 1929 when she came out she was out for quite a while when she went north.

Q. You didn't go with her when she went north, did you?

A. No, sir.

Q. I am talking about the period from 1930 on. You say you went and got her about four times.

A. Yes.

Q. And each of those were for short periods lasting approximately two or three weeks, is that your recollection?

A. Two or three weeks at a time.

Q. And those periods were the only times from 1930 on that you had anything to do with the Seminole?

A. That is all, sir.

Q. You never visited her at Ft. Lauderdale except when you went to get her, did you?

A. Yes, several times. I was up there.

Q. Do you remember any special time that you were ever up there—I am talking about the times other than those that you went to get her?

A. Yes; one time I went up and took the batteries off of her; took the batteries out and brought them to Miami; that was sometime around 1932, I guess, or 1933; I went up there and got the batteries and brought them to Miami.

Q. Were new batteries put on at that time?

A. No; they were just working on them; later on in the summer I took them back, together with an electrician, and put them back in there.

Q. Why were they brought to Miami at that time?

A. They just had to be repaired; that is all; they were brought her just before repairs.

Q. Is that the only time that you brought the batteries to Miami?

A. Yes.

Q. Your occupation is Boat Captain; isn't it?

A. Yes.

Q. You are a boat captain rather than boat engineer?

A. Yes, sir; I am a boat captain.

Q. Now during the last three times the Seminole was out was Mr. Schlappi the engineer?

A. Three times?

Q. Yes.

A. I guess he was.

Q. What is that answer?

A. I think so.

Q. Was he a good man as engineer?

A. A very good man.

Q. Did you rely on him for conditions in the engine-room?

A. Yes, sir.

Q. What is that?

A. Yes, sir.

Q. Was there any need to check up on him?

A. I checked on everybody; when I am Captain of a small boat I always do my own checking.

Q. Do you call the Seminole a small boat?

A. Yes. It is not a big boat.

Q. What is the biggest boat you have been Captain of.

A. Well, I have been Captain of good sized vessels.

Q. How big is the Molly-O?

A. Much smalier than the Seminole.

Q. How long is she?

A. Seventy feet.

Q. Do you call her a small boat?

A. Yes, sir. I am my own engineer on the Molly-O and have been for ten years.

Q. You do not carry a separate engineer on her?

A. No, sir.

Q. When you are asked to take charge of the Seminole on this last trip were you told that you are being employed by Mr. Phipps?

A., I was down on the Keys on my boat and I got a telegram from Mr. Hawkins saying that "Mr. John S. Phipps wants you to be Captain of the Seminole". Now whether that meant that he wanted me to take charge of a charter party or not, I don't know.

Q. You were informed by Mr. Hawkins that Mr. John S. Phipps wanted you to take charge of the Seminole, is that right?

A. Wanted me to act as Captain of the Seminole.

Q. Did you know Mr. Schinigoi, the steward on the Seminole on this last trip?

A. Yes, sir.

Q. He was your steward on the Molly-O, wasn't he?

A. Yes, sir.

Q. Did you tell him that you were being employed by Mr. Phipps to take the Seminole out?

A. No, sir.

Q. Do you remember that?

A. No, sir, I said I was going with Mr. Phipps.

Q. You would not deny that you told Mr. Schinigoi that Mr. that Mr. Phipps had hired you, would you?

A. No more than I would say on my own boat; any man that takes my boat—

Q. Did you know that Mr. Schinigoi has testified that you told him that Phipps had told you—

A. No.

Q. You didn't know that?

A. No.

Q. Will you answer yes or no, so we can get it in the record?

A. No.

Q. You discussed your testimony with your lawyers in the case before coming to Court, did you?

A. Yes, sir.

Q. Did they tell you that Mr. Schinigoi's deposition had been taken in New York?

A. Yes, sir.

Q. Did they tell you that Mr. Schinigoi had testified that you told him that Mr. Phipps hired you?

A. No, sir.

Q. They didn't tell you that at all?

A. No.

Q. Are you sure of that?

A. Yes.

Q. How much water did the Seminole draw?

A. Approximately four feet.

Q. Was that both forward and aft?

A. Yes.

Q. And amidships?

A. Yes.

Q. You spoke of the necessity of getting gas for priming the engines. Is it necessary to prime the engines only when they are cold, is that true?

A. No, I never started the Seminole's engines, but I think they needed gas at all times.

Q. You needed it to prime the engines when you started them cold?

A. Yes.

Q. You do not say that it is necessary to prime them when they are warmed up, do you?

A. I couldn't tell you that, I think they did; I think they had to put gas in them every time.

Q. Did you ever have to do that?

A. I never have started the engines.

Q. You never started the engines of the Seminole?

A. No.

Q. Did you ever see a boat with a gasoline tank on deck from which gasoline could be drawn if necessary?

A. Yes, sir.

Q. That is frequently done, is it not?

A. Yes, sir.

Q. If you have a tank on deck from which you can draw gasoline when you need it, then there is no need of having a draw-off line in the engineroom also, is there?

A. If it was equipped that way; if it was equipped that way, it would require an extra gas tank; that is all.

Q. And that tank, under that arrangement, would be out on deck?

A. Yes.

Q. And if it were out on deck there would be no danger of any leakage from the tank or the valves getting into the engineroom, would there?

A. If it wasn't near the engineroom it couldn't near the engineroom it couldn't get in.

Q. I want to ask you about the way the windows on the Seminole was left when you left the boat at Ft. Lauderdale in April, 1935. Did I understand you to say that the windows were all left open?

A. Yes; the glass windows were all open on my instructions. Mr. Schinigoi did that.

Q. Were they fully down?

A. I wouldn't say that they were all right down at the bottom, but I would say that they were at least three-quarters of the way down.

Q. And that is all of them around on the main deck?

A. Yes.

Q. Did these windows have wooden shutters that went outside of them or inside of them?

A. They had Venetian blinds inside of them; but they were not solid.

Q. Were these Venetian blinds laid in a solid frame?

A. Yes.

Q. With the slats laid in at an angle?

A. Yes.

Q. And they fitted into each window, did they?

A. Yes.

Q. And you say you could raise them up and lower them down the same as you could the windows, is that right?

A. Yes.

Q. How are these windows, or Venetian blinds, or whatever you call them, left when you left the Seminole?

A. Left pretty near shut; I would say about three quarters of the way; three-quarters of the way shut.

Q. Before you left the Seminole, did you go all around the main deck to see how these windows had been left by Schinigoi?

A. To each individual window; I went through the boat entirely, before I left I went entirely through the boat.

Q. Who left the boat first, you or Schinigoi.

A. I think we got off about the same time, maybe half a minute apart.

Q. You went off together?

A. Yes. I came out of the engineroom and I went all over the boat. I went to all of the windows, just like you have here; the windows were all down; which means that they were open, and the Venetian blinds, as I call them, were about three-quarters up; three-quarters closed.

Q. When you left the boat at which end did you leave it?

A. I got off right about the middle, right about the center.

Q. Did you see Captain Pilkington there?

A. Yes.

Q. Did you have the keys at that time?

A. Yes, sir.

Q. Was the boat locked up?

A. Yes, she was locked up.

Q. The after door on the main deck was locked?

A. Yes.

Q. And the engineroom hatch was locked?

A. Yes, sir.

Q. And were the quarters on the upper deck locked?

A. Yes, sir.

Q. Did you give the keys to Captain Pilkington then?

A. No, sir.

Q. You took them with you when you went away?

A. Yes.

Q. Do I understand you to say that when you went away you told Captain Pilkington to close the windows if it rained?

A. That is right. He had an ordinary pass key himself. He could take that pass key and get in the boat. He couldn't get in the dining room or the deck house, but he could get in that "hall" with the ordinary pass key.

Q. You assumed that he had some kind of a pass key that would let him in?

A. Yes, he had them ever since the Seminole had been up there; he could go in that stern deck; he could always get in there. It was just an ordinary pass key that you could buy two for a nickel, and it was customary—

Q. It was customary for you to leave the keys with Captain Pilkington, too?

A. That is right.

Q. So on this occasion you told him to go into the boat, which was locked, and close the windows in the event it rained?

A. All of those windows were pulled back. I took the keys to the deck house and dining room and the engineroom with me. He could get in the engineroom in the hull of the boat through this window near the alleyway; he could always get in the engineroom.

Q. Why did you take the keys away with you?

A. Because I left some silverware there and Mr. Hawkins wanted me to—Mr. Hawkins wanted to take the silverware off, so I brought the keys to the dining room and turned them over to him. He got it a couple of days later, and that's the reason I turned the keys over to him when I came to Miami.

Q. You always left the keys before?

A. Yes.

Q. Didn't you trust Captain Pilkington?

A. Yes, but I had orders from Mr. Hawkins to bring the keys to Miami.

Q. These pans that were under the gasoline tanks; you could see those from underneath, could you?

A. You could see them; yes, you could see them underneath.

By Mr. Matteson:

Q. And what material do you say they were constructed of?

A. It was iron on the underneath pans, and then there was a wooden front end to the tank, it was set in, which you could see very plainly through those holes cut in the bulkhead for the gasoline lines to come out of. It was very plainly seen.

Q. How deep were those pans?

A. The pan itself,—I didn't know until the boat burned, just how deep the pan was, because you couldn't see.

Q. How deep were they?

A. I wouldn't venture to say.

Q. Well, give us some idea; was it six inches or more or less?

A. Probably four inches.

Q. Probably four inches?

A. Yes, sir.

Q. And were the edges of the metal plates turned up to make the sides?

A. Yes, sir.

Q. Were the pans flat?

A. Flat on the bottom, yes, sir.

Q. And were they level?

A. Yes, sir, when the boat was level.

Q. And this wood that you say that was inside of the pans for the tanks to sit on, just describe to us; how much of it was there? Was there a platform, or just a couple of beams, or how was it?

A. It was pretty solid.

Q. What is that?

A. It was solid, and chiseled out for the edges of the tanks to sit in. It was a frame to hold the tank. I would say it was about two inches and a half deep.

Q. And it filled the bottom of the tank?

A. Yes, sir.

Q. Came right out to the edges?

A. Yes, sir, very close.

Q. So that you had a tank that was about four inches deep—I mean a pan that was about four inches deep?

A. Yes, sir.

Q. And it was practically completely filled with a wooden platform, is that it?

A. Practically filled, yes, sir.

Q. And the tank rested on the wooden platform?

A. That is right.

Q. Well, where was this drain line that you saw?

A. Went out of the forward starboard side; went down in the bilge, and then overboard,—in the engineroom, and overboard.

Q. And it came out of the forward starboard side,—starboard side of the tank, is that right?

A. Yes, sir, that is right.

Q. How wide was this pan fore and aft?

A. Fore and aft, the tank, probably two and a half feet, three feet, probably.

Q. Well, it was practically the same width as the tank?

A. Yes, sir, the pan.

Q. And this drain line, when it came out of the pan, did it go down?

A. Straight down, yes, sir.

Q. How far down?

A. Went down to the beams; went down to the frames of the boat; then came back up again about a foot and a half; went down along the beams and then came up about a foot and then went out.

Q. Did it come under the engineroom floor?

A. No, sir.

Q. Did it go below the level of the engineroom floor?

A. It was on the same level if the engineroom floor had been up to those tanks.

Q. And the engineroom floor was about how far above the bottom of the ship?

A. A foot and a half.

Q. Now where did this pipe lead outboard?

A. Run into—went into the toilet drain; went out the side.

Q. The toilet was on the port side, wasn't it?

A. One on the starboard side too.

Q. Where was the toilet on the starboard side?

A. In the first stateroom you come to there.

Q. First stateroom you come to?

A. Yes, sir.

Q. Aft of the engineroom?

A. Forward of the engineroom.

Q. Forward of the engineroom?

A. Forward of the engineroom, yes, sir, over by the tanks.

Q. I understood you to say this drain line led aft towards the engineroom.

A. It went down, and it was on the—the tanks was forward of the engineroom; this went down and on the side and then back into the first toilet drain that went out.

Q. Now the one that you saw on the port side,—I didn't trace it. We built some racks in there to hold the valves and oil and so forth under these tanks; the storage room under those tanks. And we built these racks for sorting out valves and fittings and everything was kept under those gas tanks, which we could get under at all times.

Q. Did you have quite a quantity of parts of that kind under there?

A. Yes, sir.

Q. So that any time you needed something you could find—probably find something of the kind in these racks under there?

A. Yes, sir; the engineer.

Q. That was the engineer's department rather than yours?

A. It was the engineer's department more than mine, yes, sir.

Q. Now you say this drain went into the drain of the toilet?

A. Yes, sir; went overboard.

Q. How was it connected there?

A. It was a fitting, just an ordinary fitting went into this toilet fitting.

Q. And what part of the toilet fitting?

A. Just before it got overboard; the steel hull, she had big iron fitting there, just before it went into the overboard, there was a drain went out of that tank, a three eighths.

Q. Connected into that—

A. Fitting, yes.

Q. Into that drain?

A. Yes.

Q. Well, there was water passing through that drain frequently, wasn't there?

A. Yes; it went overboard just the same.

Q. And then if there was water passing through that drain, it would pass back up through this drain line as well, would it not?

A. The tank is about a foot and a half higher than—two feet higher than that drain.

Q. You had a length of pipe coming back and down, and again up; now if this is connected to a pipe, at one end through which water passed, the water comes back through that pipe until it finds its own level again?

A. Finds it own level, that is right; if there is anything above that level it will run out.

Q. Then this drain line that you speak of must have been partially filled with water at all times, is that right?

A. Part of the time I would say it was filled with water. I didn't go into it very thorough, because I wasn't much interested; the only thing, I saw it in there, that is all.

Q. You just saw there was a line there?

A. Yes, sir.

Q. You don't regard that as a very efficient drain, do you?

A. No, I didn't at the time regard it as a very efficient line; but it was there just the same.

Q. And the one on the port side, I understood you never did find that?

A. I didn't trace it; I had no occasion to trace it.

Q. Where were you when you were approaching Fort Lauderdale when this one engine quit?

A. When the one engine commenced to cause trouble we was almost at the sheds.

Q. How far away?

A. I would say we had made the last turn there, about, not over a thousand feet away.

Q. And so you made the last thousand feet with one engine only?

A. I don't know whether the other engine was running or not; I don't know. I just depended on the port engine to bring her up there with, to stop.

Q. When you stopped for lunch that day, I understand the engineer told you that you were pretty near out of gas?

A. Yes, sir.

Q. And he didn't know whether you would have enough gas to get up there?

A. Yes, sir.

Q. Then in spite of that you told him to keep on running the engines while you had lunch; is that right?

A. Yes, sir; I told him to; yes, sir; but he didn't; he shut them off.

Q. He shut them off?

A. He shut them off; yes, sir.

Q. Oh, I see.

A. We went in that canal, I am pretty certain he shut the motors of; he insisted that we didn't have gas enough.

Q. I see; he insisted on having his way, and shut the engines off?

A. Yes, sir.

Q. Is that right?

A. That's right.

Q. Well I don't quite understand your idea in telling him to keep them running.

A. We were going to be there just such a short time, probably ten minutes, why shut off the big motors and start them all over again?

Q. And you thought if you did, you might have to buy some more gas on the way up, didn't you?

A. Have to buy gas?

Q. Yes.

A. I didn't know ten minutes would make much difference one way or the other.

Q. If you had to buy more gas, that would give you that much more in your tanks when you got there; is that right?

A. Be more in the tanks; yes, sir.

Q. And you were trying to figure on getting there with as little gas as possible, as I understand it?

A. Yes, sir; I wanted to get there with just as little gas as I could get there.

Q. I understand that before you left Miami there was some gas transferred from the Seminole to your boat; is that right?

A. I don't remember.

Q. What is that?

A. I don't remember that; I couldn't remember those small details in a case of that kind.

Q. Well I understood from Mr. Schlappi when he testified, that you said that you wanted to have as much gas as when you started out, or words to that effect?

A. Yes, I did; that is so, I guess I did; I don't see no reason why not.

Q. And that then a quantity of gas was transferred from the Seminole to your boat?

A. That small boat.

Q. Is that right?

A. Yes, sir; if he says so.

Q. You don't remember about that?

A. No, sir, nothing at all.

Q. Haven't any recollection of such conversation?

A. No, sir.

Q. Haven't any recollection of getting gas off the Seminole?

A. Not there, no.

Q. Haven't any recollection of how it was done?

A. Not a bit. I didn't do it; that's all.

Q. You were Master of the Seminole at that time, were you not?

A. Yes, sir.

Q. And you considered yourself responsible for her?

A. Yes, sir.

Q. And all her supplies?

A. Yes, sir. If I told him I wanted that gas, I was on the Seminole quite a number of times, you know, and just this one particular time I couldn't say; I couldn't pick out one time and say anything of that kind; I couldn't say that.

Q. Did you say anything to Mr. Hawkins about getting gas for your boat off the Seminole?

A. No; that was my business. If I felt like taking gas for my own boat, why I was entitled to that.

Q. You felt you were entitled to it?

A. Yes, sir. If I put it on there, I was entitled to that.

Q. You spoke of shutting a number of water valves on the Seminole when you laid her up. Tell me just what water valves you had in mind.

A. For all the toilets, and all, going through the hull.

Q. And where are those toilets?

A. Well, it was all over the forward and after end of the boat.

Q. There were bathrooms connected with most of the staterooms?

A. Yes, sir.

Q. And did you go in those bathrooms and close the valves there?

A. No, they was on the bottom. I closed the valves—the main valves going overboard. Underneath, you could walk through the Seminole, underneath, right down under her hull.

Q. And where were those valves located?

A. They was all located under the bathrooms.

Q. Located under the bathrooms?

A. Yes, sir.

Q. Bathrooms were at the sides of the boat, were they not?

A. Yes, sir.

Q. And this walkway was in the middle of the boat?

A. Yes, sir.

Q. And the walkway was between the water tanks, wasn't it?

A. Yes, sir.

Q. Were the valves in the walkway?

A. No, sir; they was out, the side of the hull, but you could get to every one of them.

Q. How many of them were there in the forward part of the boat?

A. I don't know; I wouldn't know.

Q. Were there any in the after part of the boat?

A. Yes, sir.

Q. Where were they located?

A. Same way.

Q. Now what water valves did you close in the engine room?

A. We closed the main water valves; Rollie did that; the pumps to the engines.

Q. Who was steering the boat coming up from Miami?

A. I guess I did it most of the way.

Q. Well, that was your job, wasn't it?

A. Well in a way; yes, sir.

Q. Well, did you do the steering?

A. Most of the way. There was only four of us on there; I guess I did most of it. I know I did it coming up New River, it was crooked and tough going.

Q. Do you say that on that trip you made several visits to the engine room?

A. Going up the river, no; going up the canal, yes. I was in there three or four times—in the canal I was three or four times in the engine room; going up New River I know I was steering all the time.

Q. What was the purpose of going into the engine room those times?

A. I was consulting with the engineer, Schlappi; I was also in the galley; I was all over the boat while we was going up.

Q. No more in the engine room than anywhere else?

A. No, sir.

Q. Well when you went to the engine room, what did you do? Just look in and speak to Schlappi?

A. If Schlappi wanted me for anything; we went in two or three times, I would call him up and go down; we would discuss this, that and the other about laying up the boat, that is all.

Q. Schlappi didn't need you for anything, did he?

A. Not as I know of, but we discussed that; when you have a few men on a boat, why it is all—everybody does what they can to help.

Q. You were going to leave the Seminole that night after you got to Fort Lauderdale, weren't you?

A. Yes, sir.

Q. So it was necessary for you to get all these various things looked after so you could get away from Fort Lauderdale, is that right?

A. We did as much as we could going up; yes, sir.

Q. And you were checking these various departments as you went along?

A. Off and on; yes, sir.

Q. You weren't in the engine room very long at any one time, were you?

A. No, sir.

Q. I understand you to say that when you left the Seminole, the switches on the switchboard had all been pulled?

A. Yes, sir.

Q. However, the batteries were still connected, were they not?

A. That is right, sir.

Q. So that any one man could get current on the switchboard by throwing the main switch and the discharge switch; is that right?

A. That is right.

Q. I understood you to say that you were aware of certain insurance clauses about laying up boats with gasoline, but that nobody pays any attention to them? Is that the substance of what you said?

A. Yes, sir.

Q. What are these insurance clauses that you speak of?

A. Certain places, they demand you draw the gasoline off. That is insurance; that is a requirement of the insurance company.

Q. Well that is the usual requirement of the insurance companies with respect to laying up boats, isn't it?

A. I don't know. On a boat the size of the Seminole, I don't know whether it is or not. I have never had an insurance agent tell me to draw the gas out of the Seminole when she was insured.

Q. Well the Seminole never was insured, was she?

A. Yes, sir, she was.

Q. While you were Captain?

A. While I was Captain, she was insured; the insurance lapsed while I was on there.

Q. Well these insurance requirements are safety requirements, aren't they?

A. To protect the insurance company.

Q. Well it is to protect the vessel from loss, isn't that right?

A. Yes, sir; I think so.

Q. That is the only thing the insurance company is interested in?

Mr. Underwood:

I object to that, on the ground that this witness can't know what the insurance company is interested in, and

I think he has given a very clear answer,—to protect the insurance company.

Mr. Matteson:

I think my statement was gratuitous and didn't call for an answer.

The Court:

I think it is subject to being stricken.

Q. Did you submit any bills for the electrical work that you did on the Seminole in 1929?—any statement of the expenses in connection with that work?

A. Yes, the bills was kept in those—in her log book; the actual expense was kept in the back of that log book, and I would turn in a general bill to the office. Itemized bills was always kept on the boat, of anything done by the crew.

Q. Well now would that bill show what work was done, turned into the office?

A. I don't think so; I don't think it would show what was done.

Q. So there is no record existing anywhere now, of the work that you say was done on the Seminole in 1929?

A. I don't think so. I wouldn't know. I know her books were all gone. By the way, we never did find the safe which was missing off the Seminole; somebody got to it before we did; the safe was gone; that never showed up.

Q. Were the log books in the safe?

A. The log books was in the safe.

Q. Where was the safe?

A. In the captain's room.

Q. Was it a fireproof safe?

A. Yes, sir.

Mr. Underwood:

Can Mr. Botts tell us anything about the safe?

Mr. Botts:

No, sir, I wasn't there when the boat was raised. * * *

A. There was an accurate set of log books kept on that boat, all the time I was there.

Mr. Matteson:

If your Honor please, there are two or three things more I would like to inquire into, but I would like to have an opportunity to examine a few of the exhibits before I do that. I suggest Mr. Botts could take it up at this point.

Mr. Botts:

I haven't a single question of this witness.

(Following discussion, at 4:45 p. m. the hearing was recessed until 9:30 o'clock a. m., of the following day, to-wit, Wednesday, May 17, 1939.)

Wednesday, May 17, 1939, 10:00 o'clock A. M.

Hearing resumed pursuant to adjournment of the previous day.

*2489 CAPTAIN WILLIAM P. BAKER resumed the stand and further testified as follows upon:

Cross Examination (Continued).

By Mr. Matteson:

Q. Captain Baker, there are just a few things I wanted to ask you. Was there a screen in the ventilator,—I mean, the skylight over the engineroom?

A. Yes, sir.

Q. Was there a screen in the port window?

A. In the port window? Yes, sir.

Q. That is in the engineroom?

A. That is in the engineroom; the outside window.

Q. And was the boat generally fitted with screens?

A. Yes, sir.

Q. All the windows had screens?

A. Yes, sir.

Q. Now over the engineroom there was a steel deck, wasn't there?

A. Yes, sir.

Q. That covered the engineroom and the tank space?

A. I don't know whether it went up to the tank space or not, but I think it did. I think that raised section of the engineroom deck went up to the tank space.

Q. And that went from one side of the boat to the other, didn't it?

A. Which, the—

Q. The steel deck over the engineroom.

A. No, that came in from her decks; you had about, I would say five foot deck space on each side. It didn't go all the way out—that was about five feet in. The deck was all one level, forward and aft,—the main decks. This engineroom, the raised portion of that was just like a house, took about the same width as your deck houses.

Q. This steel cover was raised above the deck?

A. Yes, sir.

Q. How much?

A. Approximately six inches.

Q. And how much between the sides of the ship and the edge of the raised steel deck, was there?

A. There would be four feet, I would say, on either side.

Q. About four feet on each side?

A. Yes, sir.

Q. And what did the deck there consist of?

A. She had a wooden deck, canvas covered.

Q. Now you spoke of seeing the trays under the tanks, yesterday?

A. Yes, sir.

Q. Through the openings around the valves?

A. Yes, sir.

Q. I show you this Libelants' Exhibit 4, which shows the valves on one of the tanks. Is that the sort of opening that you refer to?

A. Yes, sir, that's it.

Q. Before the fire, the tanks were so set that these valves were in the middle of these openings, were they not?

A. Yes, sir.

Q. So that the tank in this picture, Libelants' Exhibit 4, has been set up a couple of inches, apparently?

A. Yes, sir.

Q. And before the fire, the bottom of the tank had been below the bottom of the hole?

A. Well, I don't know as it was the bottom of the hole; right at it, almost.

Q. Right at it?

A. Yes, sir, my recollection.

Q. It would just about cover the hole?

A. Yes, sir.

Q. Well, the tanks practically filled the tank space, fore and aft, didn't they?

A. Yes, sir.

Q. Now I am not quite clear what you could see through this hole, before the fire, when the tank was in its original position.

A. You could go right in through there with your fingers, you could go right down to the bottom of the tank,—right down in that.

Q. You say there was room to put your fingers inside the hole?

A. Oh yes, and you could run through there and go right down, the space between the wood and this drain pan.

Q. Then what you observed before the fire would be based on feeling rather than seeing, is that right?

A. Yes; you couldn't see.

Q. You couldn't see?

A. No, sir, you couldn't see.

Q. Well then do I understand that it wasn't until after the fire that you saw the trays?

A. Well, you could see this, you could see the iron. You couldn't see the wood in there, because you didn't know—you could feel it in there but you couldn't see it. I never seen it until after the fire.

Q. The wood was under the tanks?

A. No, this is the tank here, where that tank set, there is an iron tray sits out here and then there was wood inside that iron tray, to catch the end of the tank.

Q. I see; and so the tank set on the wood?

A. Yes, sir, the tank say on the wood, not the iron.

Q. And did I understand you to say that this wooden platform in the tray under the tank was gouged out to fit the bottom of the tank?

A. Yes, sir. That I seen after the fire; anybody seen.

Q. And the wood was about two and half inches thick?

A. I would say so, yes, sir.

Q. Yesterday you were telling us about the drain valve and I am still not quite clear about it; I don't mean the drain valve, I mean the drain to the pan?

A. Yes, sir.

Q. Your answer as I recollect it says—

Mr. Underwood:

What page, please?

Q. Page 2059; that this pipe went straight down from the pan.

A. Yes, sir.

Q. Went down to the beams,—the frames of the boat?

A. Yes, sir.

Q. And then came up again about a foot and a half?

A. It went up to the toilet; right ahead of those tanks, I would say. It is pretty hard to estimate; probably six feet, eight feet, up there, is the toilet opening on the side of the boat; right straight ahead, outside.

Q. Referring to this blueprint which has been marked Respondents' Exhibit A, the toilet that you refer to is the one that is in the after part of the double stateroom, is that right?

A. That is right.

Mr. Underwood:

Was that at the stateroom just forward of the place marked, lobby.

Mr. Matteson:

Lobby, yes.

Q. I am not quite sure about this space that you have mentioned, a foot and a half. Is that the space,—is that the distance from the bottom of the tank down to the beams?

A. Oh no; no, it was—the bottom of these tanks sat on the same level as the living quarters in the boat forward. The bottom of her fuel tanks,—this deck from here aft, is the same level, the bottom of those tanks. Well, the same space that you had under here, that I could walk under, you had under those tanks; it is on the same level.

Mr. Underwood:

Indicating the deck from the bow back to the place marked Lobby.

A. I could walk under those tanks, I didn't have to get down on my hands and knees. You could walk around underneath those tanks, on the floor we had under there, for our fittings; didn't have to get down on hands and knees, you could walk on your feet, squatting down, underneath those tanks, which we had fitted with the compartments for—

Q. Well, the floor of the engineroom was about a foot and a half above the bottom of the ship?

A. Yes, sir.

Q. Now referring to the Libelants' Exhibit 10, this shows the auxiliary generator, doesn't it?

A. A little auxiliary generator, yes, sir.

Q. And that sat on the floor of the engineroom, did it not?

A. Rested about five inches above the engineroom floor; practically the same level.

Q. Well, under it I see the remains of a beam.

A. Yes, sir.

Q. Is that the level of the engineroom floor?

A. I think so.

Q. And how high was this shelf that was against the forward bulkhead of the engineroom and apparently over the auxiliary motor?

A. I couldn't tell you, I don't know.

Q. The opening through which the valve from the tank came, was underneath that shelf,—that is for number 1 or the port tank, was it not?

A. Yes.

Q. And the bottom of the tank you say was just about even with the bottom of the hole?

A. Yes, sir.

Q. Well, how high were those holes above the floor of the engineroom?

A. About three and a half feet probably; three feet. That is a working shelf, it is about three feet high; that is your work bench there, this is three feet high.

Q. Now you are pointing to something on the port side of the engineroom?

A. Yes, sir. That was your work bench, over there.

Q. That was where the toilet was too, wasn't it?

A. Yes, that was the level of the work bench, just about three feet high. This is much higher, that is where the bilge pump sat up on that, pretty high.

Q. So the bottom of the hole, as I understand it, was about, according to your estimate, three and a half feet above the engineroom,—the bottom of the hole that admitted the valve to the tank?

A. Yes, sir.

Q. Now this drain line—before I get to that. Then the tray would be how far below the bottom of the tank?

A. The tray wasn't more than probably an inch. It was chiseled out to where that tank sat down almost on that steel tank—that steel tray.

Q. That would be something below—

A. Yes, sir.

Q. —the bottom of the hole?

A. Yes, sir.

Q. Then as I understand it, this drain line went directly down to the level of the beams?

A. The beams, yes, sir.

Q. —of the beams?

A. The beams, yes, sir.

Q. —of the vessel?

A. Yes, sir.

Q. And that would be about a foot and a half above the actual bottom of the vessel?

A. Yes, sir.

Q. And then ran forward from there how far in a straight line?

A. Probably eight feet. I don't remember, it was down under there; probably eight feet straight forward.

Q. And then it came up with a right angle?

A. Yes, sir, it came up with a right angle.

Q. And connected with the discharge pipe from the toilet?

A. That is right.

Q. At the bottom of that pipe?

A. I think it ran into the side, the aft side; I think that is right.

Q. What is that?

A. The aft side I think is where they went in, I am pretty positive.

Q. And was the toilet discharge pipe above the water level?

A. It was about an inch or two under.

Q. An inch or two under the water level?

A. Yes, sir.

Q. You mean, the bottom of it?

A. No, the top.

Q. Did you have a sea-valve on that toilet connection?

A. Yes, sir.

Q. What kind of a sea-valve?

A. A gate-valve.

Q. Can you describe it to us?

A. A gate-valve, an ordinary gate-valve, is all I know.

Q. Well, what is a gate-valve?

A. Just like,—a gate-valve rolls with a—(illustrating) instead of going down to a seat.

Q. It is a sliding piece of metal that slides through a socket?

A. That is right.

Q. Then when the vessel was in commission, the discharge pipe would be full of sea water when the vessel was afloat?

A. That is right.

Q. And then that water would run back through this drain line and fill the drain line up to that level?

A. To that level, that is right.

Q. Which was higher, the discharge pipe of the toilet or the pan under the tanks?

A. The tanks were higher, they had to be; they sit on the same floor level with the toilet.

Q. The same floor level?

A. Yes, sir.

Q. How much difference in height would there be?

A. There would be at least four inches higher,—three inches higher.

Q. About three or four inches?

A. Higher than the drain; yes, sir.

Q. That is the tray would be three or four inches higher than the discharge pipe that the drain line was connected to, is that right?

A. Sitting on the same floor level; it sit on the same floor level as the toilet, the same level of the tanks,—the bottom of those tanks was on that same floor level, the toilet was that flush; we never had any water in this drain,—in those pans. I figure we must have had at least four to six inches drop there.

Q. Well, if for any reason the yacht listed to starboard, so that her starboard side was brought that much lower, four to six inches than it normally would be, the water would run back through the drain line into the pan, wouldn't it?

A. It was too far inboard, she couldn't change that far. Those tanks didn't go out to the sides by at least three and a half to four feet.

Q. Well, the point I am making is simply this; if the yacht listed so that her starboard side was brought

down four to six inches, you would have that much head of water on the discharge pipe, from the toilet, wouldn't you?

A. The toilet,—we never had any backup in the toilets.

Q. Well, I am not speaking of the toilet, I am talking just about the drain line.

A. The drain lines would be on the same angle as the hull; you got to change that angle.

Q. I appreciate that; I am just taking it a step at a time. If you listed—

A. Yes, sir, the outside would be farther under water than the inside.

Q. So that you would get a head of four to six inches, whatever your list was, on that drain line?

A. The outside, yes, sir. The side of the boat.

Q. And that wouldn't be an unusual thing for the Seminole to list in such a way as to bring her starboard side down four to six inches, would it?

A. Not a bit.

Mr. Underwood:

I didn't hear you, Captain.

A. Not a bit.

Q. And if you were going through a sea-way, so the waves are coming up from time to time, whenever you passed through a wave you get a greater height of water on the discharge pipe, don't you?

A. Well, when we was under way, all these pipes have got—they have got—what do you call those?—they have scoops on there, you know, where you protect that water from coming back.

Q. What do you mean by a scoop?

A. Well, a scoop is something put on a boat where, when you are going ahead, you create a vacuum in there. All the toilets had them.

Q. Similar to a visor effect?

A. Sure, it creates a vacuum, while you are running; always create a vacuum in there. We have them on all of them.

Q. So when that was in place it would be on the forward side of the pipe?

A. Yes, sir.

Q. And the after side of the pipe would be open?

A. Open, yes, sir.

Q. And if you are under way, the motion through the water creates a vacuum behind you?

A. Creates a vacuum.

Q. —by this contrivance. If you were anchored and rolling, of course it wouldn't have any effect?

A. That wouldn't have any effect at all.

Q. You say the water never did back up through this drain line into the trays, to your knowledge?

A. No, sir, not to my knowledge.

Q. Do you know that it was necessary for some of the engineers on the boat to wipe out that tray from time to time?

A. No, sir.

Q. Never heard of that?

A. No, sir, nobody ever reported that to me.

Q. Now the pipe going down, going across and coming up, forms what you call a trap, doesn't it?

A. Trap, yes.

Q. And any water that got in there would just stay there?

A. Stay there until more pressure is applied on the other end.

Q. It would have to be forced out by pressure?

A. Sure.

Q. And you couldn't very well put any pressure on a tray end of the line, could you, to get it out?

A. It would find its own level.

Q. Now yesterday, you were telling us about some crookneck pipes.

(A.) Q. Gooseneck.

Q. Gooseneck, I think; were they in the after part of the ship?

A. There was four on each side of that engineroom desk, as it come up. They was all on that deck; and there was of them, four on each side; two inch pipe.

Q. You are speaking of the steel deck over the engineroom?

A. Steel deck over the engineroom.

Q. Did they pass through that steel deck?

A. No, sir, they went through the wooden deck right at the side of—these goosenecks was right down just—came up right at the—right by the side of that raise. They wasn't on the steel deck, they was in the wooden deck, right immediately alongside.

Q. The only testimony we have had in the case before, about these crooknecks, as I recall it, is that there were some in the after part of the ship. Were there some back there too?

A. Yes, sir; there was some down there too; some aft too. There was four back there,—away back aft.

Q. Well, you say these were two inch pipes?

A. Yes, sir.

Q. And what is a crookneck?

A. Gooseneck?

Q. Gooseneck.

A. It is a half turn, comes all the way up, and goes back; just a return.

Mr. Underwood:

Indicating 180 degrees?

Q. Yes, sir, that is at the top of the pipe, there is a bend of 180 degrees?

A. Yes, sir; come around, right around like that.

Q. So that the end of the pipe is facing down to the deck, is that right?

A. Yes, sir; facing right down to the deck.

Q. And how far above the deck did you say these pipes go?

A. Go about, I would say they was about eight inches above the wooden deck; the highest part of them.

Q. The highest part would be about eight inches above the deck?

A. Yes, sir.

Q. And then the end of the pipe, after the turn has been made, where it is facing the deck, how high would that be above the deck?

A. About two and a half or three inches.

Q. How far apart were these pipes?

A. About four feet, four and a half feet, apart; one in each corner, and they was divided equally between that engineroom—I don't know just how far that is.

Q. Where did they come down in the engineroom?

A. They went in the ceiling between the engineroom and the—the outside; she had a partition out there, in that hallway; they come right down through there.

Q. Went down through the hallway?

A. Well, in that partition, in between the partition and the hallway; they went right through—they didn't go inside the engineroom, they wasn't inside; they went right down, after they got through the deck; then they was in the engineroom.

Q. Then they didn't go through the engineroom until after they passed through the floor of the alleyway; is that correct?

A. That is right, yes, sir; they was in the partition there.

Q. They were in the partition?

A. Yes, sir.

Q. And that is on the starboard side?

A. Yes, sir.

Q. Now on the port side where were they located?

A. One in each corner. That went down; there was—she had this pipe leading up and over, through, run right along the top of the deck there, came out of the corner, came right up and out; came out from under the side of the hull and turned and came right up.

Q. Were they inside the partition too?

A. No, there was no partition over that side; that is over the engineroom. Our engineroom went one side, it was right out to the side of the ship; they made the turn and came back up.

Q. How long were these pipes from top to bottom?

A. They was about nine feet down, I guess, from the top of the engineroom hatch to the floor; went through there and turned and went down, came along the sides.

Q. Well, did you ever follow those pipes to see where they led to?

A. I did a couple of them; I didn't all of them.

Q. Which two did you follow?

A. Followed the two forward corners; both forward corners.

Q. They are the only two that you actually followed?

A. That is all.

Q. To see where they went to?

A. That is all.

Q. And this one that was in the starboard forward corner, how close to the corner was it?

A. It was in the corner, set right in the corner of the batteries; went right up the other side of the batteries, on the outside of the engineroom.

Q. And the one in the port corner, where did that lead to?

A. Went right straight down, just under the engineroom floor.

Q. That was the corner in which the toilet was, wasn't it?

A. No, it was over, it was in by the—the toilet was sitting out at the side of the ship, and this gooseneck came in right over that; it was about four feet in.

Q. I show you this picture, Respondents' Exhibit 4-A, which has been introduced, showing the condition in the engineroom sometime after the fire, and some of the wreckage. Can you point out to us the pipe you are talking about there?

A. Well, this—that's the starboard corner. This pipe came right down through this corner here, right down this corner.

Q. That is the corner you say it came down through?

A. Yes, it was on the outside of this steel bulkhead; on the outside of that steel bulkhead.

Mr. Underwood:

Indicating the fore and aft alleyway bulkhead, inboard?

A. It wasn't in the engineroom, it was at the corner at the outside, where the batteries was.

Q. But you don't see the pipe, or any part of it, or the remains of it, in that picture, do you?

A. You couldn't see it in there, it wasn't in there.

Q. And you don't see it in this other picture, Exhibit 4-B, do you?

A. It wouldn't be here.

Q. What was that?

A. No, sir, you don't see it there.

Q. I show you Libelants' Exhibit 16, this picture at the left, which also shows some of the wreckage of the engineroom. Do you see anything that looks like that pipe in there, anywhere?

A. Let's get this straight in my mind, first. I don't get the picture, to tell the truth.

Q. Well, this picture, I think I can explain it to you; it is taken in the engineroom looking towards the port

forward corner where the toilet was; and I think this engine down here, underneath, is the little generator. Does that straighten it out for you?

A. Well, this pipe here came down right over through the top here and turned right down through this corner here; it went down by the toilet, came right down through there. You couldn't see it here, couldn't distinguish it if it was there. It would be right up against the bulkhead, on this side of the little engine, between there and this side of this little generator.

Mr. Underwood:

Indicating a part of the little generator motor.

A. Right in there, yes, sir. So much of that wreckage around, it is hard to distinguish.

Q. And these pipes that you speak of now were all in the engineroom space, as I take it?

A. All in the engineroom space? No, sir; the four on the starboard side were in the—

Q. In the alleyway?

A. In the alleyways.

Q. The four on the port side were in the engineroom space?

A. Yes, sir.

Q. Were these straight pipes or did they have bends in them?

A. They had bends in them. They had pipe fittings, that they was made of.

Q. So they were not straight pipes, straight down from the deck?

A. No, sir.

Q. Did you ever see those after the fire?

A. I never looked.

Q. Did you see the Seminole after the fire?

A. Yes, sir.

Q. When did you see the Seminole after the fire?

A. Plenty of times.

Q. Well, when was the first time you saw it after the fire?

A. Sometime in October.

Q. Several months later?

A. Yes, sir.

Q. Did you see the vent pipes or any remains of them, at that time?—these pipes you have been speaking of?

A. I couldn't recall whether I did or not. I went over her pretty thoroughly at one time, after I got hold of her.

Q. What is that?

A. I went through her pretty thoroughly one time; there was a lot of stuff missing off the boat,—plenty.

Q. I imagine so, after four months.

A. Yes, it was all gone.

Q. You never did see anything of them after the fire?

A. No, I don't remember; I never even looked; never even gave it a thought.

Q. I would just like to ask you one more question about this Libelants' Exhibit 4, showing the valve coming out of the number 1 tank. Is there any drain pan visible there now?

A. No, sir.

Q. Well, there should be, shouldn't it?

A. I don't know just how it is moved around; it should be.

Q. If it was still in place it should be visible?

A. Yes, sir.

Q. Do you see it in this Libelants' Exhibit 5?

A. I don't know whether that's it or not, I couldn't swear.

Mr. Underwood:

Indicating what?

A. I don't know whether that is the pan or not; I couldn't swear to that.

Mr. Underwood:

Mark the thing that you don't know whether it is the pan or not, will you, please?

Q. This right here, is that it?

A. Yes, sir, I imagine it is, but I don't know.

Mr. Underwood:

Draw a line from that, and mark it.

Mr. Matteson:

It is sufficiently marked, by a cross. • • •

Mr. Underwood:

By a cross just to the left of the piece of weed that comes out from the opening of the bulkhead.

Q. Well, this doesn't look like a turned-up side of a pan, this thing that you are pointing to, does it?

A. No, sir.

Q. Captain, you said that you had visited the Seminole at Ft. Lauderdale at other times than when you went up to get her?

A. Yes, sir.

Q. And you spoke of one time when you went up to get the batteries, and another time when you took them back after they had been repaired?

A. Yes, sir.

Q. Do you recall any other times that you were there?

A. I was up at the Seminole quite a number of times.

Q. You don't recall any other specific occasions?

A. I used to go up there and do a lot of painting, do anything that I would see needed to be done to the boat; a lot of odd times I would go up there.

Q. There was no other special time that you recall?

A. No, sir.

Q. Except some time when you went up to do some work on her?

A. To work on her; I used to go and come—

Q. One other thing I wanted—

Mr. Underwood:

May we have him finish that? "I used to go and come"—

A. On my own time; when I thought anything was needed up there, I used to go and look after the business of the boat up there.

Q. On this blueprint, I wonder if you could indicate for me the hatchway through which you say you got down in the forward bilge space.

A. The hatchway? Forward bilge space? Right in here.

Q. Will you show us again where that was; draw a little square to represent it?

A. Let's see, it was right in here, the hatch.

Q. You have drawn an oblong in the passageway, and I will draw a line from it and marked it, hatch.

A. Hatch, yes.

Q. Now was there any other hatch on that deck?

A. Not in here, no, sir.

Mr. Underwood:

Indicating the space forward of the Lobby.

A. Forward of the Lobby, yes, sir.

Q. Was there any other hatch on that deck, aft of that?

A. No, sir, not that you could get in.

Q. Was there one aft of the engineroom?

A. Yes, sir.

Q. Where was that?

A. (Witness drawing).

Q. You have indicated a space in the galley, is that right?

A. Yes, sir.

Q. That was how you got down in the after space?

A. Yes, sir.

Q. Captain Baker, one more thing I would like to ask you: I think you said it had been customary in other years to leave the keys with Captain Pilkington.

A. Yes, sir.

Q. So that on previous occasions when the boat had been there, Captain Pilkington had the boat's keys to get into the boat?

A. Yes, sir.

Q. Well, then, I would like to ask you to explain to us how it is that you know that he had what you call a pass key.

A. I know he had several of those things, he could get into the boat, because he asked me did I want him to turn the engines over, and I told him, no, I told him I didn't want him fooling with the engines.

Q. It was customary, was it not—if you know, when boats were stored there for Pilkington to turn them over, —turn the engines over during the period of storage, if the owners wanted him to? You knew that?

A. Yes, sir.

Q. Well, when he asked you, you didn't think that he meant to turn them over right away, did you?

A. Immediately?

Q. Yes.

A. I don't know what he meant; he just asked me if I wanted the motors turned over, and I told him, no, I didn't want him fooling with them.

Q. You told him you didn't want him fooling with them?

A. I didn't want him in the engineroom.

Q. You told him you didn't want him in the engineroom?

A. That's right.

Q. And you understood what he meant, when he asked you about turning the engines over, was, that if the boat was going to be there for a long period, he would occasionally go into the engineroom and turn the engines over, if you wanted him to—by hand, is that right?

A. I imagine that was his meaning. We never—

Q. That was the way you understood it?

A. That was his meaning, I suppose.

Mr. Matteson:

That is all.

By Mr. Botts:

Q. Now then, how long have you lived in Miami, Captain?

A. I have been here since 1897.

Q. Where did you come from when you came to Miami?

A. Born in Keywest, and come from there here.

Q. Are you related to Captain Clete Baker in any way?

A. Clede Baker? Yes.

Q. What is the relationship?

A. Brother. I never heard him called Captain, before.

Q. Now you made the statement that Captain Pilkington had a pass key that would unlock this rear door?

A. Yes, sir.

Q. Did you ever see him with such a key?

A. I think I have, on several occasions. I think he came out there with this big bunch of keys and got into this boat. He had plenty of them; I have been in with him several times.

Q. When he went into the Seminole?

A. The Seminole; he and I went in several times together.

Q. Well, you used the regular Seminole keys for that, didn't you?

A. Came out of this big bunch of keys; I don't know whether it was Seminole, or not.

Q. He came out with a big bunch of keys?

A. Yes.

Q. Now do you know whether these were the regular keys for the Seminole, that had been left with him?

A. I couldn't tell you that.

Q. You don't know?

A. No.

Q. Then you don't know whether this key that he unlocked it with, was the Seminole boat keys or not, do you?

A. No.

Q. Then when you said that he had a key, you didn't know,—you were just guessing?

A. I was guessing, yes. Anybody has got a pass key. He could get in the boat.

Q. If he had a pass key he could have gotten in the boat, is that what you want us to understand?

A. Yes, sir. He had a pass key, he had a bunch of them, ordinary two for a nickel pass keys.

Q. Now are you guessing again, or are you telling something that you know this time?

A. Well, I am telling something that I know. He used to get this pass keys and come out and let me in the Seminole, and let me in there if I didn't have one in my pocket.

Q. You mean he would go in and get some keys out of his office and let you in the Seminole?

A. That is right.

Q. And was that the time when the Seminole's keys were left with him?

A. Probably so.

Q. You don't know whether he had a pass key or not, do you?

A. No, I wouldn't swear he had one.

Q. You did swear to it yesterday, didn't you?

A. No, I didn't.

Q. All right, we will leave it that way. Now let's take up the subject of these pans underneath these gas tanks a little bit.

A. Yes, sir.

Q. Now I want you to correct me if I misunderstood you yesterday.

A. Yes, sir.

Q. Or, whenever you were testifying about it. My understanding is that after the fire you said that you saw these pans, and that there was some part of the charred wood in the pans under the tanks; is that right?

A. Some part of the charred wood?

Q. Some part of the charred wood that the tanks had been sitting on, or some part of the wood that the tanks had been sitting on.

A. A lot of wood was not even charred.

Q. A lot of wood was not even charred; all right. Then after the fire you saw these tanks still sitting on the wood that had been the foundation; is that right?

A. Well, all the tanks were moved, and some parts of them were sitting on wood and some were not.

Q. But you saw portions of those original wood foundations that had been under the tanks?

A. Yes, sir.

Q. And after the fire, you saw that, did you?

A. Yes, sir.

Q. And that wood foundation was at that time still resting in these pans, is that right?

A. Yes, sir.

Q. And you saw the pans, and the wood, after the fire?

A. Yes, sir.

Q. Now then I want to get at this—before I get to that. Referring to Respondents' Phipps' Exhibit A; on the blueprint there are two outlines of the boat. As I understand it, the one on the left hand side illustrates an upper level and the one on the right hand side illustrates the lower level; am I right?

A. Yes, sir.

Q. Now on the sketch on the lower—on the right hand side, representing the lower level, there is a word, passage, written here on three different places. One aft of the engineroom, one—I will say to the right side of the engineroom, and one forward of the engineroom?

A. That is right.

Q. Is the floor level of that passageway one continual level without any steps up and down?

A. That passageway? Yes, sir.

Q. Now there is a point here that I am not quite sure about. In this passageway, to the right of the engine? room, there is an opening which might either be a door or a window, so far as this blueprint is concerned. Is that a door or a window?

A. A window.

Q. And it has been testified by Mr. Hawkins that, standing in the passageway, the lower ledge of that window would be about waist high; is that about correct?

A. Yes, sir.

Q. Now then, here is the point that I have perhaps been laboring under a misapprehension. Is the floor level of the engineroom the same as the floor level of this passageway?

A. Oh, no, sir.

Q. All right; how much below the level of the floor of the passageway, is the floor of the engineroom?

A. I don't know; it is quite a bit.

Q. Well, give us your best—

A. I think when you—it must be at least three and a half to four feet; the top of your head just about reach that window, if you was in the engineroom.

Q. Then from the floor level of the engineroom to the sill of this window into the passageway, was perhaps approximately six feet; is that correct?

A. From the—

Q. Floor of the engineroom to the sill of that window, would be approximately six feet; approximately level or a little above the top of your head?

A. That is right.

Q. How tall are you, Captain?

A. Six feet.

Q. All right. Then if a person went from the passageway through the window into the engineroom, they would have a considerable drop on the inside, wouldn't they?

A. Yes, sir.

Q. And as I understand it, the foundation or base which supported the bottom of the fuel tanks was on the same general level as the floor of the passageway and Lobby?

A. That is right.

Q. Now these metal tanks, I believe—I mean, metal pans, underneath the tanks, I understood you to say they were steel?

A. Yes, sir; iron.

Q. Iron or steel?

A. Iron or steel, yes, sir.

Q. All right; and there are two of those tanks—two of those pans underneath the tanks?

A. Yes, sir.

Q. Each pan—or two tanks resting in each pan?

A. Yes, sir.

Q. And each of those pans rested on a wooden support or foundation, which in turn rested on the pan; and then the pan rested upon the supporting foundation; is that correct?

A. There was one—inch floor underneath this whole thing. When you got under those tanks you seen wood above it, there was one inch of wood, then there was a steel pan, and inside of that pan was this wood supporting the bottom of the tanks.

Q. I see; and this wooden floor that you saw on there, to the best of your knowledge, would be about a continuation of that wooden floor of the Lobby?

A. Yes, sir, I would say it was a continuation of the floor of the Lobby.

Q. Now when this drain that you stated came out of the pan which side drain was it you said went into the toilet outlet?

A. This one here in the starboard side.

Q. Then will you indicate by making a dot with this red pencil, on Respondents' Exhibit A, the approximate location in the corner of that—or in the pan where this drain outlet left the pan?

A. This is it, right there.

Q. All right; the witness has made a cross or dot in there.

Mr. Underwood:

May we draw a line from that, and mark it, Mr. Botts?

Mr. Botts:

Yes, certainly.

Mr. Underwood:

I will draw a line from that, the arrow pointing to it, and the line to the lower margin, marking "Pan outlet".

Mr. Botts:

Drain outlet. Well, pan outlet, yes.

Q. Now that outlet, from which that drain led, is at the point marked, pan outlet, indicating by the arrow head?

A. That is right.

Q. And that then left the pan at the forward side of the pan, is that right?

A. Yes, sir.

Q. And how far from the right hand—is this starboard?

Mr. Underwood:

That is right.

A. Right and left, now, anyway.

Q. Then from the starboard edge of the pan, how far was that outlet towards the center of the boat, approximately?

A. Towards the center of the boat?

Q. Umh umh; to illustrate this, suppose that this is the—you have indicated quite a ways in there. Suppose this is the edge of the pan; how far towards the center of the boat?

A. From the side of the boat?

Q. No, from the edge of the pan. I am trying to get the location—

A. To the side of the boat?

Q. I am trying to get the location crosswise of the boat; how far from the edge of the boat and towards the center of the boat that opening was. You have said it was right close to the edge, forward.

A. Right close to the edge forward; but it is right out in the corner. Those pans were oval shaped.

Q. The pans were oval shaped, they were not square?

A. No, sir.

Q. Oh, I see; well, I beg your pardon then. The pan then was not a square pan, but oval at each end?

A. Yes, sir.

Q. —circular at each end; I see. Then that question wouldn't be appropriate. I had it in mind it was a square pan.—Now then have you marked on this Exihibt A, anywhere, the toilet outlet to which that drain pipe from the pan was connected?

A. No, sir.

Q. All right. Will you indicate on Exhibit A, the toilet that was connected with the same outlet to which the drain pipe was connected?

A. (Witness marks.) Came in right about,—I take it that is the opening in the side of the boat, and this is the toilet. This came in here.

Q. Mark there—

Mr. Underwood:

It is already marked. Witness marks a dot under a circle which contains the letters, WC, in a space just abaft the double stateroom on the starboard side of the boat.

Q. And that dot indicates the toilet. Now then approximately where, through the skin of the ship, did this outlet valve pass? Was it—

A. Here is the outlets right there.

Q. In other words, the outlet was approximately opposite the toilet?

A. Yes, sir.

Q. And how far below the water line of the ship, was that outlet?

A. From the side of the boat? About two inches below the water line.

Q. Just below the water line?

A. Just below the water line.

Q. Now my understanding is that this toilet was protected from the water backing up, by a gate-valve?

A. Yes, sir.

Q. And that this drain pipe connection went into the toilet outlet between the gate-valve and the skin of the ship?

A. That's right.

Q. Now then this drain—this pan drain pipe, as I understand it, it went straight down, or approximately straight down from the pan until it got below the level of the floor in the Lobby?

A. Yes, sir.

Q. And then passed under the floor of the Lobby and connected with the outlet gate. Now when it got over to somewhere in the vicinity of the outlet gate, or outlet aperture in the hull of the ship, did it come up again?

A. Yes, sir.

Q. And how far was it turned in an upward direction, how many inches or feet, from the time it got over to the vicinity of the outlet?

A. It came up to that—I couldn't say; it came from the bottom of the boat up to that toilet; how far that is I don't know; I wouldn't say because I don't know.

Q. I want to ask you this question, and use this as a basis so we will understand each other. We will suppose that this lead pencil mark that I have made here represents the bottom of the pan?

A. Yes, sir.

Q. (Drawing on paper.) With the edges turned up; and that these two little parallel lines that I have drawn on there represent the downward course of the toilet pipes?

A. Yes, sir.

Q. Now then how far was it from the pan down to where this outlet pipe turned to run along underneath the boards?

A. Went down to the skin of the ship, which must be—

Q. How far was that drop?

A. Oh, I could sit under those tanks; I could sit down under there. I don't know how much that would be, three or three and a half feet, some such distance.

Q. Somewhere three to four feet, would that be correct?

A. Yes, sir, three to four feet.

Q. Then we will mark here, three to four feet; that down pipe; what was the character of that pipe?

A. Galvanized pipe.

Q. Galvanized pipe. Then it came down to an ordinary elbow, did it?

A. Yes, sir.

Q. All right, we will put in the elbow here, now. And then we will start running that pipe along there again. Now when the pipe made this turn, did it go—was there any other turn underneath the Lobby floor, or did it go directly over to the point where it turned up again?

A. Went straight on.

Q. Then there was a straight pipe?

A. Yes, sir.

Q. Coming over, and that passed entirely underneath this Lobby?

A. Yes, sir.

Q. And how wide was that Lobby floor, do you know—fore and aft? What was the distance fore and aft, across that—

Mr. Underwood:

The scale is on there.

A. I don't remember these figures,—how many feet. I can estimate that; I would estimate it—

Q. Well now then, your best judgment as to that, how wide was that Lobby?

A. Seven and a half feet.

Q. Well then, this pipe running along there would be some eight feet long, would it?

A. Eight feet long.

Q. Then we will put it, eight feet plus or minus,—more or less. Now then you came to another elbow, did you, that you turned—

A. Yes, sir.

Q. And that turned up?

A. Yes, sir.

Q. All right. Now how far upwards did that pipe run before it reached its—the point where it was connected with your outlet?

A. It is the same level; that pipe turned under the floor here, came about six inches under the floor,—this did.

Q. Then this pipe would then go up about six inches less than it had previously gone down?

A. Yes, sir.

Q. And then another elbow, was it?

A. Yes, sir.

Q. And then it went straight into a—some kind of a fitting?

A. Yes, sir.

Q. Either a nipple or something?

A. Some kind of a fitting.

Q. And then goes into a fitting here, and then here is your outlet pipe coming down here, and it fitted in there in some way?

A. Yes, sir.

Q. And here is your outlet pipe that goes up to the toilet, is that it?

A. Yes, sir.

Q. And then that would be how high? And it comes in there and then goes up a certain distance, and we have the toilet there?

A. Yes, sir.

Q. All right; and then here is the gate-valve in there, shutting off that toilet; is that right?

A. Yes, sir.

Q. Now then this pipe, when the vessel was in the water,—this pipe all the way down and up to about six inches below there, was underneath the water, wasn't it?

A. Yes, sir.

Q. So that that pipe remained full of water all the time, didn't it?

A. I think so, yes, sir.

Q. There was no valve or shut-off anywhere in this line?

A. No, sir.

Q. Whenever the boat listed over so that this was a foot underneath the water, then there would be—the water would just squirt right up into that pan, wouldn't it?

A. No, sir, absolutely not.

Q. What?

A. No, sir. The side of the vessel would go down. The side of the vessel would go down, but you get in this far, you are nearer the center of the vessel, the center wouldn't go down any; the sides will go down but not the center. It wouldn't come up in that toilet. That toilet was sitting on the same floor level, no water come in that toilet.

Q. All right. Well, then, in this pipe which is underneath the outlet from the pan, I will put a W there; that would be approximately where the water level would be?

A. Yes.

Q. And from that point up to the pan is approximately six inches, isn't that right?

A. Well, I am guessing at all those.

Q. Approximately six inches?

A. Approximately. I am guessing at those.
Q. All right. Mark six inches in there.

Mr. Underwood:
Will you mark, water level, there?

Mr. Botts:
I just indicated it by a W.

A. The water level is the same in the boat, I don't care whether you come to the side, you have always got a common water level all over the boat.

Mr. Botts:
Now I would like to have that sketch that has been identified by the witness, marked as Pilkington's Exhibit 11.

(The said paper was admitted in evidence without objection and marked Pilkington's Exhibit number 11.)

Q. Now then, I am interested a little in these ventilator pipes. Now as I understood you, in the space beginning with the bulkhead forward of the tank room, and back to the bulkhead or wall aft of the engineroom.

Mr. Matteson:
You said, between the tank room; did you mean that?

A. No, it wasn't forward of the tank room.
Q. All right; from the—to the aft wall of the engineroom, there were four of these gooseneck ventilators.
A. Yes, sir.
Q. On each side?
A. Yes, sir.

Q. And as I understand it the four which were on the starboard side didn't pass up through the engineroom, but passed up through the passageway.

A. Well, they was—the engineroom is steel, then it was finished with wood, there was mahogany finish, and there was the space.

Mr. Underwood:

Indicating the pipes passed down between the steel engineroom bulkhead and the joiner work in the passageway; is that what you indicated?

A. Yes, sir.

Q. As I understand it then, these ventilator pipes on the starboard side of the engineroom passed between a steel engineroom wall and a wooden wall, that was the wall of the passageway?

A. Yes, sir.

Q. And they passed directly up through there. Now will you take this white pencil and make four little circles along the wall of the engineroom, at the approximate points where those four pipes passed upward.

A. This is all approximate, too.

Q. I understand that.

A. One was right there.

Q. See if you can make a little circle there; all right, that's it. There are four on this side; would you mind if I make those just a little heavier; so if they blueprint that it will show up a little better. Now we have four white dots on the starboard side of the engineroom, and those dots are aproximately opposite the points in the wall where those four pipes passed up, encased in the wall?

A. That's right.

Q. All right. Now then will you similarly mark the points in the port side of the engineroom, at which those pipes came up?

A. This is where you ought to get up on this deck there, because there is your engineroom hatch, on that level right there.

Q. Let's put it down here.

Mr. Underwood:

May the question be made clear as to whether Mr. Botts means where these vent pipes passed through the deck or where they went into the bilge?

Mr. Botts:

In the floor of the engineroom, where they passed into the bilge.

A. Well, that is another story. They go down; this was a raised deck; that's your steel deck, on there. Well, they would go down through here.

Q. Well, suppose you mark on the top of the deck, at the point where they came out; we will mark it there, and then we will mark it again down below, where they went into the bilge.

A. They came out right on these corners here, like this,—four of them. Now this thing here went over and came down—

(Hearing was suspended briefly.)

Mr. Underwood:

Captain Baker has indicated on Respondents' Exhibit "A" by four dots on the port side abreast the raised engineroom deck on the upper deck the approximate location of the points where the gooseneck ventilators pass through the deck. He has indicated likewise by four dots on the starboard side the places where the gooseneck ventilators pass through the deck; on the lower deck he has indicated by four dots on the port side, one to port

of the shelf and to starboard of the toilet close to the forward bulkhead, one close to the port side of the ship just forward of the window, one on the port side between the window and the chief engineer's room and one in the port after corner of the chief engineer's room, indicating the points where these vents passed into the bilges.

(By Mr. Botts):

Q. How many times have you visited the Seminole since the fire?

A. Visited the Seminole since the fire?

Q. Yes.

A. Well, I practically lived with her; I went to Fort Lauderdale and got her and towed her to Miami, and immediately when I got home she was stored in Miami, and I have had charge of her ever since.

Q. When was the first time after the fire that you saw the Seminole; how long?

A. October that year.

Q. Was that the occasion in which you saw these pans with some burnt wood, some of it burned, and what was left was resting in the pans?

A. All times since then.

Q. You have seen it any number of times since then?

A. Yes, sir.

Q. And the pans have been there in that position ever since, except perhaps for the little weathering?

A. Yes.

Q. Now there was a window in the port side of the engineroom?

A. Yes.

Q. And that window was screened?

A. Yes.

Q. How high above the engineroom floor was the sill of that window?

A. Above what?

Q. The engineroom floor.

A. Six feet probably.

Q. Was the sill of the window on the port side that opened through the skin of the ship at the same level as the sill of the window, the starboard side that opened into the passageway?

A. Practically; yes, sir.

Q. Now was there an opening in the side of the engineroom, in the port side of the engineroom?

A. There was one in the engineer's quarters, and a door opened into the engineroom.

Q. So that the window in the engineer's room was about the same level as the window in the engineroom?

A. Yes.

Q. How high above the engineroom floor was the floor of the engineer's room.

A. The floor of the engineer's room was on the same level with the main floor of the boat.

Q. And that would be some three and a half to four feet above the level of the engineroom floor?

A. Yes.

Q. Now, Mr. Baker, I believe you stated that you gassed up your fishing boats from the supply of gasoline in the Seminole?

A. Yes, sir.

Q. How did you transfer that gasoline from the tanks of the Seminole to the boats that you were gassing?

A. If we took out any amount at all we took it out with a hose.

Q. How would that hose be connected?

A. With an ordinary coupling.

Q. How would it be passed out to the boats?

A. Take it through the window.

Q. Through the window?

A. Through the window, yes.

Q. If you didn't do it that way, how else would you do it?

A. Well, we had five-gallon cans, six gallon or seven gallon cans, and if we wanted to get five gallons, we would put it in a five-gallon can and pass it through the window.

Q. Pass it out through the window more than six feet above the level?

A. We had a work bench there about three and a half feet high.

Q. You climbed up on the work bench and passed it out that way?

A. Yes.

Q. How high was this work bench top above the engineroom floor?

A. From 32 to 33 inches.

Q. And the man would stand on the work bench and you would hand him the gasoline in these cans and he would pass it out that way?

A. Yes.

Q. Captain Baker, isn't it true that when the level of gasoline in your main tanks got low, that that was the only way you got gasoline out?

A. When you got it started the siphon will work on its level; the siphon will get it up; you can start it and the siphon will pull it up over a hill and—

Q. How would you force the gasoline in to your garden hose in order to get your siphon started?

A. It never got that low; I never had it that low.

Q. On the last trip that you went down you took gasoline out of the main tanks there to supply your fishing boats on that trip, didn't you?

A. Yes, sir.

Q. Did you take it out through the hose or did you take it out in the five-gallon can?

A. Both ways.

Q. Both ways?

A. Yes.

Q. Did you ever get so low in gasoline on that trip that you couldn't take it out through the hose?

A. Not that I remember.

Q. How is that?

A. I said not that I remember.

Q. In other words, there was always sufficient gasoline in those tanks so that you could take it out through the hose if you wanted to?

A. Yes.

Q. You are sure of that now?

A. Very sure.

Q. And the bottom of these tanks was about three and one-half feet below the ledge of that window, wasn't it?

A. Yes.

Q. So when the last gasoline was taken out you had at least three and a half feet of gasoline in your tank?

A. Yes; when we left down on the Keys.

Q. I mean when you left down on the Keys.

A. That is right; I don't know how much there was in there.

Q. There was at least three and a half feet of gas, wasn't there?

A. I couldn't tell you that; that would be entirely up to the engineer. He never reported the amount of gas to me, not down there.

Mr. Underwood:

May I have that answer read?

(Thereupon the preceding answer was read by the Reporter as above recorded.)

Q. In other words, you knew that you had enough in there so that you could take it out through the hose?

A. I guess I could if I had wanted to.

Q. How many times did you ever visit the Seminole when she was up in Pilkington's Boat Yard?

A. Quite a number of times.

Q. What was the occasion of your going up there?

A. I was working on the Seminole; I was master of the Seminole, and I would go up there; if I had any work to do, I would go up there, or I would go up there and look around; I would go just at any time, just like anyone would; that was my business, you know.

Q. You were not master of the Seminole on any monthly basis, were you?

A. No; I was master of the Seminole; I was on the "papers" almost all of the entire time, and I was captain of the vessel just the same.

Q. You only received compensation for the time you actually worked as captain?

A. No; I used to work on the Seminole.

Q. What work did you ever do on the Seminole other than act as captain?

A. I acted as captain, and what work was needed I would do.

Q. Tell me something that you did.

A. I did a lot of painting; I painted underneath the decks and I would go over the boat and clean it out, and would go over and look the boat over; that was the nature of my ordinary duties.

Q. You really then were the main man in charge of the Seminole, is that right?

A. Yes, as far as working—as far as the working parts of the boat was concerned, I was in charge.

Q. When you were not on the payroll as captain and was not receiving any compensation, you didn't go up there and do any work, did you?

A. I always got paid for any work that I did on the Seminole.

Mr. Botts:

Will you repeat the question. That answer is not responsive to my question.

The Court:
Read the question.

(Thereupon the preceding question was read by the Reporter as above recorded.)

A. That question, it seems to me, ought to be out, because I got paid for anything that I did; I got paid for anything that I did on the Seminole; I never went up and worked without money.

Q. Do I understand that you are answering my question in the afirmative? I would like to get an answer to my question.

Mr. Underwood:
If your Honor please, I think the witness has answered it.

Mr. Botts:
He is trying to dodge it.

Mr. Underwood:
He has not tried to dodge anything. The answer is fully responsive to the question.

Mr. Botts:
I would like to have the question and answer read and let the Court decide whether it is responsive or not.

The Court:
Suppose you read it again.

(Thereupon the preceding question was re-read by the Reporter as above recorded.)

The Court:
Do you think you can answer that yes or no?

The Witness:
No, sir.

The Court:
Why not?

The Witness:
I don't understand the question, Judge.

The Court:
Let him read it again, and if you can answer it yes or no, and then give your explanation.

(Thereupon the preceding question was re-read by the Reporter as above recorded.)

A. For no compensation, no.

(By Mr. Botts):

Q. Now, how many times, as near as you can tell, did you ever visit the Seminole while she was in storage at Pilkington's storage basin?

A. I couldn't tell you anything about that; I worked up there for two and a half months, went and come every day; I visited her so many times that it would be impossible for me to tell how many times I was there.

Q. Now you have stated that when you left the Seminole there the last time you instructed Captain Pilkington not to go into the engineroom or turn over the engines; am I right?

A. Yes, sir.

Q. Isn't it a fact, Captain Baker, that you gave him exactly those same instructions every time you laid the boat up?

A. We never discussed it previous to this time; that is the first time he ever asked me.

Q. That is the first time that was ever discussed?

A. Yes, the first time he ever said anything to me about it.

Q. What year was that when you worked that two and a half months up there?

A. 1930.

Q. 1930?

A. Yes.

Q. What did you do?

A. General work all over the boat.

Q. You got paid for that work?

A. I always got paid.

Mr. Botts:

That is all.

Re-Cross Examination.

By Mr. Matteson:

Q. That was when you were getting her ready for charter, wasn't it?

A. Yes, sir.

Q. And you refinished the decks?

A. Yes; painted them.

Q. You say you are still in charge of the Seminole?

A. Yes, in a way; I still have charge up there.

Q. Are you being paid for it?

A. I get paid, yes.

Q. By whom are you paid?

A. By the Seminole Boat Corporation.

Q. I want to ask you if you remember that hole in the bulkhead between the engineroom and the tank space as you went through to get under the tanks?

A. Yes.

Q. That was just a hole cut in the bulkhead, was it?

A. Yes.

Q. And that was at the floor level, wasn't it?

A. The level under the tanks was lower than the floor of the engineroom.

Q. I understand that, but I mean on the engineroom side this hole was at the floor level?

A. Yes, sir.

Q. And the top of the hole was just about level with the bottom of the tanks, wasn't it?

A. I guess it was cut as far as it could go.

Q. It appears here in Libelants' Exhibit 9, doesn't it?

A. Yes.

Q. And that shows that it comes up practically to the level of the holes where the valves of the tanks come through, doesn't it?

A. Yes, sir.

Mr. Matteson:

That is all.

Re-Direct Examination.

By Mr. Underwood:

Q. You said that you were being paid for being in charge of the Seminole. Now I would like to have you tell us whether you are paid regular compensation the days when you would go up there and do something.

A. I got paid when I went up there and did anything. Do you remember where you were when the fire occurred on the 24th of June, 1935?

A. I was in Roslyn, Long Island.

Q. Had you been in the Seminole between the time you left her in Pilkington's in April and the time of the fire?

A. No, sir.

Q. Mr. Botts was asking you just now about the quantity of gasoline in the gasoline tanks when you were down on the Keys, whether you could run gas into the fishing boats by a hose. When was the last time you remember that being done?

A. I wouldn't know; I was out fishing, and I used to go fishing and some of the boats would come in to be gassed, so I wouldn't know; it was sometime down on the Keys—

Q. Did you yourself participate in the gassing of the boats?

A. Sometimes I would.

Q. And I take it that sometimes you would not?

A. Sometimes I wasn't even on the boat.

Q. Do you remember whether these tanks were used all at one time or in series?

A. Used them in series when we first started.

Q. Is it possible that when you gassed fish-boats—

Mr. Botts:

Just a minute. If the Court please, that question cannot be anything but a leading question. The Court, I am sure, understands what this question is going to be, and what it is designed for, and I object to that, because when he asks the question then the damage is done. Counsel knows that that is not a proper question.

Mr. Underwood:

I will withdraw it and put it another way.

Mr. Botts:

Let him testify and not you, if you don't mind.

Mr. Underwood:

I am scrupulously endeavoring to do that.

Mr. Botts:

Thank you; I hope you are successful.

Mr. Underwood:

Repeat the last question that was answered.

(Thereupon the preceding question was read by the Reporter as above recorded.)

(By Mr. Underwood):

Q. The last time that you observed any fish-boats gassed up by means of a hose, will you tell me what the level of the gas was in any tank?

A. I don't know.

Q. Can you tell me whether or not the level of the tanks was the same?

A. I couldn't do that either.

Mr. Botts:

You got your point and it wasn't proper, and you and I both know it.

Mr. Underwood:

I disagree with you. I am trying awfully hard not to lead.

Mr. Botts:

If you tried as hard not to testify, you would have done better.

(By Mr. Underwood):

Q. Do you remember how far down the after bulkhead of the engineroom went?

A. What?

Q. How near to the frames of the boat did the after bulkhead of the engineroom go?

A. I don't know.

Q. This space under the passageway, where there is some testimony that there were a number of pipes, water pipes and so on,—how far aft did that space go open before you came to a bulkhead that stopped you?

A. From the engineroom to the after-deck.

Q. Did the after bulkhead of the engineroom go all the way across the boat from the skin of the ship on one side to the skin of the ship on the other side under that passage-way?

A. No, sir.

Q. You said something yesterday, Captain Baker, about the details of what happened when you laid the Seminole up from time to time. I would like to ask you particularly about the details which you told us on this last occasion. Are you uncertain about anything that you said transpired at that time?

A. Well, naturally it was the last trip of the boat and it might be a little bit clearer than the others, but at this period, immediately after I was aproached by Lloyd's and asked for a statement, it was very much in my mind at that time.

Q. I do not think we have it in the record quite clear just what kind of engines those were. They were Winton engines, I take it?

A. Yes.

Q. Describe them for us; what type of engines they were and the cylinders and—

A. Winton's; 125 H. P. each, with the very finest construction there was.

Q. How many cylinders?

A. Six; very smooth-running engines; they were the best engines that money could buy.

Q. Tell us whether or not in operation at speed those engines vibrated?

A. No, sir.

Q. Captain, what has been your experience under way in the Seminole as to any vibration in the hull from the effect of the sea?

A. She had no vibration from the sea.

Q. Now you said yesterday, in response, I think, to one of Mr. Matteson's questions, that you wanted to arrive at

Pilkington's with as little gas as possbile. I would like for you to tell me the reason for that.

A. Well, I just wanted to get there with as little gas as possible, because on previous occasions when we would put the boat up with six or seven hundred gallons of gas, we would go back for it and it would have three or three hundred and fifty gallons, which is according to the records we have, and I didn't want that to happen.

Q. When you got back in October, 1935 to tow the Seminole to Miami, where did you find the Seminole?

A. She was tied up across the river from Pilkington's boat yard.

Q. How far from Pilkington's yard was she?

A. I would say 500 feet, or 600 feet.

Mr. Underwood:

That is all.

Re-Cross Examination.

By Mr. Matteson:

Q. Captain Baker, when you say some motors vibrate and some don't it is entirely a relative thing, isn't it; they all vibrate some?

A. Very little on her.

Q. You never knew a motor that didn't vibrate at all?

A. Not very much; she had the least of any boat I was ever on.

Q. One other thing: I was trying to find the place in the written record of Schlappi's testimony, but I understood him to say that the after-bulkhead of the engineroom did go all the way across under the alleyway.

A. We had two air tanks on the side; our air tanks was on that (pointing) side of the engineroom, aft the engineroom; there were two air tanks under there aft the engineroom, and off the engineroom on the starboard side you

could go through where those holes were cut for these tanks; you could go through there, if necessary.

Q. You could go through there?

A. Yes.

Q. I understood from Mr. Schlappi (if I am wrong about this, you can correct me) that in order to get into this after space you had to go back and go down through a hatch in the after part of the space.

A. You could go through that hole if you wanted to crawl through; you could get through there, if necessary.

Q. How large was the hole?

A. About this big (indicating).

Mr. Underwood:

Indicating about two feet.

A. You could get through that if necessary.

Q. You would have to squeeze through?

A. Yes, you would have to squeeze through.

Q. The bulkhead itself went all the way across?

A. Yes, the bulkhead itself went all the way across.

Q. You are just speaking of the hole in the bulkhead?

A. Yes.

Q. Do you recognize this exhibit 19 as the starboard engine?

A. Yes.

Q. Then this picture is a picture of the starboard after end of the engineroom, isn't it?

A. Yes.

Q. I see a series of valves and pipes that run back to the bulkhead not far away from the engines, is that right?

A. Yes; they are the water manifolds; they are the bilge pumps.

Q. Where is this hole you speak of?

A. This hole was right here on the side; you couldn't go through the engineroom; but it was under that passageway right there (indicating); you could go through the

end down there; these air tanks were laid back in that corner (pointing).

Mr. Underwood:

Indicating to starboard of the manifolds?

The Witness:

Yes; this picture doesn't go that far. You can go all the way under that passageway; not under there (indicating), but you could go through on this side (indicating); these are the tanks over on the side down in this corner after the engineroom bulkhead, starting there.

Q. Were the tanks entirely aft the bulkhead?

A. Yes.

Q. Then there were pipes leading from the tanks into the engineroom?

A. Yes, sir.

Q. And this hole that you speak of, is that the place where the pipes came through?

A. No; the tanks are put in there that way (indicating). It was cut this big to put those tanks through.

Q. A hole was cut there so that the tanks could be placed back there?

A. Yes; it is under the passageway aft.

Q. Where could you get in that passageway?

A. You could get in anywhere on the side; it was all open; that steel bulkhead in the engineroom didn't go all the way down.

Mr. Matteson:

That is all.

Re-Direct Examination.

By Mr. Underwood:

Q. Just to get this clear, Captain Baker: did this partition between the passageway and the engineroom indicated

on Exhibit A go down in the engineroom any lower than the floor of the passageway?

A. No, sir.

Q. Now, you have spoken about the hole in the after engineroom bulkhead?

A. Yes.

Q. Is that where the air tanks were put through?

A. Yes.

Q. Will you indicate on this blueprint where they are?

A. Underneath this floor here (indicating).

Q. Indicating the accommodations aft of the engineroom?

A. Yes.

Q. Just show us the bulkhead in which that hole was cut.

A. This bulkhead was here (pointing), and these tanks were set underneath here (indicating); there were two tanks, air tanks.

Q. The tanks were underneath or amidships the alleyway immediately aft the engineroom and the room marked "state-room" immediately after that; is that right?

A. No. They are underneath this floor in the hull of the ship.

Q. In the bilge?

A. Yes.

Q. You say there was a nole in the bulkhead, through which these tanks were inserted, and through that you could go down here (indicating)?

A. No; you would have to come down here and go down (indicating).

Q. Indicating the space beneath the passageway in the bilge?

A. Yes, sir.

Mr. Underwood:

That is all.

(By Mr. Matteson):

Q. Just to add another detail: in this photograph, Exhibit 4-A, looking into the starboard forward corner of the engineroom, you will see the partition on the starboard side of the engineroom there; is that right?

A. Yes.

Q. You can see where it stays down at the lower part of this picture?

A. Yes.

Q. Was that the level of the alleyway on the outside?

A. The alleyway, yes; the batteries are piled up high in that corner; from that point up the skin was all open.

Q. How much space was there between the bottom of that partition and the floor of the engineroom?

A. Three and one-half feet; the same level as the main deck under the engineroom level.

Q. I don't think that is very clear. Can you say it definitely?

A. This (pointing) is the main deck.

Q. You are referring to the lower deck plan on this blueprint?

A. Yes, sir.

Q. Then the engineroom floor was three and one-half feet, we will say, lower than the passageway level. That is all down under there (pointing).

Q. Let me ask you this also; from this picture I would gather that the passageway level was about even with the top of the hole in the forward bulkhead through which you got into the space under the tanks?

A. I don't know.

Q. Doesn't this picture here show the opening into the space under the tanks?

A. I don't know.

Q. They appear in this picture to be about the same level, do they not?

Mr. Underwood:

I object to what the picture shows; the picture speaks for itself.

The Court:

He can just state of his own knowledge.

A. I don't know; I just don't remember that; I just don't remember.

Q. You would not state that wasn't the fact?

A. No, I wouldn't say that wasn't the fact.

Q. On this upper deck plan are these little circles up there (pointing), do they represent cowl ventilators?

A. Yes.

Q. And this shows their relative position from the engineroom?

A. Yes, sir.

Q. Supose I mark this cowl ventilators?

A. All right.

Mr. Matteson:

That is all.

(By Mr. Botts):

Q. Captain Baker, did I understand you to say that one year you stored the boat at Pilkington's yard and when you came back there was gasoline missing?

A. Yes.

Q. What year was that?

A. I couldn't tell you; I think there were a couple of years.

Q. I see. Did you complain to anyone about that?

A. I surely did one year.

Q. To whom did you complain?

A. To Mrs. Pilkington?

Q. To Mrs. Pilkington?

A. Yes.

Q. How much gas was missing that time?

A. We figured we had lost 300 gallons.

Q. Did you mention that matter to your owners?

A. No, sir; I never said a word to the owners.

Q. You never said a word to anybody about it?

A. No; I never said a word to the owners.

Q. You thought that that was a circumstance that they were not interested in?

A. That's right.

Q. You didn't mention it to Captain Pilkington?

A. No, sir; he wasn't there; Captain Pilkington was away from that yard quite awhile.

Mr. Botts:

That is all.

By Mr. Underwood:

Q. Did you have anything to compare the amount of gasoline that was in the boat when you went to take her out with the amount of gasoline that was in the boat when you left it there?

A. The engineer always kept a log; it was always left on the desk; every time the boat was left there it would be put in the log; the running time per day, the amount of gas used daily and everything would be put in the log and left on this desk; it was always there.

Q. Was it a practice to make any note in there as to the amount of gasoline?

A. Always noted what was left when the boat was left there and what was there when we went back.

Mr. Underwood:

That is all.

Mr. Botts:

I have no further questions at this time.

Mr. Matteson:
No further questions.

Mr. Underwood:
That is all I have at this time of this witness.

(Witness excused.)

2602 Thereupon: ALLEN SIMMON was called as a witness in behalf of the Respondent Phipps, and having been first duly sworn, was examined and testified as follows:

Direct Examination.

By Mr. Underwood:
Q. What is your name?
A. Allen Simmon.
Q. Where do you live?
A. Miami.
Q. What is your business, please?
A. I am with the First Federal Savings & Loan Association.
Q. Once upon a time, Mr. Simmon, you worked at the Miami office of one or more companies that the Phipps' family had an interest in, did you not?
A. Yes.
Q. When did you start in there?
A. I think it was about 1926.
Q. About when did you leave there?
A. October, 1931.
Q. For what company did you work?
A. I don't know.
Q. Who paid you?
A. Well, the checks were always made by L. M. Handley, paymaster.

Q. What was the name of the office at the time?

A. 1317 Biscayne Boulevard.

Q. What was the nature of your general work?

A. Well, I did some buying, and also some clerical work.

Q. Did you have anything to do with the Seminole while you were there?

A. Yes, at various times.

Q. Do you remember the time when the Seminole Boat Company was incorporated?

A. Yes.

Q. I am not asking you for the year, but do you remember that such a thing happened?

A. Yes.

Q. Prior to that time who was in charge of the office?

A. Paul Scott.

Q. After that time and until you left who was in charge of the office?

A. Mr. Scott.

Q. During all the time that you were there did you have anything to do with the Seminole?

A. Yes.

Q. In general what did you have to do with it?

A. Well, mostly I was concerned with the purchase of supplies and materials.

Q. What was the balance; in a general way?

A. Beg pardon.

Q. What was the balance in a general way; you say "mostly purchasing"; what was the rest?

A. Anything that I had any instructions to do.

Q. Where did your instructions come from?

A. From Mr. Scott.

Q. Now, Mr. Simmon, do you have any recollection of any work that was performed on the Seminole in the year 1927?

A. Yes.

Q. Who was captain of her at that time?

A. Captain Nelson.

Q. Where was the work done?

A. At Merrill-Stevens Boat Yard.

Q. What was the general nature of the work?

A. General overhauling of the vessel; the entire bottom was torn out and replaced, and the water tanks were removed, that is, their location was changed; they were re-welded, and the gasoline tanks were taken out and re-welded and replaced, and new feed lines were put in, and new plumbing lines were put in, and some new electrical wiring was put in, and there was a cabin built on the deck, and all of the wood-work on the sides was replaced wherever it was bad, wherever the wood was rotten, and of course it was painted inside and out.

Q. Do you remember how long she was there for that work?

A. I think it started the first part of August and was finished sometime the following January.

Q. The following January?

A. Yes.

Q. I show you a file of bills, Mr. Simmon; can you identify those as having anything to do with this work?

A. Well, I think that these bills that covered the work, or most of it, anyway.

Q. Do you remember whether you saw these at the time?

A. Yes.

Q. Do some of these bills bear your initials?

A. I don't know; I suspect they do; five or six of them do, I believe.

Q. Without taking time to run through them all, I show you a bill dated September 17, 1927, for a total of $4,442.78 in typewriting; are these words and figures "okay for payment as corrected AAS"; is that in your handwriting?

A. Yes.

Q. Have you been through these bills and totaled them up?

A. Yes.

Q. What is the total amount?

A. $27,124.93.

Q. Are you reading from a yellow sheet of paper on top of this group?

A. That is right.

Q. Do you remember when that was made up?

A. Shortly after December 31, 1927.

Q. Who made it up?

A. I did.

Q. These are your figures?

A. Yes.

Q. How was this work done; was it by contract or otherwise?

A. It was done on a labor and material basis.

Mr. Underwood:

I offer the bills in evidence.

Mr. Matteson:

I haven't had an opportunity to examine them, if your Honor please.

Mr. Botts:

Suppose they go in subject to an objection to be made later, just like we did the others?

The Court:

They are admitted subject to objections hereafter to be made, if any.

Mr. Underwood:

Let the record show that there are in here attached to some of these blue carbon copies of apparently original vouchers of the Boulevard Mortgage Company.

Mr. Botts:

That is all right; whatever the file is, it is.

(Thereupon the file of documents above referred to were marked Respondents' 4-L.)

Q. Mr. Simmon, have you been through these bills recently to pick out how much they include for certain items?

A. Yes, sir.

Q. Does this adding machine tape show how much was included in these bills for certain things?

A. Yes.

Q. How much?

A. Pipe and fittings, $173.05.

Q. Have you figured the total labor charge?

A. Yes.

Q. What was that?

A. $17,003.01.

Q. I show you some papers which are apparently Merrill-Stevens Dry Dock Company bills. Will you tell me whether or not you recognize those?

A. Yes, sir.

Q. For what boat was that boat done?

A. Seminole.

Q. Do you know whether that was a part of the same or some different job?

A. I think this is finishing up of the same job.

Q. The figures in this last group which I hand you are not included in the totals you have given us?

A. No, sir.

Mr. Underwood:

I offer these in evidence.

Mr. Botts:

With the same understanding.

The Court:
Same ruling.

(Thereupon the file of documents above referred to was marked Respondents' Exhibit 4-M.)

Q. Did you at any time in the vicinity of 1928 make a calculation to ascertain the amount of the expenses on the Yacht Seminole for a period of time?
A. Yes, sir.
Q. Do you remember what that period was?
A. I think it was for a period of about two years, but I may be mistaken.
Q. I show you two sheets of analysis paper; can you tell me whether or not they refresh your recollection?
A. Yes; I rely on the dates shown here, July 6, 1926 to June 21, 1928.
Q. In whose handwriting are these two sheets?
A. Mine.
Q. Were they accurate when you made them?
A. To the best of my knowledge they were.
Q. Did they correctly show the amount spent during that interval for the various things stated?
A. I believe it does.

Mr. Underwood:
I offer this in evidence.

Mr. Matteson:
I think that is subject to some explanation: is this a summary of what is in the other bills?

The Witness:
It includes those other items, but there are also some other expenditures that are not included in those bills; it covers a longer period of time and greater amount of expense.

Mr. Matteson:

Mr. Underwood, is this a statement of what the books show?

Mr. Underwood:

I will ask the witness.

(By Mr. Underwood):

Q. What did you get your information from when you made up these two yellow sheets?

A. Original invoices.

Mr. Matteson:

That is a statement of what the original invoices show?

Mr. Underwood:

Yes.

Mr. Matteson:

If that is the purpose, I have no objection.

The Court:

Let it be admitted.

(Thereupon the statement above referred to was marked Respondents' Exhibit 4-N.)

Q. Did you later on, Mr. Simmon, make another calculation as to the expenses incurred in connection with the Seminole?

A. Yes, sir.

Q. Do you remember now what periods you covered?

A. I think it was a comparative statement covering possibly about three or four years.

Q. I show you six typewritten sheets of paper; does that refresh your recollection?

A. Yes.

Q. Who made up that tabulation?
A. I did.
Q. Did you make the calculations?
A. Yes, sir.
Q. Were they accurate when you made them?
A. Yes, I thought so.
Q. What was the source of your information?
A. Original invoices.
Q. Does the statement correctly show the amounts for salaries, wages, repairs and maintenance, operating expenses, dockage, furnishings and equipment and insurance for the years 1926, 1927, 1928, 1929 and 1930 to June 30th?
A. I believe that it does.

Mr. Matteson:
As revealed by the documents he consulted?

Q. Does it also accurately show the income from charters?
A. Yes, I believe it does.
Q. You made this up yourself?
A. Yes, sir.
Q. At that time?
A. Yes.

Mr. Underwood:
I offer this.

Mr. Matteson:
If it is a statement that was revealed by the records, I have no objection to it.

The Court:
I understand that that is the purpose for which it is submitted or o[illegible]ed.

Mr. Underwood:

I offer it for everything that it shows, your Honor.

Mr. Matteson:

If it is anything more than a statement of the records, of course, it is not the original record and is not the best evidence, and there has not been anything shown to show that the witness has personal knowledge of the items.

The Court:

I will admit it for that purpose. If there is anything further about it, we will consider it on the final hearing.

(Thereupon the statement above referred to was marked Respondents' Exhibit 4-O.)

Q. Mr. Simmon, during what part of the time covered by Exhibit 4-O did you have anything to do with the Seminole?

A. During the entire time.

Q. Were you familiar at that time with any work that was done on the Seminole?

A. Yes, sir.

Q. Whose task was it in those days to look over the bills as they came in?

A. Mine.

Q. Who approved them for payment?

A. I did.

Q. Did you or did you not know what work was being done during those years?

A. Yes; generally I was supposed to know what was going on.

Q. Now on Exhibit 4-O, the third sheet entitled "operating schedules", I call your attention to the third item which reads "Overhauling and repairing lighting system, including Edison batteries, generator and wiring, $330.38;

do you have any recollection as to what work was done at that time?

A. Yes; there was some wiring in the boat that had never been placed in conduit; in other words, it was well—it was of course insulated wire, but it wasn't fully protected, so all wiring was replaced and placed in conduit or wire mold.

Q. What does that amount of $330.38 include?

A. It includes only material.

Q. We are not clear about that; you use the word "conduit" and you used the words "wire mold"; I am not sure whether you used the conjunctive or disjunctive between; will you please tell us about that?

A. Well, I think this particular material referred to both; the wire mold, as I referred to it, consists of a metal base and a metal covering; it is U-shaped covering with a flat metal base.

Q. That is what you refer to as wire mold?

A. Yes.

Q. By "conduit" to what do you refer?

A. Conduit is a round pipe.

Q. Which of those does that figure of $330.38 include?

A. Well, a certain amount of both.

Mr. Underwood:

That is all.

Cross Examination.

By Mr. Matteson:

Q. This document which has been marked Phipps' Exhibit 4-M, Analysis of expenditures for the Yacht Seminole, July 6, 1926, to June 21, 1928,—for what purpose was that made up?

A. It was made up for the purpose of showing the total expenditures for that period on the boat.

Q. For what purpose was such a statement required?

A. It was required for Mr. Scott.

Q. Prior to that time Captain Nelson had been in charge of the boat, had he not?

A. That is correct.

Q. Was this statement gotten up in connection with the checking up on Captain Nelson?

A. No, sir.

Q. It was about the end of the period that you indicated on that statement that Captain Nelson was discharged, was it not?

A. No; I think that was prior to that time; I think he left as Captain of the Seminole prior to that time.

Q. Captain Nelson was in charge of the repairs that were made at Merrill-Stevens, was he not?

A. Yes, sir.

Q. And he approved the expenditures before they came to you, didn't he?

A. Yes; I think he checked the bills before I got them.

Q. And when you approved them you relied on his okay?

A. Not entirely; no.

Q. That is, I take it, you had a general familiarity with what was going on, but you relied on him for details, is that right?

A. That is correct.

Q. And the work was done under the direct supervision of Captain Nelson?

A. Yes.

Q. Take this account of Merrill-Stevens aggregating about $27,000.00, Respondents' Exhibit 4-L, charging a total of $27,124.93; is that the amount that was paid to Merrill-Stevens?

A. It wasn't the total amount by any means; it was the amount that was paid from the beginning of this one large repair operation until December 31 of that year.

Q. That amount represented on the recapitulation at the top of the bunch of papers was actually paid to Merrill-Stevens?

A. Yes, sir.

Q. Was any part of that afterwards refunded?

A. Not that I know of.

Q. It is a fact, is it not, that there were financial irregularities discovered in connection with this job and Captain Nelson's connection with it?

A. I don't recall that they were uncovered in direct connection with this job; they were perhaps suspicioned, but I don't think they were actually uncovered in connection with this job.

Q. It was found that in connection with some of the matters which Captain Nelson handled for the Seminole that he had been making a profit personally out of the work, isn't that a fact?

A. That is correct.

Q. And it was for that reason that he was discharged?

A. Yes.

Q. I take it, Mr. Simmon, that as far as this work represented by this bill is concerned, you never were able to get at the bottom of the matter?

A. No; as far as we could find there was no irregularities in this work.

Q. Did Captain Nelson make some restitution in this connection?

A. Not that I know of.

Q. Now in introducing this Exhibit 4-L you made a preliminary statement as to what you understood the work covered and I think you mentioned, among other things, the removal and replacement of the gasoline tanks. Will you point out to me where that is indicated in this file of bills?

A. I don't know that I can point to any particular items in here. I can point to items that covered that, that is, you will find items in here for oxygen and acetylene which

was used in welding, and you will find items for boilermakers' labor, and also for welders' labor used in that and other welding operations.

Q. Let me ask you this: there was other welding and cutting done on the Seminole that did not relate to the gasoline tanks?

A. Oh, that is right.

Q. And that was true with respect to the bottom and the sides of the boat?

A. Well, they were mostly riveted; as far as I know they were practically all riveted.

Q. Can you tell us whether or not the plates of the Seminole were welded in place?

A. I know that they were welded around the engine-room and up the sides; as to whether they were welded entirely over the bottom I don't know.

Q. There was considerable welding in connection with the bottom and side plating of the Seminole at that time, is that right?

A. Yes.

Q. In connection with the job all the old riveting on the old plating was cut out by burning, was it not?

A. All taken completely out.

Q. Were you familiar with the details of that personally, or just in a general way?

A. Well, I visited the yard quite a few times during the course of the work and saw what was going on, and have a general idea of what they did.

Q. But the man who was in direct supervision was Captain Nelson?

A. Yes; he was supposed to be there all the time.

Q. Do you know whether or not any trays were made for the gasoline tanks at that time?

A. Yes, sir; there were two trays made for them.

Q. Were they welded, do you know?

A. They were made out of zinc, and I think they were welded, yes.

Q. Do you know of your own knowledge that there was any welding done on the tanks themselves at that time?

A. Yes, I do.

Q. Now just where was this welding on the tanks?

A. In all of the seams; the seam on the bottom of the tank and up each side, as I recall it.

Q. Now, Mr. Simmon, do you say that all of the seams of the gasoline tanks were welded at that time?

A. Yes, sir.

Q. Of course it would be possible to determine it by inspection even now, wouldn't it?

A. I don't know.

Q. You have not had any shipyard experience yourself, I take it?

A. Oh, no.

Q. Or any experience in the construction of tanks, is that right?

A. No, I haven't had any instructions in that.

Q. I mean, Mr. Simmon, as far as ship matters are concerned you are a layman like the rest of us?

A. Yes, sir.

Q. I will ask you whether from such general knowledge you had of this job you are now in a position to say definitely that the seams of the gasoline tanks were actually welded at that time?

A. Yes, I think they were; I am fully convinced they were.

Q. Where was the welding on the tanks; by that I mean was it done on the boat or on the shore?

A. No; at the time that was done both the water and the gasoline tanks were taken out and that work was done on the side of the boat; it was on the ways on the side of the boat, right beside the boat; the work was done right there

Q. Was the deck of the boat taken off at that time?

A. No, I don't believe it was; pieces were taken of, but I don't think—there must have been some bad wood, rotten wood, that had to be taken out and replaced, but not the deck as a whole.

Q. The deck over the tank compartment consisted of steel plating, did it?

A. Over the engineroom, I believe.

Q. And that wasn't removed?

A. No, I don't believe it was.

Q. Do you know in what manner the tanks were removed from the tank compartment at that time?

A. It wasn't very much trouble about it; the whole bottom was out of the boat.

Q. I take it that the frames were still there?

A. What?

Q. The frames of the boat were not removed, were they?

A. Not all of it; a great deal of it was good.

Q. Do you know what I mean by frames?

A. You mean ribs?

Q. Yes.

A. Yes.

Q. The ribs of the boat were not removed at that time?

A. Part.

Q. What part?

A. Wherever they were badly enough rusted.

Q. That doesn't tell me very much.

A. I couldn't tell you what individual ribs were taken out.

Q. Can you tell me what part of the ship's ribs were taken out?

A. No; I couldn't say that they were taken out of any specific portion of the boat, but they were removed as it seemed necessary; certain ribs were pretty well gone by corrosion and those had to be replaced; others that were all right, they were left in.

Q. Were any entire ribs removed or just partly?

A. I couldn't say just now.

Q. Mr. Simmon, if the deck wasn't removed and the ribs were not removed, the tanks could not be removed out of the tank compartment any further than the engine-room, could they?

A. I don't know why they couldn't; the entire side wall on one side of the engineroom was off, and entirely open.

Q. You say they cut open one whole side of the ship in the way of the engineroom at that time and put the tanks out through the space where the side of the ship had been?

A. I don't know just how they took them out, but the tanks were taken out of there.

Q. As a matter of fact, Mr. Simmon, you can't tell us just what openings were made in the hull of the ship at that time, can you?

A. Only to this extent: that at that time the entire bottom was off.

Q. When you say the entire bottom was off, you refer to the plating, do you not?

A. That is right.

Q. Even if the plating is removed you still have the ribs of the ship?

A. Yes.

Q. Do you know how wide the ribs of the Seminole are spaced?

A. I don't recall exactly, but I would think they were apart 30 inches possibly, although I didn't measure them.

Q. How big were these gasoline tanks; can you tell us that?

A. I haven't any idea.

Q. Where were they when you saw them?

A. Oh, opposite the boat; right beside the boat, fairly close to the boat; on the ways at Merrill-Stevens.

Q. In what shape were they?

A. They looked pretty good when I saw them.

Q. I do not mean condition; I mean shape.

A. They were cylindrical tanks.

Q. How big?

A. Anything I might say about the size would be purely a guess, because I haven't any idea about the measurements of them; it is merely my memory of what they looked like ten years ago, and that is fairly unreliable, I would think.

Q. That is equally true of your recollection of all the details of this work, is it not?

A. No, I cannot say that it is.

Q. Except as it is represented by accounts that you referred to, that would be true, wouldn't it?

A. No; I have certain features in mind; there are certain features that you would remember, because it would make more of an impression on your mind.

Q. Which are the features that so impressed themselves on your memory back ten years ago?

A. One big feature was visiting the yacht there and being able to look through the entire yacht with the exception of the paneling around the cabins.

Q. When you say the entire bottom was off, you are referring to the steel plating?

A. Yes.

Q. I suppose it looked something like the skeleton of a whale at that time?

A. Just about.

Q. Where was the Seminole at the time this work was done; I mean where was it in Merrill-Stevens?

A. It was on the largest ways, and they were located between what is now the main building and the bridge south of there.

Q. You say she was on the ways—exactly what was it she was on?

A. What?

Q. You say she was on the ways; was she on a cradle or rails or had she been moved off to one side?

A. She was on the ways practically all of the time she was there.

Q. By "ways" you mean on the cradle which was on rails?

A. Yes, sir.

Q. There was no contract for this work, I take it?

A. No.

Q. If it was done under the direction of Captain Nelson, the various things that were done were done by his orders, is that right?

A. Yes.

Q. So that there was no contract on the part of Merrill-Stevens to do any specific work other than as items were ordered by Captain Nelson?

A. That is right.

Q. As far as having the necessary work done or as to what was to be done, you relied on Captain Nelson's decision, is that right?

A. To a certain extent; the work that was to be done was mapped out in advance or planned in advance in a general way.

Q. By whom?

A. Captain Nelson presented the original request that the work be done and an estimate of what it would cost.

Q. What was that estimate, do you recall?

A. Well, as I recall it, it was about $30,000.00; between twenty-five and thirty thousand dollars.

Q. How much did the job finally cost?

A. About thirty-seven or thirty-eight thousand dollars, as I recall it.

Q. Who approved Captain Nelson's plan?

A. Mr. Scott, I believe.

Q. With whom did Mr. Scott consult about it, do you know?

A. I don't know.

Q. Mr. Scott was the representative of the Phipps' interests here at that time?

A. As far as I was concerned his word was the final word.

Q. He was your boss?

A. Yes.

Q. He was the boss of everybody in that office, is that correct?

A. That is correct.

Q. And he was the representative of the Phipps' interests in Miami at that time?

A. I don't know.

Q. You know that he attended to various personal business affairs from time to time for them?

A. No, I couldn't say that I do.

Q. Who was the owner of the Seminole at that time; do you know?

A. John S. Phipps.

Q. That was your understanding?

A. Well, I know that because it was recorded that way at the Customs House.

Q. Did you have anything to do with that?

A. Yes, I recorded the papers when it was entered in the port of Miami.

Q. Did you have anything to do with the preparation of the papers?

A. No.

Q. Who gave you the papers to be recorded, do you recall?

A. Mr. Scott.

Q. And they had been executed by Captain Nelson, had they not?

A. I don't recall.

Q. Do you recall the alleyway that went past the engineroom on the main deck of the Seminole?

A. You say on the main deck?

Q. We will say the lower deck; I will put it that way.

A. Yes.

Q. As you went along that alleyway there was a partition on the side between the engineroom, separating the alleyway from the engineroom, was there not?

A. Yes, sir.

Q. Was there any paneling or woodwork on that partition, do you recall, or was it painted steel plate; I think that was all steel work.

Q. You don't recall seeing any workwork there?

A. No, I don't; there was a window in it; I remember that.

Q. A window leading into the engineroom?

A. Yes.

Q. And there were also windows leading from the passageway to the outside of the ship?

A. Yes, sir.

Q. Did you have any conferences with Mr. John S. Phipps with respect to this work that was done at Merrill-Stevens?

A. No.

Q. This work in this second batch of vouchers that was introduced and marked Phipps' Exhibit 4-M,—that was prior to the work represented by the vouchers in this batch marked 4-L, was it not?

A. Yes, I believe it was; some of it was prior and some subsequent.

Q. So this bunch which has been marked 4-M is just a series of miscellaneous bills, some before and some after the big job at Merrill-Stevens, is that right?

A. Yes.

Q. Now this Exhibit 4-O, comparative statement of operations from 1928 through 1930,—for what purpose was that made up?

A. That as I recall it, was made up at Mr. Scott's request to show a comparison between the cost of opera-

tions prior to the organization of the Seminole Boat Company and subsequent.

Q. There is nothing about the statement that indicates that, is there?

A. Not on its face.

Q. It is a running statement that runs from 1928 through 1930?

A. That is right.

Q. And there is no indication on this statement whatever to indicate the division point between the date of incorporation and the date subsequent, is that right?

A. I do not see any on here.

Q. So as a comparative statement between the date of incorporation and afterwards, we can't make any comparison unless you insert the date of incorporation at the proper place, can you?

A. No.

Q. And if you insert the date of incorporation you would have to insert it in the middle of one of the years, would you not?

A. I just don't recall when the operations were begun or were taken over by the Seminole Boat Company; whether it was in the middle of the year or not.

Q. There is a discrepancy here that I do not quite understand. This Exhibit 4-N shows a total of expenditures on the boat Seminole from July 6, 1926 to June 21, 1928, of over one hundred thousand dollars, but on this comparative statement that you have, if you total all of 1926, 1927 and 1928, you will still be well below the one hundred thousand total. Can you explain to us the reason for that discrepancy?

A. Yes, in a general way: This statement here eliminates practically all of the extraordinary repairs, betterments and additions.

Mr. Underwood:

Indicating that Exhibit 4-O eliminates the data referred to on the top line of Exhibit 4-N.

The Witness:

Yes.

By Mr. Matteson:

Q. I do not quite follow you on that, because the data on the top line of 4-O totals $45,000.00 and the data under the same heading "Repairs and maintenance, statement of operations," totals, just by mental arithmetic, forty-two or forty-three thousand dollars.

A. Yes. I said most of this amount here has been eliminated from this statement here.

Q. You say that most of the items on the top line of 4-N has been eliminated from 4-O, is that correct?

A. That is correct.

Q. I still do not quite follow that, because you do have in the comparative statement about forty-three thousand dollars, whereas the item on the top line of 4-O "Extraordinary repairs", and so forth, totals $45,000.00 and there is only a difference of $2,000.00.

A. This statement is supposed to be a comparative statement of operations and as such does not properly include, from an accounting standpoint any of the extraordinary repairs, betterments and additions.

Q. In your statement of repairs and maintenance in the comparative statement of operations, you do have an item of $35,974.00 in the year 1927?

A. Yes.

Q. Do you say that that was only ordinary current repairs and maintenance?

A. I would not say that it was only ordinary current repairs, but it certainly consists of repairs necessary for the maintenance of the boat, and doesn't consist of "Better-

ments and additions", which is ordinarily to be considered a capital expenditure.

Q. It must be the fact that by comparing the two statements, Mr. Simon, that the major portion of this item of $45,000.00 on 4-M is carried in to this $35,000.00 on 4-O, is that right?

A. That is entirely possible.

Mr. Matteson:

If your Honor please, I would like to have an opportunity to study these statements that have been submitted; it is hard to analyze them quickly, and I think the witness will be available.

Mr. Botts:

Maybe I can ask him a few questions.

The Court:

All right.

Mr. Botts:

I am sure he will be here the rest of the day.

The Court:

All right; you may proceed.

Cross Examination.

By Mr. Botts:

Q. Mr. Simon, do you recall who was superintendent of Merrill-Stevens at that time?

A. Superintendent, you say?

Q. Yes.

A. Mr. Thebault.

Q. That is Ed Thebault?

A. Yes.

Q. Do you know whether Ed Thebault is here or not or where he is; do you know whether he is living or dead?

A. Someone told me he was dead.

Q. I heard that too. I just wanted to find out and that—

A. That is what I heard.

Q. With reference to the gasoline tanks, Mr. Simon, do you have any idea at all about how large these tanks are?

A. This is purely a guess, but just as I remember the tanks, if seems to me that they were possibly three feet in diameter or thereabouts, and possibly five feet or a little more in length.

Q. That is your best recollection?

A. Yes, sir.

Q. How many of those tanks did you see?

A. Four.

Q. Now, how many times did your visit this shipyard during these operations, do you recall?

A. I don't recall.

Q. Well, do you know how frequently you visited it?

A. I tried to get there several times a week.

Q. Your best recollection is that you went there several times a week on an average?

A. That is right.

Q. Now, Mr. Simmon, do I understand that the entire plates were taken off of the bottom and sides of the Seminole wherever there was still plates?

A. Yes, sir.

Q. Do you know whether those steel plates were discarded and new ones put on, or whether the old ones were replaced?

A. No; it was all new steel that was put on.

Q. All new steel?

A. Yes.

Q. Now, I am no more nautical than you are; maybe we will have to explain what we are talking about sometimes, but let's try to get together.

A. All right.

Q. The ribs of a ship, as I understand it, are the members, either steel or wood (in this case steel) that go down around the bottom of the ship from one side to the other and to which plates are fastened.

A. That is what I have always thought.

Q. All right, then we are together on that.

A. All right.

Q. Now Mr. Simon, do you have any recollection about the size of the ribs in the Seminole, the size of the steel, I will put it?

A. Well, I will say they were possibly quarter to three eighths of an inch thick, and as I recall they were double angle irons.

Q. Now by "double angle irons" do you mean a piece of steel that would be roughly in the shape of a "T" when they are put together?

A. That is right.

Q. Two irons at right angles to each other were placed together so that it made a T-shaped steel arrangement?

A. Yes.

Q. Now then the part of this angle iron which would be next to the plating of the ship would be what was the top of the "T", is that right?

A. The flat part, yes.

Q. Then what would correspond to the stem of the "T" would run in towards the inside of the ship?

A. Yes.

Q. Now, Mr. Simon, do you recall what would be the width of the "T" part of this structure of the ribs; would it be six or how many inches across?

A. Of course this is a guess, but I would say about four to four and a half inches.

Q. About what would be the length or what would correspond to the stem of the "T"?

A. Half of that dimension probably; two and a half to two inches.

Q. And this steel was molded into the shape of the ship so that the combined shape shown by these ones replaced was roughly the shape of the hull of the ship, is that right?

A. Yes.

Q. Now how many of these ribs were removed from the ship during this operation, do you know?

A. I wouldn't have any idea.

Q. Were any of them entirely removed or was it just pieces here and there?

A. I don't know that any of them were entirely removed.

Q. It would be a piece cut out with an acetylene torch or something like that and another piece set in its place; is that the way it was?

A. Yes.

Q. And this new piece would be welded into place?

A. Yes.

Q. Now do you have any recollection at all as to whether there were three or a dozen or more than a dozen of these sections or ribs removed and replaced?

A. It was quite a large number; I would say it was at least half of them.

Q. You think that perhaps half of the ribs had sections removed?

A. Yes, sir.

Q. And replacements made?

A. Yes, sir.

Q. Did you ever see any of these ribs when they had been cut and were ready for replacements?

A. I presume I did; I was there during practically the entire time of the repairs.

Q. Do you have any recollection as to the length of the pieces that were removed?

A. No, but I judge it was a pretty good size; the boat was about, I suppose, forty to forty-five feet wide, something like that.

Q. What was the largest piece that you can recall that you saw taken out?

A. I wouldn't have any idea; they were varying lengths.

Q. Give us the maximum length.

A. Possibly ten or twelve feet, and that is purely a guess.

Q. Now then these pieces would be taken out at random wherever the rusting process had advanced so far that it seemed to be necessary?

A. Yes.

Q. Now do you recall that around the vessel from the bow to the stern, and at the top of the ribs there was a longitudinal stringer that went from the bow to the stern of the vessel, and to which the upper ends of the ribs were attached by welding or otherwise?

A. Yes, sir.

Q. Now do you know the name of that steel part that I have described?

A. No, I don't believe I do.

Q. If anyone should call it "deck stringer plate", you would be willing to accept that as being the name for it?

A. I expect I would.

Q. Well, we will refer to it until we are better advised as to it. We will refer to it as a deck stringer plate. Now, no part of that was renewed, was it?

A. Not as far as I remember; no, sir.

Q. That was a piece of steel considerably heavier than the ribs, wasn't it?

A. It should be.

Q. And none of that was taken out?

A. (No audible answer.)

Q. Now, did you observe the operation of removing these tanks from the tank room?

A. No.

Q. You didn't see them when they were taken out or when they were put in?

A. No, not at any time that I recall.

Q. Do you know whether or not the steel wall around the engineroom was removed?

A. Yes, it was.

Q. They removed that wall?

A. Yes, clear up to the deck level.

Q. On both sides?

A. Both sides.

Q. Do you know the purpose of doing that?

A. Sir?

Q. Do you know the purpose of doing that?

A. Putting in the new plates?

Q. Do you know what supported the steel deck when these walls were out from under it?

A. They had so many props around there, that I expect they had some for that; the thing was practically in a cradle.

Q. Now you have stated that there was some zinc pans underneath these tanks.

A. Well, they were put there at this time, I believe.

Q. Now what makes you think that they were zinc?

A. The reason is that I remember we bought some zinc plates for that purpose.

Q. Did you see these pans after they had been constructed?

A. I saw them when they were being made there on the dry-docks.

Q. Do you recall the shape?

A. Yes, generally they were flat pans.

Q. With a turned up edge?

A. Yes.

Q. How high was that edge turned up, do you remember?

A. Oh, I would imagine maybe six inches, or maybe a little less.

Q. How thick was the metal on these pans?

A. I don't remember what thickness it was.

Q. What was the shape of the pans; I mean were they the shape of this table or the shape of the tanks, or what was the shape of them?

A. In general they were rectangular pans, two pans, one under each two tanks, and it was designed to do that.

Q. They had square corners that extended out so as to encompass the circular tanks, is that right?

A. Yes; that is my recollection.

Q. How many of these pans do I understand there were?

A. Two; there was one for two tanks on one side and one under the tanks on the other side.

Q. Were these pans solid metal?

A. Yes, sir.

Q. Upon what did these pans rest?

A. I think there were some steel cross members on a sort of platform that they rested on.

Q. By platform, Mr. Simon, do you mean wood or metal?

A. Metal, as I recall it.

Q. There wasn't any wooden floor underneath there?

A. No, not that I remember seeing; I think there was some wood on top of the pans, between the pans and the tanks as I recall it.

Q. How could you see them?

A. They were placed on top.

Q. On top of what?

A. Inside the pans.

Q. Did you see them in there; did you see this wood in there?

A. Yes, I think so.

Q. When they were putting the tanks in?

A. No, I believe they were in there.

Q. How could you see them?

A. There is an opening that you could get in there through.

Q. Was the bulkhead taken down forward and aft of the tank locations also?

A. I believe it was replaced between the—I don't know what forward and aft is; I don't know what you mean by that.

Q. We will say towards the bow and towards the stern?

A. I am not sure of the location, but I think the steel bulkhead was replaced between the engines and the tanks, but not the other bulkheads, as well as I recall.

Q. Your best recollection is that the bulkhead which would be forward of the tank compartment wasn't replaced in steel?

A. It wasn't replaced at that time; I think there was a steel bulkhead before that.

Q. After the tanks were placed in there that steel bulkhead wasn't replaced, is that right?

A. The original bulkhead was left in there; I mean it wasn't taken out and a new one put in there.

Q. Then the steel bulkhead forward of the tank location wasn't taken out at all?

A. You mean the one between the tanks and the rest of the boat?

Q. Yes.

A. No, the one between the tanks and the engineroom was replaced.

Q. With a new one?

A. That is right.

Q. Now what about the steel supports underneath the tanks; were those renewed or did they stay there?

A. They were "new"; before this work was done the tanks had been at a much lower level, and they had great difficulty in getting the gasoline to properly feed when

the gasoline got low in the tanks, so they were raised at this time to overcome that difficulty.

Q. Where were the tanks while these new supports were installed? Where were they?

A. I imagine that was before they were replaced; I don't remember where they were at that time.

Q. Did you see them while they were replacing the tanks into their locations?

A. You mean while they were in the process of being put back in?

Q. Yes.

A. No.

Q. You saw no part of the process of taking them out or putting them back in?

A. I don't recall seeing that. I remember that I saw them before they were taken out and I saw them after they were taken out and after they were put back in.

Q. As I understand it, you did not see any of the process of welding the tanks?

A. I wouldn't say that I did; I couldn't say that I didn't either; I don't remember.

Q. You have no recollection on that point at this time at all?

A. No.

Q. Then your statement some time ago that they were welded is not based on anything that you recall?

A. It is not based on any remembrance of the actual operation of the welding job, no, but I saw the tanks before they were taken out and I saw them when they were ready to go back in, and I saw them after they were back in there, and I know they were completely cleaned out, and in order to do that they certainly had to take them out of there.

Q. How do you know that they were completely cleaned out?

A. For instance, Captain Nelson showed me a lot of residue and stuff there that he knocked out of the tanks.

Q. Then do I understand you to say that the tanks were taken apart?

A. I think that is right, yes.

Q. Do I understand that the seams of the tanks were reriveted?

A. I think they were all welded. They had a peculiar bottom.

Q. In what way was the bottom peculiar?

A. It was inverted.

Q. How did they cut these rivets that had been in there to get them apart to get inside of the tanks; how did they do that?

A. I don't know that, sir.

Q. Did you see these tanks when they were apart?

A. I think I saw two of them with the bottoms out.

Q. When they were put back together do you know whether they were riveted or not?

A. I am quite sure that they were all welded.

Q. Well, Mr. Simon, do you mean that they were riveted and welded or just welded?

A. They would naturally be riveted, I suppose; I don't recall; I know that they were welded around the bottom of each.

Q. How do you know that?

A. I saw them.

Q. Did you see them actually being welded?

A. No, not that I recall.

Q. Now do I understand you to say that when you saw these tanks you examined the bottom seam and that that bottom seam was welded?

A. That is my recollection, yes.

Q. Now then are you sure of that?

A. As sure as you can be of anything in that length of time.

The Court:

I think this is a good stopping point.

Mr. Matteson:

I would like to ask a question or two at this time.

The Court:

All right.

By Mr. Matteson:

Q. Mr. Simon, I just want to call your attention to the fact that these bills are made up day by day showing labor charges and material charges on each date. Wherever there is a labor charge, opposite the statement of the charge there is a statement of the particular work that that job of labor was used on that day; do you see what I am calling your attention to?

A. Yes, I do.

Q. I think you will find, as you go through these, that that is true all the way through. Now I would like you, if you will, to go through these bills and pick out the labor items that you say refer in any way to the gasoline tanks in the Seminole, that refer to the trays underneath them; that refer to the removal of the tanks or any part of the bulkhead or the tank compartments, and that in any way relates to welding, either of the tanks or elsewhere, on the vessel. Will you be kind enough to go through these documents that were produced, and in the morning be prepared to call our attention to the items that you say represent repairs of that type.

A. I will be glad to do anything I can, but, as I said before, I don't think you can identify them; I doubt very much that you can.

Q. I am calling them to your attention, and if you come back tomorrow morning and say you can't do it, we will do it ourselves from the documents, but I want to give you the opportunity to do it.

A. All right.

(Thereupn an adjournment was taken to 9:30 o'clock a. m., May 18, 1939—the next day.)

Thursday, May 18, 1939, 9:35 o'clock a. m.

(Hearing resumed pursuant to adjournment of previous day; the witness MR. ALLEN SIMMON, resuming the stand upon:

Cross Examination (Continued.)

By Mr. Botts:

Q. Now Mr. Simmon, I want to learn a little bit more about these tanks in that operation. You stated that one of these cross bulkheads, either forward of the tank room, or between the tank room and the engineroom, was removed. Now which one was it?

A. As I explained that, I didn't know what you referred to as the forward; but it was the bulkhead between the engineroom and the tanks.

Q. All right. That bulkhead was removed?

A. Yes.

Q. Now was this bulkhead removed before the tanks were removed, or after the tanks were removed?

A. I couldn't say; I wasn't there at the time the tanks were taken out.

Q. All right. Well, do you recall at the time when you saw these tanks lying out on the ground, or somewhere beside the boat, do you recall whether that bulkhead,—that engineroom bulkhead, was in place or not?

A. As I recall, it was not in place at that time.

Q. It was not in place at that time. Now then do you recall now seeing the tanks after they had been replaced in the boat,—while they were in place in the boat?

A. Yes.

Q. After they had been taken out and put back?

A. Yes, sir.

Q. Now then was this bulkhead in place at that time, when you saw these tanks after they were put back in?

A. No, I don't believe it was, when I saw it.

Q. In other words, you saw the tanks put back and in place in the tank room, and after that this dividing bulkhead was replaced; is that it?

A. That's my memory, yes.

Q. Now just what portion of the tanks were welded?

A. I couldn't say definitely, but I remember that the bottom was welded; because that was called to my attention particularly.

Q. Was there anything in the physical appearance of it from which you could and did observe the weld?

A. I don't quite understand your question.

Q. If two pieces of metal are welded together, there will be a seam or place showing where the weld occurs, won't there?

A. Yes, sir.

Q. Now then I want to know whether you observed such a welded seam, to use that term, at the point where the weld was made on those tanks.

A. Quite sure that I did.

Q. Well now then do you know that you did?

A. I think so.

Q. Well, is there any doubt about it in your mind?

A. No.

Q. Then you did or did not, now which was it? Did you see that weld?

A. I stated that I saw the weld on the bottom of the tank.

Q. That is what I want to get at, I don't want any thinking about it. Mr. Simmon, I believe that you stated something with reference to the shape of the bottom of the tank. Could you draw on that piece of paper a sketch

illustrating not to scale, of course, but illustrating in a general manner the point that you make; assuming that this tank had been sliced right through down the center of it so as to expose a cross section of it; could you draw a picture of one of those tanks? Make it two or three inches long, and if you want something to use as a ruler, why you can use the side of this pad. (Witness draws.) Now then will you make on that sketch, the words, bottom, and top, indicating? (Witness writes.) Now then will you mark the point where you observed the welded seam? (Witness marks.) All right, will you just draw—suppose you carry that arrow on out here and mark, weld. Now then will you connect that with the welded seam on the opposite side?

A. I already have.

Q. There would be a weld there also, wouldn't there?

A. Yes, sir.

Q. All right, there is the weld.

A. Yes, sir.

Q. Now then I notice that you have indicated the bottom of the tank, the metal, does not seem to come down flush with the bottom of the side; is that based on a definite recollection as to that condition?

A. That's my memory of the condition of the tank.

Q. That the metal from the bottom didn't go quite down as far as the metal from the side?

A. Yes, sir.

Q. So that the weight of the tank then would have to rest entirely on the metal of the side walls?

A. Yes.

Mr. Botts:

I will ask this sketch to be filed as Pilkington's Exhibit 12.

(The said paper was admitted in evidence and marked Pilkington's Exhibit number 12.)

Q. Now then did you personally observe these tanks, or any one of them, while the bottom was out of it?

A. Yes, sir.

Q. Now how many of them did you see with the bottoms out?

A. Two as I recall.

Q. And did you observe any part of the process of taking the bottoms out?

A. No, I didn't.

Q. You don't know how it was done, at all?

A. I haven't any idea.

Q. Now you stated that the tanks were elevated some distance above their original location, when they were replaced; is that right?

A. Yes, sir.

Q. How far was that elevation, to your best judgment?

A. I don't know.

Q. Well now, could you indicate it in feet or half of feet,—that close, do you suppose?

A. I can only say this, that I think they were raised at least two feet, possibly more than that.

Q. Well, then, we would be safe in saying that they were raised at least eighteen inches, wouldn't we?

A. I would think so, yes, sir.

Q. And possibly as much as two and a half to three feet?

A. Possibly.

Q. Now do you know what was done with the old foundation upon which these tanks had previously been resting?

A. No, I do not.

Q. You don't know whether it remained there or was cut out, or what was done with it?

A. I haven't any idea about that.

Q. These port and starboard steel walls—that would be right and left on the boat—

Mr. Underwood:

Left and right, respectively.

Q. Both of those walls were removed, were they? I am speaking now of the tank room.

A. Of the tank room?

Q. Yes.

A. I don't recall. What I refer to as the inside wall, that is the one that was inside of the boat, I don't recall whether that was removed or not. Certainly the outside wall was.

Q. Well now then, do you know which was the outside wall?

A. I don't mean to say, the outside wall; I mean the wall which the outside of the boat formed.

Q. Which wall of the tank room, if either, was formed by the outside skin or hull of the boat?

A. You mean, as to right and left?

Q. Umh hmh, as you looked forward.

A. I don't remember, frankly.

Q. That blueprint shows that this alleyway was on the right hand side of the boat as you looked forward, and the wall of that alleyway formed one of the walls of the tank room, didn't it?

A. Yes.

Q. And that wall between the alleyway and the tank room, as I understand it, was not removed; is that right?

A. That's it. I didn't recall whether or not it was removed.

Q. It might have been?

A. It might have been.

Q. Now how big was this substantial pile of rust and scale and so forth that you said was pointed out to you as having come out of these tanks?

A. Oh, possibly as big as your hat, maybe.

Q. Well, was it a peck?

A. I am afraid I haven't had enough experience with a peck measurer, to state.

Q. Well, a peck is eight quarts.

A. I wouldn't think so, no.

Q. Were the engines removed?

A. As I recall, they were, yes.

Q. Did you see the engines outside of the boat?

A. I don't recall, Mr. Botts; I am not sure.

Q. Well, then are you certain one way or the other as to whether the engines were removed?

A. No, I am not sure.

Q. Now when the tanks were cut open and rust cleaned out, then the old bottoms were put back in the tanks?

A. It is my belief that they were.

Q. And do you know, when they were put back, whether the tanks were riveted together and then welded, or just welded?

A. As I recall there were rivets driven through both of the sections,—that is the side sections and the bottom section, and then the welded seam was made, as I have shown you on the sketch.

Q. And the rivets weren't welded?

A. No, as far as I know.

Q. I beg pardon?

A. I say, not so far as I know.

Q. Well, you saw this other welding; if the rivets had been welded, you would have seen it all right, wouldn't you?

A. I expect so.

Q. So the rivets were not welded, were they? What was your answer?

A. I say, I think we can take it for granted that they weren't.

Q. I don't want to take anything for granted, I want to know. Now were the rivets welded or were they not?

A. If they were I didn't know anything about it, I didn't see any evidence of it.

Q. Were the tops taken off of these tanks?

A. Not that I know of.

Q. You saw the bottoms taken out, but you did not see the tops off?

A. That's right.

Q. So far as you know the tops were not removed?

A. That is correct.

Q. The side seam, that would be the vertical seam in the tank when it was in place, was not taken apart?

A. I didn't see it taken apart.

Q. Do you know whether that seam was welded or not?

A. No, I don't. I don't recall.

Mr. Botts:

That is all I have. Mr. Matteson is going to examine on those records, so I won't go into that.

By Mr. Matteson:

Q. Before I do that, I would like to ask you about these pictures; for instance this picture, Libelants' Exhibit 3: Do you recognize the bottom of the tank that shows through the hole?

A. Yes, sir.

Q. As—in that picture; and the rivets show there too, do they not?

A. Yes.

Q. And there is no evidence of any welding on the rivets, is there?

Mr. Underwood:

I object to that; the question is asking the witness to interpret the picture.

(Argument by counsel.)

The Court:

I will overrule the objection. Mr. Witness, you can use the picture as helping to refresh your recollection, not to interpret the picture.—He can utilize that for any questions that Mr. Matteson asks him, to refresh his memory as to what he is asked about.

Q. I will put it this way: Looking at the picture, and seeing the appearance of the rivets there, does that fix it in your mind that the rivets were not welded? Does that help you to do that?

A. Well, I don't recall that the question of the rivets being welded, was raised at all. As I said, I don't remember that the rivets were welded at all.

Q. Now this welded seam that you speak of would be completely out of sight in this picture, would it not?

A. Yes, sir.

Q. No possibility of seeing that?

A. That is right.

Q. It would be above the lower edge of the tank, as it shows in the picture?

A. It should be concealed behind this edge here.

Q. Do you know anything about the technical side of riveting?

A. No, I am not a boiler maker.

Q. Do you know how near to the edge of a plate it is proper, under boiler making practice, to place a rivet?

A. No, sir, I do not.

Q. Well, on this diagram you have shown us that the inverted bottom side of the tank is some distance above the lower edge of the tank.

A. Well, that drawing of course is not to scale; that was merely a slight offset. I perhaps exaggerated that.

Q. Well, how far above the bottom edge of the tank would you say the cap or the bottom of the tank, came?

A. You mean, this edge here?

Q. Yes, the inverted bottom, how far above the bottom edge of the outside tank would that be?

A. Oh, I wouldn't think it was any more than the thickness of the metal itself.

Q. What was the thickness of the metal of the tanks?

A. I don't recall.

Q. Wasn't the plating of the tanks, quarter inch plating?

A. You mean, the material, quarter inch?

Q. Quarter inch or five-eighths; do you know what thickness it was?

A. No.

Q. From your recollection of it, can you tell us how thick the plating of the tank was?

A. No, I don't think I could.

Q. Your recollection is that the distance that the bottom of the tank was above the bottom of the side, was about the equivalent of the thickness of the sheets of the tank, is that right?

A. Yes, sir.

Q. Can you say that the seam around the top of the tank was welded or not?

A. I couldn't say.

Q. Looking at this picture Libelants' Exhibit 6, and refreshing your recollection from that, can you tell us whether the top of the tanks—top seam of the tank was welded?

A. I wouldn't want to pass an opinion from looking at it there, no, sir, just what it would be. I don't recall actually seeing it.

Q. And the side seam of the tank, the vertical seam, can you tell us whether that was welded?

A. No, I cannot. As I stated sometime ago, I don't recall whether it was.

Q. Then the only welded part of this tank that you know of, was this seam on the underside of the bottom, is that right?

A. That's all I remember seeing.

Q. You have had no technical training I think you told us, with respect to matters of this type?

A. No, sir.

Q. Can you describe to us the appearance of this welded seam? How could you tell that it was a welded seam?

A. Well, I have seen a lot of welding before.

Q. Well, tell us, as you looked at this tank, how you were able to determine whether or not it was a welded seam.

Q. Merely because the evidence of the weld, as I recall it, was very apparent.

Q. In view of your lack of training and technical experience you wouldn't be able to tell us whether the tank, —whether the seam had been properly welded or not, I take it?

A. You asked me the question about technical experience, I thought you mean in connection with boats, or with tanks, things like that. But previously I have been familiar with the welding process.

Q. That is in the construction of buildings?

A. No, strictly in foundry work.

Q. And what experience have you had along that line?

A. Practically raised in a foundry.

Q. What kind of a foundry?

A. Malleable iron foundry.

Q. Where was that?

A. In—the location of it?

Q. Yes.

A. East Moline, Illinois.

Q. And when was the last time that you were there?

A. 1923.

Q. And did you work in the mill?

A. Oh yes.

Q. What kind of work did you do?

A. A little bit of everything.

Q. You are an accountant, are you not?

A. Yes.

Q. And is that the kind of work that you did there?

A. No. I was just at school at that time, getting what jobs I could. At foundry during vacation.

Q. Have you ever done any welding on tanks?.

A. No, sir.

Q. Did they do any welding on tanks at this factory where you worked?

A. On tanks?

Q. Yes.

A. Not that I recall.

Q. No tank work there?

A. No.

Q. I think you told us before, you don't pretend to be a technical expert with respect to welding of this kind?

A. No.

Q. Were the rivets that had been in the tank, burned out, do you know, or how were they taken out?

A. I don't know. I didn't see them taken out at all.

Q. How were the surfaces prepared before the parts were put together again? Have you any idea about that?

A. What surfaces do you mean?

Q. I mean, when the bottom was put back into the tank, do you know—

A. No, I didn't see any of the work done on there.

Q. Didn't see any of the work done?

A. No.

Q. Were the rivets replaced in the same holes where they had been before, do you know?

A. I couldn't say.

Q. You told us yesterday that there had been a certain amount of welding on the plates of the hull. When I read your testimony over I still wasn't clear as to where plates on the hull were welded. Can you tell me that?

A. I don't know that I am very clear, myself.

Q. Some of the plates on the hull were welded?

A. Yes, sir.

Q. Do you know the difference between cutting and welding by burning?

A. Yes, sir.

Q. Do you know the difference in the process?

A. In a general way, I think.

Q. What is it?

A. Cutting is the—just what it implies, cutting of the metal in pieces; and the process of welding is a process of building up with additional metal,—joining the parts.

Q. I take it that you aren't able to explain to us the difference in technique between the two?

A. No, I wouldn't attempt to pass an expert opinion on it.

Q. Well, is cutting sometimes done with an acetylene torch?

A. Yes.

Q. Do you know anything about zinc plates, with respect to the hull of a vessel, such as the Seminole? Did she have any zinc plates, do you know?

A. I don't know.

Q. Do you know what zinc plates are?

A. Yes; I know what they are.

Q. I mean, do you know what they are as applied to the hull of a vessel?

A. No, I don't.

Q. Do you know that zinc plates are frequently applied to the hull of a steel vessel, to reduce electrolysis; to absorbe electrolysis?

A. No.

Q. Were any zinc plates put on the hull of the Seminole at the time these repairs were made?

A. I don't know.

Q. You never heard of that method of reducing electrolysis on the hull of a steel vessel?

A. Yes, I have heard of it, but very recently; I know nothing about it at the time.

Q. You don't know anything about it with respect to the Seminole?

A. I beg your pardon?

Q. You don't know anything about it with respect to the Seminole?

A. No, sir.

Q. When did you first hear of zinc plates as attached to the hull of a vessel for that purpose?

A. Last night.

Q. Mr. Underwood, explained it to you?

A. Yes, sir.

Mr. Underwood:

You give me too much credit, Mr. Matteson.

Q. Who did explain it to you?

A. I think this gentleman over here; what is his name.

Mr. Underwood:

Mr. Gibbs or Mr. Meloy.

Q. Now you said that when the repairs to the Seminole were contemplated in 1927, that Captain Nelson got up an estimate, do you recall that?

A. Would you mind stating that again, please, sir?

Q. I understood you to say yesterday that when the repairs to the Seminole in 1927 were contemplated, that Captain Nelson got up an estimate?

A. That is right.

Q. I asked you whether the work had been planned in a general way by him; you said that Captain Nelson presented the original request for the work to be done, and an estimate of what it would cost. That is page 2207. Do you recall that?

A. Yes, sir.

Q. Was that plan and estimate presented in writing?
A. Yes.
Q. Do you know where that writing is now?
A. No, I don't.
Q. Where should it be?
A. I haven't any idea.
Q. Where was it the last time that you saw it?
A. It was in the file at my desk.
Q. And what file was that?
A. I don't know that the file was labeled.
Q. Do you have a file relating to the Seminole?
A. Well, I would think that it was filed among other papers.
Q. And when you left that office what became of that file?
A. It was left there, so far as I know.
Q. Part of the files of that office?
A. Not a part of the regular filing system, no.
Q. Well, was it turned over to somebody?
A. No, not officially as I recal. It was left there with these other papers.
Q. Did you turn over whatever papers that you had to the proper custodians when you left that office?
A. That depends on what you mean by turning them over. They were left there, I didn't take any of them with me.
Q. Well, they weren't left to be thrown out, they were left to be taken charge of by the proper party, is that right?
A. I don't know that I at the time though much about them.
Q. Anyway, you don't know where it is now?
A. No, I haven't any idea.
Q. Isn't it a fact that Captain Nelson estimate for that work was $7,000.00?
A. Was how much?

Q. $7,000.00 approximately,—his first estimate?

A. Oh, no; no, as I recall, it was around $30,000.00.

Q. You are quite sure that that was his estimate, around $30,000.00?

A. Quite sure.

Q. Where is Captain Nelson now, do you know?

A. I haven't any idea.

Q. As a matter of fact, isn't he Master of a Yacht here in Miami right now?

A. Nelson?

Q. Yes.

A. I didn't know it.

Q. You hadn't heard that?

A. No.

Mr. Underwood:

Is it suggested that he is?

Mr. Matteson:

He was the last time I knew, a couple of months ago.

Mr. Underwood:

When your representative last interviewed him, he was in Miami?

Mr. Matteson:

We interviewed him,—one of our representatives interviewed him, but for their own information. That was about two months ago.

Q. As a matter of fact, Captain Nelson has been in Miami more or less regularly ever since 1928, has he not?

A. I don't know, I haven't seen him.

Q. Were any members of the crew, other than Captain Nelson, on the Seminole during repairs?

A. No, I don't recall that we had any other men on the regular payroll at that time; in fact I am quite sure we didn't.

Q. How long was the Seminole?

A. As I recall she was about 105 feet long.

Q. From what records was this statement,—comparative statement of operations, taken, can you tell me?

A. Those were taken from original invoices.

Q. Well, for instance, take the year 1926, from what source was that information taken?

A. Original invoices.

Q. In what files?

A. In the same files that I kept in my personal custody.

Q. That was in the office at 1317 Biscayne Boulevard?

A. That is correct.

Q. They are not records that have been introduced in this case, so far as you know?

A. Some of them are.

Q. 1926?

A. I don't know. No, I guess not.

Q. Now I asked you yesterday if you would take this bill of Merrill-Stevens and go through it and see if you could pick out any items that you would say relate to the gasoline tanks of the Seminole. Have you done that?

A. I have gone through the bills, yes, sir.

Q. Did you find any such items?

A. I found no items that specifically stated they were for gasoline tanks.

Q. It is a fact, is it not, that you verified when you went through, that all of the labor charges are designated as being applied to some particular kind of work?

A. Not all of them, no.

Q. Well, for instance on page—the page that happens to be open, September 26 and 27, 1927, do you find any there not designated?

A. Well, for instance here is, carpenter odds and ends.

Q. Well, I assume that when the item is carpenter odds and ends we can assume that that does not relate to the tanks of the Seminole?

A. That is right; but what I meant was, that there are items that are not the labor—the labor is not specified as to where it goes. For instance you will find going through here that there are a number of items entitled piping, that is all the explanation that was given; and here is drillers; well in that case it says, drillers and chippers.

Q. Do you find any undesignated item in this bill that you could refer to the work you have told us about on the gasoline tanks of the Seminole?

A. Well, a lot of material items that could apply; that is; oxygen, acetylene.

Q. The oxygen and the acetylene were also used on the bottom of the ship, were they not?

A. Oh, yes.

Q. I am talking about labor charges particularly; because as I take it, on each day you have certain labor charges certain material charges; the material must have been used by the men whose time is charged. That is right, isn't it?

A. I don't think that you can follow—I mean I don't think that it follows that the material listed here was necessarily used by these people in that particular—

Q. On the particular day?

A. On the particular day, nor on the particular function stated here.

Q. Well, anyway the materials and equipment used on the job would have to be used by someone for whose time a charge was made, would it not?

A. Yes, sir.

Q. So the items of time are the ones that tell us the nature of the work that was done?

A. Well, not accurately at all.

Q. You think not?

A. No, sir, I know it.

Q. Tell me this, Mr. Simmon; in order for these tanks to be opened up, they would have to be freed of gas and tested before the rivets could be burned out, would they not?

A. That's what I understand.

Q. And that is an item for which shipyards make a charge when that work is done, is it not?

A. Well, as I explained before, this work was not done under contract with the shipyard. Captain Nelson had complete charge of the job, he had complete charge of the labor, and he bought the material from the yard. The work was all done under his direction.

Q. Well, I appreciate that, but you don't have any idea that the Merrill-Stevens shipyard did anything that they didn't charge for, have you?

A. Well, what I meant was, that they didn't know what these men were doing, as far as the yard itself was concerned; they were acting under the supervision and direction of Captain Nelson. None of the shipyard men were in charge of the work at all.

Q. Have you ever had any experience with the gas-freeing of tanks?

A. Of what?

Q. Of the gas-freeing of tanks?

A. What do you mean?

Q. I mean, have you in your experience ever come into contact with a situation where the necessity of freeing tanks of gas before working on them, was involved?

A. In this particular case, yes, sir.

Q. Well, I mean in any other case.

A. Well, I know enough about an automobile to know that an empty tank is the most dangerous thing you can have.

Q. Free gasoline vapor anywhere is exceedingly dangerous, isn't it?

A. Yes, sir.

Q. Exceedingly exposive?

A. Yes, sir.

Q. Now I ask you, in going through the bill did you find anywhere a charge for freeing the tanks of gas?

A. No, sir.

Q. Cleaning the tanks?

A. No, sir.

Q. Do you find any charge for testing the tanks for freedom from gas?

A. No; it is like a lot of other items not shown on the bills, because Merrill-Stevens knew nothing about it; but Captain Nelson reported to me what he did about it.

Q. Well, the work of testing the tank for freedom of gas before work is done on it, is a technical matter that is performed by experts, is it not?

Mr. Underwood:

May we have the question specified, what kind of a tank?

Mr. Matteson:

I am talking about a tank that may have volatile gasoline fumes in it.

Mr. Underwood:

Well, I object to the question on the ground it is not sufficiently specific. There are all kinds of tanks,—tanks in tank steamships, and one rule applies to them; there are cylindrical tanks, of this sort, and another rule applies to that tank. * * *

The Court:

Are you talking about this particular tank that he saw there in the Seminole?

Mr. Matteson:

Well, my question was general, if the Court please; and I think it applies to all kinds of tanks, including these.

The Court:
He is not an expert on that, is he?

Mr. Matteson:
Well, I want to find out how much he knows about it.

The Court:
I haven't considered his testimony as being of an expert nature along these lines, so I think that it ought to be confined to just what he saw in these particular tanks.

Mr. Matteson:
Well, if your Honor please, my thought in the matter has been just this: This man has been produced here with the bills from Merrill-Stevens, and they have been offered in evidence in the case, and he has assumed to give testimony with respect to the work that was done there. I am trying to get an explanation if I can of the absence from the bills of the kind of charges that would be required if the work that he says was done, was done. * * *

(The question was read.)

A. I don't know.

Mr. Underwood:
Wait.

By Mr. Matteson:
Q. You don't know anything about that?
A. I don't know anything about testing for gas.
Q. And you have no explanation of why such a charge does not appear in this bill?
A. Oh yes, I can explain that.

Q. You think it may be hidden among the labor charges that are there?

A. That is right.

Q. And if that were true, it would mean that the work of freeing the tank from gas was done, was performed by the ordinary workmen in the yard?

A. And under the supervision of Captain Nelson. In fact he reported to me that that was done.

Mr. Matteson:

I move to strike that out, if your Honor please, as not responsive to the question.

(Argument by counsel.)

The Court:

It is a voluntary statement; I grant the motion to strike.

Q. How recently, Mr. Simmon, were you asked with respect to this work that was done back in 1927 in connection with this case?

A. How recently was I asked what?

Q. How recently were you asked about this work that was done on the Seminole in 1927 in connection with this case?

A. Right now.

Q. I assume that someone of the legal staff of the Respondent talked with you before you came to Court.

A. Yes.

Q. When was it that any of them first talked to you about this work in 1927?

A. I think sometime in March, as I remember it.

Q. March of this year?

A. Yes, sir.

Q. Is that the first time that you had occasion to go back and think about this job since the matter actually took place?

A. No.

Q. What occasions in the meantime have you had to recall these matters to your mind?

A. Well, Mr. Batchelor called on me at one time at St. Augustine and asked me questions about the case.

Q. And at that time you remembered very little about it, is that the fact?

A. About the questions that he asked me, yes; he didn't ask me about the work done on it.

The Court:

A little louder.

Q. You say he didn't ask you about the work that was done on the Seminole?

A. No, sir.

Q. That is, he didn't ask you?

A. That is right.

Q. And there was nothing in connection with that interview that caused you to go back to 1927 and think about this work, was there?

A. No, I don't recall any incident.

Q. So that the first time since 1927 or 1928 that you had occasion to go back and refresh your recollection with respect to this work was in March of this year?

A. That is correct.

Q. Now what have you had to refresh your recollection with respect to that work?

A. Mostly just the bills, invoices and so forth that have been presented here, and the statements.

Q. Just these that have been offered in evidence, is that right?

A. Yes, sir.

Q. Now what is there about this set of bills, Respondents' Exhibit 4-L, that refreshes your mind with respect to the work on the tanks?

A. I don't know of anything in connection with the bills that does.

Q. Now I would like to ask you about the supports on which these tanks were placed in the tank compartment, and I think you said they were raised up about two feet from their former position, is that right?

A. That was my understanding.

Q. So that after this job was done they stood two feet higher in the tank space than before?

A. As I understand. I don't know how much higher, but they were raised.

Q. That is your recollection, approximately?

A. Yes.

Q. What I am asking you about is what supports were put under the tanks for the tanks to rest on?

A. I don't recall definitely but it seems to me that there were steel angle irons and beams under there to support the tanks.

Q. Were those beams fastened to the forward and after bulkheads of the compartment?

A. I couldn't say as to that; I don't know.

Q. How many of these supporting beams were there?

A. I don't know.

Q. You don't know how they were installed or what supported them?

A. No; I don't remember.

Q. I take it, Mr. Simmon, that you are not a technical electrician either?

A. No, sir.

Q. Now, Mr. Simmon, I would like to ask you this: I show you this photograph, Libelants' Exhibit 9; do you remember this opening in the bulkhead here which is indicated in this picture by an arrow with the letter "A" at the end of it?

A. Yes, I think I do.

Q. That has been referred to by the witnesses as the old coal hole through which coal was shoveled when the

tank space was the coal space; do you recall that opening?

A. I recall the opening up there; but I don't recall anybody calling it a coal hole.

Q. Do I understand you to say that this whole bulkhead that shows in this picture, Libelants' Exhibit 9, was renewed in 1927?

A. Which bulkhead?

Q. This bulkhead between the engineroom and the tank compartment?

A. I don't recall that I said it was renewed; I said it was removed.

Q. I thought you said it was renewed?

A. No; I said it was removed.

Q. Was the same bulkhead put back in place?

A. So far as I know; I don't know whether that was removed or new plates put in there or not.

Q. Was it entirely removed?

A. As I recall it it was entirely out of there.

Q. As a matter of fact, you see this plate in the middle which is bolted in place, wasn't that the only plate that was taken out?

A. Not that I recall; the whole thing was off.

Q. And replaced after the tanks were in place, is that your testimony?

A. Yes.

Q. And this plate in which this hole is that I called your attention to appears, the old coal hole, as I call it, is that the same plate that was there before?

A. I couldn't say as to that.

Q. Is the hole identically similar with the one that was there before?

A. It is a hole, and I presume it is the same one; I don't know the same size, shape or anything else.

Q. Your testimony yesterday was, quoting from page 2089.

"Q. Then the steel bulkhead forward of the tank location wasn't taken out at all?

"A. You mean the one between the tanks and the rest of the boat?

"Q. Yes.

"A. No; the one between the tanks and the engineroom was replaced.

"Q. With a new one?

"A. That is right."

Now, which is it. Was a new bulkhead put in or was the old one put back?

A. I don't know whether there was new plates put in there or not. As I understood it, the question was as to whether this was removed or not, and I am sure that it was removed.

Mr. Matteson:

I gather from your testimony here that you volunteered the statement that it was replaced.

Mr. Botts:

No; he was asked if it was replaced with a new one.

A. It was replaced.

Q. You are not sure now whether it was new or old?

A. It was replaced but I don't know whether it was new construction or whether it was the same bulkhead.

Q. Well, if you are not sure how was it that you happened to answer this question:

"Q. With a new one?

"A. That's right".

Were you sure at that time that it was a new one?

A. I couldn't have been, because I don't know whether the material was put back in the bulkhead—whether the

material that was put back in the bulkhead was the same material or not.

Q. At the time you were asked this question: "With a new one", you said, "That is right", without any qualification or indication that you had any doubt in your mind. Was there a doubt in your mind at that time?

A. I couldn't say why I answered it that way; I must have been confused.

Q. When did this doubt first arise in your mind about that point?

A. I wasn't aware of any doubt at all; I am still under the same impression that I was.

Q. Was that a matter that was discussed last night too?

A. This bulkhead?

Q. This testimony that you gave yesterday.

A. Oh, no.

Q. Yesterday you were clear and definite in your mind that it was a new one when you answered the question.

A. I could not have been.

Q. You say now that you could not have been when you answered; is that what I understand?

A. Yes.

Q. Is that true of any other answers that you have given here?

A. I don't know, unless I could go over them.

Mr. Matteson:

I think that is all.

By Mr. Botts:

Q. Mr. Simmon, isn't it possible that you could be just as much mistaken about the welding of these tanks as you were about the newness of that bulkhead?

A. I had no intention of ever making any statement regarding the newness of the bulkhead, and I have no recollection of that question coming up before.

Q. Do you deny that you made the statement?

A. No, I can't deny it.

Q. Now then after these tanks were removed from the hull and opened and then riveted together again and welded, do you know whether or not they made any test of these tanks; I mean do you know of your own knowledge?

A. Yes; Captain Nelson reported the test to me.

Q. I am asking you what you know.

A. I wasn't present, if that is what you wish me to say.

Q. Mr. Simmon, when I ask you a question I want to know what you know and not what someone might have told you.

A. All right.

Q. Now then I wonder if you would mind telling me how it happened that you were informed last night about this process of putting zinc plates in the hull of a steel ship; how did that arise?

A. There was some discussion; I don't recall just exactly how the matter did come up; I know there was some discussion, but I don't know that I was a party to the original discussion.

Q. I wonder if maybe I could suggest something—

Mr. Underwood:

If your Honor please, I don't think the witness was permitted to finish his answer, although I may be mistaken.

The Court:

Did you finish your answer?

The Witness:

In the course of the conversation Mr. Monroe said something about the necessity for zinc plates on the hull. I don't recall who asked the question about it.

(By Mr. Botts):

Q. Or why it came up?

A. No, sir.

Q. I am wondering, Mr. Simmon, if this could have been the way that it arose: that you were asked to point out in these bills some charge for zinc material for making these pans and you pointed to these various charges for zinc plates in here, and they said, "no; that was something else". Is that the way it came about?

A. I think Mr. Monroe was going through the bills and I don't believe I was a party to the discussion. As I recall it, there was somebody else asking about the zinc plates.

Q. You were not trying to show him where the zinc from which these pans were made were charged in these bills?

A. I don't think I was a party to it at all.

Q. Now is there anywhere in those bills a charge for any sheet zinc for the making of those pans?

A. As far as I am concerned, I was under the impression that these zinc plates answered that purpose.

Q. That is what I thought.

A. Yes.

Q. And seeing those zinc plates in there is what suggested the thought that these pans were made of zinc, is that right?

A. Yes.

Q. And without that suggestion in there you would not have been able to identify the material for these pans, would you?

A. Now, don't misunderstand me. I thought that the pans—my recollection of them was that they were made of zinc even before I examined those bills, and I just took them as verification of my impression.

Q. You know now that there is no sheet zinc charged in those bills, don't you?

A. There is zinc plates in there.

Q. I said sheet zinc out of which the pans could have been made.

A. As far as I am concerned I wouldn't know the difference between sheet zinc and zinc plates.

Q. That is not the question I asked you. You may not be trying to dodge it, but it sounds like you are. You know now that in those bills there is not one single item for sheet zinc, don't you?

A. No, I can't say that because as far as I know zinc plates and sheet zinc are the same thing; I don't know that there is any difference.

Q. Your technical advisor did not tell you the difference between zinc plates and sheet zinc?

A. I have no technical advisor.

Q. The technical expert that told you about zinc plates last night didn't tell you that difference, did he?

A. No.

Q. There is no charge in these bills for sheet zinc, is there?

Mr. Underwood:

I object to that; he has covered it many times and the bills speak for themselves.

The Court:

He says he doesn't know the difference. Suppose you specify an item—

Q. There are numerous charges in these bills for zinc plates?

A. Only one that I know of.

Q. I have seen at least two, and I haven't gone through the pile.

A. At least one in a large amount.

Q. Charges in there for zinc plates, at any rate, whether one or more?

A. Yes.

Q. You don't know of any charge in these bills for any other kind of zinc except zinc plates, do you?

A. No.

Q. Now do you think it is possible that you could have been mistaken yesterday when you said these pans were made of zinc?

A. I can only state what I said yesterday, that I believed they were made of zinc.

Q. You were quite positive of it yesterday.

A. I said so.

Q. You have said that the charge was in there for the material, didn't you?

A. I suppose I did; I don't know.

Q. Did you, as requested by Mr. Matteson, very carefully go through these bills last night to try to identify any charges with reference to the work in respect of these tanks; did you look for them?

A. Specific charges?

Q. Yes.

A. Yes.

Q. Then you know that there is not a single charge in these bills, or any one of them, for removal of the tanks?

A. No. I think the charges are there; they are not so specified, but they are there.

Q. There are no charges in there which can be identified as being charges for removal of the tanks?

A. None which is identified in these bills.

Q. And there is no work so identified on them that would in any indicate that it was for removal of the bottoms of the tanks, is there?

A. There is no item in there that states it that way.

Q. There is no item in there for riveting the tanks, is there?

A. I don't recall as to that; I don't know whether there are any general items in there; there is nothing in there that states "riveting of tanks".

Q. And there is no charge in there for welding tanks?

A. No, not under that title.

Q. And there is no charge in there for replacing the tanks in the ship?

A. It is not so stated.

Q. And there is no charge in there for making pans, of zinc or otherwise, is there?

A. It is not so stated.

Q. Do you know who it was that determined these tanks, after being in use about five years, were required to be removed, opened and reassembled; do you know who determined that that was necessary?

A. Captain Nelson.

Q. Now I think we are clear, Mr. Simmon, that there is not one single reference to these tanks, as such, in any of these bills, is that right?

A. Yes; I think that is right.

Q. Then a reference to these bills would not in anywise serve to refresh your memory as to any work with respect to these tanks, would it?

A. No, I don't think it would.

Q. Then, as far as the work on the tanks was concerned, you are depending entirely upon your memory of a transaction that occurred some eleven years ago; right?

A. About ten or eleven years ago.

Q. Now, Mr Simmon, there were many, many different items of repair—items of repair performed in connection with this rehabilitation of the Seminole?

A. Yes, sir.

Q. Can you enlighten me at all on the subject of what it was with reference to these tanks which, after eleven years, that leaves still fresh in your memory the thought or belief that the metal of the bottoms of these tanks did not come down flush with the metal of the sides?

A. Yes, I can.

Q. All right.

A. There was a discussion; in the first place, Captain Nelson didn't know whether we would be able to use these tanks, or whether we should get new tanks, and that was one part of the estimate on the work which was left open for determination. The tanks were removed, and I was very much interested, because of the buying angle, as to whether or not we would have to order new tanks or not, so I went out there to see about it, and, as I recall it, he called me up when he was ready to show me the tanks. He had two of them opened, and he decided, and I concurred in his opinion, that the tanks were in good shape and as good as any new tanks we could get, and he said, "well, we will put them back together", and the next time I saw them they were ready to go back in the boat, and he told me about all the tests that he performed on them, and the test seemed as rigid as one could desire; so, after having tested these we decided not to purchase any new tanks. I recall that there was a question in my mind (as I admitted before)—I didn't know anything about tanks—there was a question in my mind as to whether or not he could take the bottoms out of these tanks and put them in and have them as good as ever, and he said that he could. He said that he would weld around there to make sure that they were as good as ever.

Q. And that refreshes your recollection that there was a little difference in the elevation of the bottom in relation to the sides, and you remember that clearly after all of these years?

A. Yes, I do.

Q. Now when you saw these tanks in position in the ship before that engineroom tank compartment bulkhead was replaced, the pans were then underneath the tanks, is that correct?

A. As far as I recall, yes.

Q. They could not put the pans under there after they put the tanks in, could they?

A. I don't know; they might have.

Q. You have stated that you think there are labor items on these bills which are not definitely identified as being with respect to anything else and which might have covered these items of removal, opening, welding, replacing the tanks and making the pans. I am going to ask you if you will take those bills and show me a single one of the character you have mentioned.

A. You mean limit it to one single item?

Q. One or more items, I will put it, which might have been with respect to the tanks.

A. The labor is all charged, or the greater portion of it, into the "bottom", and I think that the labor charges on these items were included in this charge.

Q. Show me one labor charge that could be so categoried, will you please?

A. It might have happened in one of these items (pointing).

Q. What is it?

A. Boilermakers; bottom plates; boilermakers' helpers.

Q. Are these the items that you say—

A. I say there are items like that practically every day all the way through here.

Q. I want you to point me out one.

A. Here is another and here is another.

Q. Boilermakers, plates, bottoms and sides might have been?

A. Yes.

Q. Down here is another one.

A. Yes.

Q. That refers to "bottom" and "sides" of the ship?

A. That is what it says here.

Q. I am asking you to point out one item of labor that might have been with reference to tanks; I am not interested in the sides of the ship. I can read myself.

Mr. Underwood:

I think that Mr. Botts should not be so sharp with the witness. The witness has said that the items that he pointed to might have been with reference to the tanks.

Mr. Botts:

He may have answered it to your satisfaction but he has not answered it to mine.

Q. Now, Mr. Simmon, I am not interested in the items that show "boilermakers, bottom and sides"; I can read those myself. I want you to show me one item of labor, one or more, that might have been with reference to removal of tanks, opening tanks, welding tanks, riveting tanks, replacing tanks and making pans. I want you to show me one item of labor of that kind, if you will.

A. There is no item in there which states that that is specifically what it is; for anyone of those operations.

Q. You have told me that many times, and you have told us that there are labor items that might have been, these unidentified labor items, that might have been for this purpose; they are the ones that I want you to point out, if you can. If you can't do it right now, suppose you take these and I will give you the rest of the day to find them. You can even take your experts to help you, if you want to.

Mr. Botts:

If the Court please, instead of taking up the time of the Court for him to do that, I am through with the witness until he advises me as to these items. I am going to ask him that he take these and take all the time he wants to and look for the items such as I have asked him about. Then we will know whether he can do it or not. Maybe we can go on with something else in the meantime.

The Court:

Do you wish to do that, Mr. Simmon; would you like to take them until this afternoon?

The Witness:

Your Honor, I don't believe they would help materially in any way.

Mr. Botts:

It would help me—

The Witness:

I have—I can explain why these items were not shown individually, and when I offered the explanation it has not been accepted, so my hands are tied.

(By Mr. Botts):

Q. When you get down to it, Mr. Simmon, your only explanation is that there is no such items there, isn't that right?

A. No, sir.

Q. You can't find them.

A. It is not specified as such, and I have stated that before.

Q. I have relieved you of that responsibility, and I will ask you if you can locate any unspecified and unidentified labor that might conceivably have been with reference to removing; reconditioning, re-welding and replacing these tanks.

A. The explanation that I gave sometime ago was that Merrill-Stevens made these charges, and they had no knowledge of the work that was going on, and practically all of this labor was charged into "bottom and sides", whereas, as a matter of fact, it wasn't all "bottom" and "sides".

Q. Then your answer is that the bill is wrong, is that correct?

A. That is correct.

Q. I think you said that the Captain of the ship was the man that superintended this?

A. He did.

Q. Did he give the charges to Merrill-Stevens or did Merrill-Stevens give the charges to him?

A. Merrill-Stevens had their record of the employees; they punched in on Merrill-Stevens' timeclock, punched in and out, and these bills were made up from their records there. Now, as to charging it to the different operations, they had no record of what the different operations were. That was up to Captain Nelson, and he made his report to me as to what the work was, as to what work was being done.

Q. Do you have any of those reports or were those verbal?

A. Mostly verbal.

Q. When was it, Mr. Simmon, that you, if you have been, were made aware that the reconditioning operation with respect to these tanks was important?

A. I don't recall; I wasn't consulted about the necessity for reconditioning, but I was told that the operation was going to be performed.

Q. That is not the question I asked you. I asked you: when, after the present case was in progress was it, that you were first made aware that, if you have been at all, it was deemed important to show that these gasoline tanks were removed and reconditioned.

A. Nobody ever told me that.

Q. Nobody ever suggested that to you?

A. No.

Q. That is all, unless you want to point out these items of unidentified labor—

The Court:

He says he doesn't care to do that.

Mr. Botts:

All right; then I am through.

The Court:

You heard what he said, and I take it for granted that he means that he doesn't desire to come back as a witness.

Mr. Botts:

Yes, I heard him. That is all.

(By Mr. Matteson):

Q. Do I understand you to say that Merrill-Stevens had no foreman on the job?

A. That is right.

Q. They kept no track of what work was done on the job?

A. No, sir.

Q. How do you know that?

A. It is a matter of knowledge; that's all.

Q. You mean that somebody told you that?

A. No; I know they didn't have any foreman on the job; that wasn't the arrangement with them at all.

Q. You didn't work at Merrill-Stevens?

A. No.

Q. You didn't keep their records?

A. No.

Q. You don't know what the source of their records might have been, do you?

A. No.

Q. You are just guessing at it?

A. Except that I questioned them on some of these bills and they had no record of what work was being done except their timeclock records.

Q. So all you know is something that they told you about that?

A. Yes.

Q. Doesn't it strike you as rather extraordinary that they didn't know anything about what their men were doing?

A. Beg pardon.

Q. Doesn't it strike you as rather extraordinary, Mr. Simmon, that they didn't know anything about what their men were doing?

A. Well, the men were working under Captain Nelson, and he was supposed to keep track of them and see that they were working.

Q. And he was supposed to tell each individual man what he was to do at any particular time; is that your understanding of it?

A. Yes.

Q. And that is based on what Merrill-Stevens told you when you inquired about the bill afterwards?

A. What?

Q. That is based on what someone at Merrill-Stevens told you when you inquired about the bill afterwards?

A. Yes.

Q. It is a fact, is it not, that the reason for those inquiries was that you suspected that the bill was much too high?

A. No, that wasn't the reason at all. The bills came through from time to time during the progress of the work, and I knew from Captain Nelson's reports that certain operations were going on, and the bills were coming in for the same "old operations", and I called them up about it, and that is when I found out that they had no record, only as to the work being done—they just charged these men "in".

Q. There was at one time, when you made inquiries of Merrill-Stevens a suspicion on your part that some of the work indicated on the bill had not been done; is that the fact?

A. No.

Q. Do you recall going to Merrill-Stevens in company with Mr. Brown to make inquiries on this point?

A. Not at this time.

Q. At any time.

A. That was six months, I guess, after this work was done.

Q. And that was the purpose of that inquiry at that time?

A. No, not to find out whether the work was done; there was no doubt about the work being done.

Q. You had no doubt about that in your mind at all?

A. No.

Q. You knew at that time, didn't you, that you had already discovered that Captain Nelson had receipted for gas on one or more occasions, for 200 gallons more of gas than he actually received, did you not?

A. I don't recall that; but I knew that he accepted some commissions on sales.

Q. Did you have charge of investigating the conduct of Captain Nelson?

A. I wouldn't say that I had charge of it, no.

Q. You had a good deal to do with it?

A. I helped to a certain extent.

Q. You had at least heard at that time that he had receipted for more gas on occasions than he had received?

A. It is possible, but I don't remember that particular incident now.

Q. You had no suspicion when you inquired about this bill that some of the work represented by the bill had not been done?

A. No; there was no question at that time of that kind.

Mr. Matteson:

That is all.

Re-Direct Examination.

By Mr. Underwood:

Q. What was the questioning about Captain Nelson at that time; at the time you went to Merrill-Stevens with Brown to make inquiries about this work, what was the point of your questioning at that time?

A. The point was to find out whether he had accepted any commissions on the work done.

Q. During the progress of this work how often would you be at the yard and see it?

A. There was no regularity but, as I recall it, I was there several times a week.

Q. Who checked over these bills as they came in?

A. I did.

Q. When they came in just how did you check them over?

A. I had written memorandums and reports from Captain Nelson as to the progress and nature of the work being done, and also a rough idea in general of the number of men being employed daily.

Q. Were they checked in any way against your own observation?

A. Naturally.

Q. How at that time did the bills compare as to the nature of the charge with what you yourself had observed the men doing?

A. Well, the bills, as I said before, did not agree in all cases because there was no accurate payroll record kept by Merrill-Stevens so that the charge could be put on the bill; I knew what the operations were from the memorandums.

Q. Mr. Matteson indicated while he was cross examining you that he wanted an explanation of why the work of gas-freeing tanks does not appear on the bills. Do you have any explanation of that?

A. Yes, it is the same explanation that this work was all done, and a large body of men were working on the boats; I think at times there was as high as 45 to 50 men employed on the boat, and Captain Nelson was acting in direct charge of these men, directing each just what to do, and even he did not go into detail as to every operation performed by each man, because there was no purpose of it; the main item was to see that we paid for the men employed there and the time they worked, and that the work was all done on the boat, and the fact is that it was one large operation of labor on the boat, and there was no real reason for breaking it down to a very fine cost accounting basis for each operation.

Q. You were asked about whether Captain Nelson's original estimate was in writing. I would like you to tell me what you have done, if anything, in an attempt to locate that?

A. I was at the offices at 1317 Biscayne Boulevard and went through every bunch of files I could find there, trying to locate the memorandums and the estimate.

Q. When did you do that?

A. It was about one month ago, or six weeks ago.

Q. During the progress of this trial last March?

A. Yes.

Q. Do you remember how late you stayed up that night trying to find it?

A. About midnight.

Q. Were you able to find it?

A. No, sir.

Q. Generally, to refresh your recollection as to these repairs that were done, what have you looked at?

A. I have looked at these statements and invoices; that is about all.

Q. Do you remember anything else?

A. I don't recall anything else.

Q. By the way, have you any connection now with Mr. J. S. Phipps or any member of the Phipps' family or any corporations in which they are interested?

A. None whatever.

Q. Mr. Matteson just asked you some questions about inquiries that you made at Merrill-Stevens at the time that the work was being done, as I understand his question: do you recall any inquiries during the course of the work while you were receiving bills for it?

A. Yes, sir.

Q. On what did you base that?

A. You mean the inquiries as to the charges?

Q. Yes; on what did you base your approval or amendment of the bills during the progress of the work?

A. I had a record of the rates being paid to the different classes of labor, and of course the extensions were checked on each daily; then I had a record or reports from Captain Nelson or memorandums as to the nature of the work being done, and I checked on them physically to an extent when I went out there, and it was based upon that knowledge that the bills were okayed, relying, of course, to a great extent, upon Captain Nelson's reports.

Q. I call your attention to a portion of one of Merrill-Stevens bills which ends up with items for September 17, 1927, and I call your attention particularly to the pencil marks and calculations below the typewriting. Will you tell me whether or not you made those?

A. No.

Q. Who did that?

A. Mr. Wilson.

Q. Do you remember whether or not that was done at your direction?

A. Yes, it was.

Q. Does that bear your okay?

A. Yes, sir.

Q. You spoke to me last night about a mistake you made in your testimony yesterday. Will you tell me what that was?

A. In reply to a question asking if this last was in my handwriting and I said it was inadvertently; I had no intention of stating that, because it is not.

Q. Do you recognize the handwriting now?

A. Yes.

Q. Whose is it?

A. Mr. Wilson's.

Q. Referring to the yellow sheet which is the first page of Respondents' Exhibit 4-L?

A. Yes.

Q. Will you tell me whether or not that was prepared at your direction?

A. It was.

Q. You have said something about your experience with welding, and I don't think it is clear just how or just what you have done in that connection. Will you tell me about that?

A. I worked in a malleable iron foundary and in many cases it is necessary to correct sand blows and cracks and other faults in castings by welding, to fill up the holes, and that was the extent of my experience with welding.

Q. What did you yourself do about that?

A. About the welding process?

Q. Yes.

A. Nothing individually.

Q. Did you ever do the welding yourself?

A. No.

Q. Did you see it done?

A. I was in charge of the department where it was done.

Q. Do you know what welding looks like?

A. Yes.

Q. When you saw these two gasoline tanks from which the bottoms had been removed, I wish you would describe to me what the inside of the tanks looked like at that time.

A. Well, as well as I recall, it was just bare metal, rather bright and apparently smooth; there wasn't any particular distinguishing characteristics about it.

Q. You say it was fairly smooth. Can you tell me whether or not it showed any signs of pitting or corrosion?

A. No, I don't mean that it was finely polished, a finely polished piece of metal, but, as I recall it, it was not pitted or corroded.

Q. How about the inside of the bottoms of the tanks at that time; how did they look?

A. They looked clean.

Q. How did they compare with the sides of the tanks themselves?

A. I would say they were in about the same condition.

Q. I would like for you to describe for me a little more the nature of this pile of materials that had been removed from the tanks, and which you said was about as big as a hat.

A. It was about the size of a hat.

Q. What kind of material was it?

A. The only way I can describe it is just to say dirt.

Q. What was the texture; what did the individual pieces feel like?

A. I don't believe I examined it; I didn't put it in my hand or anything like that; I just saw it the on the ground.

Q. Did it look like corn-flakes or sand or just plain dirt?

A. No, it looked more like a sort of mud; you might say that it looked like a sort of mud that dried or something.

Q. Looked like dry mud?

A. Not dried hard; it was a little watery; it seemed to have fairly good substance; it wasn't necessarily loose.

Q. What is your recollection of it as to color?

A. I don't recall any distinguishing color in it at all.

Q. Do you know the color of rust?

A. Yes.

Q. How did the color of that compare with the color of rust?

A. I don't recall seeing any rust color there at all.

Q. Do you know what scale from the inside of a tank looks like?

A. Well, I have an idea; I don't know that I am an expert on it, however.

Q. Well, what is your idea of the way scale from the inside of a tank looks like?

A. I would think it would come out like scale off of any object that rusts; sort of flakes or sharp pieces.

Q. Did you observe any of that in this pile of dirt?

A. I don't recall seeing any; no, sir.

Q. Now during the progress of this work just what was the relation between yourself and Captain Nelson?

A. Well, Captain Nelson had charge of the work, and I had no direct authority over Captain Nelson.

Q. To whom did he report as to the progress of the work and the amount of the charges?

A. He reported to me but not as the person in authority, but as a person who was doing the accounting and keeping the records of what was done.

Q. Will you tell me whether or not he did report to you as to the progress and the nature of the work?

A. Yes, sir.

Q. Will you tell me whether or not that was in the ordinary course of business at that time?

A. Yes, it was.

Q. What did he report to you as to the method in which the tanks were tested?

Mr. Botts:

Hold it. If the Court please, that is calling for hearsay testimony and I object to it, what Captain Nelson reported to him.

Mr. Matteson:
I join in the objection.

The Court:
Technically I think it is a good objection, but we have had no objections—

Mr. Botts:
We have had some, and we have let them get away with a good deal, but I insist on this objection; in other words, I am not objecting to leading questions and things like that, where it is merely to save time, and I have failed to interpose technical objections many times, but this is a question that I think borders on dangerous testimony which we might not have any possibility of controverting.

(Legal argument.)

The Court:
I will sustain the objection.

Mr. Underwood:
I want to ask the same kind of question with reference to another matter.

(By Mr. Underwood):
Q. Will you tell us, Mr. Simmon, whether or not Captain Nelson made any report to you as to the method of preparing the tanks before they were taken apart?

Mr. Matteson:
If your Honor please, I certainly object to that; this is obviously an attempt to get in Captain Nelson's testimony without calling him.

Mr. Underwood:

It is an attempt to get into the record reports made by a subordinate to a superior official and reports made in the ordinary course of business at the time.

The Court:

I think the objection is well taken. I will sustain the objection.

Mr. Underwood:

If your Honor please, there is another basis for that question; Mr. Matteson asked this witness if he had any experience about tanks and the freeing of gas, so he opened the door on this.

The Court:

You can let him answer the question for the record, if you want to. We do not have a jury here.

Mr. Underwood:

I will appreciate the opportunity to do that, if your Honor please, as to this question and as to the preceding question.

The Court:

You may do it.

Mr. Underwood:

May we have the Reporter read the question first, and then the preceding question?

Mr. Botts:

I understand the ruling is that at present it is inadmissible.

The Court:

That is correct.

(Thereupon the question was read as follows: "What did he report to you as to the method in which the tanks were tested"?)

(By Mr. Underwood):

Q. You can answer that.

A. Do you mean before they were taken apart?

Q. No; after they were put together again.

A. Captain Nelson reported to me that they were tested under high air pressure under water for any leaks, any air leaks, and he felt confident that if they didn't show any aid leaks under water under high pressure, they certainly would not leak any gasoline out of the tank.

Mr. Underwood:

Now, Mr. Colman, read also the preceding question to which the objection was sustained.

(Thereupon the question was read as follows: "Will you tell us, Mr. Simmon, whether or not Captain Nelson made any report to you as to the method of preparing the tanks before they were taken apart"?)

A. He told me that the tanks were filled with water and would eliminate any danger of explosion.

The Court:

Now your objection is to that?

Mr. Botts:

Yes, your Honor.

The Court:

The same ruling; I will sustain the objection.

Q. Mr. Simmon, as to these two drain pans, what was their color when you saw them?

A. What?

Q. I will put it this way: Do you remember how many times you saw those pans during the progress of this work?

A. Only once that I recall.

Q. What was their color at that time?

A. I don't know; they were all painted over in red paint.

Q. Yesterday you were asked a question as to the covering, if any, on the bulkhead which separated the engineroom and the alleyway; do you remember that?

A. I was asked a question as to what I thought the wall was, as to what it was made of between the engineroom and the—

Q. What was the wall made of?

A. Steel.

Q. Was it, according to your recollection, covered with anything on the engineroom side?

A. No.

Q. Was it, according to your recollection, covered with anything on the alleyway side?

A. I don't know about that.

Q. Now you said yesterday something about Mr. John S. Phipps being the owner of the Seminole at the time this work was done. I would like to know the basis for that statement: on what do you base that statement?

A. Why, I saw the form that was filed; in fact, I filed the form in the customs house here registering the boat here in the port of Miami, and it was put in in the name of the owner.

Q. Will you tell me whether or not that is the sole basis of your statement that Mr. John S. Phipps was the owner of that boat?

A. Yes, sir; that is the only knowledge I had.

Q. It is not quite clear to me Mr. Simmon, the difference between 4-N and Exhibit 4-O; I think you said one was a statement of expenditures, and that the other was a statement of operating expenses.

A. That is right.

Q. Will you distinguish these two phrases for me and tell me which one is which, please.

A. Yes. This one, which bears number 4-N is a statement of all expenditures; that means of money expended regardless of the purpose for which it was expended.

Q. Now what is the difference between an expenditure and an operating expense?

A. Well, they may be the same thing and they may not.

Q. When they are not the same, what is the difference?

A. "Expenditure" is a more inclusive term than this; it is a statement of the cash outlay during a certain period of time, regardless of when the bills may be incurred. A statement of operating cost allocates these charges to the period of time to which they are chargeable and against each—

Q. Maybe I am wrong, but as I understand it, expenditures include all cash outlay of every nature.

A. Yes.

Q. And the operating expenses distinguishes expenditures for operation—

A. It includes expenditures for capital charges.

Q. Now as to Exhibit 4-O you said something yesterday about it being a comparison between the operations under Captain Baker and operations of the Seminole Boat Company. Will you show me how they compare—perhaps, I can shorten it by asking you what the last column on the top page of 4-O includes.

A. The last column is supported by this schedule here; it is a statement of operations during the agreement with Captain Baker from October 31, 1929 to July 1, 1930.

Q. Do the prior columns, beginning with 1926 and going to 1929, include operations under Captain Baker?

A. Only for the portion of this period and a portion of this. You see, this statement here is from October 31, 1929 to July 1, 1930, and this column here is for six months.

Q. Indicating the 1930 column?

A. Yes. So that a portion of that amount shown in this column—

Q. 1929 column?

A. Yes. And all of this —

Q. Indicating 1930?

A. Yes; in this operating statement here.

Mr. Underwood:

That is all.

The Court:

I suggest that one of you ask the witness what was involved or what was incorporated in that $50 a day charge,—lay-day.

Mr. Underwood:

I think we can agree that is a charge for the use of the Marine Whaleway or the ways per day.

Mr. Matteson:

Yes, that is right.

Re-Cross Examination.

By Mr. Botts:

Q. How did it happen that your attention was called to this pile of stuff that came out of the tanks?

A. Well, as I explained before, the discussion of tanks was quite material, as to whether we would buy new tanks or not; and anything pertinent thereto was a matter of great interest at the time.

Q. And after they had been opened up, than your attention was called to this pile of stuff that was removed from the tanks?

A. That is right.

Q. And there had only two tanks been opened at that time, when this pile of stuff was exhibited to you, is that right?

A. Yes, sir.

Q. And you say there was no scale or rust in this pile?

A. Well, I said that I didn't see anything of the ordinary color of rust, no; looked like what I thought scale looked like.

Q. You mean you did not see anything in the nature of scale, is that it?

A. That's right.

Q. When you saw this pile, only two of the tanks had then been opened, is that right?

A. Yes, sir, I believe that is right.

Q. And you found those tanks in practically perfect condition inside?

A. Yes.

Q. And after finding these two tanks in perfect condition, then you still went on to the trouble and expense of opening up the other two, to find them also in perfect condition, right?

A. Yes, sir, that's my understanding of it. I didn't see it done.

Q. Now what color was this stuff that came out of the tanks?

A. I don't know how to describe the color of it; just a mass of stuff there. I don't recall that it had any color at all.

Q. What was the particular importance of this, that they would collect it together into a pile, or what you described as a mass? Wouldn't the normal thing have been to scrape it out on the ground and let it scatter where it would, instead of collecting it into a mass or pile?

A. Well, they couldn't very well scrape it out on the ground, because this was right alongside the boat where they were doing all the work.

Q. Well, was it on the dock, or what was it on?

A. I don't know; as I recall it, some sort of a platform there, the men were working on.

Q. Well, there wasn't any particular occasion for scraping it up or collecting it in a pile, was there?

A. No. I think it was just where they had knocked it out. I just happened to be there before they disposed of it, probably.

Q. Well, they didn't collect the mass or pile from one tank, and then collect the mass or pile from the other, did they?

A. I couldn't say; I wasn't there when they did it.

Q. You don't know. Well, you saw a mass or pile of stuff to fill a hat, and you don't know whether it came out of one tank or two, then, do you?

A. No, I don't recall. I presumed that it came out of both tanks.

Q. Now then at the time when you examined the bottom of these tanks to see that these bottoms had been welded, that was the same time that you examined the sides of the tanks and saw that they had not been welded; is that right?

A. I may be making a mountain out of a mole hill, but I don't believe I ever stated that the sides of the tanks were not welded. I simply stated that I don't remember as to whether they were welded or not, because it wasn't called to my attention. I remember about the bottoms of the tanks.

Q. And you don't know whether the sides were welded or not?

A. No, I don't make any statement about that.

Q. Your mind is perfectly blank on the question as to whether or not the sides were welded, is that right?

A. Yes, sir. I don't remember that at all.

Q. Don't remember the first thing in the world about it?

A. No, sir.

Q. And your memory is just as good today as it was yesterday on that question, isn't it?

A. I think so.

(At 12:01 P. M. hearing was recessed until 1:45 o'clock p. m. of the same day, to-wit, May 18, 1939.)

Afternoon Session.

2:00 o'clock P. M., Thursday, May 18, 1939.

(Hearing resumed pursuant to the noon recess; the witness ALLEN SIMMON resuming the witness stand upon further cross examination.)

By Mr. Botts:

Q. Now, Mr. Simmon, do you recall yesterday afternoon the following questions and answers, reading from page 2073:

"Q. Do you know of your own knowledge that there was any welding done on the tanks themselves at that time?"

"A. Yes, I do."

"Q. Now just state where was this welding on the tanks?"

"A. In all the seams; the seam on the bottom of the tank and up each side, as I recall it."

"Q. Now, Mr. Simmon, do you say that all the seams of the gasoline tanks were welded at that time?"

"A. Yes, sir."

Do you remember making that statement?

A. Yes, I think I do.

Q. And today you said only the bottoms were welded, didn't you? Do you have any explanation to make of that?

A. I said as I recall it today that I knew the bottoms were welded; I didn't know whether I had seen welding on the side or not.

Q. These pans that were made to go underneath the tanks, as I understand it, you are not now prepared to say whether they were made of zinc or what they were made of, is that right?

A. My impression of that hasn't changed at all. I thought they were made of zinc.

Q. That is merely an impression?

A. That is right.

Q. And am I right that you didn't see these pans until they were underneath the tanks of the vessel, is that right?

A. No, I think I saw them before they were installed.

Q. Did you see them when they were being made?

A. No; I think they were lying there right close to the job, ready for installation with the tanks.

Q. You didn't see them when they were being made?

A. No, sir.

Q. Then I call your attention to this question on page 2087, the question:

"Q. Did you see these pans after they had been constructed?"

"A. I saw them when they were being made there on the dry-dock".

Is that true?

A. Yes, I think it is substantially. I saw the pans there, but I don't believe that I had any intention of saying I saw them while they were being built.

Q. When you said here that you saw them while they were under construction, you didn't mean that, is that correct?

Mr. Underwood:

We object to that, he didn't say that.

Q. When you stated here that you saw them while they were being made, did you mean that or not?

A. I didn't mean that I saw them while they were actually working on them, making them; no, sir.

Q. Then your testimony yesterday, if it conveyed that impression you want to correct it, is that right?

A. Yes, sir.

Mr. Botts:

That is all at this time.

The Court:

Did you want to cross him on the matters that I allowed the answer to be made on? * * *

Mr. Botts:

I would rather not cross him on that.

By Mr. Matteson:

Q. I would like to ask you a little more about this pile of material you saw that came out of one or more of the tanks. Was that hard material or soft material?

A. I didn't make a thorough enough examination of it to say; I mean, I didn't feel it, I just looked at it.

Q. Was it in small pieces like sand or dust, or was it in large pieces.

A. No, it seemed to me to be more of somewhat the nature as if you dumped out some mud,—that texture.

Q. It was moist, was it?

A. Composite mass.

Q. Was it wet—moist?

A. I don't know anything as to that. I mean, it wasn't like dust, it wasn't just loose dust, it was more cohesive than that.

Q. It wasn't like rust or scale that you would find out of a tank?

A. No, I don't think so.

Q. Rust or scale is the sort of material that you would get out of a tank by knocking, isn't it?

Mr. Underwood:

I object to that on the ground the witness is not shown to be qualified; we haven't called him as an expert.

The Court:

I think he can answer from the standpoint of ordinary common knowledge. I overrule the objection.

(The question was read:)

A. Yes, I would think so, if there was any there.

Q. What would your idea of a lot of such material be, if you were going to use the expression "a lot of it"? What would you have in mind? Would you have in mind the hatful that you spoke of, or a larger quantity?

A. Well, I don't remember; did I say something about a lot of it?

Q. That isn't the point. I said, if you were to use that expression, what would you intend to convey by it?

A. A lot of what? Of the same kind of material?

Q. A lot of the same kind of material, yes.

A. Well, I think that would depend upon circumstances. I would think that—

Q. If you were going to say that you got a lot of it out of the tank, would you say that what you saw was a lot?

A. Yes, I would think it was, to come out of a tank like that.

Q. Then when you testified yesterday that Captain Nelson "showed me a lot of residue and stuff that he knocked out of the tanks", you had in mind only this quantity that you now speak of as being perhaps a hatful?

A. Yes, sir.

Q. But you didn't have in mind rust and scale such as you would knock out of a tank?

A. No, all I had in mind was this material that was shown to me as being taken out of the tanks.

Q. Now I think you said that you saw the tank both before the crowns were taken out, while they were out, and after they were put back; is that right?

A. Yes; I think that is correct.

Q. Can you tell us this: When the tanks—when you saw the tanks first, before they were taken apart, were the edges of the crowns and the edges of the tank together at that time, even with each other?

A. I don't believe I know. I don't remember examining that feature of it at that time at all.

Q. You can't tell us whether that was so at that time or not?

A. That is right.

Q. When you saw the tanks with the crowns or bottoms out of them, can you tell me whether any part of the side seam of the tank had been loosened,—any part of the line of rivets running up the side of the tank?

A. I don't recall that they were; I couldn't say.

Q. That would probably have to be done, to release the crown, would it not?

Mr. Underwood:

I object to that on the ground that the witness has not been shown to be qualified as a boiler maker. • • •

The Court:

Isn't your question directed to him as an expert on that?

Mr. Matteson:

If your Honor please he has testified to a lot of things here, and I am trying to test his recollection and find out what he recalls. • • •

The Court:

I think that question is subject to the objection; I will sustain the objection.

Q. Well, then as I understand it, your mind is a complete blank as to whether the side seam was released or not?

A. I have no recollection of the side seam at all.

Q. You spoke, or someone—I think you spoke of it, your being interviewed by Mr. Batchelor and asked for information about the Seminole; do you recall that?

A. Yes, sir.

Q. And at that time Mr. Batchelor asked you, did he not, as to what you remembered as to the things that you had done with respect to the Seminole?

A. I don't recall that. Mr. Batchelor's questions as I recall followed a different line of questioning altogether.

Q. Isn't it a fact that you, in words or in substance, at the time you talked with Mr. Batchelor, told him that the only definite thing you could recall was that you had made several attempts, at the request of Mr. Scott, to charter the Seminole, but without success?

A. State that again, please.

Q. Isn't it a fact that at the time Mr. Batchelor talked with you, that he asked you as to the things that you had done in relation to the yacht Seminole, and you told him at that time that the only definite thing you could recall was that you had made several attempts, at the request of Mr. Scott, to charter the boat, but without success.

A. I might have told him that I had made several attempts to charter the boat, without success; but I don't recall limiting it to that entirely, in relation to the boat.

Q. I show you a letter which I believe is signed by you, on September 28, 1935. Do you recall that letter?

A. I don't recall the letter. I see my signature here.

Q. That is your signature?

A. Yes, sir.

Q. That is a letter that you sent Mr. Batchelor?

A. I believe it is.

Q. And that was in reply to a letter of which this second document that I hand you is a copy, was it not?

A. Yes, sir.

Mr. Matteson:

I would like to offer these if your Honor please.

Mr. Underwood:

I have no objection.

(The said letters were admitted in evidence and marked respectively Libelants' Exhibits 118 and 119.)

Q. Now one more thing, Mr Simmon. You have been asked about several things that you said in your testimony yesterday, and I would like to ask you about one more. Yesterday, in answer to one of my questions, I believe you stated that according to your recollection there was no woodwork in the alleyway that went past the engineroom. Do I understand you now that you didn't understand that question to refer to the alleyway that went past the engineroom?

A. I didn't understand the question to apply to the alleyway itself. As I remember it, we were discussing the engineroom, discussing the various walls in the engineroom, and I thought the question asked, referred to the walls of the engineroom as you would look at the inside of the engineroom.

Q. And you really gathered the impression at that time from my question that I was suggesting that there might be woodwork on the bulkheads in the engineroom?

A. No, I didn't understand that at all. I knew you were talking about the wall along the alleyway, but I thought you were talking about it from the viewpoint of

being inside of the engineroom, as to what the wall was made of.

Q. Well, it would be very unusual for there to be any woodwork in the engineroom, with that type of a wall, would it not?

A. I would think so.

Q. I would like to read you the questions and answers, so we will be perfectly clear on this: Page 2079, my question was:

"Q. Do you recall the alleyway that went past the engineroom on the main deck of the Seminole?"

"A. You say the main deck?"

"Q. We will say, the lower deck, I will put it that way."

And your answer was "Yes." That's clear; the alleyway outside the engineroom is referred to, is it not?

A. Yes, sir.

"Q. As you went along that alleyway there was a partition on the side between the engineroom, separating the alleyway from the engineroom, was there not?"

"A. Yes, sir."

"Q. Was there any paneling or woodwork on that partition, do you recall, or was it painted steel plate?"

"A. I think it was all steel work."

I think there is a mistake in the minutes there; a;—there should be, A.

Mr. Underwood:

I will concede there is at least one mistake there.

Q. You said "I think that was all steel work".

"Q. You don't recall seeing any woodwork there?"

"A. No, I don't. There was a window in it, I remember that."

"Q. A window leading into the engineroom?"

"A. Yes."

"Q. There were also windows leading from the passageway to the outside of the ship?"

"A. Yes, sir."

Now do you say at this time that you did not understand, when you gave those questions and answers, that we were talking about the alleyway itself?

A. No, I thought the discussion was in relation to the engineroom, as to what the dividing wall was between the alleyway and the engineroom.

Q. What was there about these questions that confused you on that point?

A. I don't know, I guess it was just the general trend of the discussion. As a matter of fact I don't know whether there was any wood there or not, from the outside of it,—I mean the outside of the engineroom.

Q. You gave an explanation of these answers on your re-direct examination by Mr. Underwood; I assume that you had discussed this testimony that you gave yesterday, with Mr. Underwood before you made your explanation this morning?

A. With regard to this point?

Q. Yes.

A. No. I don't think so.

Q. You discussed that with no one before you made the explanation on re-direct this morning?

A. I don't recall doing so.

Q. And did anyone call your attention, before you made the explanation today, to the fact that Captain Baker had testified that that partition was covered with wood?

A. No, I don't know anything about his testimony at all.

Q. You say you don't even now know that Captain Baker testified that that partition was covered with wood?
A. No.

Mr. Matteson:
That is all.

Re-Direct Examination.

By Mr. Underwood:
Q. Mr. Simmon, do you remember who it was that Mr. Batchelor told you he represented when he called on you?
A. I think he told me it was Captain Pilkington.
Q. Sure about that? Is that your best recollection?
A. Yes, sir.

Mr. Underwood:
That is all.

Mr. Botts:
I want to reserve the right to recall this witness after I have had a chance to go through these bills over there. I probably won't want to ask him to come back, but I don't want to waive that right until I have had a chance to examine those bills.

The Court:
Is this witness under subponea?

Mr. Underwood:
No, sir, he is not.

The Court:
Will you return if Mr. Botts calls you and tells you he wants you to come back?
A. Yes, sir.

Mr. Botts:

I think it is improbable that I will.

The Court:

Either Mr. Botts will call you or else he will tell Mr. Underwood and he will call you. In other words, when you get information you are wanted, you come back.

A. I will.

(Witness excused.)

2722 MR. CHARLES ARTHUR WEISS, JR., as a witness on behalf of Respondents, was sworn and testified as follows:

Direct Examination.

By Mr. Underwood:

Q. What is your full name, please?

A. Charles Arthur Weiss, Jr.

Q. Where do you live?

A. Stewart Manor, New York.

Q. What is your business, Mr. Weiss?

A. I am an accountant.

Q. How long have you been an accountant?

A. Since 1915.

Q. By whom are you employed?

A. I am employed by Bessemer Investment Company.

Q. I show you a book and ask you if you can tell me what that book is,

A. This is the ledger of Mr. John S. Phipps.

Q. Covering what period of time?

A. From the year 1903 to 1919.

Q. Is that the ledger that covers his personal financial affairs?

A. Yes, sir.

Q. Do you know where the book just came from? Do you know who has custody of it?

A. You have custody of it.

Q. Who had custody of it before I got it?

A. Our office.

Q. Have you had anything to do with that book yourself, in the past?

A. Yes, I have had charge of the accounts and the records of numerous individuals and corporations of the Phipps family.

Q. Is that one of the books that have been in your charge?

A. It is.

Q. Are you in a general way familiar with the book?

A. Yes, sir.

Q. Can you refer in that book to any capital account for the Seminole?

A. Yes, I can.

Q. You have the page?

A. Yes, sir, page number 5.

Q. Can you tell me what that is?

A. That is an account headed, houseboat Seminole, and there is an entry dated—

Q. You won't be allowed to read it. Just tell me whether it is a capital account or some other account.

A. It is a capital account.

Q. It is a capital account of John S. Phipps?

A. Of John S. Phipps.

Mr. Underwood:

If the Court please, I offer in evidence a photostatic copy of that capital account.

Mr. Botts:

May I ask just one question: This "Transferred to new L" I suppose that means, new ledger?

A. New ledger.

Mr. Botts:

I don't see the materiality of it, but I have no objection.

Mr. Matteson:

There is no relevancy to the matter, or materiality.

The Court:

We will put the burden on Mr. Underwood, upon argument, to show the materiality. We will admit it.

Mr. Botts:

That is the only page of the ledger that has anything to do with the Seminole, is it?

Mr. Underwood:

It is not.

(The said photostat was admitted in evidence and marked Respondents' Exhibit 4-P.)

Q. Now Mr. Weiss, this document which you have just identified as Mr. Botts says contains the entry, transferred to new ledger. I show you another book, can you tell me what that book is?

A. This is the ledger of Mr. John Phipps.

Q. For what period of time?

A. For the period from May 1919 to December, 1922.

Q. Does it follow next after the one you looked at before?

A. It does.

Q. Now is there in that book any capital account for the Seminole?

A. Yes, sir.

Q. Will you point it out, please?

A. It is on page 20.

Mr. Underwood:

I offer a photostatic copy of that page.

Mr. Matteson:

If your Honor please, I would like to register a formal objection based upon its materiality and relevancy; I don't object to its competency.

Mr. Botts:

I just submit it with the same observation I made with reference to the other. If the Court thinks it may possibly have any materiality I won't object.

The Court:

I will admit it.

(The said photostat was admitted in evidence and marked Respondents' Exhibit 4-Q.)

Q. Mr. Weiss this Exhibit 4-Q refers in the right hand column to a new ledger; will you tell me whether this capital account was continued after this date?

A. It was.

Q. And where was it continued?

A. In Mr. John S. Phipps' next ledger.

Q. And what have you got after that?

A. I have a ledger page taken from his ledger.

Q. I notice that heretofore we have had books, now you have a single sheet of paper. Will you tell me what happened about that, at that time?

A. In the beginning of 1923 we changed our ledgers then from the bound ledger to the newer form of a loose leaf ledger.

Q. How many of the books of the members of the Phipps family and corporations in which they are interested, and which you know about, made that change at that time?

A. Practically all of them were changed.

Q. And this sheet which you show me, what is that?

A. This is the capital account of the yacht Seminole.

Q. Of whom?

A. Of Mr. John S. Phipps.

Q. Where did this ledger sheet come from? From his ledger?

A. I took it from his ledger.

Mr. Underwood:

I offer a photostatic copy of that ledger sheet.

Mr. Matteson:

If your Honor please, I would like to add to my former objection, the objection that a sheet from a loose leaf book, even if it is bound in a book, it is no evidence of genuineness whatever.

(Discussion was had.)

Mr. Botts:

So far as I am concerned I have no objection. • • •

The Court:

I will admit it.

(Said photostat was admitted in evidence and marked Respondents' Exhibit 4-R.)

Mr. Botts:

I don't think the witness has stated what period of time that covers; I think that ought to appear.

Mr. Underwood:

It speaks for itself, I say. You can ask any questions you think pertinent on cross examination.

Q. Now I notice on this Exhibit 4-R, there is a reference to Seminole Boat Co. on July 1, 1930. Can you tell me whether there is any record that follows this one?

A. There is.

Q. Do you have it?

A. Yes, I do.

Q. Is that it?

A. This is it.

Q. What is that?

A. This is a ledger sheet taken from the ledger of Mr. John S. Phipps, recording his ownership of twenty shares of capital stock of Seminole Boat Company.

Mr. Underwood:

I offer photostatic copy of that sheet in evidence.

Mr. Matteson:

If your Honor please, I take it our position is maintained as to all these documents without repeating ourselves?

The Court:

All right.

Mr. Botts:

I am going to object, on the ground it does not show what period of time is covered by this. I am going to move to strike the previous exhibits, on the same ground.

The Court:

I don't catch the significance of your objection.

Mr. Botts:

I would just like to know over what period of time this ledger sheet purports to cover the transactions; whether it is one day, one week, one month or ten years.

The Court:

In other words, you want, while the first entry on this is November 30, 1928, you don't know whether that is the beginning of this record.

Mr. Botts:

And I don't know when is the ending of the record or anything about it.

The Court:

I think the witness ought to explain that, Mr. Underwood.

Mr. Underwood:

If your Honor please, isn't that something to be brought out on cross examination?

The Court:

Possibly so.

Mr. Botts:

It does not have to be.

The Court:

You offer a book or ledger I will say, and I think it is proper to show what period that ledger covered, not what the entry showed but the period of time the ledger covered.

Q. Mr. Weiss, will you take these four sheets, three of which have been marked and the last of which has not yet been marked, and tell me first what you know of your own knowledge as to the period of time covered; second, interpret for us what the sheets, and the books show as to the period of time covered.

A. I know from my own knowledge that the books cover the period from 1921 to date. Previous to that, I am

reading from the records. The first document covers the period from February 24, 1915 to May 31, 1919. The second document, from May 31, 1919 to January 1st, 1923. The third, from January 1st, 1923 to July 1st, 1930.

The Court:

Let me just ask you; you are reading those dates which bear the last entry on these particular pages?

A. That is right, sir.

The Court:

Well, is that because the entry shows that it was transferred to a new ledger at that time?

A. Either transferred to a new ledger or this account closed.

The Court:

For instance, this one right here, could it cover a period of time in keeping Mr. John S. Phipps' books, in regard to the yacht Seminole, for an earlier date than the first entry and a later date than the last entry?

A. No, sir.

The Court:

It could not?

A. No, sir.

Mr. Botts:

There is one more that you have offered that he hasn't covered the period?

By Mr. Underwood:

Q. What period of time does this last one, as yet unmarked, cover?

A. That covers the period from November 30, 1928 to the present time; it is still in force. This is his account on his books at the present time.

Q. Now there is an overlapping of dates.

The Court:
Have you an offer there?

Mr. Underwood:
Yes, I offer the photostatic copy.

Mr. Botts:
Now I withdraw my objection.

Mr. Matteson:
I simply want to maintain my position.

The Court:
The objection is overruled; admitted in evidence.

(The photostat offered, was admitted in evidence and marked Respondents' Exhibit 4-S.)

By Mr. Underwood:

Q. Mr. Weiss, there is an overlapping of dates between July 1, 1930 on Exhibit 4-R and November 30, 1928 on Exhibit 4-S; can you explain that to me?

A. At both times—during that time both of these ledger pages were part of Mr. John S. Phipps' ledger.

Q. What is the significance of the date July 31, on Exhibit 4-R?

A. It records the transfer of the amount of that account to the account headed, Seminole Boat Company.

Q. Exhibit 4-S?

A. 4-S.

Q. What is the significance of the date, November 30, 1928 on Exhibit 4-S?

A. That records five shares of Seminole Boat Company stock set up on this ledger page.

Q. And does that have any significance as to the date when the purchase was made?

A. That is the purchase of five shares of stock; that records the purchase of five shares of stock.

Q. Do you have anything to do with the personal accounts of Mr. H. C. Phipps?

A. I do. I have charge of the keeping of his personal accounts.

Q. I show you a book, can you identify that book for me?

A. This is the ledger of Mr. Henry C. Phipps.

Q. Can you tell me whether that contains any capital account entry in respect to the Seminole?

A. It does.

Q. Show it to me.

A. Page 93.

Q. Is that the capital account for Mr. H. C. Phipps?

A. It is.

Q. On the Seminole?

A. It is.

Mr. Underwood:

I offer this photostatic copy.

Mr. Botts:

Covering what period?

Q. What period of time does it cover?

A. This covers June 30, 1919 to January 1, 1923.

Mr. Botts:

No objection.

The Court:

It is admitted.

(The said photostat was admitted in evidence and marked Respondents' Exhibit 4-T.)

Q. Have you found in Mr. H. C. Phipps' books, any prior capital accounts in respect to the Seminole?

A. No.

Mr. Underwood:

May I have that, Mr. Batchelor, please.

Q. Now this Exhibit 4-T contains an entry January 1, 1933 new ledger; what happened at that time?

A. That is when the new system of loose leaf ledger was inaugurated.

Q. What happened then?

A. That account was transferred to a new ledger sheet in Mr. Henry C. Phipps' ledger.

Q. Have you the sheet there?

A. I have.

Q. Is that it?

A. This is it.

Mr. Underwood:

I offer a photostatic copy of that.

Mr. Botts:

Did you cover the period of time?

Q. What period of time does that cover?

A. From January 1, 1923 to July 1, 1930.

Mr. Matteson:

I just want to maintain my position all through.

The Court:

It is admitted.

(The said photostat was admitted in evidence and marked Respondents' Exhibit 4-U.)

Q. What happened to Mr. H. C. Phipps' capital account when this account was closed out?

A. That amount in that account was transferred to the Seminole Boat Company Capital stock account on July 1, 1930.

Q. Do you have that sheet?

A. I have that sheet.

Q. Is that a sheet from Mr. H. C. Phipps' personal ledger?

A. Yes, sir.

Q. Is that the original sheet?

A. It is.

Q. What period does that cover?

A. From November 30, 1928 to April 1935.

Mr. Underwood:

I offer a photostatic copy of that.

(The said photostat was admitted in evidence and marked Respondents' Exhibit 4-V.)

Q. Now what do you have to do if anything with the personal account books of Mrs. Amy Guest?

A. I also have charge of those.

Q. Does she have a capital account for the Seminole Boat Company?

A. She does.

Q. Have you a sheet?

A. Yes, sir.

Q. Are her books looseleaf books too?

A. Her sheets are loose leaf.

Q. What sheet is that that you have?

A. This is the ledger sheet of Seminole Boat Company capital stock, taken from ledger of Mrs. Amy Guest.

Mr. Underwood:

I offer photostatic copy of that in evidence.

Q. What period of time does it cover?

A. From April, 1935 until the present time, and is still a part of and an open account on her ledger.

(The said photostat was admitted in evidence and marked Respondents' Exhibit 4-W.)

Q. Do you know of any other capital accounts in respect to the Seminole?

A. No.

Q. I show you another book, tell me what that is.

A. This is the ledger of Mr. Henry C. Phipps for the years 1914 and '15.

Q. Do you find any pages in there that refer to the Seminole?

A. On page 147 there is an account entitled, Yacht Seminole Expense.

Q. On what other pages does any reference to the Seminole appear in that book?

A. Page number 178, page number 179 and page number 180.

Q. Now on one of those pages, 178, some entries other than those in respect to the Seminole, appear, do they not?

A. That is correct.

Mr. Underwood:

I offer photostatic copy of those pages insofar as they relate to the Seminole.

Mr. Matteson:

That is Henry C. Phipps'.

Mr. Underwood:

That is correct.

Mr. Botts:

You said, insofar as it has reference to the Seminole; is there anything that does not refer to the Seminole, in those pages?

Mr. Underwood:

Not that I know of, but what I meant was, I offer the pages of that, and ask leave to substitute a photostatic copy. You may look at those pages.

(The said paper was admitted in evidence and marked Respondents' Exhibit 4-X.)

Q. Have you brought with you, Mr. Weiss, the ledger of H. C. Phipps beginning with 1915 and down to 1919?

A. No, I have not.

Q. Then you can pick up the expense account of H. C. Phipps in connection with the Seminole in 1919?

A. I can.

Q. Will you identify that in that second ledger, please?

A. That is on page 153.

Q. That is an expense account of Mr. H. C. Phipps in connection with the Seminole?

A. Yes, sir.

Mr. Underwood:

I offer photostatic copy of page 153. What time does that cover, Mr. Weiss?

A. Covers from May 1, 1920.

Mr. Botts:

May 1, 1920. For the purpose of readily identifying it, do you have any objection if they write "J. S. Phipps" I believe, on this?

Mr. Underwood:

H. C.

Mr. Botts:

Do you mind if they write that on top of that?

A. —to December 3, 1922.

(The said photostat was admitted in evidence and marked Respondents' Exhibit 4-Y.)

Q. Now following that, was the account transferred to loose leaf sheets?

A. That is right.

Q. Have you the loose leaf sheets?

A. I have.

Q. What period of time does that sheet cover?

A. This page covers from 1923 through 1935.

Mr. Underwood:

I offer photostatic copies of that sheet.

Mr. Botts:

I have no objection.

(The said two photostatic sheets were admitted in evidence and marked Respondents' Exhibit 4-Z.)

Q. Mr. Weiss, I show you a book which is marked John S. Phipps, 1903—1919; can you tell me what that is?

A. That is Mr. John S. Phipps' ledger for that period.

Q. And where in that ledger first appears any reference to the Seminole?

A. On page 249 there is an account called Yacht Expense.

Q. And that is an expense account?

A. Yes, sir.

Q. What other pages in that book contain entries with reference to John S. Phipps' expenses for the Seminole?

A. Page 318.

Q. Any others?

A. No others.

Q. What period of time do those two pages, 249 and 318, cover?

A. They cover the period from September 14, 1915 through May 3, 1919.

Mr. Underwood:

I offer photostatic copies of each of those pages.

(The said photostats were admitted in evidence and marked Respondents' Exhibit 5-A-1 and 5-A-2.)

Q. It appears from page 318 that this account was transferred to another ledger.

A. That is right.

Q. Can you show me that?

A. This is the ledger of Mr. John S. Phipps for the period from May 1919 to December 1922; Yacht Expenses continue on page 171 and 176.

Q. And the period covered by those pages, is what?

A. May 31, 1919 to February 28, 1923.

Mr. Underwood:

I offer photostatic copies of those.

(The said photostats were admitted in evidence and marked Respondents' Exhibit 5-B-1 and 5-B-2.)

Q. Now it appears from page 176 that there was a transfer to a new ledger.

A. That is right.

Q. Is that the loose leaf type?

A. That is right.

Q. Do you have the sheets there?

A. I do.

Q. What period do those sheets cover?

A. They cover from January 1923 and are still a part of his ledger, right down to the present time.

Mr. Underwood:

I offer photostatic copies of these sheets.

Mr. Botts:

Is that Mr. John S. or H. C.?

Mr. Underwood:

We have finished with H. C.: These sheets being four in number, for the period January 31, 1923 through the year 1935.

Mr. Botts:

Do I understand that you are not offering these sheets so far as they cover '36 and '37?

Mr. Underwood:

Correct.

Mr. Botts:

I object unless you offer all of the sheets.

Q. Mr. Weiss, I show you a sheet and ask you to tell me what that is.

A. This is the Seminole Expense Account from the ledger of Mrs. Amy Guest.

Q. What period of time does that sheet cover?

A. From May 1935 down to the present time, and is still an open account in her ledger.

Q. What is the last entry?

A. November, 1938.

Mr. Underwood:

I offer so much of that sheet as includes the year 1935.

Mr. Botts:
I object.

Mr. Underwood:
If your Honor please, I have offered Expense Accounts in respect to the Seminole of Mr. H. C. Phipps, beginning from about 1919, down to 1935. I have offered the Expense Accounts of Mr. J. S. Phipps from the beginning—that is 1915 down through the year 1935.—Now the ledger sheets which are here, carry the expense account down through November 1938, and I have offered them only through '35. Now the same is true of Mrs. Guest; I produced Mrs. Guest's ledger sheet which covers the period 1935 to November 1938, but I have offered only so much of that as covers the year 1935; and Mr. Botts, and perhaps Mr. Matteson, too, object, because I don't offer the whole.

Mr. Botts:
If you will offer the balance of the sheet, carrying it down to date, and not offer part of it, I have no objection. But I don't think you ought to offer a part without offering all; I think it is an incomplete record, otherwise. I object on that ground.

Mr. Matteson:
I join in that objection.

The Court:
Well, in order that we may get along, I think the whole thing ought to go in. I will rule that way and let you argue it. * * *

Mr. Underwood:
My position as to that is this, your Honor: This fire happened in June 1935. The question in this case, the critical time in this case, is the day of the fire. As to this

point, the issue is whether or not the Seminole Boat Company was a live, real corporation on that date, or a sham and a legal fiction. Nothing that transpired since that time has any bearing on what happened on that date. We could have dissolved the corporation the following day, and it would have made no difference as to its health and vigor and legal reality, on the day of the fire. The reason I have gone through the year 1935 instead of stopping on June 24th is because the accounts were not posted up through June 24th until after that date, but before the end of December, 1935. * * *

Mr. Botts:

In view of the fact that it is going in, I won't indulge in any comments on it at this time.

The Court:

I rule with the objector, and then you refuse to put in anything at all, with that ruling? Or do you put it in and reserve the right to re-argue the point at the final hearing?

Mr. Underwood:

I don't want to find myself in the position of having anything after 1935 going in upon my motion. My suggestion would be to have them offer 1936, '37 and '38, if they desire, and let me object.

Mr. Botts:

I am not meeting any of it.

The Court:

Suppose we meet that at the time; but in view of my ruling, you are offering the entire paper, but limited to the period that you specify?

Mr. Underwood:

I offer the whole sheet of paper, but no figures on it that relates to any time subsequent to 1935.

The Court:

I will admit it, with the contention of the Libelants.

Mr. Underwood:

Reserving to me the right to argue my legal right?

The Court:

That is right.

(The four photostats heretofore offered as a group, were admitted in evidence and marked Respondents' Exhibit 5-C-1, 5-C-2, 5-C-3 and 5-C-4; and the photostats showing Expense Account from ledger of Mrs. Guest, last offered, was admitted in evidence and marked Respondents' Exhibit 5-D.)

Q. Mr. Weiss, have you made an analysis of the expense of H. C. Phipps and John S. Phipps through the years beginning with 1914 and going down through 1935?

A. I have, from those books, yes, sir.

Q. I notice as to H. C. Phipps, you have skipped the years 1916, '17, '18 and '19, is that right?

A. That is right.

Q. That is because we don't have the books here?

A. That is right.

Q. Does this analysis accurately state the amount paid by both of those men as shown by these books?

A. It does.

Q. —during those years?

A. That is right.

Q. This column at the right, shows the difference between the amounts paid by them in five different years?

A. That is right.

Mr. Underwood:

I offer this, subject to control by the original records themselves.

Mr. Matteson:

As a summary of what the books show?

Mr. Underwood:

Correct.

(By Mr. Underwood):

Q. I notice in the right-hand column under 1920 there was a difference of a penny, and also 1921 and also 1923. What is the reason for those differences?

A. The ledgers show those differences because the total amount ended in an odd figure which wasn't devisable by two.

Q. Now in the year 1929 there is a difference of $3,007.57; do you know the reason for that?

A. There were some personal expenses in connection with the Yacht Seminole paid for by Mr. John S. Phipps that were charged in this account.

Q. Tell what they were.

A. I think they were incurred in connection with a special trip of the boat.

Q. In the year 1932 there is a difference of $83.63, Mr. John S. paying that much more than Mr. H. C.; do you know the reason for that?

A. I do not.

Mr. Underwood:

I offer the analysis merely as a convenient summary of what the books show.

(Thereupon the analysis statement above referred to was marked Respondents' Exhibit 5-E.)

Q. What is the total amount paid by Henry C. Phipps for the years 1920 to 1935, inclusive?

A. $166,932.47.

Q. And Mr. John S. Phipps for the same period?

A. $172,758.57.

Q. And Mrs. Guest?

A. $2734.89.

Q. Now, except for the differences represented in the righthand column, how does the amount contributed or paid by Mr. John S. Phipps compare with the total paid by Mr. H. C. and Mr. Guest?

A. They are equal.

Q. Mr. Weiss, what is the nature of the expense that is included in these ledger sheets that relate to expense as distinguished from capital?

A. The items covered in the ledger pages marked "Yacht Seminole Expense" represent the expenses of upkeep and maintenance of the Yacht Seminole.

Q. How were the operating expenses charged?

A. The operating expenses on the books of the Messrs. Phipps and Mrs. Amy Guest were charged in the miscellaneous personal disbursements account.

Q. Now, I show you a check, duplicate voucher and a statement. Will you identify those?

A. The check is a check of Bessemer Investment Company drawn on the Central Hanover Bank & Trust Company, dated September 9, 1935, to the order of Palm Beach Company in the amount of $357.92.

Q. Can you tell me from the voucher to whom that sum was charged and in what amounts?

A. It was charged to Mrs. Amy Guest in the sum of $178.96 and to Mr. J. S. Phipps in the sum of $178.96.

Q. Can you tell me what the statement attached to the duplicate voucher is?

A. It is a statement of the Seminole Boat Company in account with Palm Beach Company for July, 1935.

Mr. Underwood:
I offer this.

Mr. Botts:
No objection.

(Thereupon the statement, duplicate voucher and check were marked respectively, Respondents' Exhibits 5-F-1; 5-F-2 and 5-F-3.)

Q. I did not start as early in the year as I intended to, Mr. Weiss; I show you another check, voucher and statement. Will you tell me what that is?

A. This is a canceled check of Bessemer Investment Company drawn on the Central Hanover Bank & Trust Company, dated May 27, 1935, to the order of Palm Beach Company, in the sum of $1224.91.

Q. Can you tell me from the duplicate to whom that was charged?

A. It was charged to Mr. John S. Phipps.

Q. What is the statement attached to the duplicate?

A. A statement of the Seminole Boat Company.

Q. What period?

A. January to April, 1935.

Q. What relation does the amount paid and charged to Mr. Phipps bear to the total of the statement?

A. Except for one penny, it is exactly one-half.

Mr. Underwood:
I offer that.

Mr. Matteson:
No objection.

(Thereupon the check, voucher and statement above referred to were marked Respondents' Exhibits 5-G-1, 5-G-2 and 5-G-3.)

(By Mr. Underwood):

Q. I show you another check, duplicate voucher and statement. Will you tell me what that is?

A. Canceled check of Bessemer Investment Company drawn on Central Hanover Bank and Trust Company, dated May 27, 1935, to the order of Palm Beach Company in the sum of $1224.90.

Q. Can you tell me from the duplicate to whom that was charged?

A. It was charged to Mrs. Amy Guest.

Q. What does the statement cover?

A. The statement is a statement of Seminole Boat Company for the period of January to April, 1935.

Q. What is the total?

A. $2449.81.

Q. What relation does the amount charged to Mrs. Guest bear to the total of the statement?

A. Except for one penny it is one-half.

Mr. Underwood:

I offer that.

Mr. Botts:

That is the balance—

Mr. Underwood:

The statements are identical, I believe, and this is Mrs. Guests' half.

Mr. Botts:

That is what I thought. That is all right.

The Court:

Let it be admitted.

(Thereupon the documents above referred to were marked Respondents' Exhibits 5-H-1; 5-H-2 and 5-H-3.)

(By Mr. Underwood):

Q. I show you another check, duplicate voucher and statement. Can you tell me what they are?

A. Canceled checks of Bessemer Investment Company on the Central Hanover Bank and Trust Company, dated December 30, 1935, to the order of Palm Beach Company, in the sum of $2662.07.

Q. Can you tell me from the duplicate voucher how that sum was charged?

A. Mrs. Guest was charged $1331.03 and Mr. John S. Phipps $1331.04.

Q. Can you tell me what the statement attached to the duplicate is?

A. It is a statement of Seminole Boat Company in account with Palm Beach Company, May to November, 1935.

Q. How do the amounts charged to Mr. John S. Phipps and Mrs. Guest, respectively, compare with the total amount of that statement?

A. They are each one-half, except for the one penny difference.

Mr. Underwood:

If Your Honor please, I offer these, and I would like to offer only so much of the statement attached as relates to disbursements or charges incurred down through the date of the fire. They are inextricably bound up together here, and this includes some legal expenses and some other matters.

Mr. Botts:

I object on the same grounds as I stated relative to the ledger sheet, without stating the objection in detail, assuming that the Court will probably follow the same course.

Mr. Underwood.
I am afraid I will have to offer the whole thing.

The Court:
I do not see how you could limit your offer there.

Mr. Underwood:
I cannot phrase it without taking too much time, so I will offer the whole thing.

Mr. Botts:
No objection.

Mr. Matteson:
No objection.

(Thereupon the documents above referred to were marked Respondents' Exhibits 5-I-1; 5-I-2 and 5-I-3.)

(By Mr. Underwood):

Q. Now, Mr. Weiss, you have mentioned on more than one occasion charges to Mrs. Amy Guest and John S. Phipps on these vouchers. Tell me just what that indicates when you and I have spoken of "charge".

A. This is the same as a payment by these individuals. These individuals had accounts with Bessemer. Investment Company and Bessemer Investment Company would make payments of this nature for them and charge their accounts with that amount.

Q. So that their accounts would be diminished by the amounts stated?

A. Yes.

Q. Mr. Weiss, I show you Exhibit 4-K, which Mr. Phipps testified he okayed in the sum of $1384.47 covering expenses of the fishing trip to the Florida Keys in April, 1935. Can you tell us whether or not any part of

that is included in the books that you have referred to and illustrated by this summary, Exhibit 5-E?

A. No, sir.

Q. Will you illustrate the course of charging such expense as this included in Exhibit 4-K, the fishing trip, and the portion to Mr. H. C., Mr. J. S. and Mrs. Guest?

A. The books of Mr. John S. Phipps, Mr. Henry S. Phipps and Mrs. Guest are made up from reports and statements of the transactions at their origin; they are audited and classified and journalized in the records of these individuals. Disbursements for their account for the Seminole Boat Company, upkeep and maintenance, would be charged in the account that this tabulation is made from. Items for personal expenditures reported paid by them are charged on their books to a Miscellaneous Disbursements Account, into which other personal charges are posted.

Q. The document you first referred to in your answer is Exhibit 5-E, the yellow sheet, upkeep and maintenance charges, is that right?

A. Yes.

Q. And the second one you referred to is fishing trip expense, Exhibit 4-K.

A. That is right.

Q. So that, as I understand it, the books as represented by Exhibit 5-E do not include expenses of operation on a cruise, is that correct?

A. That is correct.

Mr. Underwood:

That is all.

Cross Examination.

By Mr. Botts:

Q. Mr. Weiss, I refer now to Respondents' Exhibit 4-S, the Seminole Boat Company account of John S.

Phipps. I see the first entry in this book under date of November 30, 1938 is $50.00. What does that mean?

A. The first entry in this account is dated November 30, 1928.

Q. I meant 1928. What does that mean?

A. That represents recording ownership of five shares of capital stock of Seminole Boat Company at $10.00 per share.

Q. Now the second entry is $1,050.00. Will you likewise indicate what that means—it is dated July 1, 1930.

A. The second entry of July 1, 1930, in the sum of $10,000.00 is for 15 shares of capital stock of the Seminole Boat Company, and that makes a total of $10,050.00 for 20 shares of capital stock. This "Balance Column" is the total.

Q. How do you explain that the first five shares amounted to $50.00 and the next fifteen shares recorded at $10,000.00. What is the reason for that?

A. That represents the difference in the cost of that stock to Mr. John S. Phipps.

Q. Now the last entry under date of July 31, 1933, seems to be an addition of $5,000.00 to the account. Does that mean that these 20 shares are carried at the date of that last entry at a valuation of $15,050.00, whereas previously they had been carried at $10,050.00; can you explain what the reason or basis for that increase in the amount at which you previously carried that stock as an asset?

A. That represents an additional payment by Mr. Phipps to the Seminole Boat Company.

Q. And that is reflected there as an additional capital investment?

A. That is right.

Q. That does not represent an arbitrary inflation of that stock, but it represents a payment that was made?

A. An actual payment.

Q. This yellow sheet, Exhibit 5-E—I understood you to say that this does not reflect any of the payments for operating expenses?

A. That is correct.

Q. Have you made any tabulation of operating expenses?

A. No, sir.

Q. Are these operating expenses reflected from the books of the various interested stockholders?

A. They are included in their miscellaneous disbursements accounts.

Q. Do you have the books here showing the amounts of these for the various years?

A. I have miscellaneous disbursements accounts for the years that these ledgers cover.

Q. Well, Mr. Weiss, I will ask you this: have you the miscellaneous disbursements accounts for the years from 1930 to 1935, inclusive?

A. I don't think so. No, I wouldn't have them because they are loose-leaf ledger pages, and I have none of those miscellaneous disbursements accounts.

Q. And you didn't bring them down?

A. No.

Q. How did you happen to not bring those portions of the accounts with reference to the Seminole down?

A. I wasn't asked to.

Q. Could you make up a similar tabulation to 5-E, referring from the miscellaneous disbursements accounts, showing operation expenses paid by each of the stockholders during the years, say from 1930 to 1935, inclusive?

A. It could be done, but it would be a very lengthy and detailed task. The miscellaneous disbursements of Messrs. Phipps and Mrs. Guest include many, many items —all of their personal expenditures, some household expenditures, purchase of an automobile, and probably literally hundreds of items would be included in that.

Q. I don't think you quite understand me. I say would it be possible from those to pick out the items which had reference to the boat Seminole from those miscellaneous disbursements accounts?

A. Not from the ledger; not without an analysis of some other accounting records.

Q. Then, as I understand it, supposing Mrs. J. S. Phipps or Mr. H. C. Phipps, or either of them, made a trip on the Seminole in August, 1932, that, as I understand it, the payments that were made with respect to that trip would appear in this miscellaneous record account and it would be an extremely difficult matter, would it, to segregate these?

A. Very, very difficult.

Q. The items represented by the summary shown in Exhibit 5-E for the years 1933 and 1934, do the individual items making up these amounts appear from these ledger pages that have been filed in evidence here?

A. No, they do not.

Q. Where would you be able to obtain those items?

A. I would be able to obtain those from the papers attached to the original journal voucher from which this entry was posted.

Q. Now, Mr. Weiss, for the year 1933 I notice that there is $851.08 posted against each one of the stockholders, making the total $1702.16, and for the year 1934 it is $1028.50 and $1028.49, making a total of $2056.99 for 1934. It would not be very much of a job to get up the individual detailed items with reference to these two relatively small accounts, would there?

A. I think it could be compiled.

Q. I wonder if you will do that and let us have it.

Mr. Underwood:

If your Honor please, I do not think the witness is the one to be asked to do that. I think the request should

come to me. It puts the witness on the spot, and I would like to have the purpose of that stated. It does not seem to me that the amounts of money spent cruising through these years have any bearing on this case.

Mr. Botts:

It is not cruising expense. The breakdown of these—

The Court:

You don't want this on the record?

Mr. Botts:

No; I don't think so.

(Legal discussion off the record.)

By Mr. Botts:

Q. I understand the Palm Beach Company has been merged into or absorbed by another company, and is not now actively functioning under that name, is that right?

A. That is right; that is what I understand.

Q. As I understand it, Mr. Weiss, Bessemer Properties has succeeded to the status formerly occupied by the Palm Beach Company.

A. Yes.

Q. Now then does the Bessemer Properties have any outstanding and unliquidated bills or claims against Palm Beach Company for advances made and not reimbursed by the Palm Beach Company?

A. Not that I know of.

Q. You don't know of any?

A. No.

Q. Well, does the Seminole Boat Company owe Bessemer Properties or Palm Beach Company any money on the books of those companies, or either of them?

A. I do not know that.

Q. You do not think the books here would show that?

A. I have never seen the books of the Seminole Boat Company.

Q. Well, doesn't Bessemer Properties have a ledger account on their books against Seminole Boat Company?

A. It does.

Q. You have seen that account?

A. I have seen statements—yes, I have seen that account; that is correct.

Q. That account is kept under your direction?

A. That is correct; it is kept in our office.

Q. You do not have that book with you?

A. I do not.

Mr. Botts:

Mr. Underwood, would you mind having the witness furnish us with a statement of the balances due the Bessemer Properties from Seminole Boat Company as shown by the books of Bessemer Properties.

Mr. Underwood:

Now?

Mr. Botts:

Yes; up to now.

Mr. Underwood:

I wouldn't mind. I object to going into the accounts following at least a year after the fire. What has transpired since then and what credit has been made following that time, has no bearing on the issues in this case. The question in this case—one of the questions in this case is whether this was a real corporation on the day of the fire.

Mr. Botts:

And that question may be largely affected by what has been done since. This corporation did not die as a corporation on that date, and how it functioned from that time on may be a very important question as to its corporate status, if any.

Mr. Matteson:

Of course Mr. Underwood has already put in the books of the Seminole Boat Company down to 1938, and they show an outstanding balance unpaid.

Mr. Underwood:

They were subpoenaed; you wanted them and I produced them. I do not intend to prove anything by them except that they are the books of the Seminole Boat Company. What has followed subsequent to the fire I think is wholly immaterial in this case.

Mr. Botts:

If counsel declines to furnish that information I see nothing to do but stand on the books of the Seminole Boat Company and the statement of Mr. John S. Phipps in that respect.

Mr. Underwood:

Pardon me. I didn't hear that.

(Thereupon the preceding statement of Mr. Botts was read by the reporter as above recorded.)

Mr. Underwood:

I will produce anything that the Court directs me to produce, if it is in existence and it is possible to get it, but I don't see the materiality of it.

Mr. Botts:

I have no other questions of this witness.

Mr. Matteson:

I have two or three.

By Mr. Matteson:

Q. Mr. Weis, we have here an exhibit that has been offered as the books of the Seminole Boat Company, and I notice that on one of the pages here,—I am referring to Phipps' Exhibit Z, there is a statement on the voucher number 95 that it is to record the purchase of Mr. H. C. Phipps' one half interest in the Seminole Boat Company by Mrs. F. E. Guest on March 23, 1935. (Consideration $5,000.00.) Now I think I noticed on Mrs. Guests' account here that the consideration was $2500.00. Can you tell me which is correct?

A. If you show me those accounts I think I can. The books of Mr. Henry C. Phipps record the receipt of $2500.00 for the sale of twenty shares of the Seminole Boat Company.

Q. Then $2500.00 is the correct consideration, rather than that which appears on voucher number 95, which is part of Phipps' Exhibit Z?

A. According to the books of Mrs. Guest and Mr. Henry C. Phipps.

Q. Mr. Weiss, your name has come into this record before, I think, as the author of certain statements coming down to Palm Beach, which were the basis on which the—at least part of the basis on which the books of the Seminole Boat Company were made up. I take it that you do send down such statements from time to time, approving the accounts that have been forwarded to you, and directing the proper entries on the books that are kept at Palm Beach?

A. I send statements and acknowledge statements from Palm Beach, and I advise them of transactions that have occurred in our office.

Q. And the auditing of those accounts which come to New York or which come to your office, are audited there before the transactions are complete?

Mr. Underwood:

I object to that, your Honor, unless "Those accounts" is made more clear. Accounts of the Seminole Boat Company, or Palm Beach Company or what accounts?

Q. Well, I am taking for instance,—there is an exhibit here that has a statement attached—I will pass that for the minute while we are trying to find it. I refer now to these exhibits which have been marked by 5-G-1, 5-H-1, 5-I-1 and 5-F-1, and this exhibit 5-I-1, two, and three: Three is a statement headed "Seminole Boat Company in account with Palm Beach Company, May to November, 1935. I take it that that records an indebtedness of the Seminole Boat Company to the Palm Beach Company. And that indebtedness was paid by a check, which is Phipps' Exhibit 5-I-1 of the Bessemer Investment Company to the Palm Beach Company.

A. That is correct.

Q. And that was a payment which was charged in equal shares to Mrs. Guest and Mr. John S. Phipps; is that correct?

A. That is correct.

Q. In other words, that represents a payment by those individuals, which is the equivalent to their having drawn their personal checks for their respective amounts?

A. Yes, sir.

Q. In other words, to put it simply, Mr. John S. Phipps and Mrs. Amy Guest paid this account of the Seminole Boat Company in account with Palm Beach Company?

A. They paid it to the Palm Beach Company.

Q. And that represented no cash transaction as far as the Seminole Boat Company was concerned; in other

words, the money did not pass through the hands of the Seminole Boat Company?

A. The actual money did not,—was not, from this evidence, paid to the Seminole Boat Company.

Q. It was a debt of the Seminole Boat Company, paid directly by John S. Phipps and Mrs. Guest?

A. That is correct.

Q. And that is true also of the statement and payment represented by exhibits 5-F-1, 5-F-2 and 5-F-3, is it not?

A. Well, these are payments to the Palm Beach Company for the account of the Seminole Boat Company, by Mrs. Guest and Mr. John S. Phipps.

Q. Well, that statement is a statement of an indebtedness of the Seminole Boat Company to Palm Beach Company?

A. That is correct.

Q. And it is paid directly to the Palm Beach Company by Mr. Phipps and Mrs. Guest?

A. That is correct.

Q. And I take it that after that transaction was completed, there would be some sort of a statement prepared for the books of the Seminole Boat Company to record the transaction?

A. Yes, sir.

Q. And that is true in respect to the transactions represented by 5-F-1, 2 and 3 as well as 5-I-1, 2 and 3?

A. Yes, sir.

Q. And it is also true of these transactions which are represented by 5-G-1, 2 and 3, and 5-H-1, 2 and 3, is it not?

A. Those payments also represents payments made to Palm Beach Company for the account of Mrs. Guest and Mr. John S. Phipps for the account of the Seminole Boat Company.

Q. Well, they were payments of an indebtedness of the Seminole Boat Company to the Palm Beach Company, by Mr. John S. Phipps and Mrs. Guest, were they not?

A. Well, they were actually payments making up deficits of the Seminole Boat Company.

Q. Yes. But the payments were made direct by the individuals to the Palm Beach Company?

A. That is correct.

Q. Then subsequently to the completion of those transactions, a memorandum would be made up from which the appropriate entries would be made on the books of the Seminole Boat Company?

A. I presume that would be done in the Florida office.

Q. Are you the successor of Mr. LeCount?

A. Mr. LeCount worked in our office at the same time that I did.

Q. Well, was he your subordinate or your superior, or was there any distinction?

A. We don't have those fine distinctions.

Q. Well, this exhibit, Respondent's Exhibit 4-H, I believe it was testified by Mr. Anderson of Palm Beach that he received this statement from your office, and used that as a basis, at least partially, of his information for making up the books of the Seminole Boat Company. Is it a fact that such statements do originate in your office and are used for that purpose?

A. They do; they are used for reporting to the Palm Beach Company, Seminole Boat Company or other corporations, the status of their various accounts with the books of the corporations whose records are kept in our office.

Q. Well, a statement like this indicates that you have received information from the Palm Beach Company supporting these items, and that they have been properly audited, and that the transaction has been completed in New York; is that right?

A. This statement indicates that we have charged against this account these items, which may have come from the Palm Beach Company, or they may have come

from some other original source and have been accumulated in this statement.

Q. And it shows that they have been audited and approved in your office, does it?

A. All accounts passing through our office are scrutinized and approved, and we are governed to a very large extent upon classifications made at the original source of the transaction.

Q. And the supporting vouchers come to you along with the record of those transactions, do they not?

A. They usually do.

Q. And they are scrutinized and approved in your office?

A. That is right.

Q. Well now, what is the office in which you work in New York?

A. We have an office, the office of Bessemer Investment Company is at 15 Exchange Place, Jersey City; the Phipps family also have an office at 465 East 57th Street. I spent about two days a week at the Jersey office, the rest of the time in our New York office.

Q. And it is from that office that these statements emanate?

A. This statement came from the New York office.

Mr. Botts:

That is all.

Re-Direct Examination.

By Mr. Underwood:

Q. Can you tell us, Mr. Weiss, why the reimbursements were made in that method?

A. What method is that, please?

Q. The one you have just referred to, from the Bessemer Investment Company to the Palm Beach Company.

A. They were made because the Bessemer Investment Company acts as a financing company for our other corporate organizations and for various members of the Phipps family.

Q. Let me put it this way: Does the Seminole Boat Company have a running account, or has it at any time had such an account, with the Bessemer Investment Company?

A. It has no account with the Bessemer Investment Company.

Q. Did the Palm Beach Company during these years have a running account with the Bessemer Investment Company?

A. No; the Palm Beach Company had a running account with Phipps Realty Company.

Q. With what company is the running account now?

A. Now the account is with Bessemer Investment Company, because Phipps Realty Company has been merged with Bessemer Investment Company.

Q. So that these payments were made in this method because the Seminole Boat Company had no running account with the company that in effect acted as banker?

A. That is correct.

Q. Now you were asked a question about what this $5,000.00 figure represents, on Exhibit 4-V; do you remember what you said as to that?

A. I think I said that that represented additional cost to Mr. John S. Phipps of that stock, or an additional payment by him on account of that stock.

Q. I show you Exhibit Y which contains journal voucher number 18, and ask you if that helps you to say what that $5,000.00 is.

A. That's an assessment on the capital stock of the Seminole Boat Company.

Q. It is recorded there as an increase in the capital stock?

A. That's right.

Q. Now you spoke a while ago of the expenses of that 1929 cruise, which appear as a difference in the year 1929, on Exhibit 5-E; do you see that?

A. Yes.

Q. Now I show you a letter dated November 4, 1929, in Exhibit Y. Does that tell, or can you recall, what that $3,000.00 figure is?

A. Yes, it represents the cost of a special trip of the Seminole Boat Company to New York and back, which was paid for by Mr. John S. Phipps.

Q. How do you account for that cost being in the books from which you took this data, 5-E, when you said the regular course was to put such expenses in the personal miscellaneous account?

A. I can't account for that.

Q It might be a bookkeeper's mistake?

A. I think so; posted in the wrong account.

Mr. Underwood:

That is all.

The Court:

Did the discrepancy between the amount paid by the sister, in 1935, as between the books of the—her individual ledger and what was shown on the books of the Seminole Boat Company—

Mr. Underwood:

No, sir, I know of no such discrepancy.

Mr. Matteson:

The discrepancy that I noted.

The Court:

Where is that debit and credit entry?

Mr. Underwood:

There is the journal voucher, which shows 1224.90, and 1224.91.

The Court:

There was a discrepancy between this amount and the $5,000.00 amount?

Mr. Matteson:

There was $5,000.00 here and the $2500.00 here; is that what you were referring to?

Mr. Underwood:

The discrepancy as to the price of the stock, was this; it was entered in journal voucher number 95 as $5,000.00 paid; whereas actually the amount paid, according to the personal books, was $2500.00, not $5,000.00.

The Court:

But this amount here is the purchase price of the half interest—that is for the stock that she bought; is that correct or not?

Mr. Underwood:

No, sir, that $12,000.00 figure represents the corporation's liability to Henry C. Phipps at the time he sold his stock to Mrs. Guest, and when Mrs. Guest paid $2500.00 for that stock, she acquired the corporation's liability to Henry C. Phipps, as well as the piece of paper,—the stock certificate. That is what that shows. And this is simply a mistake, the bookkeeper has written down the purchase as $5,000.00, and it was a half of $5,000.00.

Mr. Matteson:

The $12,000.00 as I understand it,—Mr. Underwood spoke of it as a debit, but every time the stockholders

made a payment to the corporation, to make up a deficit, it had to be placed somewhere in the books of the Seminole Boat Company as a credit to somebody, so they set up a page, crediting Henry C. Phipps,—crediting John S. Phipps, when those payments were made, they were credited on those pages; so that at the time of this transfer, as I gather from the records, there was that amount of a credit, in favor of H. C. Phipps on the books of the Seminole Boat Company, and that was simply transferred to a new page under the name of Mrs. Amy Guest; is that actually correct?

Mr. Underwood:

You and I don't see quite the same way, but almost. The books, at the time of the sale of the stock, showed that the corporation owed Henry C. Phipps $12,000 odd dollars, and when Mrs. Guest bought Mr. Phipps' stock, they changed the books to show that the corporation owed Mrs. Guest that amount, instead of Mr. H. C. Phipps.

Mr. Matteson:

I object to the word, owed. * * *

By Mr. Matteson:

Q. You spoke of this $5,000.00 as being an assessment on the stockholders of the Seminole Boat Company?

A. That is right.

Q. As a matter of fact you don't know yourself whether it was an assessment or a voluntary contribution, do you?

A. I would have to refer to the individual entry for that.

Q. The reason I say that, is that we have the minutes of the Seminole Boat Company, and there does not appear on them an assessment.

A. My recollection is that it was an assessment, and that each of the stockholders contributed $5,000.00 to the corporation.

Q. You know that they contributed the $5,000.00 to—

A. I do know that.

Q. But you don't know the circumstances?

A. No, I don't know that.

Mr. Matteson:

That is all.

(Thereupon the hearing was recessed until 9:30 o'clock a. m. of the following day, to-wit, Friday, May 19, 1939.)

May 19, 1939, 9:30 A. M.

Morning Session.

Reconvened pursuant to adjournment.

Appearances same as heretofore noted.

The Court:

You may proceed, gentlemen.

Mr. Underwood:

If your Honor please, there are some exhibits which were offered for identification while the libelants' case was going on, and which I have not yet offered, and I would like to do so now.

The Court:

All right.

Mr. Underwood:

Exhibit "I" doesn't show that it was for identification, but according to my notes it was offered for identification.

It is a letter from Captain Pilkington to Mr. Simmon and Captain Pilkington identified it at the time he was on the stand: I offer that letter.

Mr. Botts:
No objection.

Mr. Matteson:
No objection.

The Court:
Admitted.

(Thereupon letter above referred to and previously marked "I" for identification was marked Respondents' Exhibit I.)

Mr. Underwood:
I also offer in evidence the sketch by Mr. Thompson, previously marked Respondents' Exhibit "P" for identification.

Mr. Botts:
No objection.

Mr. Matteson:
No objection.

The Court:
Let it be admitted.

(Thereupon the sketch above referred to was marked Respondents' Exhibit P.)

Mr. Underwood:
I also offer respondents' Exhibit M for identification, the sketch made, as I recall it, by Captain Patten.

Mr. Botts:
No objection.

Mr. Matteson:
No objection.

The Court:
Admitted.

(Thereupon the sketch above referred to was marked Respondents' Exhibit M.)

Mr. Underwood:
I also offer in evidence this page from the catalog previously marked Respondents' Exhibit L for identification.

Mr. Matteson:
No objection.

Mr. Botts:
No objection.

The Court:
Admitted.

(Thereupon page of catalog above referred to was marked Respondents' Exhibit L.)

Mr. Underwood:
I also offer this copy of a letter from Seminole Boat Company to Captain Pilkington previously marked respondents' Exhibit O for identification. On this there appears certain pencil writing written after the fire apparently and which I do not offer.

Mr. Botts:
We have no objection.

The Court:
Admitted.

(Copy of letter above referred to was marked Respondents' Exhibit "O".)

Mr. Underwood:
I also offer this little pamphlet which was previously marked Exhibit R for identification.

Mr. Botts:
No objection.

Mr. Matteson:
No objection.

The Court:
Admitted.

(Pamphlet above referred to was marked Respondents' Exhibit R.)

Mr. Underwood:
If your Honor please, I should like to recall Mr. Riley for examination on one point.

2770 Thereupon JAMES F. RILEY, JR., a witness previously called in behalf of the Respondent Phipps, resumed the stand and was examined and testified further as follows:

Direct Examination.

By Mr. Underwood:
Q. Since you last testified, Mr. Riley, have you read over the transcript of your testimony?
A. Yes, sir.

Q. Have you called my attention to some mistakes that appear therein?

A. Yes, sir.

Q. Do you remember last night that we discussed the matter and the stenographer read his notes back to us; do you remember that?

A. Yes.

Q. Now do you have before you some of such typewritten pages?

A. Yes.

Q. Pages 1601 to 1607, inclusive?

A. Yes.

Q. Are there corrections you want to make in them?

A. Yes, sir. On page 1603.

Q. Tell us about that.

A. Under "Question" here is: "Now when you came to that sort of a slip, did you make any memorandum?" Another question under that same "Question" is: "You ordinarily made a memorandum on the slip as to who was to pay that, did you". And the answer is "Yes, sir". That answer "Yes, sir" is to the first question and not to the second question. And it goes on to say: "I either made the charges on the statement, just who the charges would be made to, or in some instances I *filled* (that word should be "*pulled*") and collected the money from the people that the gas should be charged to".

Q. When the original transcript was written that word was written "filled", wasn't it?

A. Yes.

Q. And you called my attention to that?

you would usually make a memorandum on the slip as to how it was to be charged", and the answer is, "Yes, sir". Well I must have misunderstood the question, because the answer would be "Yes, sir" if the phrase "on the slip" was left out of the question.

Q. Now what is the fact, Mr. Riley, did you ever on any of these gasoline tickets yourself make any note as to the person or account to which they were to be charged?

A. No, sir.

Mr. Underwood:

That is all.

Mr. Botts:

No cross examination.

Mr. Matteson:

No questions.

Mr. Underwood:

Now, if your Honor please, I offer in evidence a statement which Mr. Matteson gave to me in advance of the trial which contains the names of 13 vessels for the loss of which or damages to which this suit is brought, and the names of the insurance companies which insured these vessels. At my request Mr. Matteson had this statement prepared and gave it to me as a list of the vessels that were insured and the names of the companies that insured them. I have added to the list in pencil marks at the lefthand side the amounts claimed in the libel by way of damages for these boats.

Mr. Matteson:

If your Honor please, I did furnish to Mr. Underwood the list at his request, reserving at the same time the question of relevancy or materiality, and I do object to the introduction of the list in the record on the ground that it is irrelevant and immaterial.

Mr. Botts:

I join in that same objection.

The Court:

What is the relevancy of it?

Mr. Underwood:

In the first place, if Your Honor please, I think the record should show the name of the real party in interest in each case. This is a statement showing that the underwriters have paid claims on these boats and they of course have become subrogated to any rights the owners may have had, and they are therefore the real parties in interest, and we are entitled to know that and have that made a part of the record.

The Court:

I shall reserve ruling on that.

Mr. Underwood:

If your Honor please, I would like to state one further ground upon which I make this offer; that is, as a part of my evidence to show bias and prejudice on the part of certain witnesses in this case, two witnesses called by the other side, have admitted that a substantial part of their livelihood comes from fees received from under-

writers for making marine surveys, and I want to show that a very substantial part of the amount claimed in this case is on behalf of the underwriters.

Mr. Botts:

Can't you mark it for identification for the time being subject to the ruling of the Court as to whether it will be admitted in evidence or not?

The Court:

Yes; that will be all right.

(Thereupon the list above referred to was marked Respondents' Exhibit 5-J for Identification.)

2774 Thereupon E. GEORGE BERNARD was called as a witness in behalf of the Respondent Phipps, and having been first duly sworn, was examined and testified as follows:

Direct Examination.

By Mr. Underwood:

Q. What is your full name?

A. E. George Bernard.

Q. Where do you live?

A. 6814 N. W. th Avenue; Miami.

Q. How long have you lived in Miami?

A. 14 years.

Q. What is your business?

A. Marine surveyor.

Q. How long have you been engaged in that business in Miami?

A. 14 years.

Q. You were Lloyd's sub-agent?

A. For a part of that time; for the last eight years; I don't know the exact date.

Q. What is Lloyd's whose sub-agent you are?

A. Lloyd's of London.

Q. What is it?

A. It is an organization for the classification of vessels and to take care of—Lloyd's agent proper takes care of Masters' or owners' interests or whatever may happen to come up in case of emergency or anything that you might happen to be detailed to by the Lloyd's Underwriters or board representative.

Q. That is an association of underwriters?

A. Yes, sir.

Q. You are a surveyor for the United States Salvage Association?

A. Yes, and their agent.

Q. What is the United States Salvage Association?

A. Representatives or surveyors for various bodies of underwriters.

Q. You are surveyor for the American Bureau of Shipping?

A. Yes, sir.

Q. You are correspondent of the Board of Underwriters of New York?

A. Yes, sir.

Q. What is the Board of Underwriters of New York?

A. They represent the—that is a board that represents the various underwriters that are members of that organization.

Q. All these underwriters we have talked about are underwriters on marine risks?

A. Yes, sir.

Q. Do you remember in March, 1935 when you went aboard the Houseboat Seminole and conducted a survey?

A. Yes, sir.

Q. Do you remember after the fire on the Seminole you had a conversation with Mr. Roy Hawkins?

A. Yes, sir.

Q. Isn't it a fact that on that occasion you refused employment by Mr. Hawkins because of your declaration or feeling that there was a conflict in interest between the parties Mr. Hawkins represented and the underwriters that you represent?

A. Yes, sir.

Mr. Botts:

Now, Mr. Witness, you saw me hold my hand up and you knew I was going to object to that question. You don't have to try to slip in an answer that way.

Mr. Underwood:

May I ask the Court to restrain Mr. Botts, and that he direct his statements to the Court and not give instructions to the witness. It is not for him to usurp the prerogative of the Court that way.

The Court:

I will instruct the witness. Mr. Witness, when any counsel indicate that they are going to object to a question, refrain from answering until after the Court rules on the objection.

Mr. Botts:

Now I move to strike the answer and I object to the question on two grounds; first, the question is entirely leading and, in the second place, the evidence is irrelevant and immaterial.

The Court:

The question is leading, but the damage is already done, and I don't think we can cure that. As to whether it is

material or relevant I cannot tell now. If it appears later on that it is immaterial or irrelevant, you may move to strike it, but I think that it possibly has materiality or relevancy, so I shall overrule the objection.

Mr. Botts:

Would you mind instructing counsel not to lead this witness?

Mr. Underwood:

If your Honor please, I have a right to lead this witness.

The Court:

Why?

Mr. Underwood:

I am laying the foundation to prove that he is hostile, and a witness who refused to work for us because of his interest on the other side.

The Court:

I think the leading questions should be confined until his hostility is established.

Mr. Underwood:

I think I have established it.

The Court:

I mean in the establishing of it (I am commenting on my ruling mainly); I will have to pass on that as a future question now. I see now that it is contended that he is at this time shown to be a hostile witness. I do not care to pass on that at this time, as to whether that has been established or not, but suppose we proceed without leading questions until you establish to the Court more satisfactorily that he is a hostile witness.

CLERK'S COPY.

Vol. IV

TRANSCRIPT OF RECORD

Supreme Court of the United States

OCTOBER TERM, 1942

No. 246

CHARLES CORYELL, ET AL., PETITIONERS,

vs.

JOHN S. PHIPPS AND GEORGE J. PILKINGTON

ON WRIT OF CERTIORARI TO THE UNITED STATES CIRCUIT COURT OF APPEALS FOR THE FIFTH CIRCUIT

PETITION FOR CERTIORARI FILED JULY 20, 1942.

CERTIORARI GRANTED OCTOBER 12, 1942.

VOLUME IV.

TRANSCRIPT OF RECORD

UNITED STATES
CIRCUIT COURT OF APPEALS

FIFTH CIRCUIT.

No. 10185

CHARLES CORYELL, ET AL.,

Appellants,

versus

JOHN S. PHIPPS and GEORGE J. PILKINGTON,

Appellees.

Appeal from the District Court of the United States for the Southern District of Florida.

U. S. CIRCUIT COURT OF APPEALS
FILED

(ORIGINAL RECORD RECEIVED DEC. 17/41.)

Mr. Botts:

If the Court please, I suggest that the facts elicited by this witness clearly do not show him to be a hostile witness.

The Court:

I will hear from both of you on that when the time comes.

(By Mr. Underwood):

Q. Mr. Bernard, what portion of your work is on behalf of marine underwriters? I mean by that, Mr. Bernard, what is the proportion between the amount of work you do for underwriters on the one hand and for owners on the other?

A. I judge 75% for underwriters and 25% for classification and owners.

Q. Can you break that 25% down and tell me how much of that is for owners and how much of that is for classification societies?

A. Probably 10% for owners and 15% for classification.

Q. What proportion of your livelihood comes from the fees you get from the work you have told us about?

A. About 80%.

Q. Now you have referred to or admitted a conversation with Mr. Hawkins following the fire on the Seminole, is that right?

A. Yes, sir.

Q. What did you know at that time as to the insurance on the boats that had been burned?

A. Is that as to amount, sir?

Q. I will rephrase my question so there can be no misunderstanding: did you or did you not know that some of those boats were insured by marine underwriters?

A. I knew that there were some.

Q. Did you have any information as to how many?
A. No, not at that time.
Q. Do you know?

Mr. Botts:
I object to that. It is immaterial what he knows now.

A. Not the exact number of boats, no.

Mr. Botts:
I move to strike the answer.

The Court:
Captain Bernard, you answered that before the Court ruled on the objection. I will ask you not to do that. I will overrule the objection and deny the motion to strike.

Q. What was your reason for refusing to accept employment by Mr. Hawkins when he spoke to you after the fire on the Seminole?

Mr. Botts:
I object to that as being immaterial.

The Court:
Overruled.

A. I was representative of the Board of Underwriters at that time and also agent for United States Salvage and other independent interests.
Q. Will you tell me whether or not you realized that there was a conflict of interest between the underwriters you represented and the parties Mr. Hawkins represented?
A. I think that was too early after the fire to sense anything like that.

Q. Isn't it a fact, Captain, that your appreciation of that conflict is the reason for your refusing employment when Mr. Hawkins sought to engage you?

A. Yes.

Q. Now you had surveyed the Seminole prior to 1935; had you not?

A. Yes.

Q. Do you remember when it was that you were aboard the Seminole in 1935?

A. March 27th and 28th.

Q. You were on board her two days?

A. Yes, and there may have been a third day but I don't want to make that point; but I was there two days I know.

Q. You inspected her when she was afloat as well as when she was dry, did you not?

A. Yes.

Q. And the purpose of your inspection was to ascertain her condition generally, was it not?

Mr. Matteson:

I object to that as leading, your Honor.

The Court:

I will sustain the objection.

Q. What was the purpose of your visit and survey of the Seminole?

A. To make an examination of the hull on drydock; she was on drydock when I first made an examination of her *hull* conditions and with the thought of sending the vessel out to make a short cruise as to her fitness.

Q. Her fitness in what respect?

A. Well, that just means that?

Q. In what respect were you interested in her fitness?

A. General condition as to the hull was more my interest.

Q. Are you telling me, Captain, that your only interest was in the tightness of the hull?

A. Well, that would refer to the general condition; I will say the "general condition" but primarily this first visit was to make an examination of the hull on drydock, outside and inside.

Q. How many visits did you make?

A. Two.

Q. What was the purpose of the next visit?

A. I made a verbal report and they asked for an outline to make application for insurance, and I went back and took another observation and examination.

Q. What was the purpose of the second examination?

A. It was to apply for insurance for a short trip around the Keys, I believe, and into the Gulf—

Q. Do you remember what work you thought it was necessary to do before you could pass her?

A. Outside of fire extinguishers I haven't memory of anything that I asked for; I asked for reconditioning of fire extinguishers; other than that I haven't any memory of making any recommendations.

Q. There has been some testimony in this case, Mr. Bernard, about some repairs—putting a cement patch around the stern. Do you remember anything about that?

A. Never heard of it.

Q. Do you deny that you recommended that?

A. No, sir.

Q. Do you deny that you recommended that?

A. When you say "stern" will you name the place. Do you mean the sternmost compartment? No, I didn't have anything to do with that, and I made no such recommendation.

Q. Did you make any recommendation about patching any plate?

A. No, sir; I made no recommendation about patching any plating.

Q. What your testimony be that the only thing that you recommended be done was to refill the fire extinguishers?

A. Yes, sir.

Q. Did you confine your examination to the outside of the boat?

A. I made a close internal examination of the hull and the parts.

Q. Did you go through the bilges?

A. I did.

Q. What condition did you find the bilges in?

A. I found them clean and free from gas and any element that might indicate there was any weakness or gases that might be detrimental in the use of the boat.

Q. Do you know whether there were backfire deflectors or arrestors on the carburetors on the main engines?

A. I can't certify that; I can't memorize that; I believe there were, though I am not sure.

Q. I show you a paper which has been marked Respondents' Exhibit DD, and call your attention to the first paragraph on the top of the second page. Does that refresh your recollection as to the—

Q. What is the fact; were there backfire deflectors there?

A. There were.

Q. You may keep that before you, if you like.

A. All right.

Q. Do you remember where the air tanks used for starting the motors were located?

A. I don't at this time.

Q. Will you look at the first paragraph on the second page of that exhibit and see if that refreshes your recollection?

A. Yes; it has outlined here the location of them.

Q. Is it a fact that they were located as I have suggested?

A. Yes, sir.

Q. Did you observe what sort of a generator she had?

A. Yes; she had two generators.

Q. What were they?

A. One was a six cylinder Winton and the other was a small engine, a four-cylinder Universal, I believe.

Q. Where were they located?

A. On the port side of the engineroom.

Q. In what kind of a space?

A. In an open space.

Q. Roomy space?

A. Yes; on shelving above the engineroom floor.

Q. That is the Universal you are talking about?

A. I believe they were both on the one side; if my memory serves me right they were both on the one side.

Q. Are you suggesting that the six-cylinder Winton engine was on a shelf?

A. On a base.

Q. Base and not a shelf?

A. Base.

Q. Did you observe how the carburetors received their supply of gasoline?

A. Yes.

Q. Did you observe what sort of bilge pumps she had?

A. She had motor-driven bilge pump—I am not certain whether there was one attached to the engine or not, but she had one independent motor-driven pump, rotary.

Q. Did you observe anything about her water pumps?

A. She had some general service pumps; there was a fresh water pump but I am not sure about the salt water pump, but I believe there were two units there.

Q. In what condition did you find these things we have discussed so far?

A. From my observation of the engineroom on that boat that day, without any engineer there, I judged them to be in order.

Q. Isn't it a fact that you reported that they were found in good operating condition?

A. That might have been my wording.

Q. Isn't that your wording?

A. Yes.

Q. Did you observe her electric batteries?

A. I did.

Q. What kind did she have?

A. I am not sure but I will say Edison.

Q. Do you remember how many trays?

A. No, I don't, sir, but I believe that is in the report.

Q. Can you refresh your recollection by referring to the middle of page 2?

A. 20 trays of 5 cells each.

Q. That would be 100 cells?

A. Yes, sir.

Q. Did you examine them to determine their condition?

A. They were apparently in good condition.

Q. Did you examine her gasoline spaces and gasoline tanks?

A. I don't believe you can get into the gasoline space to make much of an observation.

Q. Did you attempt to do it?

A. I did on the "entire side" because I tried to get in there and have a look.

Q. Were you looking at the tanks as far as you could?

A. I looked for any leaks that might exist in them.

Q. Did you find any?

A. No, sir.

Q. Do you remember how many tanks she had?

A. Yes.

Q. How many?

A. Four.

Q. What shape?

A. Cylindrical tanks, standing on ends.

Q. They were located in a separate space forward of the engineroom space; is that right?

A. Yes.

Q. What was the nature of their construction?

A. Cylindrical tanks with riveted seams, steel.

Q. Were they all heavily constructed?

A. They were for that service.

Q. Were they well bedded?

A. I couldn't certify to that, because I couldn't get to "it".

Q. Were they well bedded and screwed to place?

A. From what I could observe they were and I believe I wrote them up that way.

Q. In fact, you reported to that effect, did you not?

A. Yes, sir.

Q. Did you observe how those tanks were filled?

A. Yes.

Q. How were they filled?

A. They were filled from the top by a two-inch filler line.

Q. Did you ascertain whether these filling lines were tight?

A. I presumed them to be tight from their connections; they were all solid connections.

Q. Did you report that the banks filled through tight deck fittings?

A. I did.

Q. Did you observe that they were vented overboard?

A. I did.

Q. Did you observe what shut-off valves there were in the feed lines from the tanks to the carburetors?

A. I did.

Q. She was equipped with shut-off valves?

A. Yes, sir.

Q. In what condition did you find the tanks and the piping to be?

A. There were no leaks.

Q. Isn't it a fact that you reported the tanks and piping vented pipe and in order?

A. Yes, sir.

Q. Did you observe whether or not there was a glass gauge fitted to show tank readings?

A. Yes.

Q. Was there one?

A. Yes.

Q. You saw that?

A. Yes.

Q. Did you see the auxiliary gasoline tank for the windlass engine?

A. Yes, sir.

Q. Do you remember the shape of that?

A. I don't remember the shape of it but I think it was a cylindrical tank.

Q. Do you know where it was located?

A. Forward, adjacent to the engine machinery, by a window.

Q. What was it made of?

A. I can't remember.

Q. You may look at your report and refresh your recollection—the fourth paragraph from the bottom of the second page.

A. It is galvanized iron, capacity about 10 gallons.

Q. Did you examine that tank and fittings?

A. Yes.

Q. In what condition did you find them?

A. I found them tight.

Q. In order?

A. Yes.

Q. Did you examine the main switchboard of the Seminole?

A. Yes, sir.

Q. The wiring and light fixtures?

A. I noted the electrical wiring and part of the lights.

Q. Did you find them in good order?

A. Yes, they were in order.

Q. You knew they were knife switches of the open type?

A. Yes.

Q. And the switchboard was in the engineroom?

A. Yes.

Q. Did you report that all of the United States government requirements had been fully complied with?

A. Yes, sir.

Q. Did you report that from your examinations the general condition of hull, auxiliary machinery, deck and deckhouse equipment was found to be good, considering the age of the vessel?

A. I did.

Q. And you passed the vessel?

A. That report I believe was accepted by the Underwriters, and I understood she had some coverage on her for a short trip. What I certified by that remark there is nothing but an opinion, and I don't know whether it is worth anything or not.

Q. You knew that your report was going to be considered in the fixing of insurance on that vessel, did you not?

A. Yes, sir.

Q. And you had been making such reports for many years?

A. Yes.

Q. You were engaged in the same business before you came to Miami?

A. Yes, I was, and for the best firm in the United States.

Q. What firm is that?

A. Franklin A. Martin, 25 Broadway.

Q. How long have you engaged in this business altogether?

A. From the beginning of my career?

Q. Yes; from the beginning.

A. From the time I was 14 years old I have been connected with mechanical work and marine work, and I have held a Chief Engineer's license since 1900.

Q. How long have you been a surveyor?

A. Surveyor?

Q. Yes.

A. Directly surveying and general surveying—directly active 22 years.

Q. You had been familiar during all of that time with the rules National Fire Prevention Association, have you not?

A. Yes; I might be caught on some details of them, but I know their outline and their various formulaes and use them and am guided by them.

Q. I suppose you know now and knew in 1935 of the rules of the Bureau for the Prevention of Explosion and Fire on Motor Vessels?

A. Yes, sir.

Q. And you know about Lloyd's rules?

A. I would have to check up on some of them; it is too hard to remember them all.

Q. I didn't mean to suggest that you had memorized them. You are generally familiar with them?

A. Yes, sir.

Q. And you know the rules of those three organizations?

A. Yes.

Q. You examined the Seminole in 1935, in March?

A. Yes.

Q. For insurance purposes, and you passed her?

A. Yes, sir.

Cross Examination.

By Mr. Matteson:

Q. Mr. Bernard, you have been referred to as Lloyd's agent.

A. Yes, sir.

Q. Or sub-agent?

A. Umh, hmh.

Q. Will you tell us exactly what that amounts to?

A. Well, it is a person placed in a locality to attend to an emergency in the event of a vessel covered by Lloyd's, being in trouble, or any other vessel; or to serve a Master or an owner, in aiding or directing them in the time of marine trouble; also to report marine trouble and to keep in touch with the London office with regards to what might be going on; it might be a disaster; it might be some vessel that has come in here. I have had three vessels lately, one went to $32,000.00; one went up last week to $19,000.00. They like to know where that vessel is going, how it occurred, and when it occurred. That is given to them by cable through my office in this district.

Q. Do you receive any salary?

A. No, sir, there is no compensation.

Q. From time to time, when such disasters occur, you are employed by them in that connection?

A. I get a fee of some sort; it may be the underwriters will pay that fee, or it may be that they arrange with the owner to pay it, and they in turn collect from the underwriters.

Q. This Lloyd's organization that you speak of has representatives like you in many ports, does it?

A. Yes, sir, all ports are supposed to be covered by some agency or sub-agency.

Q. And you receive your compensation only when you are employed in connection with some particular disaster?

A. Yes, sir, or a loss. Suppose there is a foreign boat comes in with a loss, coming over, due to heavy weather, and I am engaged to take care of that loss and present it to the underwriters, I get a fee from that. That is how I get my compensation.

Q. But your compensation is in individual fees, in individual cases?

A. Yes, sir. Individual fees in individual cases.

Q. And this service that you perform in reporting accidents or losses or disasters, is part of the service that you render, so that you will receive employment in connection with those cases, is that true?

A. Well, I will get a fee for services for any small job that I might wish to submit, but I don't do it; that is in line; I can enter a fee but I don't do it, unless it is a major case.

Q. Does the position of Lloyd's sub-agent require any technical experience, or is it sometimes performed by people without such experience?

A. I think that is developed from knowing the character of the person that might be taking the position.

Q. The term, Lloyd's sub-agent, does not necessarily mean that a person is a surveyor, then?

A. No, sir.

Q. You speak of being the representative of the Board of Underwriters of New York,—or rather, correspondent. Is your relationship with that organization somewhat similar to what you have described with respect to Lloyd's?

A. Yes, sir.

Q. What is the American Bureau of Shipping?

A. Classification of American Vessels.

Q. Is that the official classification society in this country?

A. It is.

Q. And you are one of their list of surveyors?

A. Yes, sir.

Q. What is the U. S. Salvage Association?

A. That is a Board of Survey, representing I would say, a number of underwriters,—I don't know how many.

Q. It is an incorporated organization is it not?

A. I cannot say so; I don't know that technicality.

Q. It is an organization?

A. Yes, sir.

Q. And is employed by underwriters from time to time in connection with disasters?

A. I think it is established and maintained by underwriters; I don't believe it is employed. I think that is maintained, as I understand it.

Q. Renders services to underwriters and receives compensation for this service?

A. Yes.

Q. Is there a difference between Lloyd's as an insurance organization, and Lloyd's as a classification society?

A. I couldn't tell. I believe that would be governed by the policies issued by either one.

Q. Well, don't you know as a matter of fact that Lloyd's classification society is an independent organization similar to the American Bureau of shipping in this country?

A. Yes, sir.

Q. That is correct, is it not?

A. Yes, sir; I beg your pardon sir, you were referring to insurance, were you not—American insurance, when you first asked that question?

Q. I don't know; if there is anything that is not clear to you, we will try to straighten it out; but I don't understand what isn't clear. Is there some explanation you want to give?

A. I think I have made a long answer. I interpret you to say, or to try to ask me, the value, in words, the value of Lloyd's insurance as compared to an American company's insurance.

Q. Oh, no, we are not suggesting anything of that kind. You were employed by Mr. Hawkins to make this examination of the Seminole?

A. I believe the message came from his office. Yes, sir, Mr. Hawkins' office. I didn't get it direct, I was out at the time, and I got it when I arrived. But it came from Mr. Hawkins' office; listed that way in my office.

Q. What were your instructions with respect to this examination?

A. To make an inspection of the Seminole. She was on dry-dock and they wanted to have an inspection made.

Q. For what purpose?

A. At that particular time, it was to report on the general condition of hull, if she was all right and ready to be on dock, if there was any more work to be done on dock.

Q. So the first instruction you had was solely with respect to an examination of the hull?

A. Yes, sir.

Q. And you made that on the 26th of March, 1935, is that correct?

A. Yes, sir.

Q. And—

A. Yes.

Q. And that had nothing to do with any insurance?

A. No, sir.

Q. And did you understand at that time that you were acting for the owner of the vessel, or someone else?

A. It was an owner's call, sir.

Q. Now do I understand that you received some further instructions after you had completed that examination?

A. Yes, sir.

Q. From whom did you get the instructions that time?

A. Mr. Hawkins.

Q. Did you talk with him personally?

A. Yes, sir.

Q. And what instruction did you get with respect to that survey,—with respect to that examination?

A. He informed me that he wished to have the vessel covered to make a short trip down to the Keys, and he would like to have a report on her condition.

Q. Well, is that in substance what he said to you?

A. Yes, sir, about that, as near as I can remember.

Q. In making this examination that you made, after the first one, what did you have in mind?

A. Well, the vessel was afloat, and I wanted to see the interior of the hull, afloat. She was dry when I saw her. I wanted to see what the hull was like inside the boat. She has quite a pretty big bilge, you know, a good big bilge space; I wanted to get in there, there was a good chance; I said to myself "I am going in again and have a look around". Lots of times when vessels go on a dock why they usually check it up; they certify her when she comes off.

Q. So that is all that you had in mind when you went on board the second time?

A. Yes, I wanted to check up the machinery a little, and go around the decks and the fire extinguishers, I wanted to check them up.

Q. Did you understand at that time that you were expected to make a thorough examination of all the machinery and appurtenances?

A. I couldn't make a thorough examination on that type vessel, sir. I would have to open up machinery and open up spaces, and I could make a general examination, which would represent what I was doing; but I wouldn't make a thorough examination, no; it wouldn't be represented that way.

Q. Now you went on board the Seminole for that purpose, did you?

A. I don't know what I am answering now, sir.

Q. Well, perhaps that is not very clear. Anyway, you went on board the Seminole the second time?

A. Yes, sir.

Q. And did you go into the engineroom on that occasion?

A. I entered the engineroom, yes, sir, for a short interval.

Q. Were you alone in the engineroom, or was there anyone with you?

A. I was,—I was alone.

Q. Was there any engineer on board the vessel?

A. No, sir.

Q. Was there any Captain on board the vessel?

A. No, sir.

Q. Was there anybody on board the vessel?

A. Yes, sir; there was a young man that I saw working, doing odd jobs on the vessel; the same man was there each time that I appeared there.

Q. Was he the only one that was there?

A. Well, I couldn't vouch for that, I didn't ask him; there may have been others that I didn't happen to see.

Q. He is the only one that you saw?

A. He is the only one that I saw.

Q. Mr. Bernard, did you observe when you were in the engineroom, a drain valve connected with the gasoline piping system from which gasoline could be drawn in the engineroom?

A. I did not.

Q. If you had observed such an arrangement in the engineroom, would you have passed the vessel?

Mr. Underwood:

Wait a minute, I object to that, your Honor; it is speculative.

(Arguments by counsel.)

Mr. Botts:

If the Court please, I would like to make this observation; that if proving an examination for the purpose of some insurance, isn't calling for an expert opinion and expert examination, I don't know what its purpose was; and I think clearly he has presented that phase of it and purported to rely on it.

The Court:

No, I don't think so. I think the witness has not been introduced as an expert. He has been introduced,—he may be an expert, but he has been introduced to testify as to his employment, and what he did, and the report he made. This question I think calls for an expert opinion to be made at this time, so unless the Libelants care to make him their witness, why I shall sustain the objection.

(Argument by counsel.)

Mr. Matteson:

As I understand the question is objected to and the objection is sustained, is that the position?

The Court:

Yes, sir.

Q. How do you account for the fact that you did not observe that draw-off line in the engineroom, Mr. Bernard?

A. It is out of the ordinary lead from the main line; it went along from the port side—

Q. Well—

Mr. Underwood:

Let him finish, please; how did it go?

A. It is off the ordinary lead from such a line; it was a long lead, from the main line, run along the starboard side of the vessel, from the manifold of all four tanks. It was made into this main line. And this, as I saw it after the fire, led close athwartship over to the port side of the vessel, and probably led underneath some conditions such as batteries or something else, and was not observed. We looked for draw-off lines or draw-off connections in close proximity to the main line.. The main line and the feed line to motors. Another point was that that would probably be in the shadow; the ship was dead, and they hadn't anything in the way of lights in that engineroom, and I didn't go searching for something out of the ordinary, in the draw-off line.

Q. How long were you in the engineroom, Mr. Bernard?

A. Well, at that time I was in there probably about twenty minutes. But I had been previously in there, with regards to the motors, particularly the motors and the general lineup of a little generator and the bilge pumps; the bilge pump connections mostly; went in there to get all leads to see if they led to the different places.

Q. You were in the engineroom twice?

A. Yes, sir.

Q. And the first time you were interested only in bilge pumps, is that right?

A. No, I said, a combination,—the general condition of the engines and pipe lines, but not going into any detail. Primarily it was to see about the bilge pump and bilge pump conditions; that was when I was considering the hull.

Q. That was the bilge pump and the bilge pump connections and whatever machinery was connected with the bilge pumps, is that it?

A. Yes, sir; the motor to drive the bilge pumps; they wouldn't be any good if the motor wasn't fit to move them,—the generator.

Q. Let's see if I understand you correctly. The first time you went into the enginercom, you were—the only thing you examined was the bilge pumps and the bilge connections,—and the engines connected with the bilge pumps?

A. And the switchboard and connections that drove that motor, and the general conditions; and that involved a lot in that engineroom, to move that bilge pump; they have a lot of moving parts and connections.

Q. Did you move the bilge pump?

A. Oh no, I wouldn't start anything on a dead ship, not me.

Q. Why not?

A. Why it isn't my place, not my property. I would ask for or order it done, and go back and find out how it was operating after the official operator was on it.

Q. Was there anyone there that you could order to operate the machinery?

A. Not that I know of, that had—I wouldn't want to ask, only from the firm themselves,—to send their man there and start the motor.

Q. And did they send any man over to operate it?

A. I didn't ask for that and didn't require it. I convinced myself it was all right.

Q. And you are referring now to the pump?

A. I am referring to the pump and the parts that were required to operate the pump, which are many. It has to go through the switchboard, the generator has to be started, and there is a manifold of valves has to be operated; sea-suction to be opened up.

Q. Now tell us just exactly what you did to ascertain the operating condition of the bilge pump?

A. I went down to have a look at the motor, the generator. The generator apparently was in good condition. There was nothing wrong I could tell, from the ordinary standpoint of many, many vessels I have examined standing still. There is one way of examining it, but from what I could ascertain, that the generator, switchboard, and the connections, and the batteries necessary to maintain those, together with the pump itself, and its connections, were in order. I tried the valves and manifold.

Q. Did you try anything else?

A. No, just tried the valves and manifold; tried the valves and the bilge manifold.

Q. You tried the valves?

A. Yes, sir.

Q. And is that all that you tried?

A. That's all.

Q. What else did you try?

A. I didn't try anything else.

Q. Did you operate the generator?

A. No, sir.

Q. Did you operate any of the machinery?

A. No, sir; never have on any vessel that I ever approached as a surveyor or an owner's representative, or as a superintending engineer.

Q. I understand you to say that if there is an engineer present, you order them to do that?

A. If he offered to do so; if I said to him, "I am going to ask to have these turned over", if he said he would turn them over, they do it all right. I didn't ask him to do that.

Q. There was no one there at this time that you could ask to do that?

A. No, sir. I believe that was pretty early in the morning I went over there, very early that morning, I remember.

Q. Well, you can't really determine the operating condition of a piece of machinery without operating it, can you?

A. Well, I think so.

Q. Merely by observation?

A. I think the underwriters understand that. We don't try out every part.

Mr. Matteson:

I move to strike that out as not responsive.

The Court:

* * * I grant the motion.

Q. Just confine yourself to answering my questions, please.

A. Yes, sir.

Q. Did you operate any of the switches on the switchboard?

A. No, sir.

Q. Did you make any test of the gasoline tanks?

A. What kind of test, please? Hydraulic?

Q. I want to know what you did.

A. I made a search for odor or leak of gasoline; for the odor or leak of gasoline from the gas tanks.

Q. And that is all you did?

A. Yes.

Q. Did you put your head in under the gasoline compartment?

A. Well, I don't say I put my head in, or what I did; I can't remember what I did.

Q. Did you go into that compartment?

A. I couldn't go in there.

Q. Why not?

A. It was between bulkheads; between bulkheads.

Q. Could you see part of the tanks?

A. Might get a slight observation of the side of one or two; nothing—

Q. You couldn't make any general examination?

A. No, you could not; no.

Q. Was there any gasoline in the tanks at the time, do you know?

A. I didn't observe that, sir.

Q. Then do I understand that your observations in the engineroom were confined merely to visual observations?

A. Yes, sir.

Q. Where was the boat when this examination was made?

A. Coconut Grove; down at Coconut Grove, Florida.

Q. And where was she lying there, afloat?

A. She laid the first time on the marine ways there.

Q. And the second time?

A. At a pier adjacent there, one of the piers, I can't remember which one.

Q. A pier that projects out in the bay?

A. I couldn't say that, I don't remember that. As near as I remember, the second time she was in that yard.

Q. Did you have any light in the engineroom when you were there?

A. No, sir.

Q. The current was all off the switchboard, was it?

A. I couldn't say, sir, I don't know.

Q. You don't know whether any of the switches were connected on the switchboard at that time?

A. The switches may have been in there, but the current must have been cut out at the batteries. I didn't move the battery switch. There is a cutout on that battery.

Q. You can't tell us whether any of the switches on the switchboard were connected at that time?

A. There was no juice on the main switchboard, I know that. There may have been switches in on the board, but no juice from any main, through the board.

Q. How do you know there was no juice on the switchboard?

A. I didn't see any lights burning anywhere.

Q. Is that what you judged by?

A. Yes.

Q. Did you examine the switches on the switchboard?

A. Not closely. It was a good looking switchboard, that's all I memorized.

Q. That's all you noticed; it was a good looking switchboard?

A. Yes, and has an elevation from the floor, and that was essential.

Q. What was the condition of the windows in the engineroom when you were in there the second time, afloat?

A. The condition of them?

Q. Yes, were they open or closed?

A. I don't remember.

Q. Do you remember the location of those windows?

A. Yes, sir, I do.

Q. What windows were there?

A. There was a window through the top side on the port side, through the side of the hull, top side of the hull on the port side; that is a rectangular window. There was a similar window in a fore and aft bulkhead in the alleyway on the starboard side.

Q. Was that a steel bulkhead between the engineroom and the alleyway?

A. Yes, sir.

Q. What means of ventilation did you notice in the engineroom, besides the windows?

A. From a raised trunk they had two fourteen inch ventilators. They also had a ventilation through a hatch that entered the engineroom. That's about all that I can remember, I believe. There may have been another coam-

ing or a hatchway, I am not sure, but I believe there was, three sources from that raised trunk over the engineroom.

Q. That is these cowls—

A. There might have been windows in through the raised trunk, I can't remember; but there was a raised trunk over the engineroom on the boat deck.

Q. And extending upwards from that raised trunk, were these two cowl ventilators?

A. Yes, two cowl ventilators.

Q. And this hatch, was that in the raised trunk?

A. It extended above the raised trunk, it was what we call a coaming, a raised coaming.

Q. Is that all that you saw in the way of ventilation at that time?

A. All that I can remember.

Q. Did you observe any sort of ventilating device that led into the bilges?

A. There was none.

Q. Are you sure of that?

A. Not that I observed.

Q. Did you look for them?

A. I don't believe I did; I don't think I did.

Q. These ventilators that extended up from the deck, did you observe those on deck?

A. I can't remember that, whether I went up there to look at those cowls or not.

Q. How did you get into the engineroom?

A. I went down through a hatch from the upper deck.

Q. And that's this hatch that you have just spoken of in the trunk over the engineroom?

A. Yes, sir.

Q. What do you mean by trunk?

A. It is a raised structure over the level of the ordinary decks; steel structure; it happens to be a coaming,—raised coaming.

Q. Then as I understand it, over the engineroom there was part of the deck that was raised up a little higher than the rest of the deck?

A. Yes, here is the deck; I believe this is the boat deck; I am not certifying this correct. Over the engineroom was a raised trunk on which was these ventilators. In other words, the distance from the engineroom up to the deck would be one distance, and then you come up probably eighteen inches, when you get into the space, which gives more air from the engineroom; in other words, it helps to ventilate that engineroom space.

Q. What is it helps to ventilate the engineroom space?

A. This compartment, this rise, that extends the height of the engineroom.

Q. It extends the height of the engineroom?

A. Yes.

Q. In that particular spot, is that it?

A. Yes. Well, that is fitted over many cabins and many places; that is its purpose.

Q. How high did you say this trunk was?

A. I believe it was, as near as I can memorize or visualize, somewhere about fourteen to eighteen inches.

Q. And the hatchway and the cowl ventilators were on top of this trunk, is that it?

A. The hatchway was; now I am not certain about the cowls, the ventilators. I think it was a tube or a duct; but the duct that led into the engineroom come over the top of that raised deck.

Q. If the stenographer has it correctly, Captain, I don't understand it; would you read the question again to him.

(Preceding testimony was read.)

Q. Well now, you have a statement of a duct; what do you mean by that?

A. That is the extension, the tubing that goes from a ventilator, goes into small lines; that is after it leaves

the cowl section; an air duct or ventilator duct or ventilator tubing.

Q. Well, these cowl ventilators, as I understand it, came down to the top of the trunk?

A. Uhm, hmh.

Q. Have you any recollection of their coming any farther than that?

A. No, I have none.

Q. There has been some suggestions, Captain, of some two inch pipes with goosenecks at the top, fixed in the deck besides this trunk and extending down into the engineroom. Did you see anything like that—extended into the bilges?

A. I didn't notice them, sir; I didn't observe them.

Q. When you describe the means of ventilation in the engineroom, you did not mention any such thing, did you?

A. No, sir.

Q. And I understand you to say you did not observe any such thing?

A. No, sir.

(Informal recess was had.)

Mr. Matteson:

* * * I move to strike out the testimony of this witness on direct examination that he passed this vessel for insurance.

(Discussion and argument.)

Mr. Botts:

* * * I move to strike all the testimony whereby he was qualified by his experience as an expert. I refer to the testimony as to the length of time that he was acting as surveyor, for whom he has worked, and his

various qualifications. They asked him every question that would qualify him as an expert. * * *

Mr. Matteson:

If Mr. Underwood will agree in this case that he will not in this case for any purpose, at any time, rely upon the testimony of Mr. Bernard as an expert, or on his report as a qualified expert, the situation would be quite different. * * *

The Court:

I will have to adhere to my original ruling. The motion is denied. * * * .

(By Mr. Matteson):

Q. Mr. Bernard, do you draw a distinction between an insurance survey and a condition survey?

A. I do, certainly do.

Q. What is the difference?

A. I am carrying out a condition of survey now here on a yacht going to the west coast. I call for that yacht to be dry docked, her bottom cleaned, her plates drilled for thickness; both tail shafts out, thrusts opened up. Mind you, this is two lines of shaft,—inboard and outboard shaft; going on now, right here in Miami. The fuel tanks emptied, all fuel taken out, and entered and cleaned. That has been done on this yacht. The work on the port engine, I inspect every cylinder head; taken to the yard, treated to remove sand and hard scale. Removed every piston, wrist pin, connecting rod, and its bearings; laid them out and examined them. I have stripped the engine casing of that port engine, and had men go in there and clean it, and have a man who is responsible to me, to see that it is clean, all crevices. When that is completed I am going over on the port engine; when that is completed I will go into the pressure tanks

and put hydraulic pressure on them and test them out, also take the thickness of those tanks. I will go to the switchboard; I am not an expert electrician, but I will have a report from an electrician, as to the terminals, and as to the strength of what might be contained in the safety fuses of those particular switches. I have been in her bilges, every part of her and crawled through them. I have opened up where I could on her skin, and examined her internally. I have searched her masts, and searched her deck where the masts come, searched the metal stepping, and all coamings and decks, and all pie-plates on her deck, and the deck itself. I have raised her anchor chains, gone down into her chain locker; removed the protection boards in the bilges,—had them removed, to get into the bliges, to see the condition of the metal and the condition of the protective coating in all those bilge spaces. That is what you call condition surveys.

Q. And is that the kind of a survey you made with respect to the Seminole?

A. It was an inspection for insurance purposes.

Q. And not a condition survey?

A. No; not as known as a condition survey.

Q. What do you charge for a condition survey?

A. A condition survey? I am doing that for Lloyd's, Lloyd's Classification of Vessels, and I have nothing to do with the charge. They are paying me a charge that I might submit, as to the number of visits required and the energy I may have to spend there. It is in the book there. Mr. Thompson—that book he holds, he has got it there. I would have it if I had the books, but the property happens not to be mine.

Q. Well, it would be a good deal more than $17.50, wouldn't it?

A. Sir?

Q. That work would amount to a good deal more than $17.50?

A. Would you allow me to answer about the $17.50? Would you like to know about that?

Q. Just answer the question.

A. It would be more, yes, sir; it would go into probably $235.00 and might involve the owner,—you see, that is the fee, and may involve the owner in spending $2,000.00 or more. This owner will probably spend $2500.00.

Q. And for what purpose would that amount be expended?

A. Opening up, dry-docking the vessel, opening up, meeting the requirements of painting bottom—cleaning and painting bottom, pulling out all shafts, doing what is required to do to the bearings, to maintain her condition as being a-1, what might be involved in renewing parts of engines that might be required, to bring her to a-1 as to condition.

Q. That's what you do to bring her to an a-1 condition?

A. Bring her up; she is classed, mind you; and the Seminole was not a classed vessel. There are only a few rules and regulations that might guide you as far as the Seminole was concerned, being in condition,—or any such type of vessel. They are classed by different requirements from the ordinary—

Q. Do you think the standards of safety with respect to class jobs are any different than the standards of safety with respect to other yachts?

Mr. Underwood:

I object to that, on the ground it is the same type of question to which your Honor sustained objection before. * * *

(The question was read.)

The Court:

Do you mean, Mr. Matteson, to inquire—to make this question the basis for comparison of the different kinds of examination made?

Mr. Matteson:

Yes, sir. He has talked about two kinds of classifications, two kinds of surveys; and I am trying to draw out what the difference between them is.

The Court:

I think that goes to the question of the examination, the character of examination he made. I will overrule that objection.

(Argument by counsel.)

Let me ask the witness a question, and that will help me rule. That is a technical question, I think, Mr.—Captain Bernard.

A. Yes, sir.

The Court:

I will ask you, would that help the Court in determining the degree of thoroughness of your investigation of the Seminole?

A. I don't think it applies, sir.

The Court:

Well, I sustain the objection; reverse my ruling.

(By Mr. Matteson):

Q. You are familiar with the rules of Lloyd's Register of Shipping, with respect to composite and steel yachts, a copy of which has been marked Libelants' Exhibit 101, are you not?

A. No, sir, I am not, that's the first time I ever saw that.

Q. Well, does that also apply to this other book, construction and classification of wooden yachts, Libelants' Exhibit 101-A?

A. I might get a pamphlet from that particular volume, but I am not familiar with the volume. If I had work to do I might get a pamphlet that would be an extract from some rule there, or some necessary required examination.

Q. Well, are you, do I understand, now making a Lloyd's survey of a yacht here in Miami?

A. Yes, sir.

Q. And are you guided by Lloyd's rules in making that survey?

A. I am, from the office rules and the forms from the office covering that. I am not taking it—it is the result of a determined formula, or rules and regulations set up as required, to put that vessel in class.

Q. Well, do you mean that you have the rules of Lloyd's applicable to that yacht, in some other form than we have here?

A. Yes, sir, have it in a pamphlet form. I don't have to have it in that big book form.

Q. Have you a copy of that pamphlet with you?

A. I have, yes. I don't think anybody here has seen them before, but that's the way I am working on that job. That's a number-1 classed.

Q. Well, what are these rules that you have produced, Captain?

A. What are they?

Mr. Underwood:

I object to the witness being asked what papers are, unless the papers are in evidence.

A. I can't describe them, sir. They are a portion of the rules and regulations required by Lloyd's to guide a

man that they send out on a particular job; and some of that job may have been done by some other man that may come here, and I have a record of what the other man did, and I have a record of what I should pick up now; and when she goes to the west coast, the other man will have a record of what the last man didn't do. That doesn't apply to all of this.

Mr. Matteson:

I would like to have these marked for identification.

The Witness:

I can't take those; I have got to return them where I got them. I will type them out.

Q. Could we borrow them long enough to photostat them?

A. They have got two books that have the same thing in them. I don't need to give those up.

Q. I think they must be in here. See that red book over there? I guess you can get it, or the green book underneath there.

Mr. Botts:

That blue book, I think that is the one.

A. You will find them along here; special survey number 2, periodical surveys.

Q. Well, those don't seem to be like these that you have shown us.

A. This is a ship, see, steel vessel. That is pertaining particularly to the small type of yacht. They have eliminated, see, some of the rules that would not apply to that sized vessel, and they have made it up in a pamphlet to make it easy for the man, or the owner, on the job, or something for the man to stand by so the owner will know what he has to contend with.

Q. Well, would you have any objection to our borrowing this from you just long enough to have them photostated?

A. I borrowed them from someone else, I don't know what I am going to do about that. I can type them and give them to you, but I am not going to let them go out of my hands. I have got an office, I will go and type them. I am honorable that way, when I get anything I am going to hold onto it and return it.

Q. Will you do this for us, Captain; will you, when you get back to your office, call the Biscayne Engineering Company and ask them to make photostats of these and send the bill to me?

A. All right. I am going on the job when I get out of here.

Q. Now, Captain, you made the statement that these rules that we have just referred to, do not apply to the Seminole; what do you mean by that?

A. She is not a classed vessel.

Q. That's all you mean by that?

A. Yes.

Q. You are familiar with these regulations governing marine fire hazards?

A. I could refer to them. I should think that they contain what I am after. I am not familiar with them, I don't have them by heart, but I know they exist in there, the various rules. They might wish me to become familiar with them.

Q. I am referring now to Libelants' Exhibit 97. Do you use those rules in your business?

A. When they apply, yes, sir.

Q. And in making the examination of a yacht for insurance purposes, do you consider those regulations apply?

A. Yes, they apply; not compulsory, I don't think. They are established.

Q. Are they the rules that you follow?

A. No, sir, they are not; I don't always follow them to the detail, no, sir.

Q. Well, what are those rules, Captain?

A. Well, they are rules and regulations governing marine fire hazard, indorsed by the American Marine Standards Committee, National Board of Marine Underwriters.

Mr. Underwood:

Captain, when you made that answer you were reading from the cover of the pamphlet, were you not?

A. Yes, sure.

(By Mr. Matteson):

Q. Well, then do I understand you to say that when you make a survey that you understand is to be used for insurance purposes, you are or are not guided by those rules?

A. I am not guided by them; I try to follow them as best I can, as near as the book will allow or the job might support.

Q. And you also said, I think, that you are familiar with these rules which are entitled, Regulations for the Prevention of Explosion and Fire on Motor Boats, Approved by the National Board of Fire Underwriters, which has been marked in this case Libelants' Exhibit 24?

A. I am familiar with them.

Q. And do you apply those in your surveys that are to be used for insurance?

A. I have copies that I take with me most every survey, and try to comply with them; and those that are determined not to follow out, I will stipulate it in the end of my report, around "Something wanted".

Q. Then if you find something which does not comply with the rules here, I understand that you note it at the foot of your survey?

A. Yes, sir.

Q. Is that right?

A. I do as a rule, if there is anything, yes.

Q. You did not note in your survey of March 29, 1935, the presence of the drain valves, did you?

A. No, sir, I didn't know they were there.

Q. And drain valves are one thing that are prohibited by these rules of the National Fire Protection Association,—drain valves in the engineroom, is that not right?

A. Yes, sir, I think there is a paragraph there; draw-off—they mention them as draw-off; draw-off from the gasoline line. I think you will find it there on the second page, item 14, maybe.

Q. Yes, here it is, on page 4 of the exhibit 25, paragraph G; outlets on gas feed line for drawing loose gasoline for any purpose whatsoever, are prohibited in the engineroom compartment.—I would like to ask you this question; you say that you did not note this in your report, and you have given two possible reasons for not noting it in your report; one, that you didn't see them, didn't know they were there; and the other, that sometimes you don't note things when you regard them as extreme. Now which was the reason you didn't note that in this report?

A. I didn't see them?

Q. Did I understand you to say there was a shut-off on the storage batteries?

A. Shut-off?

Q. Or cut-off, or cut-out?

A. No, I didn't locate that. There must have been a cut-out by which to separate the batteries from the switchboard.

Q. You mean, on the switchboard, or somewheres?

A. I couldn't tell you where it was, I didn't locate that and I didn't memorize it.

Q. You didn't locate that?

A. I didn't try it out, but I presume I read the right way, see; it was in conjunction with the switchboard.

Q. You said something about your understanding that that vessel was to be used on a short voyage; did I understand you correctly on that?

A. That's what I understood, yes, sir.

Q. What did you understand by a short voyage?

A. Well, it was going to make a short run, a short trip somewhere.

Q. And—

A. Down to the Keys, in these waters, down to the Keys, as I remember it now. Someone said she was going to Cape Sable; as I remember it, she wished to go to Key Largo and return, with a party.

Q. And was it your understanding that it was simply for that short voyage that the insurance was required?

A. Well, it wasn't put to me that way, no, sir.

Q. Do I understand that you deny telling Mr. Hawkins that there was a plate that needed reinforcing?

A. I didn't report any bad plate, sir.

Q. You didn't mention any such thing to Mr. Hawkins?

A. No, siree.

Q. And if you had noted any such thing, it would have been important for you to have placed that in your report, would it not?

A. Oh yes, or keep away from the job until it was made good. I don't think I would have made any report; kept off the job.

(The last answer was read at the request of Mr. Underwood.)

Q. If you knew, and if you examined a vessel and you knew that she had a plate reinforced in concrete,—with concrete, would you report her in good condition without mentioning that fact?

A. I would have to mention it, yes, sir.

Mr. Matteson:

I think that is all at this time.

By Mr. Botts:

Q. I understand you went twice into the engineroom; correct?

A. I did.

Q. Were they both on the same day or did you go in the engineroom on each day?

A. I went in there on two visits.

Q. Probably on two separate days?

A. Yes.

Q. The first visit was for the purpose of examining the mechanism for the bilge pumps as I understand?

A. No, sir,—oh, yes, that is in connection with the bottom, yes, sir.

Q. And how long did you stay in there at that time, to your best recollection?

A. I might have been there fifteen minutes.

Q. And about the same length of time the second day?

A. About that, yes, sir.

Q. Now you stated that you examined her pipe lines and found them tight?

A. I don't think so, no, sir; I didn't examine the pipe lines. I might find that pipe line—

Q. You said that you found no leaks in the pipe lines?

A. I would like to know what pipe line you are referring to.

Q. I don't know, you used the expression. Well, did you examine her pipe lines?

A. If you name them I will tell you.

Q. Did you examine any of them?

A. I examined the gasoline line, yes.

Q. You examined the gasoline line. Now that included the lines from the intake on the deck, down to the carburetors, did it?

A. Well, they are not connected; they are related to one another only by distance between the tank extension or construction.

Q. Read the question.

(The question was read.)

A. I couldn't reach in and see the filling line, any more than to see the connection was tight on deck; to examine the filling line, any more than to see that there was a tight connection from the tanks to the deck.

Q. So you didn't examine it?

A. I didn't make any assertion that I had examined the fill line.

Q. You don't know whether that fill line leaked or not, do you?

A. It was intact to the deck, as required; and to search it as far as we could go.

Q. Was there any gas in the tanks when you examined her?

A. I didn't look for gas.

Q. You don't know whether there was any gas in the tanks or not. You made an examination to see whether there was a gas leak?

A. Umh, hmh.

Q. Didn't you?

A. Umh, hmh.

Q. Did it occur to you that it would be a good idea to find out whether there was gas in the tanks, before you examined to see whether there was gas leaking out of the tanks?

A. How would I do it?

Q. I am asking you.

A. I wouldn't attempt to find out whether there was gas, alone in the engineroom. I presume there was gas there.

Q. You presumed there was gas?

A. Yes.

Q. But you don't know?

A. No, I don't.

Q. Now then did you examine to know there were shut-off valves at the tanks, between the tanks and the carburetors?

A. Shut-off valves on the tank.

Q. Between the tanks and the carburetors?

A. There were shut-off valves at the tanks and at the carburetor.

Q. All right now, then, did you examine those valves to find out whether they were opened or closed?

A. No, sir, I did not handle them.

Q. They might have been wide open so far as you know?

A. And they could stay that way as far as I was concerned; I wouldn't touch them.

Q. I am just trying to find out what you did.

A. I would not manipulate them, see.

Q. I am not asking you what you would have, I am trying to find out what you actually did do; that is what I am trying to get at. Now then you didn't try manually, with your hand or otherwise, a single valve anywhere in that pipe line system, did you?

A. No, I didn't.

Q. And did you go into the tank compartment?

A. I couldn't get in there.

Q. There was no way that you could get in there, was there?

A. Might get a look in, get your eyes up in there and get a scant view of the side of a tank.

Q. But there was no way by which you could really make an examination of those tanks to determine whether or not they were tight, was there?

A. No, sir, there was not.

Q. And you didn't attempt to make such an examination, did you?

A. No.

Q. All right.

A. What I did, to prove those tanks were not leaking, was to see there was no evidence of gasoline odor or a drip or drain in the bilge; that's why I followed the bilge.

Q. So far as you could tell from the examination by the physical situation permitted, you found no leak, is that it?

A. No leak, no; the tanks were tight.

Q. Now since you don't know whether or not the gas if any in the tanks, was cut off at the tanks, you won't know whether or not there was any gas in the gas lines at the time you made the examination, do you?

Mr. Underwood:

I object to the question as speculative.

Mr. Botts:

Strike it off.

Q. Do you know whether there was gas in the gas lines from the tanks to the carburetors when you made the examination?

A. I believe there was, yes.

Q. Well now, what makes you think so, if you don't know whether there was gas in the tanks?

A. Well, we will presume there was gas in the tanks. I know there was gas in the tanks.

Q. Well, how do you know it?

A. I can't tell you what elevation there was, but you could tell whether a valve was started from its seat by its valve system,—to an engineer.

Q. But you didn't touch the valves, you say?

A. I didn't touch them.

Q. As a matter of fact you don't know whether there was any gas in those gas lines or not, do you?

A. I presume there was gas.

Q. You presume there was, but you don't know, do you?

A. No, I am not positive.

Q. All right. Then isn't this a fact; that all you can say is that you saw no gas leak? Isn't that about as far as you can go?

A. Yes, I can say this; that I saw no evidence of there having been a gas leak.

Q. All right. You didn't touch any of the valves to see whether they were opened or closed or their condition? Did you touch any of the pipe lines?

A. I went over the pipe line, yes.

Q. How?

A. Went along it, observed it by the light,—flashlight I had in my hand.

Q. Was the engineroom dark?

A. It wasn't any too light.

Q. This was in the daytime, wasn't it?

A. Yes, sir.

Q. The shades pulled on the windows, were they?

A. I don't know, I didn't observe any shades on any of the windows.

Q. Well, the engineroom was so dark that in order for you to make any sort of an examination you used a flashlight, is that right?

A. It is customary to carry a flashlight in a place like that.

Q. Did you use your flashlight?

A. I might have used it from habit, yes, sir.

Q. You don't know whether you used the flashlight or not?

A. I don't know whether I turned the button on at that particular time, or no; but I believe I did.

Q. Now isn't it true that your examination was very superficial?

A. No, sir.

Q. You didn't look around carefully to see what was in that engineroom, did you?

A. I did.

Q. I wonder if you saw the valve here that has been—I am referring now to Libelants' Exhibit 11, did you see that pair of valves in the engineroom anywhere?

A. I think—that is the overflow valve; I wouldn't recognize those valves, but I know from what I have heard that those are—

Q. Did you see those valves?

A. I can't remember whether I saw them or no. There may be others like them, I may have seen other valves, I couldn't tell; I don't have that in mind, five years.

Q. I call your attention to Libelants' Exhibit 13, the gasoline can; did you see that can in the engineroom?

A. No, sir.

Q. I call your attention to Libelants' Exhibit 14, the top part of a funnel; did you see a funnel—

A. I can't recognize it. I didn't see any funnel.

Q. You didn't see anything of the kind. If the three objects to which I have called your attention, namely, the pair of valves, the gasoline can and the funnel, or any one of them, were in the engineroom, it didn't sufficiently impress you that you have any recollection of it; is that right?

A. No, sir, I don't recollect them.

Q. You have no recollection of them. Now you have stated that you examined the switchboard, and that the switchboard was in good condition, is that right?

A. I didn't say the switchboard; I said the switches. But I said the switchboard and all the conditions were what would be considered a good switchboard. I didn't have time to examine the switches. That is just the switchboard in general.

Q. Well, I made a memorandum, I don't want to go back to the testimony, but didn't you say in your direct examination that you examined the switches and that they were in good condition?

A. Examined the switchboard and the connections.

Q. You didn't examine the switches then to find out whether they were in good condition?

A. I didn't see anything the matter with them.

Q. Wait a minute now. Did you examine the switches?

A. Yes, why I examined the switchboard, I didn't detail every switch; I made no observation of the condition of the other switches on that particular switchboard.

Q. You just walked up to the switchboard and took a glance around?

A. I went there in a hurry, yes.

Q. Glanced around hurriedly?

A. It doesn't take a man that knows, to know to read a switchboard if it is wrong.

Q. Well, you are not here as an expert, so I don't know whether you know or not. So far as you observed, the switches were in good condition?

A. Yes, sir.

Q. Now when you said that you observed the location of the switchboard and that it was well above the floor, which is essential,—to use your language. Why is it essential to have the switchboard well above the level of the floor?

A. Well, it is a precautionary measure, to keep knife action or spark conditions away from low places, and in the event of an accumulation of vapor or gases that might be hazardous.

Q. Now then where is that blueprint?—I understand that you examined the bilges very carefully and went through all parts of them, and made a particular examination as to the bilges; is that right?

A. I examined them. When I examined them why I examined them, that is all; I don't say, very carefully, very carefully.

(At 12:30 o'clock P. M. the hearing was recessed until 2:00 o'clock p. m. of the same day, May 19, 1939.)

May 19, 1939, 2:00 P. M.

Afternoon Session.

2832 Thereupon E. GEORGE BERNARD, a witness produced by the Respondent Phipps, resumed the stand and was examined and testified as follows:

Cross Examination (Cont'd.).

By Mr. Botts:

Q. Captain, you recall the little alleyway to the starboard of the engineroom, don't you?

A. Yes, sir.

Q. Now then do you recall the construction of the partition between the alleyway and the engineroom?

A. Do you mean the shape or—

Q. Do you recall the material of which it was constructed?

A. Steel, I believe.

Q. Now I want to ask you if there were four two-inch ventilators that passed up and went by that partition and up through the deck of the engineroom?

A. I didn't see that; they may have been but I don't know.

Mr. Underwood:

Wait a minute. Let him finish. If your Honor please, I will ask you to instruct Mr. Botts not to interrupt the witness. He has offended very seriously in that respect and I have been very patient about it.

The Court:

I think the witness ought to finish his answer.

Mr. Botts:

Certainly I will let him finish.

Mr. Underwood:

May we have the answer read?

(Thereupon the preceding answer was read by the Reporter as above recorded.)

The Court:

Did you finish your answer, Mr. Witness?

The Witness:

Yes.

The Court:

All right; proceed.

Mr. Botts:

Now, do you apologize?

Mr. Underwood:

No, I do not.

(By Mr. Botts):

Q. You went down into the bilge, did you?

A. I was in the bilges, yes.

Q. Now were there four ventilators, two inch ventilators, from down below the bilges, in the bilges and along about where that partition was and running from the bilges up into and through the deck of the engineroom?

A. In which bilge space are you referring to?

Q. Approximately underneath the engineroom?

A. That would be the engineroom bilge space?

Q. Yes.

A. I didn't see any pipe.

Q. Were there four more over on the port side?

A. I believe I have answered that question, sir.

Q. I asked you on the starboard side. Now I asked you if there were four more on the port side?

A. I didn't see any pipe.

Q. You examined all down there, didn't you?

A. I examined the bilges in regards to the condition of the hull but not as to the—

Q. Did you examine them with reference to ventilators?

A. I did.

Q. You say you did?

A. Yes.

Q. Then if there had been ventilators there you would have seen them?

A. They would have been pretty small ventilators if they were intended to ventilate the bilges—two inch ventilators.

Q. You saw nothing of that kind?

A. No.

Q. Now was there any ventilation in the tankroom space?

A. Will you name the tank space?

Q. The main tankroom space just forward of the engineroom?

A. I can't remember whether I checked that or not.

Q. As a matter of fact, Captain, an examination for insurance such as you were making is not a complete examination by any manner of means, is it?

A. In what view is it not complete, sir?

Q. In any respect is it a complete examination?

A. Complete examination? I don't know what you are drawing the line on as to complete examination. I thought we had that kind of an answer this morning.

Mr. Botts:

Read the question, please, Mr. Reporter.

(Preceding question read by the Reporter as above recorded.)

(By Mr. Botts):

Q. Would you mind answering that question and then make any explanation you desire?

A. Our purpose in making such examination is to try to fill out the application to direct the underwriters to the general condition of the vessel, particularly applications for insurance.

Q. Is that examination a complete examination or not?

A. It was in so far as that was concerned, that type of examination.

Q. That type of examination?

A. Yes.

Q. It is not a very thorough examination, however, is it, Captain?

A. Are you referring to me personally as to what I did or what is required on that application?

Q. What you did?

A. It was the best of my intention to fill that requirement.

Q. Did you make a thorough examination of that engineroom?

A. That was in my mind to do and I believe I did. I did the best I could under such an examination, such a form of examination; I didn't strip or open her up, and I wasn't required to do that. It was a dead-job and without an engineer; I did the best I could.

Q. Captain, I don't want you to misunderstand me: I am not criticising your examination, but I am trying to develop its character: when you examine for insurance you make a rather casual examination rather than a thorough examination, and isn't that the ordinary practice of every surveyor?

A. I am sure I cannot answer that; that is outside of my reach. I can't answer for anybody else, and I can't answer for the rules and regulations of the Underwriters.

Q. As to yourself, Captain, isn't your examination for insurance rather casual than thorough?

A. In my position I don't believe I can accept any form sent out by the Underwriters to be filled out. I do not criticise that but—

Q. You do not seem to understand my question.

(Preceding question read by the Reporter as above recorded.)

A. If you can give it to my direct I can answer it; if there is any man who can answer it I can.

Mr. Botts:

Would you mind repeating my question, Mr. Reporter?

(Question re-read by the Reporter as above recorded.)

A. If I could understand it I would be willing to answer it.

Q. Can't you answer that, Captain? You seemed to answer in detail on your survey.

A. I can't do it because I have no subject in front of me to work on. If you will put before me a definite subject to work on, I will try to answer you, but you haven't given me anything to work on. You have asked me a question and you don't seem to understand it yourself.

Q. That is what I am trying to get you to explain, so that I will understand it. I will ask you again, Captain: When you examine a vessel for insurance do you make a thorough and complete examination? You can answer that yes or no, and then you can explain it to your heart's content.

A. I make an examination to ascertain the facts, whether there is a claim or where the necessities require you to make it complete in one way or another. Every examination is not the same because each and every particular ship design is different and they have specific requirements. We are supplied with a book of rules and regulations and we try to comply with them.

Q. Did you make a complete examination of the Seminole for this insurance?

A. When you say "Did I make a complete examination", I would say that I didn't open up any machinery and parts of this ship, and I wouldn't consider it a complete examination without I did.

Q. When you were down in the bilges did you crawl down into that portion of the bilges below the engineroom?

A. Below the engineroom?

Q. Yes.

A. No; I am too big to go in there.

Q. So you don't know what was below the engineroom floor?

A. Yes; I can get my head and shoulders into these two compartments or spaces, and if they are clean I can

by such observation as required readily ascertain the conditions.

Q. When you were down in the bilges, then, as I understand it, you looked down under the engineroom floor but didn't crawl down underneath, is that right?

A. I would say that I would have if I could, but I couldn't.

Q. You looked but you didn't get down there, is that true?

A. Yes, that is true.

Q. Now when you were in the engineroom you didn't take up the sections of the floor that are said to be removable in order to look down underneath here?

A. I can't remember; I can't remember the type of floor it was; whether it was board or plating or whatnot, but I was able to remove them enough to convince myself that the conditions were right.

Q. Did you remove some portions of the—

A. I can't remember, but I know I convinced myself they were all right; I would say they were all right.

Q. What did it take to convince you that things were all right?

A. Existing conditions and what I could observe.

Q. Now then did you examine all of the gasoline pipes from the tanks to the engines and carburetors?

A. I believe I answered that question before, sir.

Q. Just humor me by answering it now, will you? I haven't asked it before.

The Court:

Even at the burden of repeating, you had better answer the question again, Captain.

A. I examined the gasoline line from the tanks to the engines and motors.

Q. Were any portions of those lines that you examined underneath the floor?

A. I can't remember that. I have been on a good many vessels since that was done.

Q. In order to know that you had examined these lines you had to trace them from the tanks to the various carburetors, didn't you?

A. You could see them, sir; you could follow them almost with your eye while standing in one place.

Q. If they were in the engineroom you couldn't?

A. No.

Q. I mean if they were under the engineroom floor you couldn't?

A. No.

Q. Did you take up the engineroom floor to examine those portions that were underneath the engineroom floor?

A. These movements or actions of mine I can't remember exactly but I know I convinced myself that they were all right.

Mr. Botts:

That is all.

(By Mr. Matteson):

Q. I think you said, Captain, that the Seminole was not a classified vessel?

A. She is classed but I would not say she was a classified vessel. I would not say she was not classified; I would say she is not a classed vessel.

Q. There is no reason why a vessel like the Seminole could not be classed if the owner asked to have her classed and was willing to undergo the expense of it?

A. That would have to be determined by the Committee through survey upon application being made by the owner to the Committee of Lloyd's; in other words, she might or might not be able to meet the requirements.

Q. I am not speaking so much as to whether the Seminole could pass such an examination or not, but I mean with respect to a vessel of the type of the Seminole there is nothing to prevent the owner making application, is there, and if she could pass the examination she would be classed, is that right?

A. I cannot tell you what would be required by Lloyd's to classify that type of vessel; I really cannot answer that in an intelligent manner.

Q. Any vessel can be classed if she can pass the examination, is that right?

A. They would always be classed if they could afford to meet the expense. It makes a difference whether a yacht was designed originally to be classed, to be a classed vessel; it makes a difference as to whether she was constructed with the intention of being classed, or whether they were just trying to make a vessel of her, without any thought of classing her. Sometimes it is a matter of little difference to the owner.

Q. If she is of such construction that she would not come up to Lloyd's specifications, then there would be no use of making application, is that right?

A. Well, they might be able to arrange it by compensating for the beams or girders or stringers or deck plates or bulkwark plate so as to allow it to come within the classification requirements of the vessel. That would be a lot of trouble and would entail an abnormal expense, and it might not warrant you in spending that much money to get the vessel into that classification.

Q. Any vessel can be classed if she is sufficiently well built to meet the requirements and can pass the usual examination, is that right?

A. That question is something like the situation that exists today with the United Fruit Company; they have three or four of the finest passenger vessels carrying freight, because the requirements of the United States

Steamship Inspection Bureau cannot be met with; it would cost $285,000.00 to meet the requirements of the United States Steamship Inspection Service to allow passengers to run on that vessel—

Q. Now, Captain, we seem to be talking at cross purposes here.

A. I am trying to explain to you, sir, that the cost is prohibitive; that is what I am trying to explain.

Q. The simple question that I am trying to ask you is just this: Any vessel can be classified if she can meet the requirements, whatever they are, by construction, alterations or whatever it may be—any vessel can be classed if she can meet the requirements; is that right? Just answer my question yes or

A. The structural features of the vessel would not warrant the opening and changing to make her meet the requirements.

Q. That is something else, Captain: Now I will ask you the same question again. I think it is very simple and you can answer it yes or not: Isn't it a fact that any vessel can be classed if she can meet the requirements, structurally or otherwise?

A. I don't know. I don't think that is right because Lloyd's require, when you make application, a detailed drawing of your keel, specifications as to the thickness of your plate and the frame of the vessel, and the position of your bulkheads and so forth, before they would be interested in classifying her.

Q. You keep telling me, Captain, about the things she would have to have in order to meet the test.

A. There are some other things involved, and I don't think the owner would want to pay for it.

Q. Anybody could make application if they wanted to go to the expense, is that right?

A. Yes, sir.

Q. Now, Captain, there has been quite a bit said here about insurance surveys and passenger vessels and passenger insurance. You were employed to make this survey by the owner or owners of the Seminole.

A. I believe the first word of that——I believe the first—

Mr. Matteson:

I just want to warn him to tell us what he knows of his own knowledge and not what somebody else told him.

Mr. Underwood:

I submit that the question asks for a conclusion. Ask him by whom he was employed.

The Court:

He said that he was told by Mr. Hawkins in both instances.

Q. You had no communication with any insurance company with respect to this survey, did you?

A. No.

Q. You had no authority from any insurance company to pass or not pass any vessel for insurance?

A. No, sir; that could not be.

Q. You never had that?

A. I never had such an order.

Q. So this survey, as I understand it, insofar as it is called an insurance survey, was a survey that you made for the owners which they could use in connection with their application for insurance, is that right?

A. I was going to tell you about that when you interrupted me. That is what I was bordering on when you interrupted me.

Q. I don't want to know anything that somebody told you. I want to know what you yourself know.

A. I understand the owners' representative made application for the insurance, and they had to get a survey report, and they asked me to make out a survey report, and that was made out and delivered; I don't know where it was delivered, whether it was delivered to the agency in Miami or whether it was delivered to Mr. Hawkins. I just couldn't tell you that, but they handled the insurance work on that through a local agency and since then I found out that it went to Chubb & Sons in New York.

Mr. Matteson:

I move to strike that out, if your Honor please.

The Court:

The motion is granted.

Q. You were paid by the owners of the vessel for your survey?

A. I am not sure of that, but I believe I was, sir; I was paid for it but I am not certain who it was from.

Q. Did you observe when you made a survey of the vessel that the feed line to the small generator on the port side of the engineroom was connected to the bottom to a trap or drain like this which has been marked a part of Exhibit 17?

A. What?

Q. I asked you did you observe that the gasoline feed line that led to the small generator on the port side of the engineroom was connected to the bottom of a trap or drain such as the one which is a part of Exhibit 17?

A. I can't remember that; I can't remember a detail like that.

Q. You are familiar with this kind of a drain?

A. It is a strainer body, I take it to be.

Q. You cannot tell us whether or not at the time you observed that feed line it was connected to the bottom of a trap like this?

A. No.

Q. If you had noticed that you would have put it in your report?

Mr. Underwood:

I object to that as speculative.

The Court:

Sustained.

Q. I show you this paper and ask you if that is your signature at the bottom?

A. Yes; sure that is my signature.

Q. Is that your handwriting on that page, too?

A. Yes.

Q. There are several questions on the page and the handwriting constitutes answers to the questions, is that right?

A. I don't remember anything about that, but if something is there as being said by me I would want it correct. That's an opinion there, isn't that an opinion?

Q. Yes, it is.

A. Well, I think it is right, and I haven't said anything different from that.

Q. I am not suggesting that you have, but these are your answers to these questions, is that right?

A. Yes, sir; I don't recall them but that is my signature there.

Mr. Matteson:

If your Honor please, I would like to make a formal offer of this paper. I realize that under the ruling you made sometime this morning that probably it will be excluded, but I would like to make the formal offer, and if it can-

not be admitted then I would like to have it marked for identification so that it will be a part of the record.

The Court:

All right; let it be identified now. Out of the regular order of procedure that has been announced, you wish to make the offer at this time?

Mr. Matteson:

Yes, your Honor.

Mr. Underwood:

I object to it on the ground that it calls for an opinion of an expert and is not proper cross examination, and I have not called him as such expert.

The Court:

I have permitted cross examination along the line indicated by question number 1 in this written sheet. Question number 3 calls for an answer which is contrary to the ruling I have previously made, therefore I exclude the instrument insofar as question 3 is concerned.

Mr. Matteson:

We appreciate that that is in accordance with your ruling this morning.

The Court:

It speaks for itself insofar as I think Question number 1 is pertinent, so I think the purport of the ruling will be carried into effect if I deny your application to admit that in evidence.

Mr. Matteson:

Yes.

The Court:

All right.

Mr. Matteson:

Then may we have it marked for identification at this time.

The Court:

Yes.

(Thereupon the document above referred to was marked Libelants' Exhibit 120 for Identification.)

Mr. Matteson:

Now, if your Honor please, there is one other thing, and I do not want to elaborate on or attempt to re-open the question that we argued this morning, but I would like it to appear on the record that there are a number of other questions exactly along the same line that I would like to have asked, but which I did not feel I could do under your Honor's ruling.

The Court:

All right.

Mr. Matteson:

And I would also like to make it clear that my position will be that, inasmuch as Mr. Underwood has objected to the examining of this witness as an expert on whom he relies, I shall argue that he is not entitled to rely on him as an expert for any purpose at all.

Re-Direct Examination.

By Mr. Underwood:

Q. Captain Bernard, you have told us about a survey that you are making on a boat now, which you described, I think, as a classification survey; is that correct?

A. Yes.

Q. You said that you didn't find any engineer on the Seminole when you made your examination?

A. That is correct.

Q. Did you send for one?

A. No, sir.

Q. Did you consider that necessary to your work at that time?

A. No, sir.

Q. As I understand your testimony, when you gave answers to Mr. Matteson's questions, you concluded that there was no electricity on the switchboard solely from the fact that you saw no light burning, is that right?

A. Yes.

Q. Do you remember telling me this morning that you saw all four of the gasoline tank valves where they led into the gasoline manifold?

A. Yes, I hand-reached them.

Q. Will you tell us what you mean by that?

A. By hand-reach I mean so you can reach with your hand. Sometimes they are put in a place like off to the side but you could put your hand in there and reach them all right.

Q. Did you say that each one of these valves was hand-reached?

A. Yes, sir.

Q. I show you Libelants' Exhibit 9 which, I think it is fair to say, is a picture taken after the fire on the Seminole, and I call your attention to the aperture in the bulkhead marked number 1, which is a hole through which the gasoline feed line came from number 1 tank; do you note that?

A. Yes.

Q. And the valve was stationed there (pointed)?

A. Yes.

Q. I call your attention to the fact that the hole through which number 2 tank feed line led is marked number 2?

A. Yes.

Q. Do you see that?

A. Yes.

Q. Do you see the shelf there indicated on this picture?

A. I see some kind of an obstruction there; I can't definitely say what it is, but I know you had to go under it.

Q. Do you remember a desk on the forward bulkhead?

The Court:

Let me suggest that you not lead him, Mr. Underwood. Just ask him does he remember a desk there.

Q. Do you remember a desk in the engineroom?

A. No.

Q. Do you remember what was to the right of this shelf which was on brackets shown in Exhibit 9?

A. Is this to port or the center line of the ship.

Q. It is to port. I think it is fair to tell you that.

A. You are asking me about something to starboard.

Q. Yes; what was next or starboard—.

A. There is something like a large obstruction there. If that is shelving it would really have to be for batteries.

Q. You see this in this corner (pointing)?

A. Yes, sir.

Q. Do you see in this photograph, Exhibit 9, a bracket which might be for a shelf?

A. Yes.

Q. Do you remember what that was for?

A. No, I don't.

Q. I think it is fair to tell you that the evidence shows that the batteries were on shelves that were in that corner.

A. All right.

Q. What I am trying to get at is whether you remember what was between the shelf that the batteries were on and the shelves on the brackets shown in Exhibit 9?

A. I don't remember.

Q. You did look at the valve which came to the manifold from number 2 tank, did you?

A. Yes.

Q. And you saw that?

A. Yes.

Q. Do you remember now whether there was anything between where you stood and that valve on number 2 tank when you saw that valve?

A. I can't visualize what it was; I don't know; it is too long ago to remember that.

Q. Captain, is your eye-sight good?

A. I can compete with anyone.

Q. And you were using your flashlight?

A. Yes.

Q. And your examination was conducted after sunrise?

A. Early A. M., yes.

Q. Was the Seminole under any shed?

A. No, sir.

Q. Was she along side any pier with a shed on it?

A. No, not that would obstruct any possible light—any light that could come in came in where it was possible to come through that side window or overhead.

Q. Nothing obstructed the light from the port window or through the skylight in the top of the engineroom?

A. I am not sure whether the skylight was opened.

Q. Light would come through it whether it was opened or not, would it not?

A. Light would come through the side window, I believe, but I don't know where else it would come in there.

Q. Did you see these two valves between you and the valve to number 2 tank when you looked at the valve to number 2 tank?

A. No.

Q. Don't you remember a desk immediately to the right of the valve to number 2 tank?

A. No.

Mr. Matteson:

These questions are leading, if your Honor please.

The Court:

I think they are and I think they are contrary to the ruling of the Court. This is re-direct examination and I think you are confined to non-leading questions, Mr. Underwood.

Q. Do you remember whether or not you followed the manifold to its end?

A. Gasoline manifold?

Q. Yes.

Mr. Matteson:

If your Honor please, I think that is leading, too.

The Court:

No, I don't think that is leading, but I think he has answered it, if I remember correctly.

A. I have answered it, sir.

Mr. Underwood:

I will withdraw the question.

Q. How far did you follow that manifold?

A. The manifold proper from the tanks is almost visible from one standing place, if you wanted to locate yourself on either side of the center line of the ship.

Q. What was at the starboard end of that manifold?

A. A line leading aft from the motors; main feed line.

Q. You remember just one line?

A. Yes; the feed line ran in that direction.

Q. What was at the port end of the manifold?

A. I believe a valve came out of the tank and turned in the end port tank and went in and form a manifold. Of course this is a long time back.

By Mr. Matteson:

Q. Did you see any trays under the tanks?

A. Trays?

Q. Yes.

A. There was some bedding or something there, but I just could not make out what it was, and I made an inquiry of a young fellow that was there, and I asked him if he thought there were trays under there. I asked him if he had been in the engineroom, and he said that he went in there sometimes, and I just referred to him like this, "I believe there are trays under those tanks or the tanks are sitting in some kind of a tray"; I can't remember whether I said it was a whole one or a divided one. I just didn't come to a decision as to that.

Q. Did you consult that boy who was there about anything else in the engineroom?

A. No. He was only a young man and I met him here the other day in the hall; that is the first time I met him since that occasion, and he introduced himself.

(By Mr. Botts):

Q. Well, Mr. Bernard, did you get any information with reference to this boat from anyone or from any source other than your own observation?

Mr. Underwood:

I object to that as immaterial, and it is improper cross examination.

The Court:

Do you mean by that did he base his report that he did make on information other than that which he himself obtained?

Mr. Botts:

That is correct.

The Court:

I think he can answer that. The objection is overruled.

A. No, sir; it is wholly and solely on my own findings, observation and writings.

Mr. Botts:

That is all.

Mr. Matteson:

This survey, as I recall it, was marked as an exhibit and received in evidence for the sole purpose of showing that the report was received. I think that is clear in the record, but if it was offered for any other purpose, then I would want to cross examine about it.

Mr. Underwood:

That is correct. There is no disagreement about that. It was received for the sole purpose of proving that there was a survey.

The Court:

All right.

Mr. Underwood:

Now, if your Honor please, I offer in evidence Exhibit 3-Q for identification, which Mr. Hawkins identified as a copy of the policy of insurance which was taken out following the survey by Mr. Bernard, and I offer it solely for the purpose of proving that the vessel was insured at that time. There is some writing up here that I will not read to you, and which I know my friends will object to, so I do not offer the typewritten "Seminole Boat Company" over to the left in the top of the document.

Mr. Matteson:

I object to it as incompetent, irrelevant and immaterial. I do not think that the fact that this vessel was insured

by any particular company or at any particular time is a relevant fact in this case.

Mr. Botts:

I join in that same objection. I think it is illustrative of no material issue in this case.

The Court:

Ruling reserved.

Mr. Matteson:

It remains marked for identification and ruling on it is reserved?

The Court:

That is correct.

Mr. Matteson:

Mr. Bernard had these pamphlets and he agreed to permit us to have photostats made of them, and I ask that they be marked for identification, and I would like to suggest that two numbers be left open on the record for them.

The Court:

All right; leave two numbers open there for them.

(Thereupon the Hearing was Adjourned to 10:00 A. M. October 9, 1939.)

Miami, Florida, October 10, 1939, 10:00 o'clock, A. M.

Morning Session.

2856 Thereupon: WIRTH MUNROE was called as a witness in behalf of the Respondent Phipps, and being first duly sworn, was examined and testified as follows:

Direct Examination.

By Mr. Underwood:

Q. Your name is Wirth Munroe?

A. Yes, sir.

Q. W-i-r-t-h M-u-n-r-o-e?

A. Yes.

Q. Where do you live?

A. In Coconut Grove.

Q. How long have you live in Florida?

A. All my life.

Q. What is your business?

A. I am a yacht designer and marine surveyor.

Q. How long have you been in that business?

A. Since 1929 for myself.

Q. What was your experience with yachts prior to that?

A. Well, my father was a yacht designer and I spent—of course grew up with him—and worked for him, and have been in and around boats ever since I was old enough to handle it myself.

Q. What work did your father do that you participated in?

A. Well, he was a designee, and I participated in that with him, what work I could do at that age, and also in repairing. We had a small marine railway and did a lot of

rebuilding and installation of motors on both power and sail, and any kind of yacht repairing.

Q. Have you worked or did you work with anyone else prior to going into business for yourself?

A. Yes. I was—what you might call—an apprentice with Mr. N. G. Herreshoff, of Bristol, Rhode Island. He spent all of his winters here for about eight years around our place, and we did some of his designing here, and I was an apprentice to him.

Q. How long have you been familiar with power yachts and had to do with them,—over a period of how many years?

A. That is rather hard to say, because I have been with them all of my life; I don't know just when I started.

Q. About how many years?

A. Well, I would say twenty-five years.

Q. And where has that experience been?

A. Right here in Miami; a majority of it here in Miami.

Q. You said something about being a surveyor; have you been regularly employed by anybody as a surveyor?

A. Well, I have been on call for two insurance companies, and whenever they have a survey to be made I am notified to go out and make it.

Q. What type of survey is that?

A. That is for insurance, and the general condition of the boats; for fire and also for maintenance and operating.

Q. Are you familiar with gasoline motor installations on power boats and auxiliary boats in these waters?

A. I am.

Q. On what type of boats particularly?

A. Particularly on auxiliaries where there are gasoline motors; of course today we are installing Diesels mostly.

Q. Are you familiar with the standards of practice and care followed in the construction and maintenance of power vessels in these waters?

A. I am.

Q. You have spoken of being a designer; what type of boats do you design?

A. Primarily auxiliaries and power vessels, gasoline driven or Diesel driven.

Q. Does that include vessels that have gasoline motors and gasoline tanks?

A. An auxiliary, in my term, is a vessel that is driven both by sail and power, primarily by sail, but they have gasoline motors or Diesel motors installed for auxiliary power.

A. I have.

Q. Have you supervised the construction of any such vessels?

Q. About how many?

A. About seven.

Q. Does that include the installation of gasoline tanks and feed lines and electrical equipment?

A. That includes everything from the time the keel is laid until the trial trip; everything that goes aboard the boat I have to supervise; I supervise practically every bolt and nail which is driven.

Q. Apart from your experience in constructing and surveying vessels that are propelled by gasoline, have you been aboard other vessels propelled by gasoline; if so, in what number?

A. Yes. I have been aboard a great many vessels in this locality. I have made it a business to go aboard as many boats as I could, because from these boats I always learn something that I might use in my own construction later on; so it is always interesting to see what someone else does and the manner in which they do it. I have been aboard, I would say, a couple hundred boats of size, and I can't tell you how many small boats.

Q. By "boats of size" can you tell us what size you mean?

A. From 40 feet up.

Q. By "small boat" you have in mind something smaller?

A. More or less open boats and boat cruisers.

Q. Since the fire on the Seminole have you examined her?

A. Yes.

Q. Have you familiarized yourself with the layout of her motors and her gasoline tanks and feed lines, switchboard and so forth?

A. I have made a very close survey of her construction; I have been aboard her several times.

Q. Did you observe whether or not it was possible to drain all the gasoline from the tanks through the feed line?

A. No, it is not possible to drain every bit of the gasoline from these tanks.

Q. What is your opinion as to the propriety of that condition?

A. The amount of gasoline that will remain in those tanks—and if not gasoline, some fluid in the bottom there—would amount to a very small amount. I figure in the entire four tanks about sixteen gallons. We very seldom—practically never today—put a draw-off at the bottom of a tank. That is put there for preventing any refuse or any small amount of water that is condensed from getting into our feed line. In these particular tanks any small amount of water in the bottom of them would lay in that V section around the edge and form a seal against any gasoline going through there. Gasoline being lighter than water, naturally it will float on the surface of the water.

Q. In your opinion were these tanks so constructed as to be a proper installation for a vessel of that class?

A. I would say that they were quite proper.

Q. Have you calculated the capacity of these tanks?

A. Yes, sir.

Q. What did your calculation result in?

A. Each tank contained 491.79 gallons. That may very a little bit, but it is very close. The tanks are 42 inches in diameter and they are practically seven feet in height. Of course there is no seven feet capacity there.

Q. In reaching that figure have you made proper allowance for the concave shape of the bottom?

A. I have, and also for the set-in of the bottoms where it is set in the side.

Q. Did you observe the comparative size of the filling line and the vent line?

A. The filling line was a two-inch pipe; the vent was half inch pipe.

Q. What is the purpose of the vent?

A. The vent is to carry off the air from the tanks as the fuel is put in. It is also to prevent any sealing when the fuel runs in, and the air naturally has to come back into the tank as the fluid runs out.

Q. Is there any reason why the filling pipe should not be four times as large as the vent pipe?

A. Yes. The filler pipe naturally has to be large to accommodate the flow of fuel or liquid as it goes into the tank, to prevent any flowing back or any dripping in the line, and especially over the filler pipe; and the vent doesn't necessarily have to be as large as the filler pipe because there is only air passing out of the vent line.

Q. Assuming that you are filling the tanks with a full stream of gasoline through the filling line, is there any reason why the half-inch vent line cannot discharge the air as fast as the gasoline comes in?

A. Air can be compressed and will naturally pass through a smaller pipe at the same rate that fluid will run down a two-inch pipe. There is another reason for having a small vent.

Q. What is that?

A. That is that when a tank is partly full it will—what we say—breathe, due to the change in pressure in the outside of the vessel or the difference in temperature

between day-time and night-time. The air is forced in or sucked back through this vent, and by keeping it as small as possible it prevents any heavy air or moisture-laden air from being sucked back into the tanks at night and condensing on the inside of the tank and getting water in with your gasoline.

Q. Do you mean to say that the smaller the vent the less condensation?

A. The less chance of getting condensation in the tank.

Q. In your opinion was this installation proper insofar as the size of the filling pipe and the vent pipe were concerned?

A. Yes, sir; it was perfectly proper.

Q. Did you observe any drip pans under the gasoline tanks?

A. Yes; there are drip pans under all four tanks.

Q. Will you describe how many pans there were and their general characteristics?

A. There are two pans under the four tanks. There are two tanks in each pan.

Q. What are the pans made of?

A. The pans are made of iron sheet steel, the exact thickness I don't know, but it is about three-sixteenths, I believe, or at least that weight. They are about four inches deep and naturally the width of the tanks; they are square on the upper or outer ends of the compartment, and they have a round end in the center; in other words, the number one and number two tanks are sitting in one pan and number three and number four tanks are sitting in another pan.

Q. Numbering them from the port—

A. Numbering from the port side.

Q. In your opinion were they of proper design and properly installed?

A. They were quite proper in design and they were properly installed.

Q. Have you been able to ascertain whether or not these pans had an overboard discharge?

A. No, I haven't been able to determine where the drain went to. There were drains in both pans but the pipes leading from that vent were destroyed due to the fire and wrecking, and I cannot determine where they went to.

Q. What did you see of the pans that causes you to say that there was something leading from them?

A. There is a pipe connection with a piece of broken pipe in it, or was in the rounded end of each pan.

Q. That is the inverted—

A. That would be near the center.

Q. The inverted end of each tank?

A. Yes.

Q. Where were these fittings with respect to the square opening in the engineroom bulkhead?

A. They were directly behind that square opening.

Q. From your examination could you ascertain what was attached to these openings prior to the fire?

A. You mean the openings in the pans?

Q. Yes.

A. No, I couldn't say, except that there was a pipe screwed into it.

Q. Were overboard drains in your opinion necessary from these pans?

A. Well, as long as there was no leak in the tanks there was no necessity for any drain to drain off any condensation or water that might possibly come from the outside of the tanks, gasoline having a tendency to keep the tanks cooler than the atmosphere at times.

Q. Did you observe how the tanks themselves were secured or held in place in the tank compartment?

A. Yes. These tanks sat on a framework of four by fours in the pans. There is a four by four going all the way around the outside edge of the pans, fitting snug into it, and there is a center-piece running athwartships or the

length of the pan or the length of the pans, running all through the middle, and in this was cut a groove for the lower edge or bottom edge of the tank to sit in.

Q. How deep was the groove?

A. Oh, about half an inch.

Q. How did the groove conform in shape to the tanks?

A. Well, it is circular, so that the entire lower edge of the tanks set right into the groove. Of course this framework wasn't circular so that the groove ran across the four by fours.

Q. You mean the tank sat on a square base and the groove was only made in that part of the square base where the bottom of the tank came in contact; is that right?

A. That is what I am trying to imply.

Q. How about any other supports that you observed?

A. There were vertical supports between the tanks; there were three of them, with a spreader running fore and aft, which was notched out to fit the size of the tank; the lower spreader is about one foot above the pan and the upper one—I can only assume—was maybe a foot below the top, but that upper one has fallen down, and it was badly charred, so I couldn't examine it; it was badly charred and had fallen down on the lower one.

Q. Have you had some photographs made to show the conditions of which you have been speaking?

A. Yes, I had some photographs made.

Q. You went there with the photographer?

A. Yes.

Q. That was last May?

A. I believe it was at the last session; yes, it was in May.

Q. Now I show you a photograph and ask you whether or not that is one that was taken of the Seminole tank compartment, or a portion of it, at that time?

A. Yes, that is a photograph which I had the photographer make of the port end of the tank compartment.

Q. Will you describe to us from what point it was taken and in general orient us so we can understand it?

A. That photograph was taken looking directly down into the compartment.

Q. And what is this white substance at the bottom of the photograph?

A. That is a part of number one tank; that is the side of number one tank.

Q. Just mark on there "number one tank".

A. (Witness complies.)

Q. Now what bulkhead is this on the right where the rivets appear?

A. That is the forward bulkhead of the tank compartment.

Q. Will you please write on there "forward bulkhead"?

A. (Witness complies.)

Q. Then what is this bulkhead at the top of the photograph?

A. That is the port side of the vessel.

Q. Will you please write "port side" on that?

A. (Witness complies.)

Q. Then this, of course, at the left margin of the photograph is the bulkhead between the tank compartment and the engineroom?

A. Yes.

Q. This we see at the bottom is the bottom of the tank's compartment?

A. That is the bottom of the tank compartment. There was still water there; it wasn't pumped out at the time this photograph was taken.

Q. So there is water at the central portion of the photograph?

A. Yes.

Q. Now I call your attention to apparently a beam of some kind; will you tell us what that is?

A. This beam running through the lower center part of the photograph is the framework inside of the pan on which the number one tank sat.

Q. Will you write the word "beam" on there, please?

A. (Witness complies.)

Q. Now what is this article that is in the photograph below the beam and actually to starboard of the beam, between the beam that you have marked and the number one tank?

A. That is a center stringer that runs athwartships through the middle of the pan.

Q. That is also a beam?

A. Yes.

Q. Will you write the word "beam" on that?

A. (Witness complies.)

Q. You have spoken of a groove in which the tank sat. Can you indicate that on the photograph?

A. Yes. You can see it finely outlined in there (pointing); this is the outside of the groove (pointing), and there (pointing) is the inside of the groove. This was all full of ash and stuff.

Q. Suppose you draw an arrow at one end of the groove and at the end of the arrow mark the word "groove".

A. (Witness complies.)

Mr. Underwood:

I offer this in evidence.

Mr. Matteson:

No objection.

The Court:

It will be admitted.

(Thereupon the photograph above referred to was marked Respondent Phipps' Exhibit 5-J.)

(By Mr. Underwood):

Q. I show you another photograph. Was that also taken of the general part of the tank compartment, with the camera pointing approximately straight down?

A. This was taken in practically the same position as the other one, of the same part of the vessel.

Q. This is the number one tank?

A. Yes.

Q. Is this the forward bulkhead?

A. That is the forward bulkhead at the right-hand end of the photograph.

Q. Does the groove appear also?

A. That groove here is very pronounced, because I had it cleaned out; it is shown there coming clear around under the forward side of the pan.

Q. Will you just draw a line with a pen all the way through the groove, starting over here at the right and then going to the left, and then mark it "groove"?

A. (Witness complies.)

Mr. Underwood:

I offer that.

The Court:

Let it be admitted.

(Thereupon the photograph above referred to was marked Respondent Phipps' Exhibit 5-K.)

(By Mr. Underwood):

Q. I show you still another photograph. Was that taken at the same time?

A. Yes, this photograph was taken at the same time as the others.

Q. Will you tell us where or about what portion of the boat?

A. This is of the tank compartment, showing the space between the number one and number two tanks and the after bulkhead.

Q. Indicating number one tank and number two tank?

A. Yes.

Q. And this bulkhead which appears in the upper left-hand corner of the photograph is the bulkhead between the tanks and the engine-room?

A. Yes.

Q. You have spoken of wooden members. Do you see any in that photograph?

A. This here in the center, running diagonally across the photograph, is the remains of one of the upright columns.

Q. Was that upright in the Seminole?

A. Yes.

Q. I will draw an arrow to it and mark it—what is the proper name for it?

A. It is a stanchion. You can also see in this photograph the remains of the lower piece or spreader that went between these two stanchions running fore and aft between the two tanks, to separate the tanks.

Q. As that installation was made, will you tell me whether or not number one tank and number two tank were both in contact with that thing that you call the spreader?

A. Both number one and number two tanks were touching that.

Q. Was that spreader shaped in any way to conform to the tank shape?

A. Yes.

Q. I will draw an arrow to that under which you have indicated as a spreader and write on it "spreader".

A. All right.

Mr. Underwood:

I offer that photograph in evidence.

Mr. Matteson:

No objection.

The Court:

It will be admitted.

(Thereupon the photograph above referred to was marked Respondent Phipps' Exhibit 5-L.)

Q. Now, bearing in mind that construction, Mr. Munroe, in your opinion were these tanks properly tight and secure?

A. They were perfectly secure. I know of no better way of holding them in there. These stanchions or uprights were fastened to the base that sat in the pan and the tanks were entirely tied together, so they couldn't upset without all of them upsetting.

Q. In your opinion could they move at all with the normal vibration of such a vessel?

A. No. The tanks had a very large base and the lower end of the tank was set in a groove, and they couldn't shift, so there would be no vibration at all. These tanks could have very easily sat there without any vibration whatsoever, with the amount of offshore work that she did.

Q. Was there any means of access for a man into the tank compartment that you could observe?

A. No; only by removing the center plate in that bulkhead between the compartment and the engine room.

Q. Do you know what type of construction was above the tank compartment prior to the fire?

A. I haven't any way of telling what was above the tank construction. There might have been hatches above there, and there may have been space where a man could have gotten in.

Q. Is there any way of positively telling now?

A. There is no way of telling now what form of construction was over the top of these tanks.

Q. Assuming that a man could not get into that tank compartment to inspect these tanks without taking out that plate with force, in that part of the engineroom bulkhead, tell us whether or not in your opinion that was a proper construction.

A. That was a proper construction.

Q. Was there any need for access to the tank compartment to test the tanks?

A. No, because these tanks could have been tested in other ways without having to see the actual tanks themselves.

Q. How, for example, could you test these tanks without getting into the compartment?

A. You can put a hydrostatic test on them.

Q. How laborious or troublesome a job would be?

A. No job at all. All you have got to do is to put a riser on the filler pipe and plug the vent pipe; put a riser on both of them and fill this riser. The riser can be the height of whichever test you want to put on, according to the maximum pressure that you want to put on.

Q. Would such a test be an adequate test?

A. Yes.

Q. Is it customarily or frequently used?

A. It is very commonly used.

Q. Could you tell by such test whether a tank leaked or whether or not it had a margin of safety?

The Court:

What is a riser?

The Witness:

A vertical pipe.

(By Mr. Underwood):

Q. By putting a riser on the filling pipe you have in mind another piece of pipe connecting to that and going up straight in the air?

A. Yes. That riser would give added pressure to the bottoms of the tanks, whatever distance you want it. You can get any pressure at the bottom of your tank that you desire by merely increasing the height of the pipe, and you could determine just what factor of safety you want

to use. You know what the normal pressure would be on the tank without any riser, and with a riser you can either double or triple [illegible] at distance from the top of the tank to the bottom; you [illegible]uld either double or triple the pressure.

Q. Have you calculated the pressure at the bottoms of these tanks, assuming that they are filled with gasoline?

A. Yes, sir. The normal pressure at the bottom of these tanks filled with gasoline would be 2.22 pounds per square inch.

Q. Assuming that they were filled with water, what would the pressure be?

Approximately three and one-half pounds.

Q. What is the formula for calculating pounds of pressure per square inch; with water, first?

A. We used half pound to the foot of rise, or depth.

Q. In other words, a vessel filled with water a foot high will have a pressure at the bottom of one-half a pound to the square inch?

A. Yes.

Q. And a vessel filled with water two feet high will have one pound?

A. Yes.

Q. And so on?

A. Yes.

Q. The pressure at the bottom varies according to the—

A. The pressure on the bottom varies according to the density of the liquid contained in the tank. If you put mercury in there you would have a great deal more pressure on the bottom than would be the case with gasoline.

Q. These tanks were seven feet high?

A. Yes, and forty-two inches in diameter.

Q. In order to subject them to a hydrostatic test, giving them twice the pressure at the bottom of the tanks as they would normally have when full, how high a riser would you have to have?

A. Another seven feet.

Q. By adding seven feet—

A. You double the pressure at the bottom of the tank, irrespective of the diameter of the pipe.

Q. Just so that we may have some idea of this 2.22 pounds per square inch pressure, can you tell us what the ordinary pressure on a garden hose in Miami is approximately?

Mr. Botts:

I object to that—

A. In other words, from 40 to 50 pounds.

Mr. Botts:

I don't think that is material, if your Honor please.

The Court:

I am frank to state that I do not know whether it is or not at this time.

Mr. Matteson:

I don't know how the witness could know unless—

The Court:

I will let it remain and will determine later whether I should strike it.

(By Mr. Underwood):

Q. Did you observe the concave and convex ends of these tanks?

A. I did.

Q. Which is properly the bottom of such a tank?

A. The concaved end.

Q. In these tanks was the concave end up or down?

A. Down.

Q. Why is that properly the bottom of such a tank?

A. Because a grooved surface as that was, with a head on it towards the pressure, is the strongest form of support, the same as a bridge.

Q. Does the stability of the tank in place form a part of the consideration in determining which should be the bottom?

A. Yes. You couldn't very well put a convex end of the tank down and expect the tank to stay there without considerably more bracing. With a convex end you have a rim, which is square and forms a perfect brace.

Q. You said, "convex end down"; did you mean convex or concave?

A. Concave end down.

Mr. Matteson:

I don't think his testimony is very clear on that.

The Witness:

I am just a little bit mixed up in the use of these two words. I know the difference, but it is hard to put the right one in the right place. It depends on whether you are looking on the inside or the outside of the tank too. You might use the words "ends of the tank", I suppose.

Q. As the tanks were installed the bottom was the concave end?

A. That is right.

Q. I think that is the phrase that was used by the Libelants' witnesses. Now with the concave end down it is quite obvious that you have a flat bottom?

A. You have a rim; a rim that is perfectly square, and you could set it on most any flat surface and it would set upright without any support whatsoever.

Q. Have you ever seen in any boat a gasoline tank of that type installed with the other end up?

A. I never have; I have seen them on their sides too, but I have never seen them with the convex end down.

Q. Did you observe the rivets at the bottoms of these tanks?

A. I did.

Q. Can you tell me whether or not they were welded?

A. They are apparently not welded.

Q. Can you tell me whether or not they were soldered?

A. Around the bottom they were soldered. I assume from what little bit you can see—there were places all the way up to the top where a small amount of solder is still visible.

Q. Where?

A. On the seams and around the rivets of the side seams.

Q. Vertical seams?

A. Vertical seams.

Q. What would be the effect of fire on the solder?

A. Fire would melt the solder; solder has a very low melting point.

Q. How do you account for the fact that you found solder around the bottom seams and not towards the upper end of the vertical seams?

A. There was ash and stuff around the bottom of the tank for approximately 20 inches to two feet, and the solder wasn't melted in that section, and up above the heat got to it and the solder was burned off and ran down.

Q. As you examined these tanks, will you tell us whether the rivets in the bottom were soldered?

A. The rivets in the bottom seam showed an indication on the inside of being soldered, that is, inside of the bottom rim.

Q. How about the rivets on the outside of the bottom; could you tell?

A. There were small pieces of solder there; some of it has flaked off with rust. When I first examined the tank it was quite plain.

Q. In your opinion are the rivets soldered on the outside of the bottom?

A. Yes.

Q. How about the vertical seams?

A. They were soldered too. Of course, as I explained, most of that solder on the outside of the tank has been flaked off by rust, but when that tank was first removed there was no flaking and there was still signs of the original paint; there were still signs of the red lead paint around these tanks where the fire had not burned off, but since then the tank has flaked and the "air" has removed any indication of the paint or the solder.

Q. In your opinion was welding necessary on such tanks?

A. Not necessary for that use.

Q. What is the purpose of welding?

A. For strength.

Q. In your opinion were these tanks strong enough for their purposes, bearing in mind the pressures involved, without welding?

A. They were plenty heavy enough for the use that they were used for, put to; they were strong enough for a great deal higher pressures than ever applied to them.

Q. As a matter of fact, was soldering necessary in your opinion for tightness?

A. It wasn't necessary, absolutely necessary, but it was a good safety factor; it eliminated any possible chance in future of any leaking in the tank.

Q. Did you observe the relation between the bottom edges of the cylindrical sides of the tanks and the bottom edges of the bottom of the tanks?

A. Yes. The side plates of the tank projected down below or beyond a flange at the bottom.

Q. By about how much?

A. I would say roughly one-eighth to three-sixteenths.

Q. That left approximately a rectangular space?

A. That left a small space in between the two, so that the two didn't come flush.

Q. Was that space filled with anything?

A. That space was filled entirely with solder; there were a few places that were not quite filled; there was some solder that might have come on during the fire or heat.

Q. In your opinion was that space filled with solder prior to the time of the fire?

A. It was.

Q. In your opinion was it necessary to caulk the seams of these tanks?

A. Well, it is customary in the building of such tanks to caulk them if they are going to be put under any pressure, but if they were soldered afterwards and they knew they were going to be soldered or going to be galvanized afterwards, there was no absolutely necessity of caulking.

Q. What is the purpose of caulking; tightness?

A. To make the seams tight.

Q. How far apart were these rivets?

A. These rivets all over the tank, both the vertical seams and the bottom, were practically one inch apart; one inch to one and one-sixteenth of an inch.

Q. Approximately what was the diameter of the rivet hole?

A. That is pretty hard to tell. I assume that it was approximately half inch or a little less. They normally would be between three-eighths of an inch to half an inch rivets.

Q. In other words, in your opinion is that proper spacing for rivets for tanks of that type?

A. That is plenty close enough for a tank of that type.

Q. In your opinion would riveting at that distance apart make a gasoline-tight tank?

A. I see no reason why it should not; I believe it would.

Q. Considering of course the pressures involved and tanks of that size?

A. The pressure is so little in tanks of that size, tanks of that use.

Q. As to their strength, were the tanks proper in your opinion?

A. They were quite proper; more than proper and more than necessary.

Q. What can you say about the cylindrical shape of the tanks as bearing upon their strength?

A. A cylindrical object is about the strongest form of tank you can make; a sphere would be stronger, and next to that is the cylindrical tank.

Q. What is the thickness of the material?

A. Approximately three-sixteenths of an inch.

Q. And what material is it?

A. Steel.

Q. Was it galvanized?

A. It was originally galvanized steel.

Q. In your opinion is that a proper type of material and proper thickness of material for tanks to be used for gasoline in such a vessel?

A. In my experience that is plenty sufficient, quite sufficient.

Q. Did you observe that the bottom seams of these tanks were singly riveted?

A. They were singly riveted.

Q. Have you ever seen such a tank for gasoline double riveted at the bottom seam?

A. Never; I have never seen a gasoline tank or water tank double riveted.

Q. What is the purpose of double riveting?

A. Double riveting is applied where extreme pressure are going to be used on a tank.

Q. Is double riveting for strength or tightness?

A. Double riveting is put in to get more shearing, rivet shearing surface.

Q. Is that another way of saying it is for strength?

A. It is for strength, yes.

Q. In your opinion was any additional strength necessary for such tanks with such pressures?

A. There was no need for any additional strengthening.

Q. Could you tell whether the rivet holes were punched or drilled?

A. That I could not do; it doesn't matter. A rivet hole that is punched and then reamed is just as good as a drilled hole. We specify in punching holes that they be punched smaller than the diameter of the rivet and then reamed; also reduced to remove any distorted material in punching. Either a drilled or punched hole could be uneven, in pitch or in alignment.

Q. Can you tell anything about the way these rivets line up or don't line up, whether they were punched or drilled?

A. No. As I just stated, either a drilled or punched hole could be out of line.

Q. Considering the small pressures involved in these tanks, in your opinion does it make any difference whether the rivet holes were punched and reamed or drilled?

A. No, it doesn't make any difference in a tank of that kind.

Q. Now as to the size of the tanks, what can you say about the propriety of having tanks of that size?

A. For a vessel of her size a five hundred gallon tank—we will call it five hundred—is not too large in my estimation.

Q. You have already expressed the opinion, I believe, that they were amply strong for this use?

A. Yes, they were amply strong.

Q. Have you made any test of one of these tanks?

A. I have.

Q. Which tank was it?

A. Number 4.

Q. When did you make it?

A. I made it the later part of May.

Q. Where was the tank when you tested it?

A. The tank was removed from the compartment by a derrick.

Q. Were you there?

A. I was there.

Q. Was it done under your supervision?

A. It was.

Q. Where was it placed?

A. The tank was taken out and placed on a derrick barge.

Q. What did it rest on?

A. I had the tank set on two four by fours for the purpose of getting the bottom edge up above the deck of the barge so that the inspection could be made of the bottom while the test was being made.

Q. Did the tank stand upright?

A. Yes, on its own bottom without any bracing.

Q. Then what did you do?

A. I proceeded to put a water connection, hose connection, in the drain-off, which is in the bottom of the tank, or the bottom of the seat.—

Q. You mean at the place where the feed line came out of the tank?

A. Yes.

Q. What did you put there?

A. I put a hose connection there, screwed a hose connection into that bushing that was already there, and then in the filler hole at the top I inserted a pipe plug in the two-inch opening. I screwed a pipe plug into that and connected the hose from the city line pressure to the tank and proceeded to fill it with water.

Q. How did you fill it with water?

A. The tank was filled up to the very top; I had it filled so that the water was just even with the vent hole in the top. I watched that while the thing was being filled, to see that the tank was absolutely full.

Q. When you filled it with water, what did you do?

A. While this tank was full of water at that level I thoroughly examined the bottom edge, the side seams and underneath it, using a flashlight—by using a flashlight I could get around all sides of it. I also rapped the sides of the tank with a hammer to jar any possible corrosion loose; in other words, I tried my very best to make it leak, but it did not leak.

Q. Did you find any leaks?

A. I found only two leaks.

Q. Where were they?

A. One was in the cast iron bushing in the drain on the feed line.

Q. Where the feed line valve was?

A. Yes. And that crack was put in there when we screwed in the bushing.

Q. How do you know that?

A. Because as I screwed the thing in I heard it crack.

Q. Who was screwing it in?

A. My helper.

Q. Where were you?

A. I was standing right alongside of him, watching him to see exactly what he did, and I heard the thing crack when he tightened up on the fitting; and the other leak was in the plug that was applied to the filler hole in the upper end of the tank, and that was due to the rusty condition of the threads.

Q. Could you get a tight fitting in?

A. No, we couldn't without using some shellac, which we didn't have at the time. We didn't bother with it because we knew we could check that.

Q. Did you find any leaks in any seams or at any rivets anywhere?

A. There were no leaks whatsoever in any seam or any rivet in that part of that tank.

Q. Then what did you do after that?

A. After testing it with a normal supply or quantity of water in it, I screwed in a half-inch length—a ten-foot

length of half-inch pipe—screwed that into the vent hole in the very center of the top, upper end, and then filled this to the top with water.

Q. Did you find any leaks?

A. At this point there were still no leaks. I went over it the same as I did in the first place; I used a hammer and checked every seam and every rivet and there were still no leaks.

Q. About what pressure was there at the bottoms of these tanks with that ten-foot riser coming above the vent filled with water?

A. That ten-foot riser would give you eight and one-half pounds.

Q. At the bottoms of the tanks?

A. Yes.

Q. After that riser test, what did you do?

A. After that test I removed the riser and inserted a half-inch plug in place of it, so that there was no air in the tank whatsoever. The water was right about flush with the very outside tank, and in this hole I inserted a half-inch pipe plug and then I turned on the complete city pressure.

Q. Approximately what was that?

A. The city pressure out there is approximately 45 to 50 pounds.

Q. Did you find any leaks?

A. I went over the tank in the same manner as before and there were still no leaks. After that I got up on top of the tank and exerted considerable pressure with my heels, practically kicked the tank with both heels which gave the same effect as a hydraulic ram.

Q. And you jumped on top of the tank and—

A. I did more than jumped; as I came down I kicked with both heels.

Q. What effect, if any, did that have on the tank?

A. The effect was the same as a hydraulic ram.

Q. After that did you find any leaks?

A. I then examined the entire tank and I could still find no leaks, but one-half of the tank had been bulged due to that excessive pressure.

Q. Before you made that test was the concave shape of the bottom of the tank a fair curve or not?

A. Yes.

Q. After you jumped on the tank what did you find had happened to the bottom?

A. That half of the bottom of the tank was bulged out.

Q. Did you examine the rivets and seams thereafter to see if they leaked then?

A. I examined every part of that tank, including the seams and the rivets, and I could find absolutely no evidence of a leak in that tank anywhere.

Q. Excepting of course the two leaks that you have already mentioned?

A. Yes, which I already knew about before I even started.

Q. You say that the one near the feed line outlet was in the bushing?

A. That was a reducer bushing. You see, the hole in the tank had a two-inch fitting which was put in there when the tank was originally built, and that was reduced, I believe, to three-quarters. The hole was two inches, but it had a three-quarter inch reducing bushing on it; it was made of cast iron.

Q. You said something about hearing that crack when it was being set up.

A. As we screwed the new fitting, or this hose connection into the bushing, that pipe threading is not tapered down, and if you exert enough pressure in turning these things up, you can split one of these cast iron bushings.

Q. Did you observe whether or not that is what happened?

A. That is exactly what happened; because when they get old, as that one was—they are made of cast iron, and

we know and knew at that time, that we had to set the thing up much tighter than we ordinarily would have.

Q. For what reason?

A. Because of the improper threads that were in there due to rust.

Q. What do you mean by "improper" threads"?

A. The threads having been used for some time, the threads were naturally pitted and rusted, and they wouldn't make as perfect a connection as a new fitting.

Q. Is that the same condition that you found at the filler line opening in the tank?

A. Yes. That was exposed ever since the fire, and that was even in worse shape before the—

Q. Have you examined this valve on exhibit 2?

A. Yes, I have seen that several times.

Q. Will you tell us whether or not that valve is a proper type of valve for such an installation?

A. That is a perfectly proper type of valve; it is a standard Globe valve.

Q. Can you tell whether or not that valve is tight now?

A. That valve is tight at the present time.

Q. How do you tell?

A. By trying to suck through it.

Q. Have you done that?

A. I have.

Q. Have you been able to suck anything through it?

A. No, sir.

Q. What does that indicate to you?

A. It indicates that the plug and the seat in here (indicating) are still in usable condition.

Q. Tight even today?

A. Tight even today.

Q. Now there has been some suggestion of an expansion of the union on this fitting; are you able to detect any expansion of that union?

A. That is pretty hard to say. I could put a pair of calipers on it, but even at that it would not be correct,

because this fitting has been cut; it shows teeth marks of a Stilson wrench on it, which would naturally increase the diameter and it would have a tendency to swell the outside.

Q. Now assume that it has been expanded; can you tell whether or not it was tight?

A. I could tell if I could get it apart; you can tell whether the thread is tight, whether the pipe is all the way up to the shoulder on the inside.

Q. Now there are two parts to that, a male part and a female part; is that correct?

A. That is right. This is the male end here and this is the female end here. You see, there is no shoulder on the inside of that at all. You can see in this end of it here, the female end; you can see the threads on the inside of the fitting, indicating that all of the threads were not used up in setting up the pipe.

Q. What does that indicate?

A. It is possible to set this thing up further and naturally make it tight. The same thing applies to this one on the male end, but not as much as on this other one.

Q. Are these tapered threads or not?

A. All pipe threads are tapered slightly; it is done for the purpose of making a tight joint; as you screw the thing in its naturally increases in diameter and forces the pipe against the other threads.

Q. Does that have a widening effect?

A. Yes, and that could in time have a tendency to spread these (indicating).

Q. What is indicated to you by the fact that the male end is not all the way up to the shoulder of the female?

A. That the pipe was tight; that the joint was tight, that all above the threads was entirely used up.

Q. In your opinion was that a tight joint on the Seminole before the fire?

A. A perfectly tight joint, if it was made up in that manner; if it was made up in that manner, naturally it was tight.

Q. You have seen Libelant's Exhibit 11, these two valves, which we call drain valves or draw-off valves—you have seen these and examined them, have you not?

A. Yes, sir.

Q. Do you understand that there was a line from the feed manifold that led athwartships and ended up in these two valves which were sometimes used for drawing off gasoline from tanks into a can?

A. Yes; that is what I gathered from testimony given here.

Q. From your experience with vessels in these waters, will you tell me whether or not that is a proper condition on such a vessel as this?

A. It is very common; it is a very common practice on boats of her type; it is quite proper; it is a necessary part of the vessel.

Q. Are there any reasons why that fitting should be in the engine-room rather than some place else?

A. Well, the drawing off of any quantity of gasoline should be naturally under the supervision of the engineer, who is the man who is experienced in the handling of gasoline, and it should be his duty to know how much gasoline has been removed from his main tanks or from any other tanks on the vessel, so that it would naturally be a prudent place to put it in the engineroom where he had supervision of it. Also, in that type of vessel it was necessary to prime your motor with raw gasoline, and the best place to get that raw gasoline was from some place in the engineroom.

Q. Are there other considerations besides the fire hazard that must be taken into account in determining such matters?

A. Certainly, yes.

Q. Tell us about that; what are they?

A. As I explained, this motor had to be primed to start; even when it was hot it had to be primed.

Mr. Matteson:

If the Court please, I object to this because this witness, as I understand it, has never had any experience with the engines of the Seminole, in attempting to operate them. He cannot possibly speak of his own knowledge with respect to them; he is only drawing some conclusions here, and I move to strike them out.

The Court:

Well, it is an assumption on his part. I think that the testimony ought to be withheld until he is qualified.

(By Mr. Underwood):

Q. On what, Mr. Munroe, do you base your thought that these engines had to be primed even when hot?

A. Because of the experience that I have had with—not necessarily a Winton motor—but with motors of that same period and—

Q. Same size and type, you mean?

A. Not necessarily the same horsepower, but motors of nearly the same size but of different makes, 20th Century and the old Buffalo—

Q. At that time was it customary to have chokes on motors?

A. When that motor was built of that size they didn't use a choke.

Q. Do they use chokes on motors of that size today?

A. No.

Q. In your opinion, from your experience, was it necessary to prime that motor to start it even when it was hot?

Mr. Matteson:

I object to that, if your Honor please; I don't think the witness is qualified to speak with respect to the motors of the Seminole under the circumstances.

The Court:

I think this goes to the quality of his testimony. You may cross examine on this.

A. Yes.

(By Mr. Underwood):

Q. Will you tell us whether or not in your opinion the possibility of having to prime these motors to start them, even when they are hot, is something that should be properly considered in determining whether these draw-off valves for gasoline should be in the engineroom or somewhere else?

A. In order to prime the motors, I believe it took in the vicinity of a pint—I think that was the testimony that was given, or a quart to prime both motors, and that is considerable gas to be used, and naturally it took a quart priming can that you had about that size, which has been described in the testimony—it only held about one quart or less, and naturally it had to be refilled as soon as the motors were primed.

Q. Why is it necessary to have a ready supply of gasoline for priming motors; what are the other considerations that touch upon it besides fire hazards?

A. Other hazards due to the failure of the motor, stalling of the motor, where the motor might have to be started in a hurry in approaching a dock or going through or under a bridge, or approaching a bridge; you have your hazards on the external part of the vessel; you might strike a dock or run into a shoal or go on a lee shore, and might have to start your motor hurriedly, and naturally a motor will start much quicker when primed than it would start ordinarily.

The Court:

Mr. Munroe, you spoke of what the testimony was. Did you hear all of the testimony or did you read the testimony?

The Witness:

I heard all of the technical testimony.

The Court:

If you take any testimony as the basis for any of your testimony, I wish you would refer to it. If you take any part of the testimony as a basis for your answers, I wish you would state just what it is.

The Witness:

I will if I can remember it; if I can remember who said it.

The Court:

You don't have to state who said it; just state the factors you take into consideration as a basis for any expert opinion that you may render. I am not asking you to do that now, but I am merely making this observation for your guidance in the future.

The Witness:

Very well.

(By Mr. Underwood):

Q. All things considered, can you tell us whether or not in your opinion it was proper to have such an arrangement as this in the Seminole?

A. If there was going to be any free gas used in the boat, it was better to have it right where it could be easily obtained and under the supervision of an experienced man.

Q. How many of these valves had to be opened in order to draw off gasoline?

A. Two besides the ones on the tank.

Q. In such installation as you have seen before, have you seen one or two?

A. I have never seen but one.

Q. Have you examined these two valves that form Exhibit 11?

A. Yes, I have looked at them.

Q. In your opinion are they proper valves for such use?

A. They are perfectly good Globe valves; it is Crane 150; that is the water or steam pressure it can be used for.

Q. Is there any similar marking on the other valve?

A. On the other valve is 125; that is the maximum amount of pressure for steam.

Q. Do I understand that these figures, 150 and 125 indicate the pressures that these valves are supposed to withstand under normal conditions of steam?

A. That is correct, of steam.

Q. What pressure would they be subjected to when closed on the Seminole, assuming that the tanks were full?

A. Not over two and one-half pounds.

Q. I haven't asked you to calculate the margin of safety, and I won't. What type of valves are these; let's take first Crane 150?

A. This is a metal to metal Globe valve.

Q. Is that what is called a ground-seat valve?

A. This is a ground-seat valve on this. No, I will take that back. I have examined it now. That is a composition seat valve, the Crane 150.

Q. The 150 valve is a composition seat valve?

A. That is correct.

Q. Have you been able to tell from your examination what kind of composition the seat is made of?

A. No.

Q. Do you remember opening that valve with Captain Patten?

A. Yes.

Q. Did you observe the residue of the stuff that came out?

A. I did, but I am not a chemist and I couldn't tell what the ingredients was that that stuff was made of, that that seat was made of.

Q. In your opinion is a composition seat valve a proper valve for a gasoline line?

A. Providing the composition is proper—providing the composition is a proper one for resisting gasoline.

Q. Is there such a composition seat?

A. There is.

Q. Is it made by a reputable maker who makes them?

A. It is made by Crane and also by Jenkins.

Q. Is it used for gasoline customarily?

A. This is the valve that they recommend for the use of gasoline.

Q. There is a special seat made for gasoline?

A. Yes, there is a special composition seat made for handling gasoline?

Q. We have had some discussion as to the relative merits of metal ground seat and composition seat valves; what is your opinion?

A. Either one in my opinion is good. I think that the composition seat, if the proper composition is used, makes about as tight a joint as it is possible to use. I notice that Crane always uses the composition seat in his heavier pressure valve. This one is marked 150, and it is a composition valve. The ground seat is plenty good enough for the low pressure. It will take care of any sand or grit that gets in there. It would easily pulverize most anything that gets in there except possibly a diamond; and will naturally break that grit down until it will make a perfect seat instead of moving up in the joint, in the compound of the composition seat.

Q. In your opinion, were these valves proper valves?

A. They were perfectly proper.

Q. Assuming, Mr. Munroe, that the line which led from the feed manifold to these drain valves led back athwartships from the starboard end of the manifold, through the

sides of a tank which was situated above the square opening in the forward engineroom bulkhead, and was supported by these sides, in your opinion was that adequate support for such a line made up as this line was?

A. I would say that it was perfectly adequate; it was a three-quarter inch line, and the spacing of these supports was quite sufficiently close.

The Court:

We will take a five minute recess.

(Recess.)

(By Mr. Underwood):

Q. Now, Mr. Munroe, before the recess we were talking about supports for the drain line that led to these valves. I want to get it clear. In your opinion was that support from the sides of the tank adequate suport for a line of that size and length to insure it against leakage due to vibration?

A. Yes. The supports were plenty close enough together. Of course, I couldn't tell what the size of the hole was through there; I assume that it was a neat fit.

Q. I will ask you to assume that it was, Mr. Munroe.

A. All right.

Q. Something has been said about the union between these two drain valves that form Exhibit 11, and I think there has been some testimony that it was installed the wrong way. What have you to say about that?

A. I really can't say that there is any wrong way; the customary manner of setting up a union of this type is to make it up against the line; in other words, as the nut is turned it is turned to the right to set the nut up to the thread behind it.

Q. Against the line that is already in place?

A. Yes.

Q. And that has a tendency to tighten up the joints that are already in the line to which it is being added?

A. That are already in the line, and that is the way it is made up; the metal end of this thing is on the main line.

Q. Assuming that there is a column of gasoline in the pipe, does it make any difference which way the union is made up, whether in one direction or the other?

A. After it is tight the pressure on both sides is equal, so that it wouldn't make any difference if the nut is set up tight.

Q. Have you examined the plug of the ground-seat valve, the valve marked Crane 125?

A. Yes, I have examined this.

Q. In your opinion is that a proper plug?

A. This is a proper type of plug and seat.

Q. Some attention has been called to the condition of the contact rim or surface of the plug; what have you to say about that?

A. There is a small flaw in this plug; whether it was present prior to the fire or not cannot be determined; that could easily have occurred due to corrosion since the fire, due to the heat, and even if it was there prior to the fire it is on the upper end of the plug, above where the plug seats.

Q. Do I understand that you say that the crack in the contact surface is above the point where the plug comes in contact with the seat?

A. That is correct.

Q. That being so, could there be any leak or is it physically possible to have had any leak in that flaw?

A. No possibility.

Q. Have you tested that valve to see whether it is tight now?

A. No, I haven't. It could easily be loose now due to the extreme temperature that was applied to it, the heat of the fire warping the metal.

Q. Some comment has been made about the angle between the plug and the seat of that valve. What is your opinion as to that?

A. Well, this is quite a sharp angle. I would say offhand, without measuring it, that it is sharper than a 45-degree angle. This is not a straight faced angle; it is rounded. You can get anywheres from 45 to more of an angle.

Q. I think the suggestion has been made that the needle type valve is the preferable type. What is your opinion as to that?

A. A needle type valve is not a proper valve for a cut-off valve, due to its increased area of contact between the plug and the seat, there being more chance of grit or foreign matter lodging in there and keeping the valve from seating properly. A needle type valve is used only for throttling purposes, where you want to graduate the flow of fluid through the valve.

Q. In your opinion is the angle on that valve a proper angle for this use?

A. It is quite a sufficient angle.

Q. Assuming that there was a glass gauge in the engineroom and that it ran from a T-connection in a manifold which was packed with asbestos packing, will you tell us whether or not that is a proper fitting for an engineroom of that type of boat?

Mr. Botts:

I object on the ground that there is no evidence that there was any asbestos packing.

The Court:

I don't think so. Does the evidence establish that?

Mr. Underwood:

My recollection is that the witness Schlappi so testified.

The Court:

I will overrule the objection and let the assumption remain in, and if the assumption is not well-founded, of course the opinion goes out.

Mr. Underwood:

Does Mr. Botts have any contrary recollection?

Mr. Botts:

I think he said it was wicking.

A. The use of a glass type gauge in such an installation is quite proper; it is the only correct manner of measuring his fuel consumption or the fuel remaining in his tanks. A gauge of that type is used on all steam boilers where greater pressures are used, and it is in common use on a great many vessels, even in gasoline today. On several boats that I have been on I have seen them in use, and I have installed them myself. There is one boat here in town right now that has, I believe, four sight gauges in her fuel line, right in her engineroom.

Q. Some question has been raised as to the accuracy of my recollection as to the nature of the packing in the fitting, so I will ask you the same question again, and ask you not to assume anything about the packing, and will ask you whether or not such a device as a glass gauge is a proper device to have in an engineroom of a vessel of this type?

A. A glass gauge is perfectly proper.

Q. I believe you have already given your reasons in an answer to a previous question?

A. Yes.

Q. Is wicking a proper type of packing?

A. That depends on what you are speaking about. If you are speaking about cotton wicking, that is one thing. Wicking is made up in several forms. There is asbestos

wicking, cotton wicking and graphite wicking; also flax wicking. Wicking is anything that is made up with fibre or threads.

Q. I take it that your opinion is that some wicking is all right and some wicking is not?

A. That is correct.

Q. What is the particular hazard, if there is one, of a glass gauge for gasoline?

A. The only hazard of a glass gauge is that it is easier to break, but where this particular gauge was installed I can't say, because there is no indication as to where it was. If it was up against the wall in back of a panel and protected on either side by rods or strips of wood or anything which would prevent the accidental striking of it by a wrench or anything in the engineroom, either by a human element or something swinging—a gauge of that type is usually installed with a cut-off valve at both top and bottom.

Q. Do you know whether this one was?

A. This one had a cut-off valve at the bottom I am sure, because I found a part of the lower end of it; I don't know what was on the upper end.

Q. You have not seen the upper end?

A. No. That is a standard valve manufactured for that sole purpose.

Q. In practice is gasoline ordinarily in the gauge?

A. No. You open your valve and allow a column of fluid to rise in your tube, and you measure it, and then after you are through with that you can drain it back into the line and remove all gasoline or fluid from your gauge.

Q. In your opinion is it necessary and proper equipment to have cut-off valves in gasoline feed lines near the carburetors?

A. That depends a great deal on the head in the line; it is not absolutely necessary.

Q. What is the ordinary purpose of having cut-off valves in a gas line near the carburetor?

A. Only when working on the carburetor and disconnecting the gasoline from the carburetor, to disconnect the gasoline from the carburetor.

Q. Now in this installation I will ask you to assume that there were cut-off valves in the gas line at a point below the manifold and at a point below the strainers where the feed lines led from the manifold down toward the bilge; that would be very close to the forward bulkhead of the engine room—assuming that there were shut-off valves in each gasoline line so situated, in your opinion was that sufficient for that line?

A. It was.

Q. Assuming that these valves were shut, would there be any head of gasoline on the carburetor?

A. There would be no head whatsoever.

Q. Why is that?

A. If the valves were tight and allowed no pressure to come through from the tank, in order for fluid to run out of the pipe below the valve, it would be necessary for air to rise in the pipe, and in this particular case the fuel lines ran down under the floor and floor timbers and then came up again to the carburetors. So that the rise of pressure on that line from the cut-off valve—which I assume the position of—was very low.

Q. Now is there any common experiment by which you can illustrate your testimony that there would be no head of gasoline on the carburetor with the valve shut tight?

A. Yes. You can take an ordinary garden hose or tube, or anything of that nature, and submerge it in water, or in any fluid, and put your thumb over the upper end of it and nothing will drop out of it except one or two drops at the lower end, and the smaller the tube or pipe the less chance of that.

Q. Did you find any drip pans under the carburetors?

A. No, sir, there were not.

Q. In your opinion were they necessary on an installation of this type?

A. They were unnecessary in a carburetor of that type; the carburetor wasn't chocked; it had no choke on it.

Q. Before we go any further, suppose you explain to us the function of a choke in a carburetor that is—

A. The purpose of a choke in a carburetor is to close off the air intake considerably and force or suck more raw gas through the jet of the carburetor; in other words, it breaks the flow through the tube rather than through the air intake and sucks raw gas up into the manifold.

Q. Where you have a carburetor with a choke, and you use the choke, Mr. Munroe, will you tell us whether or not it increases the flow of gas into the carburetor?

A. Yes, because you pick up a heavier flow of raw gas, and that hangs on the side of the manifold, the upright side of the manifold, and afterwards that will fall down and run back down the manifold into the outlet pipe of the carburetor.

Q. Is there any distinction between the two types of carburetors, those with chokes and those without chokes, as to the nature of—

A. Yes, there is.

Q. What is that?

A. Well, in a carburetor that has no choke you never get raw gas into the manifold.

Q. What is your conclusion from that as to the need for a drip pan?

A. There is no heavy fluid to run back and flood the carburetor. Even if there was a drip pan under there it only holds a certain amount, and when it is full it runs over and goes into the bilge.

Q. I believe you stated that these carburetors on the Seminole was of the type that didn't have a choke on them; is that correct?

A. That is correct.

Q. Now, there is some evidence in this case of a drip pan arrangement, that is, an attachment back of the in-

take of the carburetor to drain any dripping back into the carburetor or into the cylinders of the motor; are you familiar with such a thing?

A. There is such a drip pan on the market, and I have used them.

Q. How recent a development is that?

A. The last five or six years only.

Q. Is it in common use?

A. It is not in common use now. It is not very satisfactory, because unless you open the valve in your suction line to allow the gas to be sucked back into the manifold—it would only work the time you leave that open after the gas is out, and it allows too much air to go through the carburetor and it causes a poor mixture in your motor.

Q. Does it work when the motors are not in operation?

A. No, it doesn't.

Q. Were there backfire arrestors on the motors of the Seminole?

A. There were?

Q. Did you examine them?

A. I did.

Q. In your opinion were they proper?

A. Quite proper. Of course they are not entirely there; part of them has been destroyed, but what was left of them indicates that they were quite satisfactory.

Q. Of course they serve no purpose when the motors are not running, do they?

A. No, sir; they serve no purpose when the motors are not running.

Q. Now, Mr. Muhroe, the feed line from the tanks to the carburetors of the Seminole was made up of brass pipe and fittings, as I think you observed. In your opinion is that the proper material and type of material to use for an installation of this kind?

A. That is perfectly satisfactory material to put on an installation of this size.

Q. Does copper tubing in your opinion have any superior advantages?

A. No; it has no superior advantages; it has only the advantage of being quicker to install, which in modern days prevents labor expense.

Q. In your opinion where copper tubing has been used, what has been the actuating reason.

A. Simplicity of construction is the principal reason and the saving of labor costs.

Q. Is copper tubing cheaper?

A. Considerably cheaper.

Q. In material as well as labor?

A. In material as well as labor. Of course it does reduce the number of joints, and that is what cuts down the labor charge.

Q. Is it possible to make a satisfactory and a tight installation with brass tubing and fittings such as was used on the Seminole?

A. It is perfectly possible to make a tight fitting in a brass pipe, to make a tight joint in a brass pipe.

Q. How does that compare with copper tubing as to strength and stability?

A. Brass pipe is really stronger; it has less chance of being crushed by someone striking it or by being pinched under a floor beam. You are apt to get a hole in copper tubing, and copper tubing is quite a little softer, and it is more subject to wear and chafing.

Q. In your opinion is either one more subject to injury from vibration than the other?

A. No; neither one. Either copper tubing or brass pipe can be distorted or broken by vibration. Copper tubing is softer, and of course has to set up a different vibration to that of a harder substance, and naturally the difference in size of the harder substance changes the vibration.

Q. Considering for the moment solely the question of vibration, in your opinion was the gasoline feed line

system on the Seminole a proper installation, properly protected against vibration?

A. Where I could see it, where it still remains, I would say that it was.

Q. In your opinion when does the effect of vibration show up?

A. During operation of the boat.

Q. Assuming that the Seminole had been laid up for 60 days when this fire occurred, and that she didn't show any leaks up to the time she was laid up—would you expect to find any effect of vibration coming into evidence while she was laid up?

A. There would be no effect of vibration while she was laid up, and if there were no leaks at the time she was laid up there, then certainly no leaks would start from vibration afterwards.

Q. In your experience is it customary to solder joints in brass pipes for gasoline feed lines?

A. I would never recommend it.

Q. Why not?

A. There comes times when a line has to be taken down. I will admit that a soldered joint is tighter; maybe it is about as tight as any as you could possibly put in there, but in order to disconnect these threads it is necessary to use a blow torch on the joints, and one doesn't want to use a blow torch on a gasoline line.

Q. What is the customary method in your experience of making up joints in such a feed line?

A. You mean what would be applied?

Q. What, if anything, do you apply?

A. I would apply principally orange shellac.

Q. Do you always use that?

A. Well, under some conditions we don't, depending a great deal on the pressures; sometimes it is necessary to use litharge and glycerine mixed with shellac.

Q. Will you tell us whether or not some such preparation is commonly used in making up such joints?

A. All gasoline joints that I have ever seen shellac has been used on them.

Q. Can you tell from your examination of the joints in this line what, if anything, was used?

A. No, I cannot tell from these exhibits here; these exhibits have been burned and the shellac was destroyed under fire.

Q. Can you tell whether or not anything was used?

A. No, I couldn't tell whether anything was used.

Q. Assuming that the proper compound of shellac and whatever substance you have in mind was used in the making up of these joints, is its absence from the joins today any evidence that it was not used?

A. No.

Q. What would happen to it in a fire?

A. It would burn up; it would be burned up and destroyed.

Q. In your opinion was there any need for coils in this feed line?

A. No, there was no necessity for a complete coil in this feed line.

Q. What kind of feed lines do you put coils in sometimes?

A. Only in copper tubing. In this line, wherever there was an angle it acted the same as a coil; a coil is put in there to relieve the strain on the connection.

Q. In view of the distance which I take it you have observed from the feed manifold to the carburetor, would you anticipate any effect of vibration on the feed line?

A. No; they seemed to be properly installed under the engineroom floor.

Q. Now, as to the ventilation of the tank compartment, we will assume that it was ventilated by only the holes in the top of the bulkhead through which the filler line ran and the holes at the bottom of the bulkhead thhrough which the feed line ran, and the spaces which you have observed under the tank compartment, and the

spaces between the edges of the pans and the bulkhead —you have observed these spaces?

A. I have.

Q. In your opinion was that adequate ventilation for this compartment?

A. It was. There was a chance for complete circulation of air around these tanks, especially the space between the pan and the bulkhead, which was a matter of about two inches; you could stick your hand up through there, and there was quite sufficient space below the pan to the floor.

Q. I will ask you to assume that the engineroom was ventilated by two cowl ventilators, which I think you have seen on the boat—is that right?

A. I have.

Q. And that they didn't extend into the bilges but only a short distance below the deckhead, also by a skylight and by an engineroom hatch, which I think you have also seen; is that right?

A. I have seen the opening.

Q. You have seen the openings in the steel top of the engineroom, have you?

A. I have.

Q. Also by two windows, one on the starboard side leading into the alleyway and one on the port side. I will ask you to say whether or not ventilation from these sources was adequate ventilation for an engineroom of the size of that on the Seminole, containing the gasoline installation which he had?

A. These openings would supply a great deal of air to that engineroom, in fact, a great deal more, due to those windows, than in the average engineroom or engineroom compartment of any other boat. I would say that there was quite a sufficient circulation of air. Any wind passing in the windows, although the floor was below the ceiling of the windows, it would have a tendency to curl and go

down around the floor and circulate across the floor in through the bilges.

Q. How does that ventilation compare with the ventilation on other gasoline propelled vessels?

A. This is a great deal more ventilation than on the average boat. Of course boats of her type, where you have large square ports opening directly to the outside of the vessel, you have considerably more ventilation than you will find in the average engine space or compartment of any boats.

Q. Now from your experience, Mr. Munroe, will you tell us whether knife switches are proper for use on a switchboard in an engineroom on a vessel like the Seminole?

A. Knife switches are absolutely correct; I have never seen any other kind of switch used.

Q. Is any other type of switch in common use?

A. No; every switch today, whether it is enclosed or open, is a knife switch.

Q. What is the customary type of switch used on gasoline propelled vessels?

A. Knife switches.

Q. Any boxes around them?

A. No box around them. You will find today, which is a very modern improvement, so-called improvement,—you will find what is known as a dead-throw switch panel.

Q. What is the purpose of that?

A. Merely to protect the engineer or man in the engineroom from coming into contact with a live switch or live contact which is perfectly open behind the panel.

Q. In your opinion do you get a spark from opening or closing a knife switch with an installation of 110 volts, or approximately?

A. In my experience I have never seen a spark occur on the closing of a knife-type switch; sometimes a very small spark occurs when it is opened.

Q. When you say "small spark", how big a spark do you mean?

A. Something that you would have to look for twice to see, unless you were looking directly at the contact.

Q. When that spark occurs on the opening of a knife switch how long does it last; what is your experience?

A. Only just a flash.

Q. Does it go anywhere; does it drop or rise or stay at the poles of the switch?

A. No, no; it only occurs between the blade of the switch and the pole.

Q. How about the location of the switchboard; it was in the engineroom, and I think you have seen the bolts—is that right?

A. Yes.

Q. The bolts that held it in place?

A. Yes. And from these bolts I would say that that was in the proper position in the engineroom.

Q. Assuming that it was where the bolts were in the center of the after engineroom bulkhead,—is that a proper location for the main switchboard with open switches?

A. That was as good a location as they could get in that boat. It was perfectly proper, no matter where it was.

Q. From your experience are switchboards customarily so located?

A. I have never seen a switchboard anywheres but in the engineroom; in fact, it has to be in the engineroom; for instance, you can't run out of your engineroom to open a closed switch when you are starting your generator.

Q. In laying up vessels of the gasoline propelled type, in your opinion is it customary down here to empty gasoline tanks?

A. On small vessels or open boats, where there is no necessity for gasoline to be present, they usually remove the gasoline, but not because it is a hazard so much, but from the fact, due to the small fuel line—in other words, gasoline leaves a sludge, which fills these gasoline lines.

so we remove the gasoline from them for that purpose. In the larger vessels that have a generator, and where batteries are left on the boat, in order to keep these batteries in condition it is necessary to run your generator.

Q. Is it the practice to leave the gasoline in the tanks of the larger vessels?

A. Yes, so that the man who looks after the generator and batteries can operate.

Q. What in your opinion is the proper thing to do in the laying up of a boat of this kind; is it proper or not to leave the gasoline in the tanks?

A. So long as the tanks don't leak and there is no leak in the line, there is no chance for gasoline to leak into the bilges, and a full tank of gas is much safer than an empty tank.

Q. Have you heard of or are you familiar with Lloyd's rules for the construction of yachts?

A. Yes, I am familiar with them.

Q. Have you ever used them in the construction or design of a vessel?

A. I have never used any of them in any of my construction, no.

Q. Is it customary in this locality to build vessels or keep vessels up to the requirements of Lloyd's rules?

A. It is not necessary in this locality to build or equip a vessel according to Lloyd's rules. They are applied primarily to vessels of the offshore type.

Q. You mean seagoing vessels?

A. Yes.

Q. Was the Seminole of that type?

A. No, she was not.

Q. Is it customary down here for inland vessels, not of the seagoing type, to live up to Lloyd's rules?

A. No, it is not.

Q. Have you any familiarity with the rules of the National Fire Prevention Association?

A. Yes, I am familiar with them.

Q. I show you this book, Libelants' Exhibit 25; is that what you are talking about?

A. Yes, that is the book that I am familiar with.

Q. Also Libelants' Exhibit 97, which contains as an appendix Libelants' Exhibit 25?

A. I have seen these and read them.

Q. Is it customary for vessels down here around Miami or in Florida waters in your experience to live up to the requirements of these rules?

A. No, it is not customary to live up to these rules.

Mr. Botts:

I object to that and move to strike the answer.

Mr. Matteson:

I join in the objection, if your Honor please; I understand that it is a well established principle that no custom can justify a negligent practice.

(By Mr. Underwood):

Q. Do people generally use these rules as a standard by which to equip their vessels?

Mr. Matteson:

If your Honor please, that doesn't seem to be the question here. It is a question of whether competent people dealing with such problems recognized these as standards. Whether this gentleman was familiar with the rules doesn't seem to make any difference.

The Court:

I understand that the witness is testifying from the standpoint of an expert. I think it is proper for him to answer the question as to whether or not these rules are observed in the architectural construction of vessels in this community as a standard of good construction. I

think that is the intent of the question, so I will overrule the objection.

Mr. Underwood:
Read the question.

(Thereupon the preceding question was read by the Reporter as above recorded.)

A. I don't know of these rules being in the hands of any of the builders around here, with the exception of the large yards.

Q. Do you regard them as the proper standards for vessels of this type?

A. I consider them as a standard of practice where it will apply best in the case that I am using.

Q. What do you use as your standard—

Mr. Botts:
I object to that as being immaterial.

The Court:
I will sustain that objection.

(By Mr. Underwood):

Q. Mr. Munroe, I show you Libelants' Exhibit 24, which is entitled: "E. D. Wright, Bureau For The Prevention of Explosion and Fire on Motor Boats", and so forth. Did you ever hear of these rules before I asked you about them in connection with this case?

A. No, sir. I had never seen them prior to the time that you called my attention to them.

Q. Are they in your judgment proper standards by which to test a gasoline propelled vessel?

A. I don't say that they are proper standards; this is only one man's opinion. My opinion is—

Q. Are these rules commonly used down here?

A. I have never seen them before, so I don't know.

Q. Do you recall what was the nature of the construction beneath the drain pans that were under the gasoline tanks?

A. You mean the supports?

Q. No. Was there any wood in there?

A. There was a wood cushion or something of that nature under these pans.

Q. Have you examined that?

A. I have.

Q. Was it destroyed by the fire?

A. It has been slightly burned but wasn't entirely consumed by the fire.

Q. How about the members that form the cushion on which the tanks sat; were they affected by the fire?

A. These cushions, or four by four frames that were under the pans on which the tanks sat are as new or as in good condition as they were when installed; there hasn't been any fire touching them, there has been no heat applied to them, and when I first opened that compartment there was still red lead paint on those members.

Q. Did you draw from that condition any connection as to the presence of fire or the existence of fire under the gasoline tanks?

A. I would draw from that conclusion that the fire in the engineroom and under the tanks wasn't of any severe nature, because none of these things have been burned to any extent. The floor timbers under the engineroom floor and motor bearers are not badly charred.

Q. By "bearers" you mean these athwartships wooden beams?

A. The four by four pieces on which the main motors sat are not badly charred, to show any indication of there having been a severe fire in the bilge or in the engineroom.

Q. If there were no gasoline vapors in any quantity

in the bilge of this boat would you expect or would you not expect a severe fire at this place?

A. I would certainly expect it. I have seen it in other cases. I know of one case in which the entire bilge of the boat was practically consumed. The frames and the inside of the inside planking and the floor timbers under the floor, above the floor, and way up in the sides of the vessel, between the ceiling and the planking, was badly charred, yet there were very few places above the floor where it showed any signs of fire, so that in going below in her, before opening the floor boards, you never would have suspected that she had been afire.

Q. From the condition of these members are you able to form an opinion as to whether or not there was any severe fire in the bilge of that boat?

Mr. Botts:

I think it is improper to ask a person as an expert a hypothetical question upon subjects as to which there has been no direct testimony.

The Court:

You mean direct testimony to the contrary?

Mr. Botts:

There has been no direct testimony as to this fire, therefore my understanding is that a hypothetical question on that subject is not proper.

The Court:

Read the question.

(Thereupon the preceding question was read by the Reporter as above recorded.)

The Court:

The objection is overruled.

A. From the condition of them I would say that there had never been any severe fire in the bilge of the engineroom or under the tank compartment of that boat.

Q. From your examination of the remains of the Seminole did you observe any evidence of a violent explosion?

A. That is rather hard to determine, because the fire had warped the plates, the bulkheads, and the hatch above the engineroom has been removed; so I really cannot see any place or evidence of an explosion. There are places where the plates have buckled. That could have been done during the fire itself, considering the extreme heat.

Q. Now, Mr. Monroe, bearing in mind all the details that we have referred to about the Seminole, will you tell us whether or not in your opinion in her construction and equipment she complied with the standards for such things accepted and employed by reasonable, prudent men in this locality for similar vessels?

A. From the examination I have made of that vessel, she seems to have complied with all of the necessary safety factors. The installation was proper, and I can find no place in her where there was any flaw or any chance for the leaking of gasoline. The pipe lines are tight and made up properly. Of course there was very little we could see of them. Certainly the tanks were proper. The trays that they sat in were proper and the ventilation seemed to be proper in that boat.

Q. Now assuming that the Seminole had been laid up for two months under a shed at Pilkington's Boatyard, and that on June 24, 1935, when Abel went over and into the engineroom there was no odor of gasoline, was there in your opinion any reason why he should hesitate to close from three to five open knife switches on the switchboard to get lights?

A. There was no reason why he should not close these switches, if he smelt no odor of gasoline, and he struck a match, as I believe the testimony has stated—Mr. Thomas, I believe mentioned that—had there been any gas in her

that match would have ignited it before the closing of any switches. The boat was laid up only two months prior to that in good condition; she wasn't in service—

Mr. Matteson:
It strikes me that the witness is summarizing the testimony here.

The Court:
I think so.

Mr. Underwood:
He is just giving his assumption, your Hoonr.

The Court:
Mr. Witness, if there are other facts developed in the testimony, on which you base a part of your answer, you should state the facts on which you make the answer.

Mr. Underwood:
I think he was doing precisely that, your Honor.

Mr. Matteson:
Do I understand that the question is to be answered over again?

The Court:
Yes, I think he should answer the question again. Strike that answer.

Mr. Underwood:
Read the question.

(Thereupon the preceding question was read by the Reporter as above recorded.)

The Court:
Now answer that question.

A. The answer there is "no".

Q. Why not?

A. Smelling no odor of gasoline, it is perfectly logical that—

Mr. Botts:

Just a minute; he is arguing again, Judge.

The Court:

Let him continue the answer.

A. Well, I personally would not hesitate to close them.

Q. Why wouldn't you hesitate to close them?

A. Because I smelled no odor of gasoline, and knowing that there isn't much spark made by the closing of a switch, or any spark at all by the closing of a switch, there would be nothing to ignite any gas fumes.

The Court:

We will recess now until two o'clock.

(Recess taken to two o'clock, P. M. October 10, 1939—the same day.)

2:00 o'clock, P. M., October 10, 1939.

Afternoon Session.

Mr. Underwood:

Just for the purpose of the record, I suggest that it be recorded that on Friday last the Court, accompanied by counsel for the three parties, who in turn were supported by experts, visited the wreck of the Seminole at Nutta's Yacht Basin and made a general examination. Is that satisfactory and adequate?

Mr. Matteson:

Yes, as far as it goes.

Mr. Underwood:

I don't know whether you want anything further or not.

Mr. Matteson:

I would like it also to appear on the record that it was my understanding that the arrangement which we entered into last March for this examination, was that the boat would be in the same condition when we went there in October as it was at the time we adjourned Court in May. It appears that there was a great deal done in the interim. Since the last session at least one of the tanks was taken out of the boat. I don't know what was done with the others, and tests were made not in my presence, and I want to register on the record my formal objection to that procedure.

Mr. Underwood:

Mr. Matteson expressed that view in a letter which he wrote to me during the summer sometime, and I examined the record to see if there had been an agreement as to that. I found no express agreement as to that. I will say that all that was done was to remove one tank, which the Court and counsel saw on Friday last. The purpose of that was to put the tank in a position where it could be more thoroughly and completely examined, particularly where the bottom of it could be examined, inasmuch as some issue has been raised as to the construction at the bottom of the tank and underneath the tank, and also the test that the witness now on the stand has testified to.

The Court:

Well, any statement that counsel wants to make on the record I think should be made. I do not see any action of the Court called for on it.

Mr. Underwood:

First, we all know that the tank was not permanently removed from the boat, but was put back on the boat, and was there on Friday last for such examination as anybody cared to make. Mr. Matteson used the expression "a good deal was done", and in that connection I will say that nothing was done except the removal of the tank and a test made thereon.

Mr. Botts:

I might state in that connection that my recollection was so clear that it was understood that the tank was not to be moved out of there, that we were to look at the tank and the tank would be removed in our presence, if necessary, but in the meantime the tank was to remain in its status,—my understanding was so clear as to that, that I seriously debated registering my protest to what had been done there by refusing to go to the boat, and I do feel that it would have been better if the boat had remained in its exact status, particularly in view of an issue having been raised here as to the condition of these tanks. I may have a misrecollection of the understanding, but I seriously doubt it. It certainly seems to me that it was hardly the thing to do for the other side to go out there months in advance and take that tank out and learn what the situation apparently was, learning the situation long in advance of any equal opportunity on the part of the fellow I represent. In other words, I felt it so strongly that I discussed or debated very seriously whether it would be proper for me to register my protest by refusing to participate in that examination.

Mr. Underwood:

The record will show and the Court will remember whether there was any such agreement.

Mr. Botts:

I checked it with the Court Reporter. The Court Reporter definitely remembers it, but he didn't take it down.

Mr. Underwood:

I don't know what the Court reporter remembers, but I think it is not unfair, in view of this comment to call attention to the fact that a person, impliedly in the employ of the widow of the deceased Abel but apparently actually in the employ of one or both of my adversaries here, took occasion, while the boat was still hot from the fire, to remove, without permission form anyone, and in effect steal certain equipment from the boat, which remained in possession of my adversaries in this case for many months, as the record shows, refusing to deliver it over to the original owner, the Seminole Boat Company. If there is any criticism in this case along that line, I think it does not lie in the morals of the gentlemen on the other side of the table.

Mr. Botts:

Had we not preserved them, this equipment would have never been before the Court. This equipment is now before the Court in just exactly the condition it was in.

Mr. Underwood:

I don't know whether Mr. Botts is testifying about the exact condition or not. I dispute that statement.

Mr. Botts:

Yes, I am; because they were in my possession from the day after the fire until they were delivered to the Court, and I say they are in the exact condition they were in, and I am willing to be sworn and so testify.

Mr. Matteson:

It appears from the testimony of the witness on the stand that there have been changes in the condition of the tank due to corrosion and the weather.

Mr. Underwood:
Since the fire?

Mr. Botts:
I would like to say now to counsel that I challenge him and I dare him to produce evidence to show that these articles were not in the exact condition when presented in Court as they were at the time we took possession of them. I dare him to try to prove otherwise.

Mr. Underwood:
Of course Mr. Botts has a complete advantage because his representative took them in his custody without our observing them or having any opportunity to determine in what condition they were. I can tell in some measure the difference between the way they now are and the way they were before the fire in April, or the last time anybody on our side of the case saw them.

The Court:
Let's proceed with the testimony. I do not understand that the Court is called upon to rule on anything in this connection at this time.

2929 Thereupon: WIRTH MONROE a witness in behalf of the Respondent Phipps, resumed the stand and was examined and testified further as follows:

Direct Examination (Cont'd.)

By Mr. Underwood:
Q. Mr. Monroe, there are two little details that I want to clear up. You mentioned a crack in the tank fitting which you heard when you connected up the hose for this test that you made in May. Did you examine the crack as well as hear it?

A. Yes, I examined it after hearing the break; I then examined it before I proceeded with my test, and it showed a bright small crack which wasn't there prior to the fitting of the hose connection, because I examined it prior to putting any connection into it.

Q. Will you describe for us the kind of leak that there was in that tank during the test?

A. In the first test, when the tank was just normally filled with water, there was just a slight leakage out of it, a matter of really no consequence; it was enough so that when we wiped it off with a rag it immediately came back again, and you would more or less call it a leakage, but under the high pressure that particular crack did show a stream projecting out from the—

Q. How big a stream?

A. About the size of a needle or common pin point; of course that was only when the extreme pressure was on it.

Q. How about the volume of leakage at the filling connection?

A. At the filler hole it was about the same; of course there wasn't any pressure created on that as there was on the lower one, but you could see it running down the edges of the tank, and it could be wiped off and kept from going all the way to the bottom.

Q. Was there any stream on that?

A. There was no stream at all on that.

Mr. Underwood:

You may cross examine.

Cross Examination.

By Mr. Matteson:

Q. Mr. Monroe, you have described yourself as a yacht designer.

A. Yes.

Q. What educational qualifications have you as a yacht designer?

A. You are speaking of education?

Q. Yes.

A. Well, my education has been along a practical line. My instructions were from my father and as the result of an apprenticeship with Mr. Herreshoff. I do not hold any college degree. It has been a school of practical experience.

Q. You never have studied marine architecture?

A. I have studied it at my own home but not in a school.

Q. What was your father's name?

A. Ralph M.

Q. Is he living now?

A. No, sir.

Q. How long ago did he die?

A. In 1933.

Q. Did he maintain a construction yard or repair yard or anything of that kind?

A. We maintained a small yard.

Q. What do you mean by a small yard?

A. Well, we couldn't handle vessels much over 40 feet in length, or drawing over four feet in draft.

Q. In that yard you say you handled vessels up to 40 feet?

A. We hauled them longer than that.

Q. You say you hauled them; do you mean that you maintained a marine railway there?

A. Yes, that is right.

Q. And the capacity of that marine railway was for vessels of yacht construction of about 40 feet in length?

A. I have hauled vessels on the marine railway up to 47 feet, but of low displacement.

Q. Where was that yard located?

A. On the east of Biscayne Boulevard in Coconut Grove.

Q. Is that yard still there?

A. It has been moved from the original location to another location.

Q. You have the same marine railway?

A. No, it is a new marine railway.

Q. The same size?

A. Yes.

Q. Do I understand you continued your father's business since that time?

A. I have.

Q. Are you engaged in the business of construction and repair at the present time?

A. I am.

Q. Is that with respect to the same class of vessels that you have described, up to 40 to 45 feet?

A. At that particular yard, yes, although I discontinued hauling large vessels, because I don't have the equipment now.

Q. What do you mean by "larger vessels"?

A. Up to 47 feet.

Q. How large vessels do you take care of there now?

A. I am only handling up to about 35 or 38 feet.

Q. Are these wooden vessels?

A. Yes, sir.

Q. Most of them are auxiliary sail vessels?

A. Not all of them; a majority of them are power, entirely power vessels.

Q. How many vessels did you handle there in the past year?

A. In the past year I don't recall—I haven't been at it—I haven't done any of that in the past year; I haven't been in contact with the yard as much as in the years previous. My business has taken me away from Miami.

Q. Is someone else operating the yard now?

A. I have a man there that takes care of it and I only permit him to haul the smaller vessels.

Q. Have you engaged in the manufacture or sailing vessels?

A. The design and construction of them.

Q. What type were they?

A. Auxiliary cruising vessels.

Q. Were some of them not auxiliary?

A. Small launches.

Q. I mean some of them are purely sailing vessels?

A. Some of them are purely sailing vessels, but the majority of the larger vessels were all auxiliaries.

Q. You only handle wooden vessels there, do you not?

A. You will find very few steel vessels in this vicinity.

Q. And none as small as that, I take it?

A. No.

Q. Now, take an average vessel of 40 feet, such as you handled there, with auxiliary equipment; what sort of a motor would she have; how large?

A. You mean the vessels that I would haul at that yard?

Q. Yes; vessels that you worked on there.

A. That depends on the type of boat, whether she is a straight cruising boat or whether she is an express cruiser.

Q. These vessels don't ordinarily have a separate engineroom, do they?

A. In some of them, yes.

Q. What sort of engineroom would they have, where would the engine be placed in an auxiliary vessel such as you handled down there?

A. Such as I handled there they wouldn't. The auxiliary wouldn't have a separate engineroom, no; I thought you were speaking of power vessels.

Q. Where, on these auxiliary types, would the engines be placed?

A. Well, in some they are placed amidships or slightly aft that.

Q. Or in the cockpit?

A. In other cases under the flush-deck aft.

Q. Usually in the cockpit?

A. In the smaller auxiliaries, yes.

Q. You say sometimes in a separate compartment?

A. Merely separated from the balance of the hull.

Q. What sort of a compartment would that be?

A. A compartment large enough to take the motor but not large enough for a man to walk around on; you couldn't do if on a 40-foot boat.

Q. In that type of vessel where would the gasoline tanks be placed?

A. Usually in the wings.

Q. By "wings" you mean either side of the motor?

A. Yes, or under the main deck.

Q. What sort of gasoline tanks do you use in vessels of that type?

A. Usually they are constructed of tin-lined copper or leaded steel, and occasionally tanks similar to these as in the Seminole, but not as large, of course.

Q. How large a tank capacity does the ordinary 40-ft. auxiliary cruiser have?

A. Fifty to sixty gallon, depending on what the boat is to be used for.

Q. In other words, that would be about a little over ten per cent. of capacity of one of the tanks of the Seminole, is that right?

A. Yes; that entirely depends on whether the boat is to be used for coastal work, inland navigation or whether she intends to go on long cruises where she is unable to get gasoline; in that case we put in larger tanks.

Q. The conditions with respect to piping and ventilation would be quite different in that 40-foot auxiliary cruiser from what they were in the Seminole?

A. It would be considerably harder to ventilate such compartment, which is just as important—

Q. You recognize that ventilation of a gasoline boat is highly important, do you?

A. I consider it is one of the important factors in installations of the motors.

Q. May I ask your age, Mr. Munroe?

A. I am thirty-six; I will be thirty-seven next month.

Q. When you say that you worked with your father in his yard, will you tell us just what you did?

A. I did everything that I was asked to do, from carpenter work to rigging, piping and plumbing, and tinsmith work; anything that had to be done, I had to do it.

Q. How many employees did you have in that yard?

A. The maximum at times was six to eight men.

Q. You were one of them?

A. I was one of them, but I never got paid for it.

Q. You spoke of your connection with Mr. Herreshoff; will you tell us just what the nature of that was?

A. I was with Mr. Herreshoff as what would be termed an apprentice. Mr. Herreshoff and my father were very old friends, and Mr. Herreshoff lived with us here in Miami for a matter of eight or ten years.

Q. That is the winters?

A. He spent his winters here, and in the summer I used to spend a month to six weeks with him at the yard in Bristol, Rhode Island.

Q. What would you do up there?

A. I wasn't working or doing any of the actual labor, but I was with him on all of his inspection tours and conversed with him about the type of construction or whatever was being done in the yard; I was offered a job with him, with the yard, as a draftsman that could go from the drafting room to the actual construction. They had no one there that could do that, and I was asked to stay there, but due to my father's health I was unable to accept the offer.

Q. How many summers were you there?

A. I don't recall.

Q. More than one?

A. Yes, I was there five or six summers at least.

Q. You say you had an offer to go into the drafting room?

A. I was asked to go into the drafting room, yes.

Q. You had no experience in drawing, I take it?

A. Only on the work that I had done for my father and for Mr. Herreshoff down here.

Q. You would have had to go into the drafting room and work your way up?

A. I presume that was the intention; they wanted someone who had some structural knowledge, who had a knowledge of drawing as well as construction, and that is more than you find in the ordinary draftsman.

Q. Mr. Herreshoff was a constructor of sail vessels, wasn't he?

A. Not entirely.

Q. That principally was what he did, wasn't it?

A. In the later years, yes.

Q. What do you mean by "later years"?

A. The last ten or fifteen years of his life. He constructed both power and sail; in the early years he was in steam.

Q. It was during the last years that you had experience with him, I take it?

A. That is right.

Q. What sort of vessels have you designed?

A. Principally auxiliary sailing vessels or cruising vessels.

Q. What types?

A. Just what do you mean by "type"?

Q. You say you designed auxiliary sailing vessels; I want to know what they are like.

A. Some were centerboard boats, and some were keel boats, some ketch rigs and some schooner rigs.

Q. How big were they?

A. 60 and 65 feet.

Q. You have no qualifications for designing other than practical experience, the experience that you testified about?

A. I consider that quite a big asset.

Q. You say you didn't go into the drafting room at Herreshoffs; did you ever serve time in a drafting room anywhere?

A. I have never served time in any drafting room except my own.

Q. You say that you are called on for insurance surveys by two other companies which have interests here in Miami, is that right?

A. Yes.

Q. How many such surveys did you make in the past year?

A. I am not sure just how many, about a dozen maybe.

Q. For what period of time have you been averaging as many surveys as that?

A. Well, I have been surveying for one company for three years and for another one about two years, or more. I have forgotten just when I did start. The first survey I did I know was in 1929 or 1930.

Q. Were these surveys that you made for them principally damage surveys?

A. No, they were new policies.

Q. What rules do you recognize as standard practice in making a survey of a vessel for insurance purposes?

A. I don't know that I observe any particular rules.

Q. I didn't ask you what you observed; I asked you what rules you regarded as standard?

A. I don't consider any of them standard.

Q. Then you make your own rules?

A. I apply my observations to the conditions of the vessel and the type of vessel; I don't think you can apply a rigid set of rules to all vessels under all conditions.

Q. You know that there are many sets of rules that have been made up to deal with such conditions, do you not?

A. Yes, I know of the existence of them.

Q. Do you consider that all these insurance companies expect of you, when you examine a vessel, that you should use your own experience?

A. They must, because all I send to the insurance company office is a detailed report of what I find on a boat, and with recommendations as to any change in the ventilation, and if they don't care to accept the boat as she is, then they write me and ask that certain changes be made before the policy will be written. I have recommended in several cases that policies be not written on certain boats, and they accepted.

Q. You say that you are familiar with these rules of the National Fire Prevention Association?

A. I know of their existence, yes.

Q. Referring now to Libelants' Exhibits 25 and 97.

A. I know of their existence, but I don't know them word by word.

Q. Are you generally familiar with the contents of them?

A. I can't say that I am generally familiar with the entire contents of them.

Q. Do you refer to them from time to time in examining vessels?

A. I have no copy of them.

Q. You have no copy of them?

A. I have no copy of them, so I don't refer to them.

Q. You refer to no rules whatever when you examine a boat?

A. That is right. I will say one thing: that no vessel that I surveyed has had any accident aboard her.

Mr. Matteson:

I move to strike that out; it is not responsive to any question.

The Court:

I think it is subject to being stricken. The motion is granted.

Q. Isn't it a fact, Mr. Monroe, that these rules or other rules represent standards which you at least attempt to approximate?

A. I probably do approximate them, yes. Probably my ideas coincide with the rules set apart there, but I can't say that these rules can apply to all conditions, especially here in this climate.

Q. What is there different about the climate of Florida and the climate anywhere else with respect to the safety of gasoline vessels?

A. These rules are set down to accommodate vessels in a cool climate, where your enginerooms are usually closed up, with the exception of your cowl ventilator; with no ports on the side of the vessel at all. Here we have a warmer climate and gasoline vapors will evaporize much easier, and you can leave your ports open on the side of the vessel.

Q. It is true, I take it, that because of the warmer climate you do get a greater evaporation of gasoline here, is that right?

A. That is right.

Q. And evaporation of gasoline is a source of explosion on auxiliary vessels; is that correct?

A. That is correct. The more it is diluted the less chance of explosion.

Q. And the only reason you think that there is any difference is because you think there is greater opportunity to keep the windows open down here than in other places, is that right?

A. It is possible. It is possible to ventilate down here easier than in the north.

Q. Of course it is true that gasoline vapor is considerably heavier than air?

A. Yes.

Q. It is true that it tends to collect in low places of a vessel, is it not?

A. That is correct.

Q. Then if it were necessary to have bilge ventilation in one part of the country, it would be just as necessary to have bilge ventilation in another, would it not?

A. I think you could get ventilation into the bilge without necessarily having a cowl ventilator going all the way to the bilge.

Q. Do you happen to know where the Seminole was built?

A. No.

Q. Isn't it a fact that she was built in the north?

A. She may have been. I didn't examine the records to see where she was constructed. I presume she was built in the north, as she was of steel construction.

Q. If gasoline vapor tends to accumulate in low parts of a vessel, that would certainly be just as true in Florida as anywhere else, wouldn't it?

A. It would settle here just as well as it would in the north, yes.

Q. The warmer the climate the more quickly it would settle?

A. Yes.

Q. There would be a greater discrepancy between the density of gasoline vapor in warm air than gasoline vapor in cold air?

A. You are getting into testimony out of my line; I am not a chemist.

Q. It is equally true that the air that you do get into the windows, with such ventilation here, would likewise be warm air?

A. Yes, it would be warm air.

Q. It is also true, is it not, that a very small percentage of gasoline fumes mixed with air would create an explosive mixture, wouldn't it?

A. I don't know.

Q. You don't know anything about that?

A. I don't know anything about the combustibility of gasoline; I am not an expert on combustion.

Q. I find here in one of the exhibits, Exhibit 24, a statement that only three per cent. of gasoline fumes mixed with air, makes a mixture that might be explosive. Do you agree or disagree with that statement?

A. I am not in a position to make any statement concerning that at all.

Q. You do not question the accuracy of that?

A. I don't question the accuracy of it; he probably studied it; I haven't.

Q. Now you agree that it would have been possible to drain all the gasoline from the tanks of the Seminole, do you not?

A. That is correct.

Q. You agree that there was a V-shape angle in the bottom of these tanks around the concave bottoms, all around, where whatever liquid was in the tank would remain continuously?

A. That is correct.

Q. You agree that in any gasoline tank you get a certain amount of water due to condensation or other causes?

A. That all depends on the size of your vent pipes.

Q. Now, Mr. Monroe, you were explaining to us this morning how the size of vent pipes affect the amount of condensation in the gasoline tank. I didn't quite follow you on that. You say that there is expansion or contraction of the liquid in the tank due to change in temperature?

A. No, not in the liquid.

Q. What is the expansion?

A. It is the air that is in the tank; a full tank will not breathe, so to speak; it will not breathe through a vent pipe, though an empty tank will.

Q. You say that if you have a smaller pipe for a vent you won't get as much condensation?

A. No, because she don't get the volume of air. It would be a slower process and you will have more chance for the air to condense on the way as it goes in and runs back out again.

Q. The area of a small pipe is less than the area of a big pipe?

A. That is correct.

Q. So you really have more condensation surface in the larger pipe?

A. You would.

Q. As far as the amount of air that goes in or out of a tank, due to contraction or expansion, the amount of air would be exactly the same, whether you had a large pipe or a small pipe, wouldn't it?

A. It depends on how long a period, and the difference between pressure between the outside and inside of the tank.

Q. You don't have any idea that a vent pipe half inch in size would restrict the ingress or egress of air from a tank such as a five-hundred gallon tank on the Seminole, do you?

A. These were two thousand—

Q. I am talking about one tank.

A. It would restrict it to a certain extent; it would slow up the flow.

Q. You think a half-inch pipe would slow up the flow?

A. It would slow up the flow of air going in and out of that tank.

Q. A half inch hole is a big hole?

A. Yes.

Q. For air; is that true?

A. It is sufficiently large enough for some uses, for that vent pipe.

Q. Is this contraction or expansion a slow or quick process?

A. Well, it is a slow process.

Q. It would be very, very gradually slow, wouldn't it?

A. It might occur over a matter of several hours, yes.

Q. So that the movement of air in or out of a vent pipe to accommodate contraction or expansion would be very slow at best, wouldn't it?

A. Yes.

Q. Do you really think that under these circumstances it would be slowed up to any extent by the diameter of a half-inch pipe?

A. Yes, indeed; a little more than a two-inch pipe.

Q. Whatever air went in would be the same air, whether it was a small pipe or a big pipe, wouldn't it?

A. Yes, it would be the same air after it got in there.

Q. If it was moist air in one pipe it would be moist air in another pipe?

A. I still don't believe that the same amount of moist air will go through a small pipe as will go through a large one, even in the same length of time.

Q. How much flow of air per minute do you think would be necessary to accommodate a half-inch vent pipe on the Seminole to take care of the contraction on expansion which might take place there?

A. I don't know; I haven't attempted to figure it up.

Q. Don't you think that a half-inch pipe would take care of a complete change of air in a tank such as on the Seminole gas tank, in five minutes?

A. No, sir.

Q. Now with respect to the drip pans under the four tanks; I think you called them drip pans, did you not?

A. I think that is correct.

Q. What did these drip pans rest on?

A. They rested on angle supports and also the walls primarily, and the walls of the bulkheads.

Q. The angle iron supports were attached to what?

A. Partly to the bulkhead and partly to the stanchion underneath.

Q. You say that the angle supports were fastened to the bulkhead?

A. I believe they were partly to the bulkhead and partly to these longitudinal angles running at the bottom of the bulkhead.

Q. How were they fastened to the bulkheads?

A. I didn't observe close enough to see whether they were riveted or bolted.

Q. Do you see any fastenings in this picture—I show you Exhibit 9—between the angle supports and the gas tanks and the bulkhead?

A. I can't determine any in that photograph, no; there are several rivet heads and bolt heads showing there, but I don't know where they go.

Q. Can you say positively whether or not these angle iron supports to the tanks were fastened in any way to the bulkheads?

A. They were indirectly fastened to the bulkhead, but apparently were fastened to the angle that runs horizontally along the bulkhead, and the bulkhead was also fastened.

Q. I don't understand what you mean.

A. I mean that the supports were fastened to the angle iron.

Q. You mean at the bottom of the—

A. No, the longitudinal stringer across the bulkhead at the bottom of the tank.

Q. You mean they were riveted to the bulkhead; you mean to the bulkhead itself?

A. The bulkhead was also fastened to that angle.

Q. Now, you are talking about the foundation?

A. I am talking about the foundation of the tanks; the trays.

Q. Right down at the bottom of the ship.

A. Below the bottom of the ship.

Q. Close to the bottom?

A. The trays that the tanks sat in.

Q. I am talking about the angle supports.

A. Angle iron supports to what? I guess I am talking about one thing and you are talking about another thing.

Q. I will try to clear it up. The trays rested on angle irons which ran fore and aft?

A. That is correct.

Q. What spacing was there between them; have you any idea?

A. I don't know; I didn't measure it.

Q. About a foot?

A. It might have been.

Q. Those fore and aft pieces that were directly under the trays were supported by something to keep them off the bottom of the ship?

A. That is correct.

Q. What were they supported by?

A. They were supported by the framework that held the bulkhead on the after side.

Q. They were supported by vertical angles, were they not?

A. Vertical angles, and also the longitudinal angles that ran athwartships of the vessel to the back, and the bulkhead which was the forward end of the engine-room; the forward end of the tank compartment didn't go down to the floor; it only went as far as the main floor.

Q. These vertical angles went down to the bottom of the ship?

A. Yes.

Q. How did they fasten there?

A. I didn't examine them close enough to find out; I assume they fastened to the frame.

Q. You say they also fastened to another angle; is that what you say?

A. There was another angle crossing the bulkhead.

Q. Is that on the interior of the tank compartment?

A. Directly under the tank compartment, on the compartment side; it doesn't show in the engine-room.

Q. Was that angle fastened to the engine-room bulkhead?

A. I believe it was.

Q. I show you this exhibit, Libelants' Exhibit 9, and ask you to show me where these fastenings come there on the engineroom side.

A. I can't say just where; I don't know whether I can show you or not. I see here a row of rivets running horizontally across there, and here is a row of rivets here (indicating).

Q. These (pointing) are below the bottom of the opening that went under the tank compartment?

A. I see the hole now, but I didn't see it at first. The rivets are up in here (indicating), and there may have been rivets in back of this thing before this stiffner was put in here.

Q. Can you show us that angle in any of the photographs which are exhibits in this case?

A. I haven't looked for it; I don't know whether it would be possible to find it or not.

Q. Can you show us that angle in any of these three exhibits introduced this morning, referring to exhibits 5-J, 5-K and 5-L; just look down in the tank compartment there (pointing).

A. Yes, they are all above the trays—I can't see under the trays.

Q. I take it that you did not actually observe that they were so fastened?

A. I know that the trays were fastened to the framework there in places, but I didn't measure them.

Q. I am not speaking of the trays fastened to the framework; I am speaking of the structure under the trays.

A. I didn't examine it closely.

Q. So you can't tell us definitely whether they were attached to any angle on the forward and after bulkheads or not?

A. No, I couldn't say.

Q. Now, getting to the trays; did I understand you to say that they were fastened or simply laid in?

A. They appear to have a fastening; the vertical side of the tray appears to be fastened to the bulkhead; I don't know whether it is fastened to the bulkhead or whether it is just put in there to keep the tray in position in the compartment; I couldn't tell you.

Q. You can't call our attention to any of this spacing in these exhibits here?

A. No, because—well, in this photograph here, Exhibit number 9, this is on the outside of the engineroom side of the bulkhead, and underneath you couldn't see that one.

Q. Naturally that fastening didn't come over?

A. I don't know whether that came through the frame or one of these angles down here (pointing).

Q. Such frames as there are on the engine-room side?

A. That is correct, the vertical frame.

Q. So any fastenings to these frames should appear on the engineroom side?

A. They might have used the same hole of the bolt, right through the bolt, and then into the frame, the vertical frame, and not be shown as a separate rivet.

Q. The bolts are riveted together?

A. They are in that place (pointing).

Q. Where do you see any bolts in the removable plate?

A. Of course the removable plate had bolts in it.

Q. Of course that was in the center of the bulkhead?

A. Yes. There are a few bolts in them; not all rivets. As I recall, there were occasional bolts along there (indicating); and there were bolts over here (indicating), I think; I wouldn't be sure about that. I remember seeing bolts there.

Q. What was the size of these angles that form the supporting forms for the tanks?

A. I didn't measure them; I didn't think it was necessary to note those.

Q. Would it be about an inch and a half on this side of the angle (indicating)?

A. Roughly, I will say they were an inch and a half or an inch and three-quarters; those that I remember seeing underneath there.

Q. So that this platform that was built up with these angles was supported simply where the bottom of the vertical angles were made fast to the stringers of the ship's walls, is that right?

A. Yes.

Q. And possibly with a few fastenings to the bulkhead itself; is that correct?

A. That is my impression of it.

Q. As far as fastening to the bulkhead, that is only possible?

A. I didn't examine the supports of these trays; I didn't think it was necessary, so I didn't examine them carefully.

Q. In other words, the tanks were not supported on any part of the frames of the vessel itself; the platform was a separate structure built in there for that purpose, is that right?

A. As I gather it, that point was supported from the frames underneath the main frames of the vessel, or stringers, and what was down underneath that mud I don't know.

Q. I mean of course at the bottom where they were fastened to the stringers; that was the only place they were fastened; in other words, they were not resting on any part of the original structure of the ship; it was a specially built platform in there for that, is that right?

A. That is the way I see it, without a detailed examination.

Q. This one that appears in the doorway here has been bent over and closed; do you recall that?

A. I recall that, yes.

Q. How do you account for that?

A. I don't account for it; I don't know how it happened; I have no theory on that at all.

Q. Now this photograph here, exhibit 5-J; is that just the way it looked when you first saw it?

A. That is just the way it looked when I first saw it; there was nothing disturbed.

Q. Nothing removed from that space?

A. Nothing removed or disturbed.

Q. Now this photograph, exhibit 5-L, shows the vertical stanchion—I believe that is what you called it—between No. 1 and No. 2 tanks.

A. That is correct.

Q. And there was a stanchion such as that between No. 1 and No. 2 tanks also between number 2 and 3 tanks and between No. 3 and 4 tanks; is that right?

A. I assume that, because this one is the only one that was projecting above the ash at all; after we cleaned out the ash between tanks 3 and 4, a piece of such stanchion was still visible; the top of it had been burned off; I didn't clean out between No. 2 and 3 tanks.

Q. As I understand it, these braces were inserted between number 1 and number 2 and between No. 2 and No. 3 and between No. 3 and No. 4 tanks?

A. That is right.

Q. In this photograph, exhibit 5-J, there was no similar stanchion on the port side of No. 1 tank.

A. There was no remains showing there, if there was one in there; if there was one there I didn't see any signs of the remains of any; it might have been there; that was all open and could have been easily consumed in the fire.

Q. Then these stanchions and the bases between them were largely separators for these three sets of tanks; is that right?

A. They were separators.

Q. And the ones that were braced on the port side of the ship could move in unionism between or toward the port side, if there was any?

A. Yes, it could be done, but I don't know how they were tied at the top; if they were tied together at the top as they were at the bottom I believe the three stanchions would hold the four tanks.

Q. Was there any spreader between the number 4 tank and the starboard side of the compartment?

A. I found no remains of any.

Q. You called our attention here to the remains of one of these upright stanchions in this Exhibit 5-L. Did you observe how that stanchion was fastened in place?

A. You mean at the bottom?

Q. Anywhere.

A. I didn't examine the bottom of that stanchion at all. I didn't check into the edges.

Q. Did you on any other stanchion?

A. No, sir.

Q. Where the number 4 tank was removed, the upright stanchions were clearly visible?

A. The heels of them were, yes.

Q. Isn't it true that they were mortised into the four by four frames that were under the trays?

A. They may have been; I don't know.

Q. You observed no other means of the fastening of these stanchions in place?

A. No. There is an indication of a beam being gone from the top of the tank compartment, but that is only a theory—an indication of a beam having been there.

Q. What kind of a beam?

A. Judging from the size of the opening, the starboard end, I would say it was a V-beam or a T-beam—a metal beam.

Q. Do you refer to this opening shown in Libelants' Exhibit 6?

A. That is correct; that is the opening I am speaking of.

Mr. Matteson:

I think we called attention to that at the examination, your Honor.

Q. Shall we mark this "opening for beam"?

A. Yes, opening for beam.

Q. That apparently is an opening in the side of the compartment that was used for gasoline tanks; that was an area intended to accommodate a beam?

A. That is my assumption.

Q. Did you observe whether or not there was any place where such a beam could have been fastened in place at its ends?

A. On the forward end I think the main frame of the vessel, the intermediate frame of the vessel, was slightly bent; there was one about that position where the bottom of the angle occurs.

Q. That is on the port side?

A. On the port side, and a like one on the starboard side.

Q. Do you think it would have fastened to one of the uprights along the side of the ship?

A. The intermediate frames, yes.

Q. If that was the case, how would it have been fastened to such a frame?

A. Either bolted or riveted, either one; the beam has been torn loose and the end of the frame is all distorted—the holes in the end of the frame.

Q. Would there be a bracket to support a beam at that point?

A. You mean a gusset?

Q. Gusset or bracket.

A. There might have and there might not have, depending on whether it was structurally necessary. We don't put gussets on every beam.

Q. You mean you don't put a gusset on every beam on a steel vessel?

A. It is not absolutely necessary, depending on what the above is above it.

Q. Such gussets are put there for rigidity or strength?

A. That is correct; you might put them on every other one but not every one.

Q. There is no evidence of there having been any other beam than this beam that you speak of at that height of the vessel?

A. I don't recall seeing any gussets on the frame that you are speaking of.

Q. Or any other beam?

A. That is right.

Q. Referring to Libelants' Exhibit 6 again, what was in the top of the bulkheads of the tank compartment; can you tell us; what was there to stiffen it at the top?

A. I couldn't tell you; I never saw it before the fire.

Q. There certainly wasn't any steel angle across the top?

A. There might have been.

Q. If there had been such an angle it would have been riveted there in part of the structure?

A. The plates would have been fastened to it probably.

Q. How do you account for such an angle not being here at the time this picture was taken, or at the present time, if it was there at the time of the fire?

A. When that entire steel hatch was taken off the engineroom it was probably moved out; I don't know how that was taken off.

Q. Did you observe the end of the steel hatch to see whether there was any evidence of a fastening here (pointing)?

A. It is impossible to see the inside of that steel hatch in its present position.

Q. There is no angle in the top of the forward bulkhead there, is there?

A. No.

Q. And that opening was attached to the steel hatch?

A. I don't know; it may have been.

Q. As a matter of fact you see no evidence that there ever was a steel angle bracer at the top of these bulkheads?

A. There were bolts or rivet holes in the top of these plates or bulkheads, indicating that something was up there; that something "steel" was up there.

Q. As a matter of fact isn't there just as much indication that there was a wooden beam across there as there is that it was a steel beam?

A. There might have been wood across there; there are remains of wood screws in places.

Q. At the top of the—

A. Yes.

Q. And a number of holes?

A. Yes. There could have been wood pushed in there instead of a metal beam.

Q. How about the after bulkhead of the engineroom?

A. Similar condition.

Q. There was no angle across the top of that, was there?

A. Not as it is now.

Q. And the holes that were found at the top of the bulkhead contained wood screws?

A. I saw some in there, yes. There may have been a wood filler in there with a steel beam behind it. She had a wooden deck.

Q. Now what was there then about the bulkheads on the tank compartment to give horizontal rigidity; I mean fore and aft?

A. I don't know; there was nothing left to determine that from; certainly there must have been something there, as it didn't hang there by itself.

Q. Of course it would stand in place with its vertical stiffness, wouldn't it?

A. To a certain extent.

Q. It would stay in place?

A. Yes, it would stay in place.

Q. If it had no horizontal stiffening there would be nothing to prevent its weaving if there was any pressure turned against it?

A. It is logical that a beam was there, so—

Q. I am just assuming from the testimony that there wasn't. If there wasn't, there would be nothing to prevent it from weaving in that manner, would there?

Mr. Underwood:

Prevent what from weaving?

Mr. Matteson:

The forward and after bulkheads.

A. No, nothing as far as we can tell now.

Q. A wooden beam across there would certainly not be as satisfactory for the purpose of insuring rigidity as a steel angle, would it?

A. Maybe not quite but if it was heavy enough it would answer the same purpose.

Q. If there was any tendency for these bulkheads to weave fore and aft by the vibration of the movement of the vessel, that of course would put a strain on all of the fittings attached to the tanks?

A. Not if the tanks didn't move.

Q. If the bulkheads moved the tanks would be likely to move?

A. Not necessarily; they could move quite a little bit without touching the tanks.

Q. Did you measure the width of the tank compartment from forward to aft?

A. I believe I did.

Q. In doing that did you allow for the distortion caused by the explosion and fire?

A. I took it to the ends where the bulkheads were not distorted.

Q. You agree that that was 43 inches?

A. I believe that that is right; it was about 43 or 44 inches. I don't recall my exact measurement right now.

Q. If the tanks themselves were 42 inches in diameter, as I think you measured them, there would be a space between the side of the tanks and the forward and aft bulkheads not over one-half to one inch?

A. There was more space than that.

Q. I am only asking you as a matter of mathematics?

A. I know, but there is something wrong with that measurement, with your measurement. I do know that there is more space than that between the bulkheads, because there is space enough between the side of the tanks and the bulkheads to put my hands down between them.

Q. Just where was that space; I mean was it in the bulkheads?

A. In the bulkheads, the forward and top bulkhead and the next one. The number 4 tank compartment is the only one I dumped the ashes out through that space.

Q. As a matter of fact, in the space left after you removed the number 4 tank, where the tray underneath it was visible, there was a space of not over one to two inches between the end of the tray and the starboard bulkhead; is that the way you observed it?

A. Yes.

Q. Isn't it a fact that forward and aft the tray came up practically to the bulkheads and there was hardly no space?

A. There was space enough there for me to put my hand down there; it was one to one and a half inches.

Q. Are you sure that wasn't due to distortion?

A. It couldn't be distorted; it was all too rigid there.

Q. What was too rigid?

A. The tray and the framework around the bulkhead.

Q. Of course the bulkhead might have been distorted?

A. It showed no signs of distortion; the sides of the trays and the bulkheads were parallel.

Q. You say now that there was space enough for you to get your hand between the tray and the bulkhead. How much space did you say that was?

A. Full inch to an inch and a half.

Q. Did you also say that the trays were fastened to the bulkheads?

A. I believe the trays were fastened to the bulkhead plating; just how I don't know, but there was a spacer in there.

Q. At least they were not fastened close against it?

A. They may have been fastened, and there may have been only a spacer to keep the tray from moving around in the compartment.

Q. How about on the forward bulkhead?

A. The same thing.

Q. Any spacers there that you saw?

A. There were spacers in there.

Q. Did you see them or—

A. I saw them there.

Q. Now referring to the tanks themselves; you observed that the tanks were steel tanks and that there was no evidence of caulking them, did you not?

A. There was no evidence on the outside that I could see of caulking.

Q. Of course at least on the bottom of the tank, the only place that the tank could have been caulked would have been on the outside; is that correct?

A. I think that was covered with solder.

Q. And there was no caulking along the sides?

A. Not that I could determine.

Q. Do you know any rule about the spacing of rivets, as to how closely they may be spaced, as a minimum with respect to the diameters of the holes?

A. There is a rule, yes, but I don't have it memorized.

Q. How many diameters of your holes do you have to leave between holes in order to leave sufficient metal to have the proper strength?

A. I don't carry that in my mind; I refer to a manual when I need that; I very seldom use such a thing.

Q. Isn't it a fact that the holes must be spaced not nearer than four diameters?

A. I don't know.

Q. I take it that you do not have much call for information with respect to riveting in your angle of the profession, is that right?

A. Very seldom, yes.

Q. You spoke this morning of the rivets being spaced one-inch to one-and one-sixteenth apart, and you estimated the holes to be a half inch or so in diameter; is that right?

A. They are not over half inch; they are a little under.

Q. That would be spacing, if that were true, of approximately two diameters?

A. That would be two diameters, yes; center to center.

Q. Center to center is what I am talking about.

A. All right.

Q. As a matter of fact you are not sure what the size of the shanks of the rivets or the holes they pass through might have been?

A. You can tell that by drilling one of them out.

Q. As a matter of fact, Mr. Munroe, one familiar with riveting could determine that from an inspection of the heads?

A. There is a standard size head for the shank of certain rivets, yes.

Q. You don't know what that is?

A. No; when I need that I refer to a manual.

Q. Have you had any experience in the making of cylindrical tanks?

A. Not of that size, nor of riveted tanks.

Q. You have had no experience in that?

A. No, I never made one.

Q. As a matter of fact you would not, even with your experience, rely on a tank that was merely riveted to retain gasoline or any other liquid, would you?

A. If that tank was made for it I would rely on it, yes.

Q. Did you ever hear of a tank that was made for such a purpose without being either caulked or welded?

A. I know that there have been numerous occasions where tanks of that type, although smaller, have been used for gasoline, but whether they were caulked or not, if they were galvanized by a manufacturer, I rely on them.

Q. As a matter of fact you would not trust a plate on the side of a ship that was riveted unless it was caulked, would you?

A. No.

Q. And so much less would you trust a tank for the retention of gasoline that had been riveted but not caulked?

A. The side of a vessel gets a great deal more strain on it than these gasoline tanks ever get on them, more constant jarring and straining.

Q. Caulking is not a matter of strength, but caulking is a matter of tightness, is it not?

A. That is true, but you have to rely on the caulking where you have a variable strain on your plating.

Q. Would you recommend under any circumstances a cylindrical tank that had been riveted but not caulked or welded for gasoline?

A. I would test it first before I would put it in there, but I would rely on it without it being soldered or knowing whether it was caulked or not.

Q. What sort of a test would you make?

A. I would put a hydrostatic test on it, or even an air test. I would test any tank before I put it in a boat; and it is easier done by air pressure.

Q. Is there any difference between gasoline and water as to permeability or penetrating quality?

A. Yes.

Q. What is the difference?

A. I don't know the exact difference, but there is a difference in the viscosity of liquids.

Q. In other words, it is a well known fact, isn't it, that gasoline has a considerable greater penetrating quality than water?

A. That is right.

Q. It also has a cutting quality; in other words, it will cut through rust or other materials that might accumulate?

A. It might on certain materials.

Q. As a matter of fact, Mr. Munroe, you use gasoline sometimes for freeing pistons as they rust in places?

A. I wouldn't use gasoline.

Q. Or some similar oil?

A. I would use a light oil but not gasoline.

Q. That illustrates the principle?

A. That illustrates the principle, yes.

Q. Well now I will put it this way: when you make a hydrostatic test you test the strength of a tank, do you not?

A. I do.

Q. Do you make the hydrostatic test with water?

A. That is right.

Q. And water doesn't have the same degree of penetration effect than gasoline or light oil would?

A. Not at the same pressure, no.

Q. In other words, a hydrostatic test is principally a strength test, is that correct?

A. Yes, that is correct. It is for strength or for any small leaks; if there are any small leaks it will show up along the seams of whatever you are testing. You can test it and if the metal was porous it would force the liquid through the metal if it was porous in any place.

Q. I understood you to say that you would not trust a tank that had been riveted and not welded or caulked, unless you were satisfied by some proper test that it was also gas-tight?

A. That is only natural. You are not going to install a tank in a compartment and then go in there and find that it leaks and then take it out again. Even a caulked tank might leak if it wasn't properly caulked.

Q. Caulking is the ordinary precaution to take to make a tank tight?

A. If it is going to be put under any great pressure, but under low pressure such as this it wasn't necessary.

Q. As I understand it, you said you observed evidence of solder on this tank before it was taken out of the Seminole; is that right?

A. Yes, that is right.

Q. Did I understand you to say that there was evidence of solder around any of the rivets?

A. There was on the lower line of rivets on the bottom; there is an indication of solder on them.

Q. On the outside of the tank?

A. It is pronounced on the inside of the tank, but due to the flaking or rust on the outside of the tank a majority of it has been removed, removed by the flaking and that rust.

Q. And this occurred, as I understand it, since last May when you first observed it?

A. This was observed since last May. Of course there was some flaking on there when the tank first came out of the compartment. I knocked it off in getting down to the clean rivet and clean seam, so that I would be able to examine it and not have the examination made through rust.

Q. Then there was an accumulation of rust under the solder which caused it to flake off; is that correct?

A. That is correct, but that only occurred since the fire.

Q. That is your assumption.

A. (No audible answer.)

Q. In any event, whenever it happened, that is something that will account for the removal of the solder if rust does get underneath it; is that correct?

A. Solder will flake off if it is on top of rust; it only penetrates as far as rust and only makes contact with the rust.

Q. And that can occur after the solder had been applied, of course?

A. Yes; after the solder is applied and worked down to the sides.

Q. How is solder applied, do you know?

A. Solder is applied by the use of an acid flux and a soldering iron; it is sometimes done with an open flame. The flux is put on to clean the metal up and make it perfect between the two metals.

Q. Of course solder on the outside of the tank would not protect the tank from inside corrosion?

A. No, it wouldn't.

Q. The best it could do would be to offer a support at the extreme outer edge, is that correct?

A. It acts as a support on the outside, yes.

Q. And if any rust gets under the solder and flakes off, it doesn't even do that, does it?

A. No, not if it is rusted.

Q. And the quality of iron is such that it is subject to rust?

A. It varies with the type of steel, whether it is steel or iron.

Q. Now take this bottom seam, you see that there is a sort of crack, I will call it, or notch, where the bottom of the tank didn't come down quite so far as the side of the tank; is that correct?

A. That is correct.

Q. And that notch, according to your observation, had been filled up with solder?

A. It was.

Q. To begin with, there is no question but that it had never been welded, is that correct?

A. I don't know.

Q. You didn't see any evidence of welding on it?

A. I didn't remove any of the solder to determine that.

Q. Would you have been able to see it without the removal of the solder?

A. I assume that there was no welding there.

Q. You think that crack or notch had been filled up with solder?

A. I believe it was entirely filled up with solder; wherever I saw it, it was; there were one or two small places where the notch wasn't completely filled and smooth.

Q. Of course it would have been impossible to put solder or anything else on the sides of these tanks while

they were in place in the compartment, with the bulkhead in place?

A. No, you couldn't put the solder in there; you would have to turn the tank on its side or end and solder the bottom of it.

Q. You would have to take it out in order to work on it?

A. The tanks would have to be out of there in order to solder them.

Q. If this bottom piece was soldered, as I understand it, the tank stood up in place on a wooden base in the tank compartment?

A. That is correct.

Q. So that it was resting on the edge where this solder had been applied; right?

A. That is right.

Q. And it was resting on wood, wasn't it?

A. On wood.

Q. And I suppose it would have a tendency to cut somewhat into the wood?

A. It would have a tendency to compress the wood.

Q. What effect would that have on the solder after it was applied to the bottom of the tank?

A. No effect at all.

Q. It would place a strain on it?

A. It would have a tendency to force the solder up into the wood at that angle.

Q. Whatever the effect, Mr. Munroe, it would have had the effect of placing a strain on the solder, wouldn't it have?

A. The solder would bear some weight, but I wouldn't say it was anymore strain—not as much strain as metal itself; not a damaging strain anyway.

Q. All around this bottom edge where you thought the solder had been applied there were places where there was no solder present at the time you observed it?

A. There was no solder at all. There was solder there, but it was not filled up as full as the other parts of the rim or the edge.

Q. When we were there the other day there were spaces where there was at that time no evidence of solder at all?

A. No more than what I have spoken of.

The Reporter:

May we have a recess.

The Court:

Yes. We will take a five-minute recess.

(Recess.)

(By Mr. Matteson):

Q. We were speaking a moment ago about the subject of interior corrosion. What causes interior corrosion of a tank?

A. Due to the moisture from the chemicals that are in the fluid contained in the tank.

Q. And gasoline has such a fluid, does it?

A. I believe the present gasoline contains considerable acid that is not entirely washed out.

Q. And any moisture or water accumulated in the tank of the type of the Seminole would accumulate in that crease around the bottom?

A. It would accumulate there, yes.

Q. And the effect of such water or acids from gasoline would be to corrode metal?

A. Yes, it would work faster in the presence of air and oxygen.

Q. There is always a certain amount of air in water?

A. A certain amount, yes; and a small amount of oxygen.

Q. You have experienced very considerable tank corrosion in tanks containing water only—steel tanks?

A. Yes.

Q. You spoke of steel or iron with respect to the effect of corrosion, I think. What is the difference between steel and iron in that respect?

A. Pure iron doesn't rust or corrode except in a fine powder. Steel, when it oxidizes, builds up a flaking, but not necessarily does it remove a great deal more of the original metal. It has a swelling tendency in steel.

Q. When you speak of pure-iron do you mean cast iron?

A. No, I am speaking of pure wrought-iron.

Q. There is a difference between cast iron and steel?

A. There is.

Q. With respect to corrosion?

A. Yes; cast iron varies, too.

Q. Which is more subject to corrosion, cast iron or steel?

A. Steel.

Q. When steel corrodes it is subject to what is called pitting, is it not?

A. That is correct.

Q. In other words, instead of corroding evenly it corrodes in holes or pits, is that true?

A. It will in some places more than others, and that is true of any rolled metal.

Q. You didn't make any test of any of these other tanks, did you?

A. No, sir.

Q. Did you move number 1 tank in the course of this investigation you made in May?

A. No, sir.

Q. The reason that I ask that is because these photographs which you have shown here, for instance Exhibit 5-K, show the number 1 tank displaced to starboard, which I estimate is about six inches; is that about right?

A. I would say that it is around five or six inches; that is hard to determine; five inches maybe.

Q. I show you this photograph, Libelants' Exhibit 4. That shows the opening for the number 1 tank with the valve in place, doesn't it?

A. Yes. I don't know whether that is the number 1 tank or not.

Q. I believe the testimony indicates that it is. If that were the fact, that the fixture shown in the opening in Libelants' Exhibit 4 is the number 1 tank, the number 1 tank must have been practically in place at the time that picture was taken, wasn't it?

A. I believe that that is the number 2 tank.

Q. That as it may, if the statement I just made is true, then the number 1 tank must have been substantially displaced at that time?

A. That tank as shown in that photograph is approximately from the center of the hull; it is merely tipped to one side. I think you will find that to be the number 2 tank.

Q. We will take that up later. In any event, you are sure that you didn't move number 1 tank at that time?

A. I am sure that I didn't touch number 1 tank at all.

Q. Who was present—just a minute. Were number 2 and 3 tanks moved at that time?

A. Neither number 1 or number 2 tank was disturbed.

Q. Who was present at the time you moved number 4 tank and made these tests that you spoke of?

A. The man there at the yard that handled the derrick; I don't know who he was. I believe Mr. Newell himself was handling the—

Q. He is the man you spoke of as your assistant?

A. No, sir. I hired Mr. Newell to take the tank out, and that was all. He had to handle the derrick; that wasn't my job to handle the derrick.

Q. What date was this done?

A. I don't recall the exact date.

Q. Do you recall the day of the week?

A. I believe it was Monday or Tuesday. We started to do it on Saturday but it rained and I couldn't get anything done, couldn't get the boat pumped out; so I think it was Monday or Tuesday that the work was done—it was either Monday or Tuesday that the work was done.

Q. That was after the Court had adjourned at the last session on Friday?

A. Yes, sir.

Q. You began your operation on Saturday and completed it on Monday or Tuesday; is that correct?

A. That is correct.

Q. Was Mr. Thompson present?

A. Mr. Thompson? No, sir. You mean that gentleman, Thompson?

Q. Yes, sir.

A. No, sir.

Q. Was Captain Patten present?

A. No, sir.

Q. Was any one representing the libelants, or the respondent Pilkington, present?

A. Not to my knowledge. None of these gentlemen here, at least.

Q. Was any notice given to them, of what tests you were making?

A. Not by me. It wasn't my job.

Q. By whom were you requested to make the test?

A. Mr. Underwood.

Q. How long were you engaged in making this pressure test on the number four tank, that you described to us, altogether?

A. I believe it was the best part of an afternoon. I know we didn't get away from there until quite late; it was about dark before we left there—before I left there.

Q. Would you say, from two to six, about four hours?

A. It might have been. It took some time to fill the tank with water. I didn't keep an exact check on the time that we worked on it.

Q. And in that period you did all of these things that you have described? Made all these various tests?

A. I made them personally; yes, sir.

Q. And you spoke among other things of fixing a riser at the top of the tank and filling the tank with water to the top of the riser?

A. That's right.

Q. And it was after that, that you capped the vent hole and gave it the City pressure test; is that right?

A. Yes.

Q. How long was that, how long a period of time was that riser pipe under the pressure test?

A. I don't remember the exact length of time; it was probably twenty minutes, half an hour. I know it took some time to go all around the tank and examine everything.

Q. You put it in place and then you went around and examined the tank?

A. I examined all seams and all rivets.

Q. And that took about twenty minutes, you think?

A. Twenty minutes to half an hour, at least.

Q. The tank was in an upright position at that time; was it not?

A. It was standing on its bottom, in an upright position.

Q. And I think you said you went around it with a hammer?

A. I used a machinist's hammer; about a pound hammer, pound and a half hammer; about a pound hammer, I guess.

Q. Did you do that before you filled the tank, or afterward?

A. I did that before I filled the tank; also during the time that it was full; and every time I made a test on it for a different pressure, I sounded it with a hammer.

Q. Did you use any pressure gauges of any kind to note the pressures you were getting?

A. No pressure gauges at all.

Q. There is no pressure gauge to determine what the city water pressure was?

A. I merely inquired from one of the men that I know, in the City water department, the head of the thing, what the pressure was in that locality.

Q. Of course the pressure varies with the length of your connection from the city main, does it not?

A. Oh yes, indeed.

Q. You have the effect of pipe friction and hose friction?

A. Pipe friction and all that to contend with.

Q. Then I take it that you haven't much doubt that there was an accumulation of rust on the inside of the tank, to be knocked loose when you hammered it?

A. No, I do not assume for a minute that there was any sediment or anything on the inside of that tank.

Q. You don't know whether there was or not?

A. No; I can't tell.

Q. It would be natural, under the conditions that that tank had been subjected to for the last four years, that there was a considerable accumulation of such kind in the inside of the tank, is that not right?

A. There is a bare possibility; there is a good possibility that there might have been some scale, from those tanks sitting open as long as they have.

Q. And as a matter of fact there is good reason to believe that the tank was partially filled with water containing a certain amount of debris, at the time of the fire; isn't that true?

A. That I don't know; I don't know. Apparently there was salt water in it at that time, maybe.

Q. Under the conditions under which you made this test, of course any accumulation of debris or rust, anything there may have been in the tank, would have been on the bottom of the tank, would it not?

A. Well, they were in an upright position all the time, yes.

Q. And with this V-shape around the bottom of the tank, it would be natural for any such debris to lodge in that V-shaped formation, would it not?

A. It would be the natural place for it to lodge, yes.

Q. And applying a pressure test, the first effect of this would be to force any such material into that seam; isn't that correct?

A. You can say that it might have a tendency to force it in there, yes. You are still assuming that there is stuff in there, though. I don't know that there was. It might have been displaced from putting the water into the tank. I put that in from the bottom, it had a swirling motion, it would disturb any rust flakes or mud or dirt of any kind that was in that.

Q. Now this filler plug that cracked, the first you noticed of the crack was when you heard the crack, is that right?

A. I heard it; yes.

Q. You hadn't noticed it before that time?

A. There was no crack there prior to my turning the fitting into the threaded hole.

Q. At least not that you observed?

A. I certainly would have seen one if it was there. I examined that very closely.

Q. This connection to which you screwed the hose connection, is a strong, cast-iron connection, I think you said?

A. It is a standard reducing bushing.

Q. And that is made to stand considerable strain, isn't it? You ought to be able to screw a pipe in there as

hard as you can do it by hand, without causing any damage, oughtn't you?

A. I can take a brand new one out, and split the same way. I did that one, by setting up the fitting too tight; use a Stilson wrench; using an eighteen inch Stilson wrench on a three-quarter fitting.

Q. Well, what did you use in screwing up this connection?

A. An eighteen inch Stilson wrench.

Q. They come bigger than that?

A. Beg pardon?

Q. Stilson wrenches come much bigger than that?

A. Oh yes; come to four feet and bigger; they come smaller, too.

Q. Well the point I make is simply this; it is quite possible that there may have been at least a flaw there that wasn't readily noticeable, before you started to screw this up; isn't that true?

A. Not necessarily. There didn't have to be a flaw in that casting in order to make a crack.

Q. You didn't take the casting out of the tank, did you, to examine it?

A. No, I didn't remove it.

Q. Didn't examine it on the inside?

A. It certainly was not noticeable on the outer face, if it was there.

Q. Just where was the crack in the casting?

A. It extended from the small hole clear to the outside of the bushing, right straight across, which you would—the type of crack you would get in trying to expand a hole.

Q. Now I didn't visualize it very well. You have a small hole in the tank.

A. You have a small hole in the bushing; you have a large hole in the tank.

Q. And it was the bushing that cracked?

A. It was the bushing that cracked; not the tank.

Q. I see. Well the bushing, is that sort of a reducing connection?

A. That is a reducing bushing, yes, to reduce the hole from two inches to three quarters of an inch.

Q. In other words, it is two inches diameter on one end, and three quarters on the other; is that it?

A. Yes, sir; it looks exactly like a nut with a hole in the center of it—the thread.

Q. And that was part of the original installation of the tank?

A. That was part of the original installation of the tank. It looks just like a plug.

Q. Can you see it in this picture, for instance?

A. You can see the outer edge of it right there.

Mr. Underwood:
Referring to Exhibit Four.

Q. Is this what you have reference to?

A. That is the edge of the plug; yes, sir.

Q. (Marking on photograph.) The edge of the plug.

Mr. Underwood:
Better call it a bushing; it isn't strictly a plug.

Mr. Matteson:
No, the plug wouldn't have a hole in it.

Mr. Underwood:
It is like a plug, except the hole.

A. It is built just like a plug, threaded plug, only in the center of the plug it has another hole with a reduced size.

Mr. Botts:

I don't believe you identified that photograph by number, did you, Leonard?

Q. Referring to Libelants' Exhibit Four.

A. That is a standard bushing.

Q. Is that screwed into the tank, or riveted in?

A. Screwed into the tank. When I examined it after the crack, and heard it, I looked at it and I could distinctly see the bright metal all the way along the crack.

Q. You spoke of the difference between single riveting and double riveting, and the purposes for which single and double riveting are used. In view of what you told me about your experience in riveting, I don't take it that you consider yourself an expert on riveting.

A. I don't say that I am an expert. I have studied it.

Q. You haven't had a great deal of experience with it?

A. I haven't put it in practice a great deal.

Q. And have you—you say you have never had any experience in the construction of tanks, yourself?

A. Not of this type of tank, no.

Q. And consequently I take it you haven't had a great deal of experience in differences between punching and drilling holes for tanks?

A. Not in this particular case, no—this type.

Q. Now referring to these valves, which have been marked Exhibit Eleven: (separating valve stem) you were saying that this flaw or crack that appears in the valve part of Crane number 125, would not cause leakage of gasoline past the valve—reducer gasoline valve.

A. As far as I can tell from this valve, and the shiny part of it, the seat is below—the actual contact between the plug and the seat, is below the hole in the plug

Mr. Underwood:

Below the crack in the plug?

A. Below the crack.

Q. How do you determine that?

A. I determine it by the brightness of the metal. Apparently from this point to there, is the contact seat.

Q. As a matter of fact it is not as bright at the top as at the valve surface.

A. It is slightly—it is not as bright as it is below the crack.

Q. And where it is bright, that indicates that it has had contact with a binding surface?

A. That would indicate contact with the seat. Even if there was—even if it contacted above this point, or the point of the crack, there is still sufficient seat below the crack to keep the valve tight.

Q. Now you are referring to the area of brightness between the bottom of the valve and where the dull part begins, is that right?

A. That is right. Well I don't know that that was the seat before the fire, though—or the contact of that plug before the fire.

Q. Well the brightness would seem to indicate that.

A. The brightness indicates that that is where it touches now. That whole plug has been so badly burned from heat or distorted from heat, that there is other cracks in there as well.

Q. Well you notice that there is considerable irregularity in the plug; that it is worn off a great deal more in some spots than others; have you noticed that?

A. Yes, there seems to be some irregularity along the bottom there.

Q. That is an indication of wear, is it not?

A. No, sir; that was put there when the plug was ground into the seat; because this bottom face of this plug is not true surfaced with the seats; it is not concentric.

Q. Well the bottom surface does not touch anything when the valve is closed, does it?

A. No, it does not.

Q. That part goes into the hole?

A. That is right.

Q. This projection on the bottom of it, is just a sort of a guide, is it not?

A. I don't know what that was for.

Q. Now as you turn that around, can't you observe that it is a good deal more worn in some parts than others?

A. Now just what part do you mean? You mean this brightness on this plug?

Q. I am not talking about the brightness; I am talking about the shape of it.

A. Well the plug as a whole is a casting, and naturally it would be a little irregular, because it has not been turned in a lathe to make it perfectly round.

Q. But the valve, to be a good valve, should be machined to fit its seat?

A. This area of the face of the plug, from this point to the bottom, has been machined, or has been ground into that seat; machined first and then ground to fit that seat.

Mr. Underwood:

Would you say, indicating that portion of the plug which can possibly come in contact with the seat of the valve?

A. That's right.

Q. Now looking into the valve seat, what is it that this rounded surface of the valve fits against?

A. This—I don't know how to explain it; that shoulder down in the bottom of the valve with the slight angle on there, which is the seat—

Mr. Underwood:

Had you better look at them one at a time?

A. You can't get the light in there unless you get it just right.

Q. What is it that you call the seat?—the seat there? Can you indicate? There is a lot of area in there.

A. I can point to it, but I don't know how I can describe it for the reporter to get.

Q. Here is a pencil.

A. I have a pencil right here.

Mr. Underwood:

Just indicate it.

A. This shoulder, right where the point of my pencil is, can you see? That is the seat on which the plug rests or is forced down tight against, that is beveled; it is narrow and it is beveled, to fit that plug.

Q. How wide is that seat?

A. You mean, the face of it?

Q. Yes.

A. The face of that seat appears to be. I should say about three thirty-seconds; it is hard to tell; it is over a sixteenth; you can't measure it.

Q. The reason I asked you that was because I wasn't quite sure where it began and where it stopped. Do I understand that it begins at the edge and goes back up to this crease?

A. No, sir; it only begins on this point right there, and extends down into the hole. This ridge there is the ridge left by the tool that cut the seat square in the first place, to make a smooth surface to start grinding on.

Q. Well it would look to me as if the only thing that the valve seat would come in contact with would be practically the upper edge of what you call the seat; is that right?

A. No; it is ground to fit that entire angle—that corner of that seat; the corner from the top face here to the

inside of this circle here. It does not touch on the top, and it does not touch on the inside here; it touches on that angular face which is right across the corner. I can draw a picture of it better than I can describe it.

Q. Well that looks to me a good deal narrower than three thirty-seconds, is the thing that raises a question in my mind.

A. It might be only a sixteenth.

Q. In fact, except for the edge, it would appear to me that the hole goes down almost vertically, doesn't it?

A. It does, with the exception of that slight angular face where the plug fits to it.

Q. Well, there is only a very narrow edge that comes in contact with this valve, is there not?

A. That is right. That is correct.

Q. And whether or not gasoline would leak through this particular flaw that we have been pointing out here, would depend on whether that flaw came down to the edge or not?

A. Whether the seat touched that flaw; yes.

The Court:

Well as the valve is screwed into this, the valve seat, what finally gives it final contact, when it becomes tight, you can't screw it any further?

A. This plug is driven down into that angular seat in here.

By the Court:

Q. Well that is a curve there.

A. This is a curved surface.

Q. As it gets into the valve seat—

A. That is probably ground to the slight curve too, to fit this.

Q. That is what I was going to ask you. When this curvature comes in contact with the curvature there, and

then there is a tightness, or tightness beyond which you can't tighten it?

A. That is what determines the bottom of the valve, is the tightening of the plug.

Q. Well the natural—a glance at this valve seat would indicate as Mr. Matteson expressed it, that it was vertically straight, And that there was no rounded curvature there, to match this rounded curvature on the valve stem.

A. (Witness drawing.) That is approximately a cross-section of this valve. Of course that particular one, there is an opening goes down here, but that doesn't matter. The plug is shaped like this, the stem goes on up here. Now the only contact that there is between the plug and the seat, is this—this is the seat, with a little short angle there; and this plug comes down and contacts that; it does not rest here or on this side.

Mr. Underwood:

In other words, it doesn't rest on the horizontal surface?

A. Or the vertical surface.

Mr. Underwood:

But on the curved surface.

A. On the angular surface.

By Mr. Matteson:

Q. Just draw a line there from each end of the seat, out here, and mark it Seat; mark it Edges of Seat. (Witness marks.) Then there is simply the width of that very narrow seat that comes in contact with this rounded surface of the plug or valve; is that right?

A. That is correct.

Q. And how wide do you figure that is, from observation of the valve?

A. Say a sixteenth of an inch, or a little more. It is over a sixteenth, if you want to speak of it in that particular fraction.

Q. Well whatever the cause of it, you do see, do you not, that this valve seat is worn shiny, practically to its upper edge, on both sides of the flaw?

A. You mean the upper side of this face?

Q. Yes.

A. I wouldn't say that.

Q. Take it and look at it in various lights, and be sure.

A. The shiniest part of that seat is right at the bottom of that flaw.

Q. I am not talking about the shiniest part.

A. That is where the contact is.

Q. I take it that wherever it is shiny, there has been some contact; perhaps there has been more contact at some point to make it shinier there, but wherever it has rubbed there has been contact; is that right.

A. This other shininess can be due to handling. I would not say for a minute that that is contact of the seat.

Q. All right. Now what do you say about this valve, which shows distortion by the fire, or any effect of fire?

A. Well this plug shows very minute cracks in the plug, right through there; you see several of them.

Q. Now look the entire fixture over and show me anywhere else on the entire fixture that there are any cracks due to the fire—possibly due to the fire.

A. I can't offhand see any particular ones on the external part of this thing now. I can't get a good enough light down in there to determine any in the seat.

Q. And of course the interior of the valve is somewhat more protected than the outside of the valve?

A. What the outside of the valve looks like does not matter as long as it is tight.

Q. But what I am saying is, in the case of fire the outside would be more affected than the inside, very probably, would it not?

A. Not necessarily. That plug may be of different metal than the bowl,—the outside bowl of that valve.

Q. Now you were speaking about the connection of this valve; I think you told me that all threaded connections are tapered more or less.

A. That is correct.

Q. And for that very reason you don't expect a threaded connection to be screwed up the full length of the threads, do you?

A. Not always. That depends a great deal on the tap or the die that is being used.

Q. Well the point is that the threaded connection is used repeatedly, each time you use it you will probably be able to screw it up a little further than the last time.

A. You probably could tightened it up a little further each time.

Q. And when you come to the point where you have used up all the threads, you have used up all your possibilities of tightening it any tighter, haven't you?

A. No, sir; not until the male—or the female end has been expanded or the male end has been reduced until it is smaller than the size of the fitting.

Q. Well now take this fitting here; I refer to the fitting that screws into valve number 150; you see that that screws up the full length of the threads very readily, don't you?

A. It seems to now; yes, sir.

Q. And brings the pipe end of the fitting up against the end of the valve; is that right?

A. It seems to at this time; yes, sir.

Q. Well then after you have reached that stage, your tightness is going to depend on whether the end of your pipe fitting accurately fits against the seat of your valve; is that right?

A. You are not dependent on that; no.

Q. That, plus whatever there is in the threads?

A. Yes; if it goes up as it does now, yes. It goes up that way.

Q. Now that is not a machined fit on the end of that pipe against the valve, is it? It is just an ordinary piece of pipe sawed off, as straight as a workman could saw it?

A. No, sir; that is machined.

Q. What?

A. That is turned in a lathe, that union; the shoulder of that union is turned in a lathe—the end of it.

Q. Well do you think that the fit of the shoulder of the union against the valve proper, is an adequate connection for a gasoline pipe, when the threads have been all used up to the maximum of their capacity?

A. I would not say that as this valve and union are now, that that is a proper fit, no. I would not pass it as being a proper fit or a tight fit.

Q. On the opposite end, we have some of the threads still exposed.

A. That is correct.

Q. And that is the normal thing that you would expect, is it not?

A. Yes.

Q. That shows that you have still got some of your tapered threads to use up for the purpose of getting tightness?

A. That's right.

Q. That is what is lacking on the other end?

A. At the present time it lacks that; yes. I don't know that that is the condition that has always been in there.

Q. Of course. Now the same thing, referring now to Exhibit Number Two, the same thing exists as it is at present of course, with respect to this union that is adjacent to the valve and the Tee, that I was calling attention to on the oher exhibit. In other words, the threads going into the union have been entirely—passed entirely into the union; is that right?

A. Yes, they have in this case; yes, they have passed in there.

Mr. Underwood:

I am sorry I didn't hear that; do you mind if I ask that that be read? (The last question and answer were read by the reporter.)

Q. In other words, they have gone in and exerted their maximum of wedging effect, due to the taper?

A. They have not exerted their maximum wedging effect, no.

Q. Why do you say that?

A. That fitting could still be set up tighter, and still be perfectly tight. I say that because there is still room for the pipe, or the male end, to be driven down into the female end, whether there is any threads on it or not; there is still threads in contact with each other.

Q. Well let's take just this end, which I take it is the male end.

A. Well this happens to be the male end of the union; yes.

Q. Now all I am talking about is the threaded connection which connects the pipe with the male end of the union; that has gone in as far as it can go, hasn't it?

A. No, it has not; it can still go further.

Q. Why do you say that?

A. Because there is nothing inside here to prevent the pipe from continuing right on out through here. You could have this pipe extending out here, with the exception of not being able to make a joint at this point; but if it wasn't for that, you could continue on through, it could go there another nearly a quarter of an inch.

Q. But to begin with, you would have to have some threads on the inside for it to run through.

A. There are threads in there; you don't have to have threads in here, no; it would compress the point to that point and still be tight, because there are threads further back in here; there is threads on the pipe.

Mr. Underwood:

The female part?

A. In the female part, the threads are in there.

Q. Well of course the pipe is thicker before it is threaded than it is after it is threaded; threading takes some off it, doesn't it?

A. It takes some off.

Q. So after you got to the point where you were forcing the part of the pipe that had no threads, into the male end, you would have an exaggerated wedging effect, would you not?

A. It would still be a wedge; it would be exaggerated, yes.

Q. Well that has gone in a lot further than is normal, hasn't it?

A. That is about normal. You can't tell from—you could not tell from the lack of threads on the outside whether that is an improper thread or not, because in a great many cases pipe varies in size. A thread or die is standard, and sometimes the pipe is larger, which would show more threads out here; or if the pipe was smaller it would show less threads.

Q. Well do you say there is room, looking down into the male end of this union, for that pipe to come right on through?

A. There is. That is the end of that shoulder that is shown inside there, is the end of the brass pipe.

Q. The end of the brass pipe; you don't see all of the brass pipe through that hole?

A. No, you only see the end of it.

Q. You don't see all of the end of it, do you?

A. Yes, I see all of the end of it.

Q. You say you see the full thickness of the pipe through that?

A. No, because some of it has been taken off by the die when the thread was cut; the end of the pipe would naturally not show as much thickness as the pipe further back.

Q. Well let me get at it this way. Whenever you screw a threaded connection, with a fitting such as this, you have that wedging effect, due to the taper, don't you?

A. That's correct.

Q. And if the fixture isn't strong enough to take it, after you have wedged it to a certain extent you will expend it or crack it, just like you did the fitting on the gasoline tank when you made the test; isn't that right?

A. Yes, sir.

Q. I will ask you to look at the pipe end of this fitting and tell me whether it isn't a fact that the male end of the fitting has been forced apart and expanded out of its normal shape by the wedging effect of screwing the pipe in.

A. I can't say offhand that it has; it doesn't look to me like it has. It might show with a pair of calipers or a micrometer, but to the visual eye it is not.

Q. Can't you see it quite readily by looking at the width of the crack right around the pipe, where the pipe goes into the fixture?

A. I know, but the pipe may not have been the full size to start with—a standard pipe.

Q. You say the pipes didn't fit?

A. The pipes could still fit, and not be standard size. One manufacturer makes his pipe one size, and another makes it a little bit smaller, and it would still fit, still make a tight joint.

Q. You say that this may have fitted, in spite of the indications that I have called your attention to, that might indicate that it wouldn't fit? Is that right?

A. I still—I say that that is a tight fit.

Q. Your opinion is that it is a tight fit?

A. Well yes; you can call it my opinion.

Q. And when you spoke of screwing down against the female end, what you meant was that this pipe might still have been screwed into the male end up to the point where it would come out, and prevent contact of the male end with the female end, is that it?

A. Of the union, yes.

Q. Of the union.

A. And still make a tight joint.

Q. I guess I understand that. It is true that threaded connections in brass pipe occasionally work loose through vibration, and leak; and have to be tightened up, isn't that correct?

A. An improperly installed line might loosen up, yes; and there is a great many things that would cause it. I mean—

Q. Even reasonably well installed, brass pipe connections used for carrying gasoline might occasionally require tightening, might they not?

A. Any pipe might require tightening up.

Q. Yes, and that is especially true in the engine room of a boat where there is always a greater or less degree of vibration; that is true, is it not?

A. It depends entirely—yes; strike out. There would be more tendency to vibration in the engine room than any other part of the boat, yes.

Q. And vibration may cause loosened connections?

A. It could, under certain conditions, yes.

Q. And for that reason it is desirable to have as few connections as possible, is it not?

A. The fewer threaded joints you have, the less liability there is of any of them vibrating loose.

Q. A potential hazard you have from that source?

A. Yes, you can't always do away though with all of them that you would like to. It would be better if you only had one piece all the way.

Q. And you would have that, if you used copper pipe instead of brass pipe, wouldn't you?

A. You would have one continuous piece, yes; but you still have other hazards.

Q. About this glass gauge that was in the engine room; I understand you to say that you discovered what you thought was the fitting of that glass gauge?

A. I did.

Q. Have you got that?

A. No, sir.

Q. Where is it now?

A. It is aboard the vessel.

Q. Can you make a sketch of what it looks like?—

Mr. Matteson:

Before we go farther, I would like to mark this sketch of the valve seat; I will ask to have that marked as an exhibit now.

A. I can show you a picture of one of those such valves in the catalog I have here, if that would—of this connection. You asked me to draw a picture of it.

Mr. Underwood:

Let's get that one marked.

(The sketch so tendered was marked Libelants' Exhibit #123 for identification.)

Q. Suppose you show me the picture of the fitting in the catalog, if you don't mind.

Mr. Underwood:
Is that for identification or in evidence?

Mr. Matteson:
In evidence.

Mr. Underwood:
That is out of the regular routine. It doesn't make any difference to me, but our rule from away back in March was that you can't offer anything except for identification.

Mr. Matteson:
That is perfectly satisfactory; I offer it for identification now.

A. I don't want to lose this book. That is a similar type, I believe; the one I saw out there I think has a metal handle on it like this, but that one I believe shows a wooden handle.

Q. I think it would be better for you to draw a little sketch of it. You can use that for a model if you like. I think you said that end—

Mr. Underwood:
Before we go further, may I describe the illustration which he indicated. It is the illustration on the left of page 209 of Jenkins Valves and Mechanical Rubber Goods Catalog #23, Copyright 1933 by Jenkins Bros.

Mr. Matteson:
All right.

A. You want this in a cross-section, or do you want it just—

Q. In a cross-section.

A. To describe that valve, it is merely an angled valve with a fitting on one end to screw into a tank or a pipe fitting, and on the other merely a connection to take the glass tube, with a packing nut on it. That is about as simple, I think, a description of it as even a drawing would be.

The Court:

Let's see the picture you pointed to.

A. It is a standard angle valve.

Q. Perhaps I can—

A. Not that I don't want to draw a picture of it, but it takes time.

Q. Perhaps you are right; perhaps we can do it by a few questions.

Mr. Botts:

If your Honor please, Mr. Matteson tells me he will be on this witness until five o'clock, and I would like to get over to the office just a minute, so if I may be excused—?

The Court:

Yes, sir; that is all right.

Mr. Botts:

Because I have some cross examination of this witness.

Q. I think it has been described, that this gauge came out of a Tee on the gasoline line; is that your understanding?

A. My understanding was that it came out of the Tee in the manifold.

Q. And that would be a vertical Tee?

A. That I couldn't—no, I would say it would be a horizontal tee.

Q. And what sort of a fitting would there be on that?

A. The lower valve of the side gauge would be screwed directly into that tee, as I gather it. It could be—now it may not have been.

Q. You have called attention to a gauge in this catalog, which I gather is about twelve or fifteen inhes high. This gauge that has been described, in the Seminole, as I understand it, ran the whole height of the tanks. In other words the tee would have to support a great deal more, as I understand it, than would appear in this illustration, would it not, in the way of weight?

A. If your tube ran continuously all the way to the top, it would have to support more than this as shown; there is no dimensions on that sketch there.

Q. Of course you don't know whether it was a standard gauge fitting such as is shown here, or not, do you?

A. It was a standard gauge valve.

Q. Just what was the object that you say you saw in the Seminole—you found in the Seminole, that you thought was the gauge?

A. The object that I saw was only the valve, as attached to a length of pipe as it came out of a tee; as I recall it came out of a tee, and there was five feet of pipe or more attached to it—the sides.

Q. Where did you notice that in the wreck of the Seminole?

A. That is in the engine room in all that pile of debris. There was the remains of another one laying on top of the auxiliary generating plant, forward into the engine room. Whether it came off of that, or whether it came off of the water tanks—pump, down in the lower or right hand, starboard—forward starboard corner, or not, I don't know.

Q. When was it that you observed that?

A. I don't remember; it has been some time ago.

Q. Well this gauge has been described as being fitted within a brass pipe.

A. I believe that was one of the descriptions of it; yes, sir.

Q. If that were so, how would the brass pipe be supported?

A. I would assume that the brass pipe would merely rest on the packing nut of the valve.

Q. Without any fastening?

A. Without any fastening; it wouldn't need any fastening.

Q. If it wasn't fastened, it wouldn't be much protection, would it?

A. Oh yes.

Q. Have you any information as to how this gasoline gauge was fitted to the top?

A. I haven't any direct—no. I assume that there was another valve of the same type at the top. That is the standard practice of installation.

Q. That would be the standard practice?

A. That is the standard practice of installation.

Q. And where would it be connected at the top? Back of the tank?

A. It could be connected to the filler pipe or to the vent pipe, either one, any pipe above that. It doesn't seem to have been connected with the vent pipe, because there is no indication of the tee connection in it.

Q. Now of course if it wasn't connected with the vent pipe or the filler pipe, it would have to have a vent at the top, or it would be useless, wouldn't it?

A. It would.

Q. And would you approve a gasoline gauge with a vent at the top?

A. Open vent? No, I don't believe that would be—

Q. That would be a dangerous thing, would it not?

A. I wouldn't consider it as proper, unless it extended above the deck, or led overboard, or something of that nature.

Q. The glass gauge as described in this catalog that you refer to, is a steam gauge, is it not?

A. That is a steam gauge; yes, sir.

Q. And a steam gauge would be somewhere around twelve or fifteen inches long, would it not?

A. Might be longer. I have bought them up to three feet. I know that they can be gotten on special order, longer than that; you can get them any length you want; get them six inches long.

Q. I am not talking about what you can get; I am talking about the height of the ordinary gauge on a steam boiler; it wouldn't ordinarily be over fifteen to eighteen inches, would it?

A. Well I am not familiar with steam engines so I don't know. It seems to me I have seen them on boilers, longer than that—stationary boilers, upright boilers.

Q. Now in this case the glass gauge must have been six feet or more high, judging from the height of the tanks; is that correct?

A. That's correct, if it was in one piece. It didn't have to be in one piece.

Q. That would be pretty unusual height for any kind of a glass gauge, would it not?

A. I would think it would be rather a long glass tube. I wouldn't personally install one as long as that.

Q. Now let me ask you this. You say you have examined a number of vessels for purpose of insurance. Have you ever recommended a vessel for the purpose of insurance, that had a glass gauge for determining the height of gasoline in the tanks?

A. I have never turned one down.

Q. Have you recommended one that had one?

A. I can't say that I directly recommended them, because I don't make any recommendations whatsoever, un-

less there is something that I don't approve of, that I make a recommendation that it be changed. Now I did not recommend the gauge, because I made no mention of it; it was there, they could use their own conclusions.

Q. Do I understand that with respect to one or more vessels, that you did make a report mentioning the gauge, one way or the other?

A. I have never made one; no; because none of the vessels I have ever surveyed have had any such gauge as that.

Q. Now let me ask you about the draw-off valve. Have you ever made a report for insurance purposes, with respect to a vessel which had a valve in her engine room for drawing off gasoline?

A. No, I haven't.

Q. Never had occasion to make a report?

A. I never had occasion to make a report on a vessel that had.

Q. You were saying that it was important to have a supply of gasoline available in the engine room, for certain purposes. It would be a very simple matter to have a separate tank on deck, in the vicinity of the engine room, for storage of gasoline that the engineer might want to draw off for any purpose, would it not?

A. You could have a tank on deck, yes; it would be handy.

Q. You have seen such auxiliary tanks on deck, have you not?

A. I have seen auxiliary tanks on deck; yes, sir.

Q. And if you had such tank, there would be no necessity of having a draw-off valve in the engine room, would there?

A. Yes, there would, in this condition, under the circumstances of this installation, it would be.

Q. Why would that be?

A. Because you need a supply of gasoline where it can be gotten at readily without having to go on deck to get it.

Q. For what purpose?

A. For priming the motors.

Q. Would you approve—would you say that it was proper for an engineer to draw off gasoline for any purpose, from any connection in an engine room, while the motors were running or hot?

A. I see no reason why it shouldn't be done?

Q. The drawing off of gasoline from any connection creates fumes, does it not?

A. That is correct.

Q. Those fumes are highly inflammable and dangerous, are they not?

A. So I am told.

Q. You haven't any doubt about it, have you?

A. No, I don't think I have a doubt about it.

Q. If you have your engines, or one of them, running, you have a danger of sparks in the engine room, do you not?

A. No, not in a properly installed motor, you would not have a tendency to sparks.

Q. You have auxiliary machinery that is liable to create sparks, do you not?

A. You might get some from the generator.

Q. A spark would cause a gasoline explosion if the gasoline fumes were near it, would it not?

A. It might, yes.

Q. Well, I take it that what you have in mind is that gasoline might be needed for priming; is that right?

A. That is correct.

Q. And that is the only reason you have in mind that gasoline might need to be available in the engine room, is that right?

A. Free gas, that's the only reason I see for having free gas in the engine room.

Q. Wouldn't it be quite possible to have squirt cans of appropriate capacity, with proper caps to them, so there would be no danger of gasoline escaping from them in the engine room, where they would be readily available for such service?

A. You use a squirt can for priming a motor.

Q. And you could have it properly filled and kept in the engine room and available for that purpose, couldn't you?

A. You could, and you do; but those squirt cans have to be refilled ever so often.

Q. And if you had them filled in the engine room and ready for use, in emergency you would have them, wouldn't you?

A. That is true.

Q. And if you wanted to refill them, you could go out on deck, where the auxiliary tank was, and refill them where there would be no danger from refilling, couldn't you?

A. You could if you had time enough between the first priming and the second priming. Sometimes it is not convenient, in a case of necessity, or an urgent case, where they would have time to go up a hatch, out on deck, and fill up a tank with gas, and then spill it on the way down.

Q. How long would it take to prime and start a motor such as the Seminole had?

A. To start both those motors I should say it would take five minutes at least.

(Following discussion between Court and counsel as to calling of handwriting-expert witnesses, recess was taken until 9:15 o'clock a. m. of the following day, to-wit, October 11, 1939.)

3102 Thereupon MR. WIRTH MUNROE resumed the witness stand and further testified as follows upon

Cross Examination (Continued).

By Mr. Matteson:

Q. Mr. Munroe, we were talking at the close of Court yesterday, I believe, about the glass gauge in the engine room of the Seminole; and I called your attention to the fact that the testimony is that the glass gauge was the height of the tank. If that were true, it would require a fairly substantial fixture at the bottom, to hold that, with the brass pipe protecting it, wouldn't it?

A. It could be done that way; yes.

Q. Well, it would require a fairly substantial fixture to do that, would it not?

A. Yes.

Q. And of course, below the glass gauge itself there would be the packing gland first, I take it?

A. The packing gland is on top of the valve.

Q. Yes. There would be a valve and a packing gland, and then the glass; is that right?

A. That is right.

Q. How high would you estimate that the bottom of the visible portion of glass would be above the manifold line?

A. Well I don't know that the gauge went all the way to the bottom of the tank; or, do you mean, above the manifold?

Q. Yes; it was affixed to the manifold line, I take it?

A. Yes.

Q. And the bottom of the visible portion of the glass would necessarily be some distance above the manifold line itself; that is correct, isn't it?

A. Maybe three inches; something in that neighborhood.

Q. That would be your estimate, about three inches?

A. It depends on the size of the valve and the size of the glass tube; I don't know what; I don't recall; I didn't measure the size of the tube.

Q. Do you know the size of the tube?

A. No, I do not; I did not measure it.

Q. Now you were telling us yesterday that you estimated that there were sixteen gallons of gasoline in the tanks when the Seminole was laid up. Was that what you estimated?

A. I estimated that that was the amount of fluid or what was in the tank, that could not be drawn out through the outlet.

Q. Does that refer to each tank, or to all four tanks together?

A. That refers to all four tanks.

Q. Now will you tell us by what method of calculation you arrived at that result?

A. By taking the depth of the crown, the bottom.

Q. Will you give us the figures?

A. I will have to refer to my notes.

Q. All right.

A. I estimated the depth of crown two and a quarter inches.

Q. Now I am not quite sure what you mean by the depth of the crown. Perhaps you could draw us a little picture.

A. The height of the crown, you might call it; the distance between the chord and the top of the arc.

Q. Yes; that is from the bottom of the tank, to the top of the crown?

A. Not from the very bottom of the tank, no.

Q. Well, from the bottom of the inside of the tank?

A. From where the sides came in contact with the—

Q. With the bottom?

A. With the bottom.

Q. I see; and that I think you said was about—

A. Two and one quarter crown.

Q. I am getting the height of the bottom of the crown above the side of the—bottom of the side of the tank; what was it you said there about two sixteenths, or three sixteenths of an inch—was that right?

A. Somewheres around an eighth of an inch.

Q. An eighth of an inch.

A. An eight or three, sixteenths.

Q. I see; all right. And then the—

A. But that still does not—there is more distance than that up to the point of contact. I mean, there is the doubling of it.

Q. I will get this straight; then the height of the crown, or the bottom, at the center—above that point, the tank is in a vertical position; you figure it was two and three quarter inches?

A. Two and one quarter.

Q. Two and one quarter inches; all right. What is the rest of your calculation?

A. We know the diameter of the tank, which is forty-two inches.

Q. All right.

A. Instead of using the formula of the circle, I did not know the exact curvature of that top, so I assumed it as a triangle, as if it was merely—the bottom was merely a cone, and figured that amount and deducted one-third for the crown, which is what we use in rough figuring where we have a curved line.

Q. I see.

A. —or a curved surface.

Q. All right. Now what is the rest of your calculation?

A. Well that gives me my volume.

Q. Then that will give you the volume of the tank, as I understand it?

A. Volume of that lower part of it.

Q. The lower part of the tank. If it was filled so it just came to the top of the crown?

A. That is correct.

Q. And will you just give us the figures for that calculation?

A. I have here the total computed gallons, as 6.747 in one tank; that's without the deduction of the crown.

Q. What I want to get at, is the step; how do you get the 6.747?

A. By merely figuring the volume of that cone.

Q. Yes, but how do you figure the volume? Give me the details of your calculation.

A. Well I haven't got them here; I only put down the results of them here. That's a simple computation; any school child can figure that one out. You have got a triangle, a known base, and area.

Q. All right.

A. And a circle.

Q. What do you say was the volume of one of these tanks per vertical inch, outside, above the crown?

A. I don't know; I didn't figure that. I have a table here in Kent's that will give it to me exactly.

Q. What did you figure it?

A. I figured it per foot. The table that I used happens to give it in feet; the volume for a known diameter, in feet.

Q. Can you give us the volume per foot for a forty two inch tank?

A. I will have to look in Kent for it; I have forgotten what page the tables are, now. I can't locate my table as quickly as I would like to. The number of gallons in a one-foot column of a 42-inch circle, would be 71.97 gallons.

Q. 71.97?

A. Per foot. Here is your diameter in inches. U. S. gallons.

Q. 71.97.

Mr. Underwood:

Referring to table 31 on page 95 in Kent's Handbook of—Mechanical Engineers' Handbook.

A. Edition number ten; 10th edition.

Mr. Underwood:

Edition 1923.

Q. Well, that would be approximately six gallons per inch, is that right?

A. Roughly, yes.

Q. Now as I understand it, in order to get this result that you have given us, you multiply six gallons per inch by two and one quarter?

A. No, I didn't.

Q. Well tell me what you did, then.

A. I figured a triangle, the base of 42 inches in diameter—it is not a triangle, it is part of a cone; offhand I can't, just describe the exact form.

Q. As if it were a cone instead of a dome, is that it?

A. It is the reverse of a cone.

Q. Well, you figure the height of that cone to be two and a quarter inches?

A. That is correct, with a base of 42 inches.

Q. And after you figured—

A. That is the base, not of 42 inches, but the area of a base—a circular base 42 inches.

Q. You figured the cubical contents of a cone whose base was a circle 42 inches in diameter, and whose height was two and a quarter inches?

A. I believe that is right; I am not sure. I know how I did it, but I don't know whether you are—I used the area of a circle 42 inches in diameter, as a base, with a height of—figuring on a triangle, as a triangle, two and one quarter inches in altitude.

Q. Well then after you got through doing that, what did you do?

A. That gave me a result in cubic inches.

Q. Yes?

A. And that divided by 231, which is the number of cubic inches in a U. S. gallon, gives me the gallonage of that.

Q. Yes. Well we might—I want to suggest that we might figure it another way, and see what you say to this. If you take the cubical—the capacity in gallons, of a circular tank 42 inches in diameter, and two and a quarter inches high, isn't there a coefficient that you could apply for a reduction of that volume to compensate for the crown?

A. There are other ways of arriving at the same volume, by going at it in a different way; I admit that.

Q. Well, that would be one method of getting at it, would it not?

A. I believe that would give you—I wouldn't say that it is absolute, without figuring it out.

Q. Now in any event, what you have given us, the figure of 6.747, is the volume of liquid you figure would be in any one tank if it was filled just to the height of the center of the crown?

A. Yes, sir; that is what I figured.

Q. And that would be two and one quarter, plus one-eighth inches above the bottom of the side of the tank?

A. No, it would be more than that, because you have the doubling of the side of your bottom, and the sides of your tank, where the doubling comes, where your rivets go through; you can't include that part of it.

Q. Well I am just trying to figure, what the level in the tank is, outside of your calculation; you have just told me that you figured—that your figure represents the volume of liquid in the tank, if the tank is filled just to the height of the top of the crown?

A. That is right.

Q. That is right. Now, the height of the top of the crown is two and a quarter inches above this lower edge?

A. It is not the lower edge of the tank, no. It is the distance between where the crown of the bottom starts from the side, if you understand what I mean.

Q. How far is that above the bottom?

A. I don't know what that distance is at the bottom, offhand.

Q. You can't tell us that?

A. I can't tell you that, because I didn't measure it. I did measure in some place; I haven't got that on this particular piece of paper. I measured with a straight-edge across the bottom of the tank, measuring to the total crown and then deducting from that the distance from the bottom edge of the side of the tank, to the point where the crown of the bottom starts, above the rivets.

Q. I see.

A. I only figured from that point up.

Q. But you took a straight-edge across the bottom of the tank, measured up from the center of the bottom up to the top of the crown; do you know what that measurement is?

A. I don't recall what my measurement was; no.

Q. Well your calculation of the quantity in each tank, which you have told me is enough to fill the tank to the top of the crown—?

A. Yes, sir.

Q. Assumes that the top of the crown is level with the outlet of the tank, doesn't it?

A. Yes, sir; because I measured those two to see if they were the same, and they were near enough for my estimate. They may have varied a fraction of an inch, but they were near enough for my estimate.

Q. What was the height of the center of the outlet fixture as installed on these tanks, above the bottom edge of the tank?

A. Four and three quarter inches, I believe.

Q. Four and three quarter inches?

A. I measured that; I have got it here I believe; four and three quarter inches.

Q. That is right. Now—

A. That is to the center of the hole. Now you can figure the bottom of the hole, for the outlet.

Q. That is right. Now you told us there was 6.747 gallons in each tank; is that right?

A. That's before—that's providing there is a triangle in there, that the bottom crown is a straight line and not a curve.

Q. There were four tanks, were there not?

A. There were four tanks.

Q. Well then the full capacity ought to be four times whatever the result is for one tank?

A. That would be 26.988.

Q. Well wasn't the estimate that you gave us in the first place, sixteen?

A. Yes. From that figure of 26.988 I deducted one-third for the curvature of the bottom; which is only rough, it is not absolutely correct.

Q. Well you had already deducted that.

A. No, I hadn't.

Q. In the 6.747, had you not?

A. No, I did not. I tried to explain that the volume of 6.747 was using the crown of the bottom as a straight line, or the end of the bottom being a cone, coming to a point in the center.

Q. Well your calculations I take it—

A. I merely deducted my third after I had arrived at the total figure. Just a matter of where you deduct it, whether you take it at the end or the beginning.

Q. It doesnt' make any difference where you deduct it, if you assume that the level that you are calculating is no higher than the bottom of the middle of the crown of the tank?

A. That is correct.

Q. Of course if it is higher, then it does make a difference?

A. It makes a small difference, yes. If the crown was higher than the outlet, the bottom of the outlet, it would be less gasoline.

Q. Were you assuming that the gasoline in the tanks was no higher than the bottom edge of the outlet of the tank?

A. In normal position, as the—whatever the fluid in your tank, as it flowed out through the outlet, it would drop to the bottom of that outlet.

Q. What was the width of that outlet?

A. I believe it was a three-eighths; it is more than three eighths. It was a standard three eighths pipe, which is larger than three eighths.

Q. The diameter of the hole would be three eighths?

A. The diameter of the hole is more than three eighths; yes.

Q. Now you have told us that—you measured the distance from the center of the outlet of the tank to the bottom of the tank, as four and three quarter inches?

A. The center of the outlet, yes, to the bottom edge of the tank.

Q. And you measured the distance from the bottom of the pan to the bottom of the groove in which the tank sat, did you? Or at least you confirmed your measurement of that, did you not?

A. I confirmed your measurement out there the other day, the depth of the groove; I don't remember the other.

Q. Well wasn't it—didn't we ascertain at that time that it was two and three quarter inches from the bottom of the pan to the bottom of the groove?

A. Yes, we did; you are right; I have it here.

Mr. Underwood:

Is that two and three quarters?

Mr. Matteson:

Two and three quarters.

Q. And I think that we confirmed, did we not, that the height of the top of the engine room floor, from the plate at the bottom of the ship, was nineteen inches? Was that correct?

A. The bottom of—the top of that opening—

Q. No; I am going down to the bottom plating of the ship on the inside now, through the top of the engine room floor. What measurement have we for that?

A. I have seventeen and a half inches from the keel plate to the top of the engine room floor.

Q. Seventeen and one-half inches. Then from the top of the floor to the center of the opening through which the outlet valves of the tanks came—

A. Yes.

Q. What measurements have we for that?

A. Twenty eight inches.

Q. Twenty eight inches. So that would put the center—

Mr. Underwood:

Excuse me; may I interrupt and get that? Read me the last question and answer, please.

(Preceding three Questions and two Answers, read.)

Q. So that will put the center of the opening through which the outlet from the tanks came, a total of forty five and one half inches above the bottom plating of the ship, would it not?

A. That is correct.

Q. Did you measure the opening from the engine room into the space under the tank compartment? Have you some measurement for that?

A. I have those measurements; I didn't actually measure them.

Q. What measurement have you for that?

A. The opening is nineteen inches high, twenty-one inches wide, with the exception of that angle which is in the opening.

Q. How much is that narrower?

A. It narrows it down to fourteen inches. Whether that is the original position of that angle or not, I do not know.

Q. Now while we are on the subject of measurements, have you some measurement for the size of the opening in the steel bulkhead between the engine room and the starboard passageway which took the windows?

A. I haven't got them right here, but they were taken. I haven't got them.

Q. And you haven't the height of the bottom of that opening above the floor?

A. I haven't it in any of my notes. I believe Mr. Underwood has that.

Mr. Underwood:

This is the window in the alleyway between the engine room and the aft bulkhead; Mr. Munroe measured them and I wrote it down; if you want them you can have them.

Mr. Matteson:

Have you got them?

Mr. Underwood:

Yes; do you want them?

Mr. Matteson:

Yes.

Mr. Underwood:

The width of the opening is two feet three and a half inches; the height of it is three feet one and a half inches. It is three feet eight inches above the floor frame.

Mr. Matteson:

And have you got how far down from the ceiling?

Mr. Underwood:

No, I haven't that.

Mr. Botts:

About six inches.

Mr. Underwood:

Approximately that. I remember that, but I didn't put the ruler on it,

Q. Now this opening, the measurements of which we have just put in the record, representing the opening in the steel bulkhead which took the window into the alleyway, of course that was merely an opening cut into the steel bulkhead, was it not?

A. That is right, with a frame inside of that.

Q. There would necessarily have been a frame inside of that, which would have reduced the size of the window about two inches on each side?

A. Not necessarily; it might not over three inches altogether; an inch and a half on each side. It might have been a little more for the thickness of the sill; the sill may have been a little bit thicker than the rest of it.

Q. You would estimate an inch and a half for the sides, and say about two inches for the top and bottom?

A. It may have been more than that. There would be no necessity of making it much heavier frame than that.

Q. Now in the first place I want to describe to you a drain line, which I believe that Captain Baker said was in the pans under the tanks; the starboard pan under the tanks; consisting of a pipe which led from the starboard forward corner down to the floor beams of the vessel, forward to the base under the bathroom on the starboard side of the ship, forward of the tank compartment, and up and joining into the side of the outlet of the toilet discharge, which is said to be a few inches below the water level,—below the water line at the side of the vessel; in which the water would flow back from that overboard discharge until it stood in the pipes to the height of the outside water level of the vessel. Would you consider that a proper drain?

A. It would be a proper drain, providing the pans were above the water line.

Q. Well you mean, a proper drain for draining gasoline outboard?

A. It wouldn't be the best. It would take care of the job, but it wouldn't be the very best.

Q. Now under the conditions that I have described, you understand that the lower part of the pipe, the uprights, up to the water level, would be filled with water?

A. The pipes would be filled—in that pipe the water would be the same height as it would on the outside of the vessel, yes.

Q. And gasoline floats on water, does it not?

A. It does.

Q. And consequently, if any gasoline ran from the drip pan into the discharge pipe, it would float above whatever water was in that pipe, would it not?

A. To a small extent, yes.

Q. Well it would not be heavy enough to force itself or the water out of the pipe, would it?

A. It would if you had enough head on it.

Q. If you had enough head on it?

A. Yes.

Q. It would take quite a little head on it, wouldn't it?

A. Not a great deal.

Q. How many inches?

A. A couple of inches, higher than the pipe, for it to force its way down.

Q. Well let me see if I get this right. You mean that if gasoline ran out of the tank, out of the pan into the pipe, so that it filled the pipe to a level of two inches above the water, what do you say would happen?

A. That it would gradually work out into the other,—into the water below it, providing the outlet is not too far down.

Q. Do gasoline and water mix?

A. Yes they do to a certain extent; form an emulsion.

Q. Is that what you are assuming would happen there?

A. It would, with agitation,—there could be an emulsion formed, yes.

Q. Well isn't it a fact that gasoline would necessarily float on the water in that drain pipe line?

A. It would float to a certain extent, but after there was enough on the surface it would force its way down, it would force the water out after a while, providing there was not too much volume of water below it.

Q. Well I am assuming that the pipe is filled and runs down to the bottom of the vessel, runs forward and is filled up to the point of the overboard discharge.

A. Well I don't know that it did run down and then back up again.

Q. I am just asking you to assume that.

A. That is a different problem.

Q. That is the problem I thought I put in the first place.

A. I am sorry, I didn't understand that there was a trap in there, or a reverse siphon.

Q. If there was a trap in there, as you call it, it would not serve the purpose of a gasoline drain line at all, would it?

A. No it would not. I am sorry I didn't understand your question before, but with the reverse siphon it wouldn't be as satisfactory.

Q. Wouldn't be as satisfactory?

A. No.

Q. Wouldn't be satisfactory at all, would it?

A. It could work under the conditions; I know the reason why it would work.

Q. Well, tell us.

A. There is a condition that hasn't been brought into the thing, and that is the fact that it discharged into a toilet connection, where there was constant flow,—not constant, but frequent flow of water past that, which would have a tendency to suck any other water,—any other pipe leading into it.

Q. It wouldn't suck the water cut, would it?

A. It would suck the water from the small pipe, through.

Q. It would always,—the pipe would always be filled with some water, would it not?

A. It would always be filled, but every time that water passed through the larger pipe from the toilet, it would have a tendency to draw from the smaller pipe, any water that was in that, as you flush it, due to the flow.

Q. Would you pass such a pipe as a proper drain pipe?

A. Not with the inverted siphon in it, no.

Q. Now in the second place, did you find any evidence of any pipe that could be used as a drain pipe, on the starboard side of the pan?

A. Not on the starboard side of the pan.

Q. There was none there?

A. No.

Q. Now isn't it a fact, for a drain line to be a satisfactory line for that purpose, it would have to lead from the receptacle to the drain in a continuous down grade, to a point outside the hull of the vessel, above the water line?

A. To be a perfect one, yes.

Q. And if it was arranged in such a way that the water would flow back through it, that would interfere with its function as a drain?

A. Such a drain, running on a gradual grade, or constant grade, running to the outside of the vessel, when that vessel was under way, water was passing by her side, past the opening of that pipe, there would be a suction cut of that pipe continuously, pulling any liquid that was in the pipe, out, regardless of how high or how far below the water line it would be.

Q. And if the vessel was at rest and the line, outlet of the line, was below the water level, the water would always stand in the line to the level of the water outside?

A. It would, yes.

Q. And if the vessel listed to that side, it would increase the height of the water in such a pipe?

A. That depends on how far the pipe is from the side of the vessel, where the rise would be; how high the upper end of it is.

Q. It would cause a rise because the water level on that side would rise?

A. If it should come nearer the center of the vessel, there would be no rise. If the upper end of the pipe was near the center of the vessel, or point of roll, center of gravity, pivot point of roll, there would be no movement or rise and fall in the pipe, whatsoever.

Q. I think you said in your direct examination that drains in the drip pans would not be necessary if the pans did not leak; is that right?

Mr. Underwood:

If the tanks did not leak?

Q. If the tanks did not leak, of course there would not be any necessity of drip pans either, if the pans did not leak, would there?

A. There wouldn't.

Q. You were saying yesterday that there was no need for access to the tank compartment for the purpose of inspection of the tanks; is that right?

A. No absolute need, no.

Q. What do you mean by absolute need?

A. I mean that those tanks could be used for many years without having any outside inspection.

Q. I see. You don't think it is necessary, with respect to a gasoline tank, to have it under continuous observation by a careful engineer?

A. No it is not necessary. You will have a leak just the same, you might have a leak, I mean, regardless of inspection.

Q. But if you have an inspection then you know about it, don't you?

A. Not necessarily. A leak could occur between inspections and you would not have seen it at all.

Q. Well you will admit that a leak that you can't discover is a much more serious matter than one that there is some possibility of discovering?

A. Well it is sometimes nicer to know, you maybe put your mind at better rest, if you think you can see the outside of the thing.

Q. And if you know, then you can avoid known things until the defect is remedied of course?

A. Yes. But there is no reason why those tanks should have leaked though so there was no need for inspection.

Q. I think you said that there was no need, because you could apply a hydrostatic test?

A. That is correct.

Q. Is that the reason why you say it is not necessary to have access?

A. That is a reason, yes. You can test them beyond the service point of your tank.

Q. Now a hydrostatic test is quite an intricate matter, is it not? Takes a lot of time and a lot of arrangement?

A. I don't know; it is one of the simplest tests I know.

Q. Well if you had a boat like the Semniole, you wanted to apply a hydrostatic test to her tanks, you would have to first of all remove the gasoline from them, would you not?

A. Not necessarily, no.

Q. At least you would certainly want to remove it?

A. You could run your hydrostatic test with gas in them if you wanted to.

Q. Did you ever hear of running a hydrostatic test with gasoline?

A. No, but you could use any fluid. Hydro does not necessarily mean water.

Q. Well if you used water, water is the normal thing to use for the hydrostatic test, isn't it?

A. That is correct.

Q. And if you used water you would want to get all the gasoline out of the tanks before you put water in, would you not?

A. Not necessarily, no.

Q. If you had your tanks half full of gasoline, you say you would just fill them up the rest of the way with water, and hold your test that way?

A. Float your gasoline on top of your water, if you wanted to. It is possible to do that. I don't say that that—

Q. That would be—

A. The way everyone would do it.

Q. That would be just about throwing away so much gasoline, wouldn't it?

A. Not at all. All modern gas tanks are stored in underground tanks and pumped out by forcing water into the tanks.

Q. Well hydrostatic test of tanks is the test that is made periodically, at considerable intervals; is that not a fact?

Mr. Underwood:

I object to the question unless further facts are included; what tanks, and what type of vessels, and by whom.

Q. I am talking about any kind of a hydrostatic test of a tank on a vessel. As a matter of fact it is not practical to make such tests at frequent intervals?

A. You say it is not practical to make them?

Q. Yes.

A. No I do not know that it is impractical. Maybe I misunderstood your word.

Q. Have you ever conducted a hydrostatic test on a vessel?

A. Not on the vessel itself, no.

Q. Have you ever conducted any other hydrostatic test than the one you described to us the other day?

A. I have, on other tanks.

Q. What sort of tanks?

A. Gasoline tanks.

Q. What size?

A. And water tanks, both.

Q. What size?

A. They were small tanks, fifty to sixty gallons apiece; not round, they were angular tanks.

Q. Would you say it was a practical matter, relying on hydrostatic tests as a matter of keeping the tanks, the gasoline tanks of the Seminole, under sufficient inspection, year in and year out?

A. If you want to go to the trouble of making hydrostatic tests, yes, I would say one test a year would be quite sufficient. Very few of them are ever made, though.

Q. Then your idea would be to have a hydrostatic test once a year, and no other means of observation of the tanks in between.

A. Well there were pans underneath there, and if there was any leak in the tanks it would certainly show up in the pans. You wouldn't be able to readily determine just which tank it was, though; that would mean going to a yard and having the tanks removed, which would be the safest thing to do.

Q. Now do you approve the placing of wooden stringers in the bottom of a drip pan under a gasoline tank for the purpose of supporting the tank?

A. I certainly do.

Q. And if there were a leak in any of those gasoline tanks resting on those wooden stringers, it is a fact, is it not, that the leak would be absorbed by the wood and run off in the form of vapor?

A. It would, yes; but there is other things to consider besides that.

Q. Do you consider that that would not be a hazard which should be avoided?

A. That is the lesser hazard; what you refer to by not using wood.

Q. Do you know any set of standard rules of practice with respect to vessels of any class, that permits the use of wood fixtures in a tank compartment?

A. I am not familiar enough with any of them, to know. I have never seen anything else but wood cradles put in tank compartments—or cushions under tanks.

Q. Do you know that that practice is forbidden by Lloyd's rules with respect to yachts? Do you know?

A. I do not know it. I know that that is the common practice in this vicinity.

Q. What are Lloyd's rules for yachts?

A. Lloyd's rules are made up, as I understand it, solely for insurance purposes. They will insure a yacht that is made up by Lloyd's quicker than they will without them.

Q. Who are *they*?

A. Beg pardon?

Q. Who are "they"?

A. The insurance companies.

Q. Isn't it a fact—

A. Lloyd's is merely a brokers'—brokerage of many insurance men; central brokerage house.

Q. It is your idea that Lloyd's Classification Society is an insurance brokerage?

A. No; Lloyd's—I won't say that that particular one is. You mean the one that compiles these rules?

Q. Yes.

A. No; that is a society very similar to our American Society of Naval Architects, or American Society of Marine Engineers, or Automotive Engineers, or any others, that establish a standard. That standard may not always be practiced in every view.

Q. Such standards as are established by such organizations, are recognized as standards of careful and prudent practice, are they not?

A. Lloyd's is considered a good practice, yes, for ocean-going vessels.

(Informal recess was had, 3:36-3:43 p. m.)

Q. I take it, Mr. Munroe, that the objection you have to Lloyd's rules with respect to yachts, of which we have copies here, marked 101, 101-A, as applied to the Seminole, is that such rules apply only to seagoing vessels; is that right?

A. Practically yes. You may build a boat to Lloyd's rules that isn't seagoing; but it is primarily for seagoing vessels.

Q. Do you think that makes any rule with respect to wood in tank compartments, inapplicable to a vessel of the type of the Seminole?

A. I don't quite understand your question.

Mr. Matteson:

Will you read it? (Question read by reporter.)

A. I don't say that it is necessary to follow those rules exactly; that if has any bearing on what was done in here.

Q. I think you said that you knew of no other way of fastening the tanks, in the tank compartment, other than by wood bracing; is that right?

A. If I said that I certainly didn't mean it. There are other methods of fastening, without wood bracing; yes.

Q. And they could be fastened by steel straps to the bulkhead?

A. By steel straps, yes.

Q. These tanks were not fastened by steel straps to the bulkhead, were they?

A. As far as I can see, they weren't.

Q. Did you measure the diameter of the holes in the bulkhead through which the fixtures from the tank came? —I mean the outlet valves and the filling lines?

A. I don't recall whether I measured them or not. I don't think I did. If I did, I don't recall the measurements.

Q. Were they four inches?

A. My recollection is that they were possibly four inches, yes; they may have been four and a half; may have been three and three quarters.

Q. And of course the tanks fit up fairly close to the bulkheads, do they not?

A. That is correct.

Q. That is shown for instance in Libelants' Exhibit 4, is it not?

A. That indicates that that tank is tipped up; it would throw it a little closer to the edge of the bulkhead than it might be normally.

Q. But it would be very close to the bulkhead?

A. Yes; fairly close; within an inch.

Q. And the lower opening is partly filled with the valve fixture that comes through it, is it not?

A. Yes.

Q. And the upper openings, where the filler lines went through, were the same diameter, approximately?

A. Approximately, yes.

Q. And they were two-inch filler lines which went through there, were they not?

A. Two-inch pipe, yes; inside diameter.

Q. That would be how much exterior diameter?

A. Approximately two and a half; two and five-eighths inches outside diameter of the pipes.

Q. And the tanks would fit as closely behind the bulkheads, in the vicinity of the filling holes, as they would the outlet valves; is that correct?

A. It would if the bulkhead was perpendicular, parallel with the tank, the side of the tank.

Q. It should be perpendicular, should it not?

A. Normally, yes, it would be perpendicular; it wouldn't absolutely have to be.

Q. Now did I understand you to say that in your opinion those eight holes in the bulkhead would make sufficient ventilation for the tank compartment?

A. There was other ventilation besides that.

Q. That other ventilation?

A. There was ventilation between the pan and the side of the bulkhead, all around.

Q. How much was that?

A. Over an inch; an inch to an inch and a quarter.

Q. Around the edges of the pans?

A. At the bottom of the bulkheads where the pans fitted in.

Q. And the space below that—

A. That is at the end where the tank—or the pan, is rectangular.

Q. And the space below that is ventilated by this hole in the bulkhead, seventeen and a half inches by twenty eight inches, is that right?

A. I assume that is one of the holes; there may have been others; and there may have been other places for air to have circulated through there. There was a space under the floor forward of that.

Q. And so far as you know, that floor covered that space entirely, did it not?

A. Which floor?

Q. The floor forward of the tank compartment.

A. The main floor of the vessel?

Q. The main floor of the vessel.

A. I assume it did.

Q. Then the only ventilation would be through this hole seventeen and a half by twenty eight inches in the center of the compartment at the level of the engine room floor, is that right?

A. That was one of them. There was another place that might have been opened, where the steering gear went up to the pilot house; that may have been open through there; that floor may have been away from there. There may have been other ventilation places there.

Q. You don't know of any such thing?

A. There is no indication of it now. There had to be a shaft there,—a shaft-way for the—

Q. A shaft large enough to take the steering chains?

A. The steering chains or, judging from the type of steering gear that she had on her I assume that would have been a shaft because the rack is down below the main floor—the steering gear.

Q. What would be the diameter of this shaft?

A. Inch and a half; two inches; inch and a half.

Q. That would operate in a bearing, would it not?

A. Yes, but there had to be also a requirement there for the engine room telegraph to lead down through, and open enough for a man to work on it; install it.

Q. The engine room telegraph consists of pull-wires, does it not?

A. It does; but you have to get in there to install them, and you have to have room enough to install and repair them.

Q. But you know of no—

A. No, there is no indication today of what was there. There might have been a space there six feet square; I don't know. There may have been a space two feet square; may have a grille on one side, and might not have; may have solid wall.

Q. Let's just assume the things we don't know about, didn't exist. If they didn't exist, you would still say that these openings that we have been talking about would furnish adequate ventilation for the tank compartment?

A. I don't say that those holes in the bulkhead furnished adequate—no. I don't think that they were the entire form of ventilation for that compartment.

Q. If they were, you would not consider that adequate ventilation?

A. If they were, I wouldn't say that that was quite sufficient, no.

Q. Now in the engine room, there has been some testimony to indicate there may have been what have been described as gooseneck ventilator pipes, consisting of two-inch pipes with a gooseneck above the deck, turning over toward the deck, the pipes running down and into the bilges in the engine room. In the first place, did you see any—have you at any time seen any evidences of the presence of such pipes?

A. No, I have not. That doesn't say, though, that they weren't there. I wouldn't say that they weren't there. It is customary to put those in.

Q. Well the point is, that you saw no evidences of their having been there; is that right?

A. I can find no pipes or see no goosenecks, no. There is a lot of things missing off the boat that could have been there.

Q. Just answer my question, please. Would you consider such gooseneck pipes, if they had existed, would have been any assistance in ventilating the engine room?

A. They certainly would; they would have been of great assistance.

Q. Do you consider a two-inch pipe to be adequate for a ventilator pipe in an engine room the size of the engine room of the Seminole?

A. If there was more than two—if there were four, I would say, yes.

Q. Well when you testified that you considered that the engine room of the Seminole was adequately ventilated, were you taking into account the possible existence of such pipes?

A. I was.

Q. How would such pipes assist in the ventilation of the engine room?

A. The air as it was forced into the engine room by the other cowl ventilators, the large cowl ventilators, that only came through the deck and by the windows, the air would have been forced down through the floor and out through these gooseneck ventilators, with the pressure built up inside of the engine room.

Q. Do you know what the standard size—recognized standard size for such ventilator pipes in a vessel the size of the Seminole, would be?

A. No, I do not.

Q. Isn't it a fact that the recommended size of such ventilator pipes, by the Board of Fire Underwriters, is six inches or more?

A. I don't know. I have never read that.

Q. And at least three inches is recommended for vessels twenty feet and under?

A. I couldn't say.

Q. Now without such ventilator pipes, do you think there would have been adequate bilge ventilation in the Seminole?

A. I don't know what ventilation there was aft. There may have been a manhole on the after deck, which led from the bilge. If that was there it would assist a great deal in the ventilation of it.

Mr. Underwood:

Let him finish.

A. There are a lot of things—there are a lot of ways—

Mr. Matteson:

Before he goes further, that is not answering my question nor giving direct testimony as to conditions; just merely speculating as to what may have existed; and I object to him proceeding along that line, and move to strike out the answer.

The Court:

Read the question. (Last question and answer read by reporter.) I think the question itself rather asks for speculation.

Mr. Matteson:

I will withdraw the objection to it, if your Honor please, and follow it up.

Q. Well then, when you testified that there was adequate ventilation in the engine room of the Seminole, are you assuming that such things as you have suggested, —such as a manhole aft, existed?

A. I assume that there was the normal amount of ventilation holes used in the boat, practically. I have never seen one without such things.

Q. Then as I recall the question that was put to you yesterday, it assumed merely the presence of the skylight, and the presence of the window in the passageway, the presence of the hatch, the presence of the window on the port side of the engine room; and you testified on the basis of the existence of those things that there was adequate ventilation in the engine room. Now I understand now that you are also assuming that there were other means of ventilation, which were not included at that time—included in the statement, which I am giving you now: is that right?

A. I will still hold on the first point too, although it is contradictory to what I just said; that it is possible to ventilate that engine room alone with what openings there were in that engine room; the windows, the hatches, and the cowl; the engine room alone—not the bilges.

Q. Yesterday you made some comment with respect to Libelants' Exhibit 24, regulations for the prevention of explosion and fire on motor boats, approved by the National Board of Fire Underwriters; and I think that you suggested that these regulations were one man's opinion.

A. That is correct.

Q. I call your attention to the statement in the rules, the seventh paragraph:

Mr. Underwood:

Before you go further, may I ask that the previous question be read? (Question beginning at 5th line on this page, and answer, read by reporter.)

Q. —Which reads as follows: After examination of many boats, and doing everything possible to avoid unnecessary expense, the matter was taken up with the Na-

tional Board of Fire Underwriters, and the following have been considered necessary by their engineers.—That would seem to indicate that it was more than one man's opinion, would it not?

Mr. Underwood:

I object to that, if your Honor please; the document speaks for itself; the testimony of the man who said that he was the author of it, speaks for itself.

Mr. Matteson:

I don't think he said that he was the author of it.

Mr. Underwood:

That is my recollection. At all events, the document speaks for itself.

The Court:

I think that is arguing with the witness. I sustain the objection to the question.

Q. Well, I would like to ask you about one or two of these things and see how much disagreement there is between your point of view, and the point of view expressed here. For instance, in the 10th paragraph, on the page that I have referred to, it is stated that all tanks should have an indicating device, and such device shall not consist of glass gauges other than those of bullseye type, or of petcocks.—do you disagree with that?

A. I do.

Q. And the next paragraph, that—All outlets for drawing gasoline for any purpose whatsoever, be prohibited in the engine room.—Do you disagree with that?

A. I disagree with that too.

Q. And the next page,—that drip collectors be fastened on all carburetors; openings should be screened with #40 mesh brass.—Do you agree or disagree with that?

A. I disagree with that.

Q. Well what is your point of disagreement on that?

A. Because there are carburetors today that the drip pan is entirely unnecessary; that such conditions are taken care of by the manufacturers of the carburetor.

Q. Then I understand that you don't approve of drip collectors on the carburetors?

A. They have no particular value, in my opinion. In my experience, is that such a thing only leads a person to disregard flooding of a carburetor; say, Well the drip pan will take care of it: when it does not, only to a certain point. It is just as dangerous as not having them at all.

Q. If the carburetor does flood, it does prevent gasoline from going into the bilges, doesn't it?

A. Temporarily, yes.

Q. And you think because—(interruption). The next paragraph is that, There shall be a cut-off valve at each tank and each carburetor.—Do you disagree with that?

A. I don't see it is necessary under all conditions. It depends a great deal on the installation of the tanks and the motors and everything else.

Q. Now the next paragraph, that—Three-inch or larger ventilating pipes running all the way down to the bilges, be placed in all four corners of the engine room.—Do you agree with that?

A. I agree with the fact that ventilators, gooseneck ventilators, or any ventilator running to the bilge, is good practice; not absolutely necessary in all types of vessels though.

Q. Now do you agree with this statement: No ventilation above, either at deck or sides, will remove these vapors.—Referring to gasoline vapors.

Mr. Underwood:

Where is that found?

Mr. Matteson:

That is on page 3 of the exhibit; paragraph at the bottom, above the signature of A. C. Hudson.

A. Read that question again, will you, please.

(Last question read by reporter.)

Mr. Underwood:

I object to that, on the ground that the whereabouts of the gasoline vapors referred to, is not apparent—not included in the question. Where are they? What boat are they in? What type boat?

Mr. Matteson:

I will read the paragraph back; perhaps we will have it in more complete sense. Beginning with the statement that I read before, that three-inch or larger ventilating pipes running down all the way to the bilges, be placed in all four corners of the engine room. These shall be made so that they cannot be closed. The little water that will enter in a heavy sea would be negligible in comparison with the danger of confined gasoline vapors. Two of these pipes should be provided with electric fans, to remove gases from the bilges. If a suction fan is used, motor must be of the explosion-proof type, and located outside of fan duct. These fans should be run for at least ten minutes before starting, and after shutting down engine. Where boats are so small as to make electric fans impracticable, the same pipe should be installed with the fans omitted. No ventilation above, either at deck or sides, will remove these vapors.—

Q. I call your attention particularly to the last statement, which I take it refers to vapors in the bilges, in the lower part of the engine room. Do you agree or disagree with that?

Mr. Underwood:

I object to the question, on the ground that the type of vessel, and relative location of other ventilation in the bilges, and other pertinent information, is not included; therefore it is not a proper hypothetical question.

The Court:

I think the witness may explain; he is asked if he disagrees with that described rule of construction. If he thinks—if he wants to make any remarks about it, he may; or any difference in boats, to be brought out, may be brought out on redirect examination. I overrule the objection.

Q. What is your answer?

A. I do not entirely agree with that. It depends entirely on the construction of the vessel, the type of vessel, and a great many other conditions. You could put a cowl ventilator on deck, that would force air into that compartment and out through the bilge at a different point, and accomplish the same thing, without a blower, or without the vents leading entirely to the bilge. It depends entirely on the capacity of your engine room, the size of it, the volume of it.

Q. Well, we will refer to an engine room of the size of the Seminole. I take it that you would only disagree with this statement if there were other means provided in the bilges or lower part of the engine room, through which the accumulations of gasoline vapor could be exhausted: is that right?

A. I don't get that question.

Mr. Matteson:

Will you read that?

(Preceding question read by reporter.)

A. I am afraid I still don't get the twist of that question.

Q. Well, I will try to rephrase that. This statement, —No ventilation above, either at deck or sides, will remove these vapors,—you would agree with, if there were no means provided in the bilges or the lower part of the engine room for exhausting—to permit the exhausting of gasoline vapors?

A. I would say that you could not completely rid that engine room floor with such ventilation, unless there was other forms in the boat; some bilge ventilation at the sides, such as the goosenecks, as have been previously talked about.

Q. Now I think you said you did have some familiarity with the rules of the National Fire Protection Association, copies of which have been marked Libelants' Exhibits 25 and 97?

A. I say, I have seen copies of them. I do not possess a copy of them.

Q. And you say that taken as a whole, it is your understanding that they are not fully followed?

A. They are not fully followed; no.

Q. Well now let's see where you disagree with these rules. Take for instance page 3 of Exhibit 25, paragraph 1(d): Seams of ferrous metal tanks shall be welded, or riveted and welded.—Do you disagree with that?

A. I disagree with it, on the grounds that there are other forms of sealing that tank besides caulking or welding.

Q. Apparently the sense of this rule is that other forms are excluded.

A. That is the sense of the rule as I gather it.

Q. And you disagree with the rule, for that reason?

A. I don't believe that you have to live up to the letter of that rule there just because they say it shall be welded, necessarily, when brazing would do just as well, or soldering.

Q. Brazing of course is used only on copper or brass, is it not?

A. No; used on iron, as well.

Q. The next statement is,—All outside rivet points and heads shall be welded.

Mr. Underwood:

If your Honor please, I object to that on the ground that it is not fair to call specific items to the attention of this witness, without giving him the benefit of the following, which is the very initial paragraph in the regulations as they appear in Exhibit 97, which is: No provision in these regulations is to be retroactive as regards construction.—Matters of construction. The Witness has said that he does not possess a copy of them, hasn't used them in practice. I don't think it is fair to catechize him about specific sentences without letting him have that information as well.

Mr. Botts:

Now you have given it to him; go ahead.

Mr. Matteson:

We have referred to these rules as standards of practice, if your Honor please. This witness says he does not fully agree with them. I want to make clear the points on which he does or does not agree.

The Court:

Well this witness has expressed an opinion as to the construction of the Seminole. Now provided you incorporate in your question the proper assumptions in regard to what these rules are, then you may question whether he agrees or disagrees. Any observation that Mr. Underwood makes there about any general suggestion, is proper to be incorporated; or any other sugges-

tion you want to call to the witness' attention, Mr. Underwood, you may do so—as to what these rules are. In other words, here is a system of rules that this witness says he does not follow and does not recognize. I think you are entitled, Mr. Matteson, to inquire if he agrees or disagrees with certain rules.

Mr. Underwood:

If your Honor please, these rules don't even purport to cover the Seminole; because it expressly says they are not to be retroactive. The Seminole was built and her gasoline tanks were installed, before 1930, the date the rules were promulgated; so it is utterly immaterial.

The Court:

What do you say to that? Why should the witness be interrogated about these if they don't apply to the Seminole?

Mr. Matteson:

If we were going to apply them as rules, there might be some force in that statement. But what we are applying them as, are standards of due care. And they are standards of due care, no matter when a vessel was built.

The Court:

Well I think you may ask that, but I think you ought to ask it independent and unconnected with the matter of these rules: Do you think so-and-so? Do you think the Seminole should have been constructed along certain lines? But to have this witness explain why he disagrees with those rules, when the rules on their face don't apply to the Seminole, I think is improper.

Q. Now, do you agree or disagree with a statement that—Outlets on gas feed lines for drawing loose gasoline

for any purpose whatever, are prohibited in the engine compartment?

Mr. Underwood:

If your Honor please, I object to that. Here is a statement now draw actually out of this book, I suppose, but apparently out of thin air. I don't think it is proper to catechize the witness.

The Court:

I sustain that objection. The question is, Mr. Matteson, "are prohibited". Now we must have some standard. If that standard is inapplicable to the Seminole, I think it is not a proper basis. I think you can ask him, Do you think so-and-so?—the conclusion that that states; but not ask him whether he agrees with a certain statement that a certain method of construction is prohibited.

Q. Put it this way: Are you of the opinion that gasoline feed lines for drawing loose gasoline for any purpose whatever, are prohibited in the engine compartment?

Mr. Underwood:

I object to that; it is the same question.

The Court:

I think that is the same question. I hope I make myself clear, Mr. Matteson.

Mr. Matteson:

Will he read the question?

(Last preceding question read by reporter.)

Mr. Matteson:

That is, "*should be* prohibited".

A. There are conditions where these draw-off lines should not be prohibited.

Q. That is your opinion?

A. It is my opinion. I wouldn't hesitate to install one on a boat if I thought it necessary.

Q. Well would you—do I understand you, that you consider that they would be properly installed in a vessel of the type of the Seminole?

A. You say, that they could be properly installed?

Q. Yes.

A. They could.

Q. And of course an item such as an outlet on a gas feed line is not an item of permanent construction, is it? In other words, it is a matter that can be readily altered?

A. It can be readily altered, yes. They can be removed at any time.

Q. That is a simple matter?

A. Yes, sir.

Q. Can you give us a rough idea of the dimensions of the engine room of the Seminole?

A. Very rough; I didn't measure it. I would say that it was approximately twelve to fourteen feet long; probably nearer fourteen feet long; and possibly twelve feet wide, I think; eleven or twelve feet wide; maybe more than that. I did not measure the compartment.

Mr. Underwood:

Sixteen feet four and a half; twenty feet wide.

A. Twenty feet wide? Wider than it was long?

Q. I think that is about right. And have you got the height?

Mr. Underwood:

I don't want to mislead you about that; width at a point four feet above the bilge is twenty feet; that prob-

ably includes the alleyway. Width of the engine room above the cabin floor level, between the port side of the hull and the fore and aft window on the starboard side, seventeen feet. It would make it approximately square; sixteen by seventeen.

Mr. Matteson:
Sixteen feet long?

Mr. Underwood:
Fore and aft.

Mr. Matteson:
And have you the depth of it?—from floor to the skylight?

Mr. Underwood:
I have the height in the way of the raised trunk, eleven and a half feet. Height from engine room floor to deck line; ten feet.

Mr. Matteson:
I think that will suffice.

Q. You were referring to the valve, here the other day, that has a composition seat in it, and said that there are composition seats that are satisfactory for gasoline. You don't know whether this valve had such a seat, or not?

A. That is correct.

Q. Now I refer you to this exhibit—the ticket is off; this is Exhibit number 17, which includes a trap, used in the gasoline line. Is that what you call it?

A. That is what it is, a trap; gasoline trap, or fuel trap; not necessarily gasoline.

Q. The purpose of a trap of this type is to permit water or impurities to filter out of the gas and accumu-

late in the lower part of the trap, where they can be drained off: is that correct?

A. That is correct.

Q. Would you approve an installation in an engine room, which incorporated a trap of this type in the gasoline line, and then led a feed line from the bottom of a trap to one of the auxiliary gasoline motors?

A. I wouldn't say that it was good engineering practice; no.

Q. As a matter of fact it is very poor engineering practice, isn't it?

A. It is not the best.

Q. I want to get back to that test which you made of these tanks, for just a minute. When you ordinarily make a hydrostatic test, by placing a riser on top of a tank, and putting a head in it, what is the method of determining whether or not the test is successful?

A. To note the drop in your riser.

Q. That is, you have a riser of small diameter?

A. That is correct.

Q. Which is adequate to secure the head and pressure in the tank, but a small leak or distortion below will permit the water to fall noticeably in the riser; is that right?

A. It would.

Q. And that is the usual method of making the hydrostatic test, —to leave that condition for a period, and note whether the water falls or not, in the riser?

A. That is right.

Q. Now did the water fall in the riser that you used in connection with this test?

A. It did.

Q. And that was because of the leaks that you have described to us, that you were unable to stop?

A. It was.

Q. Consequently you couldn't determine by that method, by the usual method, whether the test was successful or not, could you?

A. That particular test there was not completely satisfactory.

Q. Now you spoke of the oxidation of the tank by exposure, since last May. Will you tell us just what that consisted of? I think you said something about red lead paint having disappeared from it.

A. That is correct. That was on the lower portion of the tank, that was buried in the ashes before I removed it from the compartment.

Q. It was painted with read lead, you say?

A. There was red lead paint on it when I removed it from the compartment.

Q. And there were no traces of red lead paint when we saw it the other day?

A. It had been washed off by the rains.

Q. Now you have talked to us some about the priming of the engines. Why is it ever necessary to prime a gasoline engine?

A. Because when a motor is cold it doesn't get the proper amount of gasoline in the combustion chamber, or into the cylinder itself, by merely drawing it through the carburetor, unless you choke it or prime it.

Q. And as a matter of fact, the purpose of priming is to make it start quicker; isn't that right?

A. A motor that has to be primed will not start at all without priming it.

Q. I see; what you need in the cylinders in order to make the engine run, is to force gasoline vapor up?

A. You do.

Q. And when your engine is cold, gasoline is drawn in the metal manifold and does not vaporize so readily?

A. No, it does not.

Q. And is that the reason you have to prime engines when they are cold?

A. That is the reason.

Q. Now when they are hot, the engines have turned over, gasoline is drawn into the manifold, the heat will vaporize the gasoline, will it not?

A. It will if the manifold is short enough.

Q. And that would give you your necessary supply of gasoline vapor in the cylinders?

Mr. Underwood:

If your Honor please, I object to this unless the size and type of the motors is included in the hypothetical question. According to the witness' last answer he needs that information properly to answer his question.

Q. I am talking about the engines of the size and type of the Seminole, particularly.

A. Well in the engines of the Seminole the manifold is quite long; the intake manifold is quite long; and that type of motor will not start, even when hot, without slight priming. It doesn't take the amount of priming when they are hot, as it does when they are cold.

Q. Have you ever operated the engines of the Seminole?

A. I have never seen them before, until this case came up.

Q. Now there is testimony in the case that the reason why it was necessary to supply—to prime the engines of the Seminole, was that the air supply, compressed air, used for starting the engines, was not adequate to turn the engines over for more than a very few revolutions. That would be a reason for priming the engines, would it not, if it were a fact?

A. Certainly would.

Q. And you of your own knowledge know of no different reason, do you?

A. I know of no reason why.

Mr. Underwood:

I am sorry; was that answer completed?

(Last question and answer read by reporter.)

Mr. Underwood:

Does that complete your answer?

A. I said all I wanted to.

Q. You said some wicking that woul be used for packing a glass gauge is good—a glass gasoline gauge, is good, and some is not.

A. That is correct.

Q. What kind of wicking would not be satisfactory for that purpose?

A. Anything made of rubber. Cotton is perfectly satisfactory; it is not as good as asbestos, however.

Q. Of course you don't know what the wicking actually used on the Seminole was, do you?

A. No, I do not.

Q. You were saying yesterday that after a test had been made of the gasoline tanks, the gasoline from the gauge glass could be run back into the manifold line?

A. It could be; yes.

Q. Just how would you accomplish that?

A. It could be drained out before the tanks were turned on again; you could turn the tanks off.

Q. You would have to first turn off all the tanks?

A. You would.

Q. And then you would drain the valve through the gasoline discharge pipe?

A. You would open the—leave the lower valve of the gauge open, and let what gasoline there was in there run into the line; or if they were full, it would run into any carburetor chamber, or wherever there was room, you could start up your motor that way.

Q. Then as I understand it, every time you wanted to get the gasoline out of the glass gauge, you would have to do it in one of two ways; either by starting up some of your gasoline-consuming machinery, or else by opening the draw-off valve and drawing it out?

A. That would be correct.

Q. I think you said yesterday that if the valve on the feed lines adjacent to the manifold lines were shut off, there would be no head of gas anywhere in the gas line, between that point and the carburetors; is that right?

A. There would not be as much head.

Q. There would be some head?

A. There would be a very slight head, yes.

Q. And of course, where the line was such shape that it ran down and under the floor and then up to the carburetor, air could return into the lines through the carburetor, could it not?

A. No, it would not.

Q. You think not?

A. It would not; no.

Q. Why not?

A. There is a float valve in the carburetor that shuts that off. Even if it wasn't there, air would not enter that pipe, either.

Q. You spoke of your objection to soldering pipes, and that if they were removed—if you wished to remove the pipes or break the connections, you say you would have to use a blowtorch to get the solder off.

A. An open flame; a blowtorch, or a torch of some kind. They would have to be heated.

Q. Soft solder can be removed with a knife, can it not?

A. It can be, but it would ruin the fitting; if you attempted to turn that pipe out of the fitting, that solder would ball up in there and make an awful mess. If you wanted to throw the fitting away afterwards, yes.

Q. I think you said yesterday that there do come times when through necessity you have to tear down the gasoline lines. What did you have in mind by that?

A. Possible stoppage from foreign matter. Some—

Q. Anything else?

A. No, that would be the only reason, unless you wanted to change the location of the line.

Q. Of course if you tighten such connections repeatedly, there comes a time when there is only one thing to do, and that is, renew them; that is correct?

A. That is correct.

Q. That would be such an occasion, would it not?

A. That would be one occasion. You might discover one faulty fitting in the line, up at the end, where it had to be undone from the end; unmade, right up to that fitting—unless there were unions in the line.

Q. I think you spoke yesterday of the fact that according to your observation there was a little burning of the timbers in the floor of the engine room and in the bottom of the tank compartment, as evidence of the fact that there was no gasoline in the vicinity of those members at the time of the fire. Did I understand you correctly?

A. I don't believe that I said that there was no presence of gasoline. I said there was no severe fire there.

Q. Well, if the lower parts of the engine were filled with gasoline vapor, but not gasoline liquid, a fire might be started by an explosion, or a condition of the gasoline vapor, without any necessary charring of those members; isn't that correct?

A. I don't know that I can answer that exactly.

Q. In other words, dry gas, or gasoline vapor, would burn or explode quickly?

A. If there was gasoline there, or gasoline fumes, I would assume that the thing would blow up in one flash.

Q. And then it would be over?

A. Then it would be over; wouldn't set fire to anything, unless there was some more liquid to burn afterwards.

Q. If there were liquid gasoline remaining then that would burn and char the members in its vicinity?

A. It would.

Q. I think you said yesterday that you would not hesitate to go into the engine room of the Seminole if she had been laid up for two months, and throw an electric knife swtich on a switchboard, if you had not smelled gasoline; is that correct?

A. That is correct.

Q. If you had been warned—I will say if you had smelled a strong bilgy odor, and had been warned against the danger of striking a match or making a light, would you have felt the same way about it?

A. I think that if I had been warned, I might have taken a little more precaution, examined a little bit closely. A bilgy odor is not necessarily gasoline.

Q. It would show—a bilgy odor would show lack of ventilation, of course, would it not?

A. Not necessarily.

Q. What would a bilgy odor indicate to you?

A. The odor of stagnant water in the bilge, if there was any.

Q. Well the odor in itself would indicate lack of ventilation, would it not?

A. I don't think so. I think you could have that odor without—or with even ventilation.

Q. You say that one reason why you would have no fear of throwing a switch in the engine room, would be that you would expect no spark, or a very small one, when you closed the switch?

A. I would expect no spark at all with the switch when I closed it, if the switchboard was high enough above the floor—

Q. What was that?

A. If the switchboard was sufficiently high above the floor so that there would be little danger of any fumes reaching to the switchboard.

Q. You would not expect any sparks on a switchboard or in its vicinity, if you closed a knife switch in the engine room, would you?

A. I certainly would not; not on one hundred ten volts.

Q. And if you closed a switch on the lower left hand corner of the switchboard and there was an emanation of sparks; eight to ten inches to the left of that, that would have been something unusual, wouldn't it?

A. I wouldn't expect it; no.

Q. That would have been what you would call a short circuit, would it not?

A. Well that I couldn't say, what it was—would be.

Q. It certainly was something that should not occur under those conditions?

A. Something—no, it should not occur; you wouldn't expect it.

Q. Well when you get an emanation of sparks, in a supposedly closed and insulated circuit, that is what you call a short circuit, is it not?

A. Yes.

Q. And such thing will not occur if the lines are properly insulated and in proper condition, will it?

A. No, you wouldn't get it from properly insulated wire.

Mr. Matteson:

That is all.

By Mr. Botts:

Q. Mr. Munroe, you have testified with reference to the expansion of gas—I mean, of air, in the gasoline tanks, and the necessity for a large or small vent pipe. I would

like to know whether or not you have ever made any technical study as to the expansion—the coefficient of expansion of air in relation to change in temperature.

A. I have made no technical examination and study.

Q. You don't know what that is, do you?

A. No; I know that it does exist, though.

Q. Do you know enough to know whether or not that expansion is relatively small in relation to the entire volume of air?

A. That—I do know that that depends a great deal upon the variation of temperature, and also atmospheric conditions. You can get the same breathing with difference in atmospheric conditions.

Q. You say that the coefficient of expansion of the air will vary with the atmospheric conditions as to humidity?

A. Not if you want to call it the coefficient of expansion of air, I don't mean that. I mean that a tank will breathe due to the difference in atmospheric pressure on the inside of that tank and the outside, due to atmospheric pressure—I mean barometrically speaking; not in temperature but in barometric pressure; that depending entirely on the size of the vent pipe.

Q. But do you have any idea at all as to what that coefficient of expansion of air is, in relation to change in temperature?

A. No.

Q. You don't have the least idea about that?

A. I don't know; no. Not necessary for me to know that; I can find it in one of these books here.

Q. Can you—would you mind finding it?

A. I don't know; it might take a little time for me to find it.

Q. I would like to have that, if you have got that in your book.

A. I don't know if it is in this book or not.

Q. Well I won't finish on it, so if you have any book with that in it, I would be delighted to have you produce that tomorrow.

A. It varies with the temperature.

Q. All right, can you from your books of reference or any other source, give me that coefficient of expansion in relation to change in temperature?

A. I believe I can give you what you want; I am not sure.

Q. All right; if you would, just in order that we may be satisfied with reference to your source of information, bring your reference book with that in it.

A. All right.

Q. All right sir; then I will pass that question until tomorrow. Now Mr. Munroe, I am not at all sure in my mind the shape of those drip pans that you mentioned in there. I understand that they were square at one end. Would you mind taking a pencil, if you have one—I don't suppose you like mine, because they write like a nail, very hard.

A. I left my pencil home.

Q. Now suppose you draw a section of the tank compartment showing both drip pans and their shape; that would be—they are divided.

A. That's the plan.

Q. I don't want to file this in evidence; I just want to be sure that I understand. Then as I understand it, these drip pans followed generally the curve of the gasoline tanks, in the center of the vessel, and were square at the outside of the vessel?

A. That is correct.

Q. Generally speaking; all right. Now then, these wooden four by four supports upon which the tanks rested, were you able from the examination that you have made, to determine in what method those four by fours were installed underneath the half-circular end of the drip pan toward the center of the vessel?

A. No, I could not tell, because I didn't remove those two tanks, and there is no way of reaching in there—at least I didn't attempt to reach in there to find out.

Q. Then you don't know at this time how those supports were underneath the two center tanks?

A. No.

Q. You didn't take them out.

Mr. Underwood:

Indicating the curved surface of the tanks—curved ends of the tank.

A. Semi-circular.

Q. Then the only one you know how they were installed, was underneath the single tank?

A. Number Four tank.

Q. And that was removed—

A. And number One tank—the square end. You can see number one after you remove number four.

Q. There was no possibility, the way these tanks were installed there, while they were all in place, for a person to examine them and ascertain whether they leaked, was there? I mean, by physically examining the tank.

A. The only part of the middle two, maybe; I don't know what other hatches there were. There was room between number one tank and the outer side of the vessel to have seen down, and for a man to have gotten that side of number one tank.

Q. Now let me—I call your attention now to the Libelants' Exhibit No. 11, the double cut-off valves, from the draw-off line. Do I understand you to say that from your examination, both of those valves were in good shape and proper, prior to the time when the composition was destroyed by the fire?

A. I can see no reason, at the present, under the present conditions, that they weren't correct.

Q. Do you see any—if they were both in good shape, any reason for two valves for that draw-off line?

A. Yes, I see a reason for two valves.

Q. What?

A. Because two valves are better than one.

Q. I see.

A. That is a very simple answer.

Q. If one was good, the other would be unnecessary, is that true?

A. No; the second one is a double precaution; it is a safety factor. I mean if you had a piece of wire that would hold, and your tension was five pounds, and you put one in there that would hold ten pounds, you didn't need the other five pounds, but you had it there for a factor of safety.

Q. Now let's get to the question. If the first—if one valve was good, and in good shape, then the other didn't serve any purpose in cutting off the gasoline, did it?

Mr. Underwood:

If your Honor please, I object to that an argumentative. I think the field has been covered, and the testimony is clean on it.

The Court:

Well I don't want to cut off Mr. Botts; I think the examination is proper; I am sure he thinks he is developing something that hasn't been developed; so I overrule the objection.

A. What was the question, again, please? (The last question preceding, was read by the reporter.)—If the inner valve was tight, the outer valve didn't hold back any gas; no, except what was in this short line here, depending on whether they closed off the outer valve first, or the inner valve first.

Q. Now I understand you to say that you think a draw-off line in an engine room, such as we have in the

Seminole, is proper and a desirable installation; am I right?

A. I believe that such a draw-off valve is perfectly safe, perfectly practicable, in a boat of her type.

Q. Now then my recollection of the reason you gave for that opinion was; that it was convenient to have it readily available for the purpose of drawing off gasoline for priming; is that one of the reasons?

A. That was one of the reasons; yes.

Q. Now I don't recall the other reason; would you mind just telling me what other reason you thought that was desirable?

A. You mean, outside of the use for priming?

Q. Yes; that is one reason—to get gasoline for priming. Now for what other reason is it desirable?

A. Because she was used as a cruising houseboat, with several small tenders, that had to be supplied with gasoline. It was impossible for them to get gasoline from any shore station where she cruised, and those boats had to be supplied; and any gasoline that was being furnished to those boats, it was better to have it come under the supervision of a licensed, or at least experienced man, who operated that gasoline.

Q. Then as I understand your point, it is substantially this; that if they were going to secure their supply of gasoline for other boats, from the Seminole, it was better to have it in the Seminole—in the engine rom, than elsewhere; is that it?

A. That is correct.

Q. But do you agree that it would be better and safer not to draw it off at all for that purpose?

A. No, I won't agree with that.

Q. You don't agree with that?

A. No.

Q. You think then that it is just as safe to draw off gasoline in an engine room, and transfer it through buckets or containers, and put it in other boats—it is your

opinion that that procedure would not in any way tend to create a fire hazard, by leaving gasoline vapors in the vessel?

A. If properly handled, there was no more danger than there is filling your automobile at a filling station on the street.

Q. Now wait a minute; do you mean to tell me—did you hear the testimony as to how it was said this gasoline was drawn off in that vessel—in the engine room?

A. I heard some of it, yes.

Q. You heard the testimony, that they set an open container such as we have, Exhibit 13, underneath this draw-off valve, and allowed gasoline to flow into that container?

A. Yes.

Q. And then when it was full they would hand it out the window; you heard that testimony?

A. I did.

Q. All right; now then do you think that that procedure would cause, or be likely to cause any gasoline fumes to be left in the engine room?

A. A very, very small percentage.

(At 5:05 o'clock p. m., hearing was recessed until 9:15 o'clock a. m. of the following day, to-wit: October 12, 1939.)

3444 Miami, Florida;
Monday, November 13, 1939.

Hearing was resumed pursuant to adjournment of Friday, October 13, 1939.

3445 CAPT. J. W. BRYANT as a witness on behalf of Respondent, was recalled and testified as follows:

Direct Examination.

The Court:
You have been sworn previously in this case?
A. Yes, sir.

The Court:
Your oath that you have already taken covers the balance of your testimony.

Mr. Matteson:
If your Honor please, I understand that Captain Bryant is now being called as a witness for Respondent Phipps; and that this is not further cross-examination, but examination on behalf of the Respondent Phipps?

Mr. Underwood:
That is correct.

The Court:
Did you make the point as to his oath?

Mr. Matteson:
Oh, no, sir.

The Court:
I admonish you though, Captain, that the oath that you have taken in the case is binding on your testimony now

By Mr. Underwood:

Q. Captain Bryant, did you ever go to Pilkington's yard in Fort Lauderdale with J. F. Riley?

A. Yes, sir.

Q. Do you remember any particular time when you went there with him?

A. Why it was in the first of the year '31. They notified me, Mr. Riley did, that he had taken charge of—taken over the Seminole from the Miami office, and she was down at Pilkington's yard at Fort Lauderdale, as I recall it; and he asked me to drive down with him, because he had never been down there; and I drove down with him.

Q. You went down in whose car?

A. Mr. Riley's car.

Q. What happened on the way down?

A. Well we got lost on the way down; getting to the yard, we got on the wrong road, and rode around down there.

Q. Between Lauderdale and Pilkington's yard?

A. Yes, sir.

Q. What happened when you got to Pilkington's yard; did you see Mr. Pilkington?

A. Yes.

Q. What happened then; what words passed between you three?

A. Well Mr. Riley had never met Mr. Pilkington, and he was taking over the boats,—Mr. Riley was. And Mr. Pilkington came out, and I introduced him to Mr. Riley, and told him that Mr. Riley was taking charge of the boats, and all of the correspondence and stuff would be addressed to Mr. Riley and the Palm Beach Company.

Mr. Underwood:

You may cross-examine.

(Informal recess was had).

Mr. Matteson:

No cross-examination of this witness, if you Honor please.

(Witness Excused.)

3447 Thereupon, Mr. WIRTH MUNROE as a witness on behalf of Respondent, was recalled and further testified as follows upon

Cross Examination.

Mr. Botts:

Mr. Matteson has some questions to ask.

Mr. Underwood:

If your Honor please, Mr. Matteson had concluded his cross-examination, and Mr. Botts was cross-examining the witness when he was last on the stand. It seems to me we should have Mr. Botts conclude.

The Court:

Mr. Matteson may ask any question he has to ask.

Mr. Matteson:

It doesn't make any difference to me.

The Court:

Either way.

By Mr. Matteson:

Q. Just one or two things, Mr. Munroe. Last October when we visited the Seminole, your attention was called to the fact, was it not, that the side plates of the vessel had not been removed, but that new plates had been placed on the side over the old plates: That is a fact is it not?

A. That's the way it appears out there.

Q. At one stage of my cross-examination, some question arose as to whether this valve shown in this exhibit number 4 and 5, was the valve of No. 1 tank or the valve of No. 2 tank. Now I would like to straighten that out if I can; and I call your attention to exhibit number 3. You recognize exhibit number 3 as showing the valve of No. 1 tank, do you not? You can see the toilet connection and the small generator also, I believe?

A. It has the appearance of being No. 1 tank. I believe this is the valve; that's in the plating.

Q. Referring to the valve that is attached to the pipe marked sea connection; is that right?

A. That is correct. I didn't actually see the side of the vessel there.

Q. Well at the left hand lower corner of the picture—

A. That's the shelf.

Q. That is the deck stringer plate on the port side?

A. No, it is sort of a bilge stringer, web stringer, that runs all through the entire vessel, and it is the same height as the main deck forward and aft of the engine room.

Q. Well taking those things into—

(Discussion between counsel.)

Mr. Matteson:

I would like to have the witness satisfied.

A. I am satisfied now that that is No. 1 tank. I was doubtful about it before.

Q. Well you can identify the valve shown in number 4, with the valve shown in number 1, can you not? They are the same valve, same opening? I call your attention to the pipe attached to the valve,—upright pipe marked sea connection on number 3; and I believe you can see a part of it in the lower corner of number 4. Also you can

see the same piece of seaweed there coming through the opening, can you not?

A. That's the same opening.

Q. Same opening?

A. My previous assertion, my recollection was that that was in the—that piece of seaweed, so-called, was in the second opening; but my recollection was incorrect on that.

Q. You are satisfied now it was No. 1?

A. I am pretty sure it was No. 1; that it is No. 1.

Q. I think you said in the course of your examination that a cylinder or a sphere is the strongest form of construction; is that correct?

A. For what purpose?

Q. For any structural purpose; an arch is stonger than a straight surface?

A. Yes.

Q. And where the pressure is against the outside of the arc, so that you have a bridge effect, that is the strongest construction, is it not?

A. It is stronger than a straight surface; yes.

Q. I mean, stronger than it would be if the load was against the inside of the curve?

A. Not necessarily. Do you mean, whether the arch is inverted, or whether it is convex or concave?

Q. No.

A. Which side the pressure is on?

Q. Yes. That one which is convex toward the pressure, is stronger than one that is concave toward the pressure, is it not?

A. That depends entirely on the anchorage of your ends.

Q. Well I am assuming that the ends are anchored?

A. One has compression, and the other has tension, depending on which the curve is, and the weight to the curve.

Q. But the compression is the stronger resistance, is it not?

A. I don't know that you can say it is stronger.

Q. You don't concede that?

A. I wouldn't concede that it was the stronger, no; because it entirely depends on what your anchorage it on the other end.

Q. Well take a tank like the tank of the Seminole, with an inverted crown on the bottom; isn't it a fact that the—assuming the proper anchorage, of course—that the bottom would be the strongest part of the tank?

A. The bottom would be the strongest part of the tank for your down pressure, yes.

Q. Now getting back to that test in October,—or the test in May, rather, that you made: Were you present when the tank was lifted out of the Seminole?

A. I was.

Q. And when it was lifted out, do I understand that you had had some stringers placed so that the tank was placed in an upright position on the stringers?

A. That's correct.

Q. And when you made your first examination of that tank, was it then in the upright position on the stringers?

A. It was.

Q. Now after the test, as I understand it, a part of the bottom crown of the tank was pushed down out of line; that's correct, is it?

A. That's correct.

Q. You noticed that after the test had been made?

A. That was after the test was made.

Q. Are you able to say that that depression of a part of the crown was not there when the tank was first placed in its upright position?

A. That bulge in the bottom was done by myself; I put it there.

Q. Well now I didn't ask you that Mr. Munroe; and I move to strike it.

A. I beg your pardon. It was not there when the tank first came out of the compartment.

Q. How do you know that?

A. Because I examined the bottom before any water was put into the tank at all, or any testing was done.

Q. Well when you examined it, it was sitting these stringers, is that right?

A. That's correct.

Q. And those stringers were about four inches high?

A. There were two 4 x 4's.

Q. Two 4 x 4's?

A. Yes.

Q. Then how did you examine it, under those conditions?

A. I put my head down and looked up underneath it.

Q. Through this four inch space between the bottom of the tank—

A. Seven and a half inches, or seven inches. A 4 x 4 is three and five-eighths inches, to be exact, and there were two of them, one on top of the other.

Q. One on top of the other?

A. That is correct.

Q. Were there two sets of those?

A. There were.

Q. You feel pretty sure that that depression in the crown was not there when you started the test?

A. I am absolutely sure it was not there.

Q. You spoke of jumping on the top of the tank. Jumping on the top of the tank would not create any pressure on the contents of the tank, unless the top of the tank gave, would it?

A. The tank was completely filled with water; the top of the tank did not have to give but very, very little to create the same.

Q. The extent of the pressure you put on the tank by that means, would depend upon the extent to which the top moved, would it not?

A. No indeed.—Well it would to a certain extent, yes.

Q. Do you say that the top of the tank was depressed to any extent by your jumping on it?

A. It was; it had to be.

Q. Was it depressed to the same extent as the depression in the bottom on the tank?

A. No indeed.

Q. Well how much do you think the top of the tank was depressed by your jumping on it?

A. That is very hard to say; but, a very small amount.

Q. Well could you give us any idea of the measurement?

A. There might have been a variation of probably a sixteenth of an inch, or to an eighth of an inch—which I doubt it was even that much.

Q. And did the top of the tank return to its original shape?

A. It did.

Q. Did you as a matter of fact observe that the top of the tank was depressed to any extent at all by your jumping on it?

A. I couldn't tell; I couldn't watch the top of the tank and be in motion at the same time.

Q. So you guess that it was a sixteenth or a little less, that was depressed—

A. I could have accomplished the same thing by using a timber or a maul or anything of weight hitting the top of the tank the same way; but not having that handy I merely kicked it with my heel.

Q. And of course, whatever you used, the pressure created would depend on the top of the tank's giving to a certain extent, would it?

A. It would have to give a very small part.

Q. And the pressure would depend on how much you would give it?

A. The pressure is multiplied terrifically in that distance between the top and the bottom.

Q. Well now you interest me. What authority have you for that statement?

A. It's the same principle as the hydraulic ram.

Q. Well what is the principle of the hydraulic ram?

A. A hydraulic ram is a container solid full of water, with a small piston at the end of it, that has a very short stroke. I do not know the exact formula or plan for the difference in power between the piston and the end of your ram.

Q. Well in the hydraulic ram that you are speaking of, is there any difference in area between the top of the piston and the point at which the pressure is applied?

A. Oh yes; the piston might only be half an inch in diameter, and the other end of the ram might be two or three feet.

Q. And that's the way you get your increase in pressure, by a difference in area, is that right?

A. Not necessarily in area.

Q. Well what makes the difference in pressure?

A. Water cannot be compressed. You have the same pressure at the—in half an inch that is spread over the area at the other end.

Q. Suppose we have a cylinder, with a piston in it, and the cylinder is full of water; and you apply a power to the piston, pushing down on the water; isn't it a fact that the pressure on the opposite end of the piston will be no greater than the force that you apply to the piston?

A. You are getting into hydraulics, and I am not a hydraulic engineer.

Q. Well Mr. Munroe you have been explaining to us the effect that you say you produced on this tank, and you attribute it to the principle of the hydraulic ram?

A. That's correct.

Q. And if that is so, you ought to be able to tell us about it?

A. I cannot explain to you all the workings of a hydraulic ram. I know that it exists; but I am not a hydraulic engineer.

Q. Can you tell us anything whatever about the principle of hydraulics, as to the forces that are produced, and how they act by the compression of a piston against a chamber filled with water?

A. I don't get your question at all Mr. Matteson.

Q. Well I am simply asking you for the underlying hydraulic principle that explains this hydraulic ram you are talking about. What is the hydraulic principle that is involved? How does it work?

A. I have told you what I know about a hydraulic ram.

Q. Well you have told us nothing; is that what you know?

A. No.

Mr. Underwood:

If your Honor please, I object to that as characterizing the witness' testimony. I didn't produce this man as a hydraulic expert in the first place, but to inquire about certain facts.

Mr. Matteson:

You certainly had him testify that he produced an effect known as a hydraulic ram, on this tank, and he attributed certain results to it.

The Court:

I don't see that there is anything for the Court to rule on.

Mr. Underwood:

I object to the last question, your Honor, as characterizing the witness' testimony.

The Court:

I overrule the objection.

(By Mr. Matteson):

Q. Put it this way: Do you consider that you have explained to us the principle of a hydraulic ram?

Mr. Underwood:

I object to what the witness considers he has explained. How does that help us to the conclusion of this case?

The Court:

Well he is on cross-examination, Mr. Underwood; I think the question is proper.

(By Mr. Matteson):

Q. Is there any further explanation of it you can give us?

A. I don't think I can.

Q. When a pressure is created by a piston in a cylinder filled with water, can you tell us how the resulting forces are distributed around the walls of the chamber and the opposite end? Any principle of dynamics relating to that?

A. I know that your pressure is equal on the bottom as well as on the sides.

Q. It is distributed over the bottom and the sides, is it not?

A. It is.

Q. And top as well?

A. No, not on the top. Of course you have the added weight of the water there.

Q. The distortion that occurred on the bottom of the tank was a great deal more than any displacement on the top of the tank, was it not?

A. There must have been more pressure on the bottom than there was on the top, otherwise it wouldn't bulge. You have the added weight of your water to help you out, so that you really have got more pressure at the bottom than you have at the top.

Q. The tank was completely filled with water?

A. The tank was in a vertical position.

Q. And completely filled with water?

A. Completely filled with water.

Q. And you noted this bulge on the bottom of the tank just after you had jumped on it; is that right?

A. After I had jumped on it. I then examined the tank all over; I had examined it just previous to my doing that, and I examined it again afterwards; and when—at that time I saw the bulge in the bottom, and you could see that it was freshly done by where it had loosened the galvanizing under the bottom of the tank.

Q. And it was subsequent to that, that you applied the riser test, was it?

A. It was before that— that was the last test I put on.

Q. That was the last test?

Mr. Underwood:

You mean, the jumping test?

A. The jumping test; the ram test was the last test I put on.

(By Mr. Matteson):

Q. Now do I understand that you examined the bottom of the tank just before what you call the ram test?

A. I did.

Q. And up to that time had there been no distortion of the bottom?

A. There was no distortion of the bottom.

Q. Now you have testified to some extent about hydrostatic tests of tanks. It is a fact, is it not Mr. Munroe, that one of the prerequisities for a satisfactory hydrostatic test of a tank, is that the tank should be thoroughly cleaned before such a test is made?

A. I don't know that that is; no.

Q. If that isn't done, any material that may be in the tank will be forced into the seams, will it not,—or it may be?

A. It may be forced into the seams, yes.

Q. And that would give a misleading result to your test, would it not?

A. All depending on what the material is that is in there.

Q. Now these tanks as they were originaliy constructed, as I understand it, had two inch outlets on the sides, at the top and the bottom; is that right?

A. There were two inch holes, bushings welded into the tanks, both top and bottom. Not in the top of the tank nor the bottom of the tank, but the sides at the upper and lower end.

Q. And that apparently was the way the tanks were constructed, was it not?

A. That is the way they were constructed originally.

Q. And a two inch opening would be very large for an outlet on a gasoline tank wouldn't it?

A. Yes.

Q. It would seem to follow from that, Mr. Munroe, would it not, that the tanks were probably not originally constructed especially for the purpose of containing gasoline?

A. I can't say that they were originally intended for gasoline, no. They were probably intended for multiple purposes.

Q. As a matter of fact they are identical with tanks that are ordinarily used for storage of water, are they not?

A. I wouldn't say that they are identical, but, very similar.

Q. Very similar?

A. —construction.

Q. And the large opening that we were just referring to is indicative of a water tank rather than a gasoline tank, is it not?

A. I wouldn't say that it was.

Q. I would like to ask you this question, Mr. Munroe. You have talked some about the drains on the trays under the tanks. If the level of the trays was below the water line of the ship, any drain leading from the trays over-

board would necessarily admit water back into the trays, would it not?

A. If the trays were below the water line, yes.

Q. Do you know what zinc plates are used for on the hull of a vessel like the Seminole?

A. I do.

Q. What are they used for?

A. To prevent electrolysis in the main hull.

Q. What is the cause of electrolysis?

A. Electrolysis is an electrical current that is set up between the iron and the bronze. If you have all iron you don't need the zinc plates. It is only where you have bronze fittings going through the iron, or bronze propellers; it is usually the bronze that the zinc would be taken out of the bronze, if you didn't have the zinc plates to eat up first.

Q. Where are zinc plates ordinarily placed on a vessel like the Seminole?

A. That depends. The majority of them are put near the propellers, usually on the hull; sometimes you see them placed on a strut, depending on where the greatest action takes place.

Q. Well they are placed anywhere in the ship where you find excessive pitting or corrosion, is that right?

A. That is correct.

Q. And that may be forward as well as aft?

A. They might be forward, they might be amidships, they might be aft.

Q. I mean, you didn't by your answer mean to suggest that the only place they are ever put is near a bronze propeller?

A. Oh, no.

Q. And as a matter of fact, if they are put on any other part of the vessel, where there are steel plates and steel frames, you haven't any contact with bronze and steel at that point, have you?

A. You won't need a zinc plate where you have steel to steel.

Q. Well the only place you would have bronze to steel, would be at the propeller, isn't that right?

A. Propeller, and the shafts.

Q. And that is in the after part of the ship?

A. Yes.

Q. And I think you just agreed that they are many times put in the forward part of the ship, as well as the after part of the ship?

A. You might have a bronze seacock fastened to a steel plating; none of it would appear on the outside, but yet there would be electrolysis set up between the bronze,—inside the plating.

Q. What I am getting at is this. It isn't the mere fact there is bronze against steel, that causes the electrolysis, is it? Isn't it the fact that there is an electric current, in addition to that?

A. There is a possibility of it, yes. But you get a greater amount of electrolysis where you have bronze or brass; any material that has zinc in it.

Q. Well it wouldn't occur in a vessel that had no electricity aboard her, would it?

A. No.—Oh, yes it would, too; I beg your pardon. It would.

Q. You think it would?

A. Yes indeed.

Q. But it is aggravated, is it not, by the presence of electricity?

A. It is sometimes aggravated by the presence of a ground wire running,—even a radio wire running to the shaft.

Q. That has to do with stray current set up in the hull, is that right?

A. Due to a stray current, yes.

Q. What would you say would be a normal number of zinc plates for a vessel of the size of the Seminole?

Mr. Underwood:

If you Honor please, I object to that on the ground it is a hypothetical question, and sufficient facts are not stated.

The Court:

I will overrule the objection.

A. Now what was that question, again, please?

Mr. Botts:

Read the question.

(The last question was read by the reporter.)

A. I don't know that I can answer that question. There are too many things dependent on it.

Q. Well let me ask you this: When one of these zinc plates is applied, about what is its usual size and weight, in a vessel the size of the Seminole?

A. You can put them on various sizes; there is no standard size for them. You can get them any size and put them on any size you want, depending on the amount of electrolysis or action that takes place at certain points.

Q. Well ordinarily they are about a foot by a few inches are they not?

A. You can buy them in sheets that size, but they are not put on a vessel, that size.

Q. Usually smaller than that?

A. Oh, yes.

Q. Usually about what size, would you say?

A. Not over four by eight.

Q. And how much would a plate that size weigh?

A. I would only be guessing at it.

Q. Well approximately?

A. Four or five pounds, six pounds. It depends on the thickness of it. Usually about a half inch thick.

Q. Now if you found as many as a dozen such plates on a vessel like the Seminole, isn't it a fact that that would be an extraordinarily large number?

Mr. Underwood:

If your Honor please, I object to that as speculation. In the first place I didn't go into the zinc plate business at all. It isn't proper cross-examination at all. He is making him his own witness as to zinc plates. In the second place, how many zinc plates somebody might put on a vessel, might be because of electrolysis; it might be he wanted to guard against it,—although we haven't any evidence of it. It is purely speculative.

Mr. Matteson:

I think we are entitled to know what our opponents position is with respect to this zinc plate matter. We have some very interesting evidence in the case with respect to zinc plates; and one of the other witnesses testified with respect to them. Now I want to know what is indicated by the conditions that we have and know existed. I think it is fair examination.

The Court:

Did he testify about zinc plates?

Mr. Matteson:

No he hasn't testified about zinc plates, that is true. But it seems to me,—of course if they don't want to be interrogated about it why that is quite all right with me. It is evidence I will put on. I don't care to press it if Mr. Underwood doesn't care to have the witness testify.

The Court:

I think that technically cross-examination should be confined to matters gone into on the direct examination.

Mr. Matteson:

Of course I think I am entitled to a considerable degree of latitude.

The Court:
I think so too.

Mr. Botts:
If the Court please, as I recall it,—it has been so long since this witness' testimony was given; I recall the witness Simmon, as I recall it, stated that by this witness he was informed as to the use for these zinc plates. Now then this witness is presented as an expert, and I think in view of all those things that latitude ought to be allowed to find out what this witness knows, and really how much of an expert he is.

The Court:
Well I am disposed to allow the cross-examination, to test his knowledge, both along the lines gone into in direct examination,—it may be that it is competent. I am just in doubt there. I am going to rule on the safe side and allow this witness to answer. I am in doubt about it, but I will allow him to answer it.

(By Mr. Matteson):
Q. Do you have the question in mind, Mr. Munroe?
A. I would like to have it re-read again; there was so much other said that I can't remember; I don't want to answer without knowing what it is.

(The last question was read.)

A. That depends entirely on the size of the plates. If they were small, a dozen would not be too many.
Q. How thick are these plates? How thick is the stock from which these plates are made?

Mr. Underwood:
I object to that as speculative.

Mr. Matteson:

That is a standard matter.

Mr. Underwood:

There is no proof about the size of it.

The Court:

You asked about some particular plates?

Mr. Matteson:

No, sir. The plating for putting in the sides of ships, comes as I understand it, in a standard size. I think that is a fact; if not, this witness can testify that it isn't. I would like to know what that size is.

Mr. Underwood:

There is no proof about it.

Mr. Botts:

He has already testified the plates are usually about half an inch thick.

Mr. Matteson:

Did he testify to that?—Then I will withdraw the question.

Q. Did the Seminole have any intercoastal or other keelsons?

A. Not that I could see in her.

Q. Did you notice the condition of this stringer that ran along the port side, that we noted showed in this picture exhibit number 3? The horizontal, fore and aft stringer along the port side?

A. That which appears as a shelf? The deck line? The main deck line?

Q. Yes?

A. Yes I noticed that.

Q. Is that what you call the deck stringer? What name would you give it?

A. It would be a deck shelf there, or deck stringer. It is a strengthening frame.

Q. It is a strengthening fore and aft frame?

A. It would be a stringer.

Q. That runs the length of the ship on her port side, does it?

A. As I recall, I think it runs the full length on both sides.

Q. When we were out there in October, did you note the condition of that port deck stringer with respect to corrosion?

A. Well there are places at the present time where it is fairly rusted through, yes.

Q. But did you note by comparison, what the condition of the same stringer on the starboard side was?

A. No I don't think I did. I should say there were about equally corroded, though.

Q. Now you have spoken about the necessity of having gasoline in the engine room for priming engines. You are familiar with an approved type of safety can which is sometimes used in the engine rooms of gasoline boats, where a supply of gasoline is required for special purposes, are you not?

Mr. Underwood:

If your Honor please, I object to the question on the ground that it refers to an approved type of safety can. Approved by whom? If it is one of these rules, I object to it; rules have no binding effect on the respondent.

Mr. Matteson:

I will strike out the word "approved".

Mr. Underwood:

Just ask the question without the word "approved".

(By Mr. Matteson):

Q. You are familiar with a type of safety can that can be used for that purpose, are you not?

A. I am not.

Q. You have never heard of such a thing?

A. I believe they have such things, but I couldn't tell you what it looked like or how it operates.

Q. If such a thing were available, that would be a perfectly adequate means for having a supply of gasoline in the engine room without having draw-off valves attached to the feed line, would it not?

Mr. Underwood:

If your Honor please, I object to that. The witness is asked about something the existence of which he does not know about. He is asked to say if something would be effective that he doesn't know exists.

Mr. Matteson:

This man has testified among other things that it is perfectly proper, and in fact necessary to have draw-off valves for gasoline in the engine room. I certainly think I am entitled to cross-examine him to the limit on that point, about which I think there is no doubt whatever.

The Court:

Read the question now.

(The question objected to was read.)

Mr. Underwood:

If your Honor please, I refer to the phrasology at the outset of the question, "such a thing"; and suggest that the previous two questions and answers be read, so that you will know what the reference is.

Mr. Matteson:

Suppose I reframe the question. I think we are wasting time.

The Court:
All right.

(By Mr. Matteson):
Q. If there were a type of safety can which could be filled ashore and kept in the engine-room as an available supply for priming the engines, there would be no necessity of having draw-off valves on the gasoline line in the engine-room, would there?

Mr. Underwood:
I object to that as speculative. What kind of can is it; what are its dimensions; what can is it; produce one.

Mr. Matteson:
All right. The question is: If there is a type of safety can which can be filled ashore and kept in the engine-room as a supply of gasoline for priming the engines, there would be no necessity of having draw-off lines on the gasoline lines in the engine-room as a means of supplying gas. I think that is perfectly all right; I think we are entitled to ask that.

Mr. Underwood:
I object on the ground that there is no proof of such thing; there is no proof of the material; there is no proof of the dimensions or the means of use. How much does it cost, and just what is it. I think we ought to at least know what the subject of the question is.

The Court:
As I understand it, the purpose of the cross-examination is to elicit from the witness whether it is, within resonable operation of the boat, proper to use a can filled ashore with gasoline and keep it in the engine-room. I don't think that question tends to elicit that. I will sustain the objection to that question.

Mr. Matteson:

If your Honor please, I do not care to press it, but I want to make my point clear. This witness has testified that it is a proper and necessary thing to have draw-off valves on a gasoline line in the engine-room, and he says the reason for that is because it is necessary to have gasoline in the engine-room to prime the engines. Now I am suggesting an alternative means by which that result can be reached, and asking him if that means is available, if that would not eliminate the necessity of having these draw-off valves. I think we are entitled to have an answer to that question.

The Court:

I think that is entirely proper.

Mr. Underwood:

But that was not his question.

The Court:

Suppose you restate your question, because I think your point is well taken.

(By Mr. Matteson):

Q. Now, Mr. Monroe, I will put it this way: I think you have said that draw-off valves on a gasoline line in an engine-room are proper on a vessel on the type of the Seminole, because of the importance of having an available supply of gasoline for priming the engines. Do I undestand you correctly on that?

A. I believe that is the way I stated it.

Q. Now, if there were available a type of safety-can which could be filled ashore and kept in the engine-room as a supply of gasoline for priming the engines, then there would be no necessity of having draw-off valves on gasoline lines in the engine-room, would there?

Mr. Underwood:

I make the same objection; it is the same question; it refers to a type of safety can. What kind of a can is it; we don't know its size; we don't know its shape, and we don't know how much it will hold. We don't know anything about it. The question is, as I understand it: If you have a safety can, and enough of them, would you have to draw off gas from the tanks to prime the motors?

The Court:

It seems to me that the answer to the question is obvious, but I think he is entitled to ask the question: If you had a safety can that could be filled ashore, would it be necessary to have a method of drawing off gasoline from the tanks inside. It seems to me that that is obvious.

Mr. Anderson:

He asked, if your Honor please, if it wasn't necessary, would it be necessary?

Mr. Underwood:

My objection is to the reference to this type of safety can. What is it? I think the witness is entitled to have more information than Mr. Matteson's conclusion that there is such a can.

The Court:

The way I construe it, I think the answer is obvious, but I will let him answer the question. The question supposes something that has not been brought out yet. It is a hypothetical question, the hypothesis of which has not been established, as I understand it, at least by this witness.

Mr. Matteson:

I agree with you. We cannot do everything at once. This witness is going away, and I would like to ask him now—

Mr. Underwood:
Why do you say this witness is going away?

Mr. Matteson:
This witness won't be here.

Mr. Underwood:
This witness will be here.

A. I don't know how to answer that question. If the can was safe enough to meet the requirements apparently set up by some insurance company, you would not be able to get gasoline out of the can.

Q. Do I understand that you never heard of such a type of can?

A. I never—

Q. And the type of can—

Mr. Underwood:
I object to that—

The Court:
The objection is well taken. We don't know what can you are talking about.

Q. I will refer you for a moment, Mr. Monroe, to the text of paragraph "M as in Mary" on page 48 of Libelants' Exhibit 97, and ask you if you will just read that and tell me if you are familiar with the type of safety can referred to there?

A. You say paragraph "M"?

Q. Yes.

Mr. Underwood:
"M" for Mary?

Mr. Matteson:
That is right. You will have to read to the end of the paragraph.

Mr. Underwood:

We object to that question because it does not describe the kind of thing Mr. Matteson has in mind. It doesn't describe any can at all. It says: "Only approved safety cans filled at the station". What is an approved safety can. I don't know that the witness knows, and the question certainly does not say.

Mr. Matteson:

I am asking the witness if he is familiar with any such type of can.

Mr. Underwood:

What type of can; what are the dimensions and the specifications of this can; what is the secret?

Mr. Matteson:

There is no secret about it.

Mr. Underwood:

There certainly is in this question.

The Court:

What is the question, Mr. Colman?

(Thereupon the preceding question was read by the Reporter as above recorded).

Mr. Underwood:

I object on another ground, that it refers to the use of carrying gasoline for auxiliary units, and not for the main engine.

The Court:

I will sustain the objection.

(By Mr. Matteson):

Q. Well, I will put it this way, Mr. Monroe: do I understand that you know of no type of safety can which would be suitable for such purpose?

Mr. Underwood:

I object to the question on the ground that it has the word "safety" in it. What is a safety can; what are its dimensions?

Mr. Matteson:

I asked him if he knows any type at all.

Mr. Underwood:

What is a safety can?

Mr. Matteson:

Ask him.

Mr. Underwood:

What one man might call safe, he might call unsafe.

The Court:

You can ask him if he is familiar with (knowing these specifications)—if he can describe a can that will measure up to these specifications; you can ask him if he is familiar with any type of can on the market that measures up to that.

Mr. Matteson:

That is substantially what I have asked him.

The Court:

All right.

(By Mr. Matteson):

Q. Are you familiar with any type of can which you would consider safe and suitable for the purpose that we

have mentioned, that is, for maintaining a supply of gasoline in the engine-room for priming the engine?

A. I don't know that I have ever seen one.

Q. After reading this rule that I called your attention to, "M" on page 48, do you have any doubt that such a can exists?

Mr. Underwood:

I object to that, if your Honor please—

The Court:

I think that is arguing with the witness. I will sustain the objection.

Q. You would not say, I take it, Mr. Monroe, that such a type of can does not exist?

Mr. Underwood:

I object to that; that is arguing with the witness. You have to bring this trial to an end some day. You have been very patient with questions of this sort. If he wants to prove that such a can exists, let him do it with his own witnesses.

Mr. Matteson:

I want to know whether this witness knows if there is such a thing in existence.

By the Court:

Q. Is there on the market to your knowledge a can that would measure up to these specifications, or can you describe a can that would measure up to these specifications?

A. I don't know of any can that measures up to that description. There must be something that is known as a safety can, but it is not generally sold on the market to my knowledge.

Q. Well, you have examined the hull there of the Seminole: are you of the opinion that gasoline was drawn off from these tanks for the purpose of starting the engines?

A. I am of the opinion that gas was drawn off through these valves into a squirt can for the purpose of priming the motors.

Q. From what you saw, are you of the opinion that gasoline was drawn off from these tanks for the purpose of putting gasoline on auxiliary boats, or do you know that; do you have an opinion about that?

A. I only know from what testimony was given by the various captains and engineers on that boat—

Q. Not from the testimony, but from what you saw. Is it your opinion that it was done; did you see enough to form an opinion about that?

A. I did not see enough to form an opinion that it was done.

Q. Well, assuming now, from what you saw, you are of the opinion that gasoline was withdrawn through these draw-off valves for the purpose of starting the engines, do you know of any other method by which gasoline could have been obtained for that purpose and kept there on the Seminole; was there any other safe way of doing it; assuming that it was necessary to have gasoline there in the engine-room for the purpose of starting the engine, was there any other safe way of doing it, or what would you say was the safe way of doing it,—I will put it that way.

A. There are other considerations, of course; of course, the safest place on the boat to keep gas is to keep the tank on deck, and only bring it down in very small quantities; but, as I stated in previous testimony, there were times when the gasoline had to be gotten in a hurry, and the engineer wouldn't have time to go on deck to get it, therefore, I feel that it was a better risk to have it in there handy, rather than to have the man go up on deck to get it.

Q. Well, assuming that it was desirable from good engineering standpoint and operation of a boat that gasoline not be kept on deck, and that gasoline was withdrawn in the usual operation of the boat from the tanks for that purpose, what other method would there have been of retaining or keeping gas there for that purpose in the engineroom?

A. The only other place to keep it in the engine-room would have been in a separate container.

Q. Is that a tank?

A. Drum.

Q. Like an open can?

A. Well, not necessarily an open can; I would not put it in an open can, but it would be a tank, a 50-gallon drum, or a 55-gallon drum, or even a smaller quantity, but there would be just the same chance of leakage to get that gas out of there as there would be in any other one.

Q. What is the comparison between the method of keeping gas in the engine-room that you have just described and obtaining it from the tanks; the tanks that you know to have existed there.

A. I don't know that there would be any advantage.

Q. No preference, one over the other?

A. No preference, one over the other.

Q. You mean by that, Mr. Monroe, if gas was kept in drums of a smaller capacity than these tanks that were used, that that would be just as safe as to withdraw the gas from the tanks that were installed?

A. Yes, just as safe as if drawn from the main tanks.

Q. That drum that you spoke of as being just safe, would that be a drum as free from contact with the air as the tanks that were installed and you know to have been on the Seminole?

A. You mean free from any leaks?

Q. No; I mean with reference to keeping them closed up, keeping the tanks or drums closed except for vents.

A. The drum I had in mind is the same type that is used for the transportation of it; you would have to put a vent into it.

The Court:
All right; that is all I have to ask.

(By Mr. Matteson):
Q. A vessel of the type of the Seminole is not subject to any governmental regulations with respect to gasoline tanks installation, is it?

Mr. Underwood:
I object to that as a question of law.

The Court:
If it is a question of law, I don't know—maybe the witness can help me.

Mr. Underwood:
I don't see why the witness should be expected to know it.

The Court:
He might enlighten the Court; I am willing to have all the information you can give me.

(By Mr. Matteson):
Q. Is it or is it not, Mr. Monroe?
A. Is it or is it not what?
Q. Is a vessel of the type of the Seminole subject to any governmental regulations with respect to installation of gasoline engines and tanks?
A. To the best of my knowledge she was not.
Q. Now there are commercial vessels which are subject to such regulations, are there not?

Mr. Underwood:

I object to that is utterly immaterial.

Mr. Matteson:

I think I will bring out the materiality of it in just a moment.

The Court:

I will overrule the objection.

A. To the best of my knowledge a vessel used for transportation of passengers is subject—that is, over a certain size, and I believe that she would come in—

Q. With gasoline engines?

A. Even with gasoline, Diesel or any other.

Q. And for cargo carrying, too?

Mr. Underwood:

I object to that. He is arguing with the witness; he is trying to elicit from him an opinion on what the law is. It is utterly absurd. We have to finish the trial of this case some day.

The Court:

The objection is overruled.

(By Mr. Matteson):

Q. Vessels carrying cargo are subject to such regulation, too?

A. I don't know that I am conversant enough with these rules—I don't know as I know these rules sufficiently to testify about cargo vessels—

Q. Now is there any reason that you can think of why draw-off valves on gaspolines would be any less safe in a commercial vessel than a yacht?

Mr. Underwood:

I object to that; it is the same old thing: arguing with the witness. I respectfully suggest that this is argumentative, and it doesn't get us anywhere.

(Legal Discussion).

By the Court:

Q. Mr. Monroe, if this vessel was used for commercial purposes and not for private purposes, would it be subject to any different rule as to having that method of drawing off gasoline?

Mr. Underwood:

If your Honor please. I hate to object to your Honor's question, but when you say "subject to any different rule", do you mean statutory law or regulation of an official body or any rule of prudence?

The Court:

I mean as to statutory governmental rule or regulation. If this vessel was used for commercial purposes, would it be subject to any governmental rules that you know of that it would not be subject to as a private vessel?

A. Yes, sir; she would come under the steamboat classification.

Mr. Underwood:

If your Honor please, I think perhaps Mr. Matteson and I can agree on that; if she was carrying passengers for hire, she would be under certain governmental rules. At the time of this fire my recollection is—although I am not certain—that these rules did not exist, but if she had been then carrying passengers for hire she would not have been subject to any governmental regulation.

Mr. Matteson:

I think you are laboring under a misapprehension as to the rules I am talking about.

Mr. Underwood:

Perhaps I am; you have been very careful not to let anybody know what they are. Do you want to show them to me now?

Mr. Matteson:
Yes.

By the Court:
Q. Getting back to the time this vessel was destroyed, was she subject to any governmental rules if she had been used for commercial purposes that she was not subject to as a private vessel?
A. I don't know that I could tell you at that time; I believe she comes under it now, or would come under it now, but if it was in existence then, I don't know.

The Court:
I think, Mr. Matteson, that you must first establish by this witness that a different rule applied to another character of vessel before you ask him why it should not apply to a private vessel.

Mr. Matteson:
That a different rule applies to another type of vessel?

The Court:
Yes.

Mr. Matteson:
Yes.

The Court:
He says he doesn't know. He says that at the time the Seminole was destroyed he doesn't know if there was any rule in existence if it had been used for commercial purposes.

(By Mr. Matteson):
Q. I show you these rules of the United States Department of Commerce, general rules and regulations prescribed by the Board of Supervisors relating to tank

vessels, and I call attention on page 17 to Rule 11-5 6, sub-section "C", relating to gasoline fuel piping under "installation of gasoline engines", and I call your attention to the fact that this regulation provides that no outlet for drawing of gasoline shall be permitted in engine compartments, and ask you if you can suggest any reason for a different standard in that respect with respect to vessels to which theses rules apply; than with respect to the yacht Seminole?

Mr. Underwood:

I object to the question; the rules refer to tank vessels, that is, vessels which carry oil in tanks.

The Court:

Is that true?

Mr. Matteson:

Yes.

The Court:

Here is the way I view this: I think on cross-examination it should be first established that there are some government rules which would be applicable to the type of vessel that the Seminole was, and then, if you can establish what those rules are, you can ask this witness as to why—you can ask him does he know of any reason why these same requirements should not be observed in the installation of equipment and operation of it in connection with pleasure craft. Now it appears that this question incorporates a standard applying to a type of vessel that the Seminole was not.

(By Mr. Matteson):

Q. I will put in this way: if the Seminole were used as a tank vessel, would your answer be any different with respect to the propriety of having gasoline draw-off valves in the engine-room.

Mr. Underwood:

I object to that as speculative, if you Honor please; that is no part of this case at all.

The Court:

I don't think it appears that this vessel could be used as a tank vessel.

Mr. Matteson:

Any vessel could be used as a tank vessel.

The Court:

You mean for carrying cargo, for carrying a cargo of oil?

Mr. Underwood:

It would have to be rebuilt at a cost of $75,000.00

Mr. Matteson:

It can be done—

The Court:

I don't think that, Mr. Matteson.

(By Mr. Matteson):

Q. Is your reason for saying that draw-off valves are proper on the Seminole the fact that she was used as a yacht?

A. I don't think that that would change my opinion on the matter at all.

Q. It would not make any difference what purpose she was used for, in your opinion?

Mr. Underwood:

I object to that; it is the same question that I objected to before.

The Court:

I think that that is proper cross-examination. I don't think that is the same question. I will overrule the objection.

A. It depends on what the vessel is being used for.

Q. Well, in what kind of use would you say it was improper to have draw-off valves in the engine-room?

A. You mean the type of cargo that she was carrying?

Q. I am leaving it entirely open and up to you.

A. I don't know that it would be entirely improper even for a vessel carrying gasoline—for tank vessels—

Q. You think it would be proper?

A. It could be done with safety, yes.

Q. That is your opinion?

A. Yes.

Q. In other words, I will put it this way: if a vessel were reconstructed and made into a tank vessel carrying gasoline in tanks, you still think it would be proper for it to have draw-off valves on her gas-lines in the engine-room?

Mr. Underwood:

I object to that as speculation, and it is also repetition.

The Court:

I will sustain the objection. The question involves "reconstruction"; I think we should confine it to the vessel as it was.

Mr. Matteson:

If your Honor please, what I am trying to do is to test the knowledge of the witness. I want to find out whether it is based on the—

The Court:

In your question you bring in the idea of reconstruction.

(By Mr. Matteson):

Q. Do I understand you to say that it might be safe or unsafe according to the type of use the vessel was put to?

A. No, not necessarily.

Q. Do I understand you to say that it would be safe in any case?

A. It could be safe in any case, yes.

Q. What do you mean, "it could be safe"?

A. The manner in which it was used.

Q. In other words, it depends on the use of it, is that right?

A. Yes, it does.

Q. In what particular?

A. Well, the person who uses it is really what I mean, the care in which it is used.

Q. Its safety depends on the personal element, then is that right?

A. Yes, it depends on the personal element; in fact, everything we do depends on the personal element. If you walk down the street you run the chance of somebody dropping a brick on you from a building; it would be safer to stay at home.

Q. Did you bring with ~~you today your~~ volume of Kent's Mechanical Engineer, Kent's Engineering Handbook?

A. I have my volume with me, yes.

Q. May I see it?

The Court:

We are getting into something else now. I want to sign my mail and catch the 5:30 bus.

(Thereupon an adjournment was taken to 9:15, November 14, 1939).

Tuesday, November 14, 1939, 9:24 o'clock a. m.

Hearing was resumed pursuant to adjournment; and

3485 MR. WIRTH MUNROE was recalled and further testified upon continued

Cross Examination.

By Mr. Matteson:

Q. Just one more question, Mr. Munroe, along the line that we were talking of last night. I understood you to say that in your opinion the question of whether a draw off valve for gasoline, in the engine room, is proper, and was safe or not, depended on the type of vessel. And when I asked you in what type of vessel it was unsafe, I understood you to say that it depended upon the person who was handling it. Now what I would like to ask you is whether you still say that it is dependent on the type of vessel, or whether you confine your opinion to the man who is handling it.

A. Well principally I would say, on the man that is handling it.

Q. You don't make any distinction between types of vessels then?

A. No.

Q. Was that question answered?

A. I answered, No.

Q. Now I would like to show you this can, and ask you whether in your opinion that would be a suitable can for maintaining a supply of gasoline in the engine room of a vessel such as the Seminole, which might be needed for priming.

A. I have seen such cans as these, before. I have never considered them as being a safety can, though—any safer than any other can.

Q. Well why wouldn't that be a practicable method of maintaining a supply in the engine room for priming?

A. The possibility of leaks with this can is just as apt to occur as in any other type of can.

Q. I suppose in any can there may be flaws in manufacture, but is there anything about the type of can that you would consider unsafe?

A. I don't know that I can say that it is any more unsafe than any other can.

Q. Well do you consider it would be unsafe, that type of can?

A. I don't consider that any can is unsafe.

Q. Well then you consider that would be a safe method of keeping gasoline in the engine room, do you?

A. You could keep gasoline in that can, yes.

Q. And that would be safe?

A. I wouldn't say it would be any safer than any other container.

Q. If the can were properly constructed and free from flaws, would you consider it safe?

A. No more than any other can that was properly examined and free from flaws.

Q. Well would you consider any can safe?

A. Yes, any can would be just as safe; a squirt can is just as safe.

Q. Did you bring your volume of Kent this morning?

Mr. Underwood:

Are you going to offer that can?

Mr. Matteson:

Yes; I will mark it for identification.

Mr. Underwood:

May I look at it?

Mr. Matteson:

Surely.

(Said gasoline can was marked as Libelants' Exhibit No. 137 for identification.)

Q. Did you bring your volume of Kent with you this morning?

A. Yes, sir. This happens to be in two volumes; I think it is the same as the one you have there, only it is in two volumes.

Q. This is Kent's Mechanical Engineers' Handbook Volumes One and Two, 10th Edition, 1923; is that right?

A. That's correct.

Q. And you regard this as an authoritative treatise, do you?

A. Regard it as what?

Q. Do you regard these books as an authoritative treatise on the subjects they cover?

A. Absolutely.

Q. Is this the same volume that you had with you in Court before?

A. That's the same two volumes.

Q. Do you draw any distinction between fuel oil tanks and gasoline tanks, as to construction?

A. There is practically no difference between fuel oil construction,—that is if you are talking about distillate, now. If you are talking about fuel oil, bunker oil, bunker oil and gasoline, there is a difference. But between distillate and gasoline there is no appreciable difference.

Q. And distillate comes under the head of Fuel Oil, does it?

A. It is a light fuel oil; yes, sir.

Q. I notice the heading of 'Storage of fuel oil', page 888 of Volume 1, reference is made to the regulations for fuel oil storage published by the National Board of Fire Underwriters. Apparently such regulations are recognized by this authority; is that right?

Mr. Underwood:

I object to that. I object to asking this witness what this authority, this book, recognizes. Mr. Kent himself is the best evidence of that.

Q. Well, do you also recognize the regulations of the National Board of Fire Underwriters, as standard for fuel oil storage tanks?

Mr. Underwood:

I object to that unless the type of tanks is specified in the question. What type of fuel oil is to be put in these tanks?

The Court:

Do you recognize that as a good objection?—I haven't ruled on that; do you want—

Mr. Matteson:

I am not going to press the question.

Q. Are you familiar with the later edition, the 11th Edition of the same work?

A. No, sir; I haven't seen the later edition.

Q. This treatise in all its editions, is regarded as standard, is it not?

A. I believe it is considered as the standard handbook of mechanical engineers.

Q. Now one more question: I think—

A. I might add further to that, that it is not the only handbook for engineers.

Q. You suggested at one stage of your testimony that there was some difference in the standards to be applied to yachts in Florida and in the north. It is a fact that yachts are chiefly used in Florida in the winter time and in the north in the summer time, is it not?

Mr. Underwood:

I object to that as immaterial. It is recognized, I will admit, that a lot of yachts are used in the north in the summer and in Florida in the winter. 'Chiefly', I don't know, and I don't think anybody knows.

The Court:

Well I will overrule the objection. It may be material; I will have to see.

Q. Is that the fact?

A. There are a great many of the vessels or boats that are used here in Florida in the winter time, and in the north in the summer. But there are also a great many of them built solely for Florida use. The Seminole I believe was one of them.

Q. Well, do you say that there is any substantial difference between the climatical conditions when yachts are used in the north in summer and Florida in winter?

A. There is a great deal of difference between climatical conditions in Florida in winter and the north in the summer.

Q. What do you say is the difference?

A. Here in the winter time we don't have the heavy moistened air that they have in the north in the summer time in certain localities; they have a great deal more fog up there, which indicates moistened air.

Q. That is the chief difference that you think of?

A. That is the principal difference, at the time, yes. We have much warmer—our average temperature is much higher here in the winter time than it is in the north in the summer.

Q. When you examined the tank that was removed from the Seminole last May, did you find any evidence of the lower crown of that tank ever having been removed?

A. The lower crown?

Q. Yes.

A. I couldn't see—I think it would be very hard to tell whether the lower crown had ever been removed.

Q. You could see no evidence of it?

A. I could see no evidence of it.

Mr. Matteson:

That is all.

By Mr. Botts:

Q. Mr. Munroe, will you tell me, please, what your scholastic education consisted of? Are you a college bred man, sir?

A. I have had some college work, yes.

Q. Where and when, and how much?

A. I had some work in Columbia University in New York.

Q. When?

A. Summer school; 1924 and '5, I believe.

Q. How long were you there?

A. I was there two years; two summers.

Q. Two summers. You are a high school graduate?

A. I am.

Q. Miami High?

A. Miami High.

Q. And what was the nature of that technical—or that training that you took in Columbia University in the summer time?

A. Principally civil engineering.

Q. And what would have been the subjects that you studied there?

A. Well it was mostly field instruction in civil engineering, and laying out bridges, highways, railroads.

Q. Well it had—

Mr. Underwood:

I don't think he has finished.

A. Geodetic surveys; all types of land surveys.

Q. Had nothing to do with boats?

A. Had nothing to do with boats.

Q. Such special knowledge as you may have with reference to boats and their construction, has been gained, as I understand it, entirely from your contact with the construction of boats, principally here in Miami; is that correct?

A. That's the principal education, you might call it, yes. My knowledge has been gained in that manner.

Q. When you were in high school did you study physics?

A. I did.

Q. One year?

A. Whatever the course was. I believe it was one year.

Q. Chemistry?

A. Chemistry.

Q. One year?

A. Yes, sir; whatever the requirements were at that time.

Q. When did you graduate from high school?

A. Nineteen twenty-one.

Q. Have you ever worked on the construction of a steel boat?

A. No, sir.

Q. Your experience has been in the construction of small wooden hulled boats?

A. The actual construction, yes. But I have seen a great many steel boats built; been in yards where they have been there—where they were under construction; but I didn't actually work on them.

Q. You weren't engaged in construction on them, so your observation with reference to those would be merely more or less casual?

A. Well I wouldn't say it was casual.

Q. Well if you didn't work on them—

A. No, but when I go into a yard like that, I go in with the idea of learning something, by observation.

Q. You looked at them, then?

A. I looked at them, and talked about them. When you go to college you don't actually work on anything.

Q. Now, in referring to these tanks on the Seminole, and the overflow pipe, you made the statement, as I recall it——and I want to say I am depending entirely on my memory; it has been some time ago, so that if I don't recollect exactly what you said, please correct me, because it is just impossible—I haven't had access to a copy of your testimony, and it is impossible for me to be certain of my memory at this time, as probably it is with you. So as I recall it, you stated that this small overflow pipe was in your judgment safer than a larger one would have been. Is that correct?

A. I believe that was the gist of it. I stated that it was not necessary to have as large a vent pipe as a filler pipe.

Q. But you stated also that the smaller pipe was safer and better, didn't you?

A. I don't know that I used the word, safer. I may have, but I don't recollect having used the word, safer.

Q. Don't you recall, Mr. Munroe, that you said it would be either better or safer, because it would not permit the entrance of as much moisture into the tanks?

A. I believe I used the words, better.

Q. Well it may have been better or safer, but the thought that you gave us, as I recall it, was that the smaller pipe would restrict the entrance of outside moisture-laden air, and therefore for that reason be better; is that correct?

A. Yes, sir; I did make that statement.

Q. Yes; all right. Now then what would cause the moisture-laden air to enter the tank through this overflow pipe?

A. Due to the difference in temperature, between the day temperature of the air and the night temperature.

Q. Now isn't it true that if the pipe was large enough to allow a sufficient quantity of air to enter the tank, the air that entered would be equally moisture-laden whether it came in through a large or a small pipe? Wouldn't it?

A. No, sir.

Q. Now just a minute, do you mean to tell me that if we had two pipes, going to the outside atmosphere, and through each of those pipes the outside air was conveyed into a tank, that there would be a difference in the amount of moisture in the air sucked in through a larger or a smaller pipe, either of them coming from the same outside atmosphere? Do you mean to tell me that?

A. Yes.

Q. Which would bring in the most air—more moisture-laden?

A. The larger pipe. The larger pipe has the greater capacity.

Q. But if you brought in the same amount of the same kind of air, it wouldn't make any difference in the amount of moisture brought in in that air, whether it came in through a large or a small pipe?

A. The same amount of air would enter through either pipe, but it would take longer to do it through one pipe than the other.

Q. Then when the air finally got into the tank, there would be the same amount of moisture brought in, whether it was brought in through a large or small *tank*, wouldn't it? In other words, if a gallon of air came in through the large pipe, or through the small pipe, it would bring in the same amount of moisture, wouldn't it?

A. Yes, it would; theoretically it would; practically it doesn't.

Q. Now why do you say that? You are an expert; now tell me, give me some expert reason why that answer is true, if you can.

A. Well for the first place, I have handled a great many gasoline tanks.

Q. Did you ever measure the moisture content of the air that came into either of them? Are you capable—do you know how to measure the moisture content of the air?

A. Yes, I know how to measure it.

Q. How would you do it? Tell me, if you know.

A. You can get—

Q. Tell me how you would do it; you say you know.

A. Do you want me to manufacture you the instrument?

Q. You are an expert, you say you know that would be true; I want you to tell me how you know.

A. I know it is true, but I am not an expert on the manufacture of those instruments.

Q. Tell me how you would measure the difference in the moisture content of the air; that is what I asked you. You are an expert.

The Court:

Just let him answer the question, Mr. Botts. That is in the record that he is an expert, now.

Mr. Botts:

That he says he is an expert.

Mr. Underwood:

Mr. Botts has said he is an expert.

A. I am not an expert on that particular line.

Q. Then your judgment on that is a guess, just like mine would be, isn't it?

A. No, sir; it is not a guess.

Q. Well if you are not an expert, then how do you know?

A. I remarked that I had handled a great many gasoline tanks; a great many boats.

Q. How does that tell you how much moisture comes in through the air?

A. I don't have to guess; I know it is in there.

Q. You have made the statement that the air coming in through a smaller pipe would have less water in it than if it came in through a larger pipe.

A. I qualified that and said it would be the same amount.

Q. —Moisture.

A. But it would take longer to get it in there.

Q. Then do I understand you to say now that if the air—the same amount of air came in, supplied from the same outside source, that there would be exactly the same amount of moisture that would come in through air brought in through a small pipe as there would through the same quantity of air brought in through a larger pipe? Do you still say that, or do you stick to your other statement?

A. I don't get what you are driving at, Mr. Botts.

Q. All right, let's start over again. Suppose that you have a quarter inch pipe, running out this window into the air in its present condition as to moisture content; and you have a three inch pipe, or a two inch pipe, running out the window to the same supply of air; and you bring in one, two or five or whatever number you please, of gallons of air through the small pipe and through the large pipe. Will there be any difference in the amount of moisture in the air which is brought in through the large pipe or through the small pipe?

A. No, there actually will be no difference in volume; there will be a difference in time.

Q. All right then, you want to change your statement that you made a while ago, do you, that there would

theoretically be no difference but practically there would? Do you want to change that answer?

A. No, sir. There are other reasons why the moisture doesn't get into the tank.

Q. Now let's see if I have got you correct on this one proposition: that if the air came in through a quarter inch pipe or through a two inch pipe, from the same outside source, that the moisture content of the air would be identical whether it came in through the small pipe or the large pipe?

A. That is what I say; yes.

Q. That is what you now say; all right.

A. I said it before, too.

Q. All right, the record will show. Then is there any other reason now which you in your expert opinion can give us, why you say a smaller overflow pipe would be superior to a larger pipe, other than the element of the air bringing in moisture?

A. Yes, there is another reason.

Q. All right, why?

A. In the first place the vents is to carry off the air in the tank while it is being filled. Air will naturally compress; fluid does not compress as much, as a very small amount, of compression; air will compress a great deal. Therefore you can use a smaller pipe, and have the air pass off as fast as the fluid comes in through a larger pipe. Another reason—

Q. Wait a minute; why does that make it better? If the air gets out, it is out; why does it make any difference whether it goes out through a large or a small pipe?

A. If you will let me finish my answer, Mr. Botts, I will tell you. The reason for a small vent is to prevent quantities of gasoline fumes from passing over the side and out of the gas tanks.

Q. Well is there any disadvantage in having the gas fumes escape overboard, outside of the vessel, or do you want to keep them in your tank?

A. You need to keep the gasoline in your tank.

Q. I say, your gasoline fumes.

A. Yes.

Q. All right.

A. Your gasoline will become dilute, will not be as high quality after the fumes have passed off of it. So to keep your quality of your gasoline up to standard you can't leave it in an open container.

Q. All right; do I understand that you now abandon your original explanation as to why the small pipe is better than a large one, since we have agreed—

A I have not abandoned anything, Mr. Botts.

Q. All right; you have changed your testimony in that respect, anyway.

A. No, sir; I have added to it.

Q. Now then don't you know as a matter of fact that sufficient air can come in to equalize the air pressure on the inside and the outside, whether the pipe is half an inch or two inches?

A. Certainly air can enter, the same as it went out; equalize the pressure.

Q. And even if it was a quarter inch pipe, the air would come in fast enough to equalize any change in pressure due to temperature, in all of these four tanks, through a quarter inch pipe, couldn't it?

A. You could put a pinhole in there if you wanted to, and allow enough time for it. There is a factor of time in there, Mr. Botts.

Q. Oh yes; I am going to get at that and see what you know about it, in just a minute; that is what I am leading up to. What is the coefficient of expansion of air in a tank, do you know?

A. I know that there is a coefficient in any place, regardless of a tank. There is one part in 491., coefficient: 491.6.

Q. What do you mean by that?

A. For every degree above 32 degrees, a change of temperature.

Q. And you say it is 491.

A. Well to explain it so you can understand it—

Q. I understand it thoroughly without your explanation.

A. Well then I won't say.

Mr. Underwood:

That might be another issue in the case.

Q. But I want you to tell me where you get the coefficient of 491. Have you got your authority there? See if you are not wrong.

A. Right there.

Mr. Underwood:

Do you want him to look?

Mr. Botts:

Yes.

A. In this volume it is on page 655.

Mr. Underwood:

Let him read it, please.

A. May I read it?

Q. Yes, sir.

A. Air expands 1/491.6 of its volume at 32 degrees Fahrenheit, for every increase of one degree Fahrenheit, and its volume varies inversely as the pressure.

Mr. Underwood:

Let's get that fraction right in the record; one over four hundred ninety-one and six-tenths. Have you got that right, Mr. Bryant?

The Reporter:
Yes, sir.

Q. Now then if there was a change of one degree in the temperature, in these tanks, there would then, according to that table, be a change of volume of one gallon of air for every 491 gallons capacity of the tank, wouldn't there?

A. That's correct.

Q. Then for a change in temperature of one degree in these 600-gallon tanks, there would be roughly one and a half gallons of air?

Mr. Underwood:
I think it is a 500 gallon tank instead of 600.

Q. Were they 500 gallon tanks? Then if these were completely empty, then there would be a change of roughly 231 cubic inches of air that would be required to equalize for the outside temperature, for every degree of temperature, wouldn't there?

A. According to that, yes.

Q. What do you say about the length of time it would take 231 cubic inches of air to go through a half inch pipe?

Mr. Underwood:
May I object to that question, on the ground that the pressures are not given. What is pushing this air?

Mr. Botts:
Atmospheric pressure; I am speaking of atmospheric pressure; that is what we are talking about.

Mr. Underwood:
If your Honor please, if you have air in a compressed air tank, 200 pounds behind it, it will take one length

of time. If you have air in a tank with no pressure behind it except that incident to the change in temperature, it will take another length of time. Now how much pressure is behind this change of air? I think the witness ought to be given that; it isn't a fair assumption otherwise.

Mr. Botts:

Oh, counsel is just trying to be foolish, and succeeding very well. He knows we are talking about atmospheric pressure.

Mr. Underwood:

I think it ought to be incorporated in the question, so it can't be referred to otherwise.

Mr. Botts:

What are we talking about.

The Court:

Is it an artificial pressure?

Mr. Underwood:

That is what I don't know; it isn't in the question.

The Court:

I assume it means ordinary pressure without any artificiality.

Mr. Botts:

We are discussing the equalization of air in these tanks and out of these tanks; and counsel knows perfectly well; he has just tried to make a foolish question, and succeeded.

The Court:

Can you answer that question, assuming that there is no artificiality in the pressure, Mr. Munroe?

A. If you are figuring the outside pressure at normal atmospheric pressure.

The Court:
You can answer the question?
A. I don't know that I can give him the exact figures.

The Court:
Well is the question, whether you can answer it or not, is it a reasonable question to you, with that hypothesis?
A. I would say it was reasonable.

The Court:
All right; I overrule the objection.

Mr. Underwood:
May we have the question read, please.

(The question was read by the reporter.)

Mr. Botts:
At atmospheric pressure; add that to it; at sea level.

A. Offhand I can't tell you that, because it depends on——I don't know offhand what the volume of a half inch pipe is; I don't carry that around in my head, and I would have to figure the friction.
Q. Could you figure the friction? Do you know how to figure the friction?
A. It is right in that book.
Q. Well you don't know how to figure it then, do you?
A. Do I have to know? There is tables in there to tell me, without my having to figure it.
Q. All right. Now then do you know approximately what the atmospheric pressure is at sea level here in Miami?
A. The same as it is anywhere else.

Q. What is that?

A. Twenty-nine and a fraction inches; practically thirty inches we call it.

Q. And in pounds, how much?

A. I believe it is around seventeen pounds; I am not sure about that.

Q. In your testimony with reference to the advisability of having a smaller pipe, on account of restricting the moisture entering the tank, as you testified in your first examination, did you take into consideration the length of time that it would take the requisite volume of air to enter these tanks through a half inch pipe? Did you take that into consideration?

A. Did I take into consideration the length of time?

Q. Yes, that it would take for that air to come in there, when you said it would be better to have it go in through a small pipe?

A. Why, yes, naturally I took in consideration the length of time.

Q. All right; then did you get the length of time from your own knowledge or experiments; or did you take it from your reference books?

A. I made no experiments on the thing at all, Mr. Botts. I didn't take it from any book either. I took it my experience.

Q. Have you ever in your experience measured the amount of air that would enter or leave a tank for a one degree change in temperature?

A. I never have, and I don't think anybody else has, either.

Q. All right. Well then you said you took it from your own experience; I am trying to get at what your experience is in that connection. If you took your facts from your experience, you must have had some experience?

A. Actual contacts; knowing what occurs in nature; what occurs in actual boats.

Q. Now wait a minute, did you consult your reference book to find out how fast air would enter or leave a tank through a half inch pipe?

A. No, sir.

Q. You didn't?

A. I did not.

Q. You didn't take that into consideration at all?

A. I did not.

Q. Would you mind taking your handbook and, referring to the flow of air, and ascertain whether or not it isn't true that at 15 pounds pressure, 107—wait, I didn't understand this table.

Mr. Underwood:

Put that in the record; I didn't hear Mr. Botts' comment fairly.

Mr. Botts:

Just withdraw the question. This table that I had reference to doesn't—

Q. Don't you know as a matter of fact, Mr. Munroe, that at atmospheric pressure here, the change in the volume of air in the tank, due to atmospheric pressure, would be extremely slow, and that either a half inch pipe or a quarter inch pipe, or a two inch pipe, any one of them would be perfectly adequate to equalize the pressure in there and allow sufficient air to be expelled or taken in, dependent on whether the—depending on change of temperature in those tanks?

A. You say that it didn't matter what the size is?

Q. I say, that don't you know that even a quarter inch *tank* would have been sufficient to equalize the air pressure, the amount of air in those—in the tanks in the Seminole, considering the change in temperature caused by atmospheric conditions?

A. If you are considering the change in temperature only, I believe a quarter inch pipe would do it. I am sure I haven't made any figures on it.

Q. Well then as a matter of fact the air would go into these tanks, carrying the same amount of moisture, whether or not it was a quarter inch *tank*,—I mean a quarter inch pipe, or a two inch pipe, wouldn't it?—assuming that the outside aperture was the same in each instance?

A. Assuming that the outside aperture was the same?

Q. I mean the outside atmosphere was the same,—instead of aperture.

A. Atmosphere; the same amount of air would pass into that tank, yes.

Q. And carry the same amount of moisture?

A. A great deal of that depends on the length of your pipe. Of course if you have the same length of pipe, I still don't think the same amount of moisture would go in there.

Q. Why not?

A. Because it would have a tendency to condense before it got in.

Q. Why?

A. Because it takes longer time for it to get in, in the smaller pipe.

Q. And what would cause this condensation that you are talking about?

A. A difference in the temperature of the pipe.

Q. Now Mr. Munroe what I am trying to get at: In your experience as a boat builder,—and I am willing to concede that you are a good boat builder.

A. I am also a designer.

Q. All right, a good designer too; we will add that. I am willing to concede that you are a good boat builder and a good designer of the class of boats you handle. But have never in all your life made any experiments, have

you, to determine whether or not more or less moisture would—or the same quantity, would go in through a small pipe or a large pipe, into tanks such as this, have you? Now have you ever made any such experiments?

A. I have never made any, and I don't believe anybody else has ever made any.

Q. But you stated in your testimony that that would be a fact?

A. From practical experience I know that it does occur.

Q. I want you to tell me, if you have never made any experiment, how you know the amount of moisture that comes in, if you have never made any experiment to find it?

A. I know there is moisture in the tank, and that is the only way it could get there.

Q. But have you ever made any experiment to determine whether or not the moisture would come in more or less through a large pipe or a small pipe? You know that moisture goes in, don't you?

A. I do.

Q. And have you ever made any comparative test where one tank was with a large overflow or pressure pipe, and another one with a small one?

A. I don't know that. I have never made any test of that.

Q. Then as a matter of fact you don't know whether there would be any difference, do you? Now just frankly, do you?

A. I do know that the smaller the vent, the less trouble we have with water in our tanks; I do know that, from practical experience, and we always put in a smaller vent for that. That is one of the reasons we put it in; that is not the entire reason, not the sole reason.

Q. But you have never made any test to see whether or not that is a fact; you have simply assumed that the smaller pipe was better, is that it?

A. I don't believe anyone else has ever made any test. I have never made one, and I don't believe anyone else has ever made one.

Q. Then your testimony in that respect was without any foundation of testing; that was true, wasn't it?

A. It is without any foundation of test, yes. Practical experience means more than a test, sometimes.

Q. Well as I understand it, you have never compared the two, so just exactly where would your practical experience in that respect come in?

A. I just stated, Mr. Botts, that the tanks that had the smaller vents, we had less trouble with water in the tanks than we did with the larger vents.

Q. Give me an instance where you have made that comparison?

A. I cannot give you any definite one. That experience is spread over several years; not necessarily in boats that I have constructed, but in other people's boats, boats that I have been on, boats that I have had to repair.

Q. All right; now then let's get to another question; and that is this draw-off valve in the engine room. I understand you to say that you consider it proper practice to put a draw-off valve or cock in the engine room?

A. Under certain conditions, yes.

Q. All right, under certain conditions it would be proper, and under certain conditions it would not; is that what I am to understand from your answer?

A. No, that is not the way I meant it.

Q. All right then?

A. I meant that if it was necessary to get free gasoline in the engine room, it was perfectly proper to have a draw-off valve.

Q. Then am I correct this time in understanding your answer, that you mean, that the condition of the engine room would not determine whether it was proper, but it would be purely a matter of convenience; is that what you intend to say?

A. If it is necessary to get free gasoline in the engine room, regardless of the condition of the engine room, or anything else, it is perfectly proper that it should be there. But if you don't need to get it, then there is no need to have it. I won't say that it is improper not to have it.

Q. Then again I would like to ask you: Do you mean to say that it is a matter of convenience, is the element which determines whether or not it is proper?

A. I don't know that the word, convenient, is the exact word.

Q. Well my understanding is that you say that if under the conditions as they exist, it is deemed desirable to get—to draw off gasoline in the engine room, then for purposes of convenience, that you then consider it proper; is that right?

Mr. Underwood:

If your Honor please, I object to that because the witness didn't use that word; he used the word, necessary. "Convenience" is Mr. Botts' word.

The Court:

I think the witness can protect himself in that. I will overrule the objection.

A. What is the question again, please, Mr. Botts?

Mr. Botts:

Read it.

(The last question was read by the reporter.)

A. In the case of the Seminole.

Q. Wait a minute, let's get the question generally, and then we will come down specifically. Just answer the question as asked please.

Mr. Underwood:

If your Honor, please—

The Court:

He is drawing the emphasis on the matter of convenience, Mr. Munroe. Is that the reason?

A. I wouldn't use the word, convenient. It is necessary, it is not convenient.

(By Mr. Botts):

Q. When would it be necessary? What would be the circumstances that in your judgment would render it necessary, then? I am trying to find out when you say it is proper to have it in there, and when you say it is not?

A. When it is necessary to have gasoline to prime your motors.

Q. Then if with the sort of motor you have in a vessel, in order to start that motor you have to prime the motor, if that is the sort of equipment, then I understand you to say that you consider it proper to have a draw-off valve in the engine room?

A. That's correct.

Q. Then let's get to this: Do you say that there is any added hazard from accumulation of gasoline fumes, by having a draw-off valve in the engine room?

A. No, there is no greater hazard.

Q. In other words you assert that there is no added hazard by drawing off gasoline in a closed engine room? Is that your statement?

A. That's correct. I do not believe there is any added hazard.

Q. None whatever?

A. No, sir.

Q. Do you agree that gasoline fumes in an enclosed space such as an engine room, is to any degree a hazard?

A. That all depends on the quantity of it.

Q. Well if a large quantity would be a hazard, a small quantity would be a lesser hazard, wouldn't it?

A. Yes.

Q. Then if there is a substantial quantity of gasoline fumes in an enclosed space, that is a hazard, isn't it?

A. Yes, it would be.

Q. Now then do you agree that—strike that. Is it possible in your judgment, from your experience, to draw off gasoline from an open draw-off valve without some gasoline fumes being thereby left, if it is done in an enclosed space, some gasoline fumes being left in the enclosure?

A. There is a certain amount of fumes come from drawing off gasoline, yes.

Q. All right. Now then Mr. Munroe, if some gasoline fumes is a hazard, the extent of the hazard depending on the extent of the fumes, then isn't it true that any procedure which will allow any quantity, even a small quantity of gasoline fumes to be left in an enclosed place, would to that extent be an added element of hazard?

A. That all depends on the amount of ventilation you have there while you are drawing it off. If the engine room were entirely closed tight, it would be an entirely different situation.

Q. Then as I understand it, in effect, what you say is this: That if gasoline fumes are emitted in an enclosure, and then by ventilation taken out of the enclosure, when the fumes are removed the hazard would be removed, wouldn't it?

A. Yes, sir.

Q. And if the fumes stay there a hazard would stay there, wouldn't it?

A. For a certain length of time.

Q. Well as long as the fumes stayed there a hazard would be there, wouldn't it?

A. Those fumes would be diluted in time.

Q. Wait just a minute now, would you mind answering the question? As long as the fumes stay there, the hazard would be there, wouldn't it?

A. Yes, but your fumes could be diluted,—would be diluted.

Q. The extent of the fumes would measure the extent of the hazard, wouldn't it?

A. Yes.

Q. And if they were very diluted fumes the hazard would be less, wouldn't it?

A. Yes.

Q. But so long as the fumes stayed there, the hazard, to that extent, would be there, wouldn't it?

A. Yes, as long as the fumes were there.

Q. You agree that gasoline fumes are heavier than air?

A. They are.

Q. You don't know as a matter of fact that when gasoline fumes get into an enclosed place,—such for instance as the bilge of a boat, that until air circulates through there, that the gasoline fumes may stay there for a very long period of time. Isn't that true?

Mr. Underwood:

May I have that question read, please?

(The question was read by the reporter.)

A. That entirely depends on the volume of the bilge, or the space in which the fumes are contained, and the amount of the fumes.

Mr. Underwood:

What was the last, Mr. Bryant?

(The last question was read by the reporter.)

Mr. Botts:

Now would you mind reading the question,—

Q. Because you haven't answered it at all, Mr. Munroe.

Mr. Underwood:

If your Honor please, I submit that that is an answer to that question.

Mr. Botts:

Well, I am asking it again, then.

Mr. Underwood:

I object to the repetition of the same question.

The Court:

Let's hear the question and the answer.

(The last question and answer were read.)

Mr. Botts:

The question I asked, if the Court please, involves a question as to whether or not gasoline fumes are dissipated of their own motion, or whether they don't have to be removed; the length of time that they will persist.

The Court:

I think you have given your explanation of your answer, but I think you ought to answer it more in the nature of yes or no, and then give your explanation.

Mr. Underwood:

If your Honor please, I submit that the witness has in effect said that he can't answer it yes or no; he said "it depends on".

The Court:

All right, if he says he can't, then that would be his answer.

Mr. Underwood:

That is implicit in his answer already.

The Court:

I construe your answer as explanation. Now if you can answer the question yes or no, it calls for a yes or no answer. If you can't answer it yes or no, why then you can state why you can't answer it that way; then let your explanation be supplemental to that.

A. I don't believe I can answer yes or no to that question without having some definite knowledge of the question.

The Court:

All right.

(By Mr. Botts):

Q. Let's then get down to kindergarten questions. If gasoline fumes,—gasoline vapor, is put into an enclosure such as a completely enclosed tank where there is no aperture to the air, they would stay there indefinitely without becoming dissipated, isn't that true?

A. They would remain in that,—they would remain there.

Q. All right. In other words, gasoline vapors don't neutralize themselves and become dissipated by any self-enervating action, do they?

A. The fumes that were put in there, that depends on the size of the container; the fumes were put in it, depends on the quantity of the fumes, the amount of air that is in there. If you put a small quantity of fumes in

there, with a large quantity of air, the fumes will be dissipated; the percentage will be distributed over the entire volume of that tank.

Q. Mr. Munroe, if you will try and comprehend the question that I asked you, these explanations that bring in something entirely foreign to the question, won't be necessary. The question is this; suppose we would take a perfectly airtight tank and insert into that tank, gasoline fumes, and close it up in there, those gasoline fumes would not be dissipated by their own action, would they?

Mr. Underwood:

I object to that on the ground that the question is not complete. It doesn't say whether the tank is filled with gasoline fumes; and if not, what percentage of the content of the tank is air and what percentage is fumes. If Mr. Botts wants to assume the tank full of gasoline vapor and nothing else, that is one thing.

Mr. Botts:

I can't assume that counsel is as dumb as he acts, either. He is simply trying to distract attention from the question that I am asking; and the question is perfectly complete if he wants to listen to it and wants to answer it; and I am going to sit here, if we stay for two weeks, until I get an answer to these questions.

Mr. Underwood:

If your Honor please, I must object to Mr. Botts' comments that are personal to me, and ask you to admonish him not to continue along that line. He has spoken of kindergarten, and counsel not being as dumb as he acts, and so on. I think that is no proper part of the record in this case. If Mr. Botts is going to be permitted to indulge in those remarks, I think that I may perhaps be unable to restrain myself at various times, when

provoked by Mr. Botts. I would prefer not to have it there.

The Court:

I didn't understand that the remark about kindergarten referred to counsel. I do think, along that line, that it would be best to let the questions be devoid of comments on what the answer has been; just let it be a question, and without comments; I think that would be a good idea.

Mr. Botts:

I would like to have the last question answered, and you will see that it is a complete question.

Mr. Underwood:

May we also have the question and answer immediately preceding it?

The Court:

Before we have any re-reading, I want to think it over a minute.

Mr. Botts:

If the Court please—

The Court:

Let me think it out, Mr. Botts; I understand your position.—Now read the question, Mr. Bryant.

(The last question was read by the reporter.)

The Court:

Well here is my reaction to that: Of course you are dealing altogether with theory. You are assuming in the question that the gasoline fumes are emitted into an air-

tight compartment; and I take it from the question, it refers to a theoretical case or something dissimilar from an engine room.

Mr. Botts:
That is right.

The Court:
But the theoretical airtight compartment—

Mr. Botts:
Yes, sir.

The Court:
Now then as to whether that compartment is entirely devoid of solid matter or liquid matter,—as I understand the objection, there is not injected into the theoretical question, as to what the condition of the airtight compartment is. It may be airtight so far as contact with the air is concerned, but its physical contents are not inclined in the question.

Mr. Botts:
It contains nothing but gasoline fumes.

Mr. Underwood:
Then I have no objection to it.

The Court:
My understanding of the objection was on the ground that you didn't incorporate in the questions, the hypothesis or the basis as to what was in the airtight compartment.

Mr. Botts:
Well I thought when I said, take an airtight compartment and put gasoline in it, if I didn't say I didn't put anything else in it—

The Court:

Well the objection is that it does not embrace the condition as to what was in the airtight compartment. It is airtight so far as air is concerned, but as to whether there is some liquid or solid matter in there, is not included in this question.

Mr. Botts:

It seems to me that it is perfectly plain that if you take a vacant space and say you put air in it, are you not assuming—it is not necessary to say you are not putting nails in it or coal in it, or manganese in it, or anything like that. That you are putting gasoline in it.

The Court:

But what is in there already? If it is absolutely devoid of any—

Mr. Botts:

Nothing.

The Court:

—substance, and just free of matter, why then I think that the question is clear. But technically I sustain the objection, and as I understand it—well anyway, I sustain that technical objection.

Mr. Underwood:

If Mr. Botts, your Honor, wants to assume that the tank is completely filled with gasoline vapor, that there is no air in it, I won't object to the question.

Mr. Botts:

All right, let's proceed.

Mr. Botts:

The point is this now; that I want to make myself clear right now. He has put a man up here as an expert.

Now then I am testing,—and I am not arguing his expertness along certain lines, but I am testing whether or not he is in fact an expert witness on the question of gasoline and so forth, or whether he is just a common, ordinary witness in that respect. Every time I have asked him a question the witness has dodged, and if he hasn't dodged, counsel has gotten up and by making an objection has suggested a method by which he can dodge the categorical answer to that question. Now I would like to have the witness give me credit for trying to ask questions that are not trick questions. If he does not understand the question, let him say so and I will try and make it plain. But I don't think that it is proper,—and that's the reason that I have made the remark I have,—I don't think it is proper for counsel as it seems to me, to try to divert the course of an examination when a witness is on cross examination and is put up as an expert, and is therefore an intelligent witness,—for counsel to all the time interject by objections when the witness is perfectly capable of protecting himself. I would like to have a little chance to develop a line of testimony from this witness; and you certainly can't do it if you are continually being captiously interrupted.

The Court:

Well all I can do, gentlemen, is to deal with situations as they are presented. I had an objection to rule on, and I have ruled.

(By Mr. Botts):

Q. Mr. Munroe, suppose you take a perfectly empty airtight receptacle and put gasoline fumes in there; would those gasoline fumes ever dissipate themselves, or would they remain there indefinitely.

Mr. Underwood:

If your Honor please, I make the same objection.

The Court:
I overrule that objection.

Mr. Underwood:
That is the same question.

Mr. Botts:
Judge—

The Court:
Let's go on now; I have ruled.

A. Mr. Botts I cannot answer that question in the form it is put, because you have not told me what quantity of fumes there are in the can, or in the container; you have not stated that it is completely filled with fumes, to saturate the solution.

Q. If there is nothing but gasoline fumes in there,—if there are gasoline fumes and nothing else in that container, will they dissipate themselves, irrespective of the quantity?

A. But you didn't ask me that before, Mr. Botts.

Q. Exactly what I did. Can you answer the question?

A. Under conditions that there is nothing in that can or container but gasoline fumes, that is to the saturated solution, then I will say that they cannot be dissipated.

Q. Don't you know that there is no such term as a saturate solution of a vapor?

A. There is.

Q. All right. Would it make any difference whether there was a cubic centimeter of gasoline fumes in a tank, or a cubic foot, provided there was nothing else in that container,—as to whether or not they would be self dissipating?

A. If the tank contained a cubic centimeter or a cubic foot if that is the capacity of the tank, then there would be no dissipation, no.

Q. But suppose you take a perfectly vacant tank, no air, it is a vacuum, and you put a very small quantity of gasoline vapor in there, will it ever be self-dissipated?

A. That's a different question. No, it would not.

Q. Then gasoline vapor will not—if it is once placed in any receptacle, will stay there until it is removed by some means; is that right?

A. Fumes will stay in that thing until it is removed, yes.

Q. Then if you take a small amount of gasoline fumes and put it into an enclosed space such as the bilge of a vessel, unless by ventilation or otherwise that gasoline fumes is removed therefrom, it would stay indefinitely, wouldn't it?

A. It would if everything was tight, yes; if it was just as airtight as a tank would be.

Q. I am not talking about airtight, now; I say, since that isn't self-dissipated, if it is put in a place it will stay until it is removed by ventilation or some other means, wouldn't it?

A. Yes.

Q. All right; since gasoline is heavier than air, it would be true that it would be likely to collect and remain to some extent in the lower portions of a vessel such as its bilge, wouldn't it?

A. It would accumulate in that portion of the vessel in the bilge, yes.

Q. And it would tend to remain there or be dissipated, depending upon how adequate or inadequate the ventilation might be, wouldn't it?

A. Not necessarily the ventilation, no.

Q. Well, circulation?

A. Nor circulation.

A. If there were no circulation, it would be dissipated.

Q. How?

A. By the gradual dilution of the gas into the air that is in that space.

Q. Well if it became mixed with the air, it would still stay there, since it is not self-dissipating; it would still stay there until it was removed by ventilation, wouldn't it? It might become diluted, depending on the quantity of air with which it was mixed?

A. Yes.

Q. But it would still stay there unless it was removed by ventilation, wouldn't it? It might become less powerful a mixture?

A. To entirely eliminate it, it would take some ventilation.

Q. All right, and the quantity of air with which it was mixed, in relation to the quantity of gasoline fumes, would determine the relative mixture of the final air-gasoline fumes mixture, wouldn't it?

A. It would.

Q. In the gas in the engine room of a vessel such as the Seminole, or any other motor vessel, where it has a bilge more or less adequately ventilated, if gasoline fumes were emitted in that engine room, there would be a tendency for those gasoline fumes to fall or drop down to the lower level of the bilge, wouldn't there?

A. Naturally.

Q. And stay there?

A. Not necessarily stay there.

Q. Subject to being removed by ventilation?

A. That's correct.

Q. Then that being true, if a space was inadequately ventilated, a small quantity of gasoline vapor might be emitted daily, and fall into the bottom eventually if inadequately ventilated, creating an accumulation of gasoline vapors that might be dangerous, mightn't it?

A. There is a possibility of such a thing, yes, depending entirely on the size of the drop and the capacity of the bilge, and a lot of other x's.

Q. That would depend then upon the ventilation and the relative size of the containers or room, in relation to the amount of gasoline vapors, wouldn't it?

A. Yes.

Q. And if the gasoline vapors stayed there without being removed by ventilation, even a small quantity of gasoline would eventually become a dangerous mixture, wouldn't it?

A. It could be, yes.

(A brief informal recess was had.)

Q. Do you know what the explosive mixture of gasoline and air is?

A. I believe it is about one-half to six and a half per cent.

Q. If you want to refresh your memory, if you will look at your book, at page 591 you will find it there; if you are not familiar with it from your memory?

A. I believe my memory is correct in saying, one-half to six and a half.

Q. Then a mixture as low as one and a half parts of gasoline vapor in 100 parts, that is 98½ parts of air would be explosive, is that it?

A. It could be explosive, yes.

Q. I mean, the explosive mixture runs from one-half parts out of a hundred, up to six parts out of one hundred?

A. That is correct.

Q. Then if gasoline vapor should accumulate over a period of time in a bilge or other place until it got to one and a half per cent mixture, it would then become a dangerous explosive mixture, wouldn't it?

A. It would become explosive, yes.

Q. Then let's get back now, to that question of the draw-off valve in the engine room. Isn't it true that it

is impossible to draw off gasoline without some amount of gasoline vapor being lost into the room or space where the draw-off process is occurring?

A. There is a small amount of fumes dissipated into the air, in drawing off.

Q. Then Mr. Munroe wouldn't it be true that a draw-off valve in the engine room would have a tendency to some extent of permitting gasoline vapor to accumulate or be discharged into and possibly accumulate in the engine room?

A. Yes, it is possible.

Q. All right; the care with which that process was carried out would minimize that danger, wouldn't it?

A. Yes.

Q. And that's what you had in mind, I take it, when you said that the danger of a draw-off valve in an engine room was in respect to the manner in which it was operated; is that what you had in mind? That one person could do it more carefully than another?

A. I stated the personal element is one of the factors, yes.

Q. And if a person exercised extreme caution, they could minimize the amount of danger attendant on that process?

A. Yes.

Q. But even in the hands of a person that is most careful, there would be some gasoline vapor discharged, and therefore some element added hazard, wouldn't there?

A. There would be some added hazard. Of course there other dependencies on that; the size of the engine room.

Q. Certainly. The extent of that added hazard would depend on these other elements too but there would be in some degree an added hazard; that is true, isn't it?

A. I think you could say it would be an added hazard, yes.

Q. Then that being true, isn't it true that a draw-off valve in an engine room, creates an added element of hazard in the engine room? The extent of that added element I am not discussing, but it does increase that hazard to some extent, doesn't it?

A. By that deduction, yes, I would say it does.

Q. If your previous answer is correct, there would be some added element of hazard, wouldn't there?

A. Yes.

Q. Then isn't it true that to that extent, whatever the extent of that added hazard, that a draw-off valve is to that extent undesirable?

A. It all depends on the extent of the hazard.

Q. Well, to whatever extent the added hazard is created, to that extent it would be undesirable, wouldn't it?

A. Yes, you could say that.

Q. Then as a matter of fact, the idea of placing a draw-off valve in an engine room is a question of convenience, isn't it?

A. Not convenience entirely.

Q. Well, all right. Isn't it true that in determining whether or not you put a draw-off valve in an engine room, you balance the convenience thereby served, as against the added element of hazard?

A. The added element of hazard, in what respect?

Q. That you have just said exists. You have said there is an added element of hazard; now you would balance the convenience against the added element of hazard, wouldn't you, and determine whether or not it was worth while to add that added risk?

A. Well as I stated in previous testimony, that there are other hazards besides that of gasoline.

Q. Well we are talking about the hazard of gasoline, now?

A. —is the reason for having the draw-off in the engine room.

Q. All right, what are those other added hazards that you say, that would be sufficiently great to overbalance the added hazard which you concede is created by putting that draw-off valve? What are those other hazards that you thereby eliminate?

A. Well if you had no gasoline to prime your motors with, readily obtainable, in the engine room, and you had to go on deck to get it, then when a vessel—a motor should fail, either on a lee shore, or approaching a bridge or a dock, or many other things, you have the other element of danger,—hazard.

Q. But if you filled a squirt can on the deck or somewhere else, and had that in your engine room, that is all you would need for your priming, isn't it?

A. For one priming, yes.

Q. Well you can always fill it up after you have primed it, can't you?

A. Yes.

Q. All right; I get what you are driving at, all right. Now then in view of what you have said, is this in your judgment a proper deduction; that the amount of hazard created by a draw-off valve in the engine room, would depend on the amount of gasoline vapor that was thereby discharged into the engine room,—wouldn't it?

A. Naturally, yes.

Q. So that after all, in determining the element of hazard of a draw-off valve in the engine room, we would all get down to the quantity of gasoline vapor that was thereby discharged into the engine room, wouldn't we?

A. Yes.

Q. And then we would take into consideration the size of the engine room, and finally find out whether or not this discharge of gasoline vapor was likely to create an explosive mixture, wouldn't we?

A. Yes.

Q. And that would be the element of hazard?

A. That would be one of the elements regarding the gasoline, yes.

Q. Yes, that is what we are talking about, the element of hazard regarding gasoline. And if the use of that draw-off valve was such that thereby there would be discharged into the engine room a sufficient quantity of gasoline vapor to create an explosive mixture, it would then become a dangerous hazard, wouldn't it?

A. It would if it was discharging enough gasoline, yes.

Q. Yes, that was included in the question. Now then we have this can, exhibit 13,—that I believe is a five gallon can, isn't it?

A. Yes, it is a five gallon can.

Q. Mr. Munroe, if you would take an open nozzle and fill this can, exhibit 13, with gasoline, and then pour the gasoline out of the can, there would be left in the can practically five gallons of gasoline vapor, wouldn't there?

A. Yes, I would say it would be, about.

Q. And since the gasoline vapor is heavier than air, that would remain almost pure gasoline vapor in that can; wouldn't it?

A. It would for a while, yes.

Q. Yes; I mean until the circulation of air would dissipate it?

A. Yes.

Q. Then if you would fill that can with gasoline, and empty it, and then fill it again with gasoline, you would then discharge five gallons of practically pure gasoline vapor into the room where that draw-off process was occurring, wouldn't you? Because the gasoline going into the can to fill it, would force that five gallons of pure gasoline vapor out into the room, wouldn't it?

A. I suppose you could say you would, yes. I think it would.

Q. It is just bound to be a fact, isn't it?

A. It is logical.

Q. Then in addition to that there is, allowing the stream of gasoline to flow into a can, there is a certain amount of gasoline vapor that is caused by the force of the stream of gasoline striking the bottom and sides of the can, and the mixture in there, so there would be some additional gasoline fumes created that way, wouldn't there?

A. There would be possibly a small addition, due to the extra surface.

Q. Then we can assume that that added gasoline vapor in there would probably equal the impurity in the can, so every time we would have the can filled we would get about five gallons of gasoline vapor that would be dissipated, wouldn't we?

A. Yes.

Q. Now then would you mind taking your pencil and telling me what the cubic contents of the bilge of the Seminole was, up to a point eighteen inches above the floor of the engine room? Could you do that?

A. If I knew the dimensions of the bilge. I don't know the dimensions of the bilge.

Q. Well you have looked at the boat. We are not trying to get to the exact cubic inch, but couldn't you, from the dimensions that we have of that vessel, give me an approximation of the cubic contents of the bilge of that vessel up to that point?

A. Yes, I could give it to you.

Q. All right, have you a piece of paper?

The Court:

Here is a tablet.

A. As I recall, that engine room is twenty feet long.

Q. No, let's have the whole bilge of the whole ship?

A. The bilge of the whole ship?
Q. Umh hmh?

Mr. Underwood:
If your Honor please, I think we ought to agree upon the curves involved, too. The curve—the radius of the bilge, the sheer forward and the sheer aft.

Mr. Botts:
This witness is a designer, and I am willing to concede in connection with the designing of boats, that he is a competent man; with reference to some of the other things I am not so liberal. But he can take this vessel, we have got the blueprints of it, and the depth of the bilge, and so on, and he has looked at it, and he can come fairly close to giving us that cubic content.

The Court:
You want him to take all of that into consideration?

Mr. Botts:
I want him to take this vessel as is, what he knows about it,—the length, and so forth; the curve of the sides, which he has examined, and tell me as near as he can,—there must be a sort of a rule of thumb method of computing the cubic contents.

Q. Wouldn't it be approximately two thousand cubic feet?

The Court:
Well let him do his figuring first.—Go on and do your figuring and then answer it.

A. I can arrive at a very rough figure.
Q. All right, that's all we are trying to get at, is the approximation; if you will come within twenty-five per

cent of correct, it will be all right. You know the length of the vessel, do you?

A. I believe it is 120 feet.

Q. 104 I believe is the figure?

A. 120 feet on deck.

Mr. Underwood:

There we are, right off the bat.

A. I will say, 110 on the water line.

Mr. Underwood:

What is your length eighteen inches above the keel?

(By Mr. Botts):

Q. It doesn't matter; you have examined her, go ahead, take any figures that you want.

A. But I haven't taken any measurements on the top of the hull forward, or the top of the hull aft, Mr. Botts.

Q. I understand that, and therefore I understand that this is going to be an approximation; but at the same time, you have examined this vessel, and you can come reasonably close to that figure, can't you?

The Court:

He has examined the vessel, Mr. Botts, but he doesn't seem to have in mind the figures on which he has got to arrive at a conclusion. What figures do you want?

Mr. Botts:

Well we have the blueprints of the boat, they are in evidence; let him have those.

The Court:

All right, give him that.

Mr. Underwood:

The blueprints don't give the details that you want. He can have the blueprints, as far as that is concerned.

A. I can give a rough cube of the thing.

(By Mr. Botts):

Q. Well go ahead.

Mr. Underwood:

I have no objection to that, so long as all his figures go in and we can compare them against the actual figures so far as we know them.

Mr. Botts:

Certainly, if you can furnish the actual figures—

A. I will assume that the length of the thing is 110 feet.

Q. All right, go ahead.

(A.) Q. I believe the beam is 21.

Q. All right. When you get down to a point two feet or eighteen inches above the engine room floor, what would be—there would be some decrease due to the curve of the bottom, wouldn't there? Take all those things in consideration. Here is that blueprint.

A. That gives me no idea of the shape of the bottom, Mr. Botts.

Q. I know.

Mr. Underwood:

Referring to exhibit A.

Q. You have examined the bottom and know generally?

A. I don't recall what the depth is from floor to the bottom of the plating, now. Can you asssist me in that?

The Court:

If the witness does not know them, he will have to be given them.

Q. Assume at a point three feet above the bottom of the vessel, then?

A. We will assume that that is three feet.

Q. A depth of three feet.

Mr. Underwood:

Amidships?

Q. Yes, all right; and assume a beam of 16 at that point.

A. She carried her beam right to the water line.

Mr. Underwood:

Is that 16 foot beam assumption referring to a 16 foot beam amidships, or an average beam of 16 feet?

Mr. Botts:

Amidships, at a point three feet above the keel; that the beam amidships was 16 feet—I mean the width amidships was 16 feet.

A. Well the beam amidships was 21 feet, Mr. Botts. I would rather use the figure 21, if you don't mind, because I do know that she carried her beam right down to the water line.

Q. But wasn't the engine room below the water line,—the engine room floor considerably below the water line?

A. Yes, but a point three feet below, say a depth of three feet, that is practically your draft.

Q. All right. I think the testimony was it was a four foot draft. All right, take it 20 feet.

A. I will take it 20 feet.

Q. All right.

The Court:

Now you are building up a lot of record with this back and forth; I think the witness ought to go on and do his figuring and then answer the question.

Mr. Botts:

All right.

A. I would say roughly 2200 cubic feet.

Q. All right.

Mr. Underwood:

May he give at this point his estimate as to beam and length and so on?

The Court:

Just for information, provided we don't get into an extended discussion on this.

Mr. Underwood:

I don't want to discuss it.

The Court:

Suppose you give the elements on which you arrive at that answer?

A. I have assumed a length of 110 feet, a beam of 20 feet, and a depth of 3, which gives me a cube of 6600; and roughly the—no, I beg your pardon, deduct a third, it would give me 4400 as the result. We deduct a third for the end beam taken off, roughly; that is the figure I use for rough displacement.

Q. Then what would be the cubic content?

A. 4400 feet. That can vary a great deal, depending on whether she has a fine entrance forward, and fine lines aft, or whether she comes up. There is a great deal depends on that.

Q. Would you mind telling me how you arrived at that figure, 4400?—Now then—

The Court:
Do you withdraw that question?

Mr. Botts:
Yes.

(By Mr. Botts):
Q. Five gallons is what percentage of a cubic foot?
A. There is 7 and 48/100 gallons to the cubic foot; it would be approximately—
Q. Two thirds?
A. Two thirds; 66%.
Q. Tell me—assuming that there are two thirds of a cubic foot of gasoline vapor discharged into the bilge of that vessel every time a five gallon can was filled, tell me how many cans of gasoline would have to be drawn off in that engine room until the entire bilge of that vessel, up to a point three feet below the keel—above the kell, would contain an explosive mixture of 1.5; assuming that none of it is dissipated by ventilation?
A. I figure roughly about 41 times; 50 times; 41 times.
Q. Then by the time 250 gallons of gasoline had been drawn off in that way, if none of those fumes was dissipated, the entire bilge of that vessel up to three feet above the keel would be an explosive mixture of gasoline, wouldn't it?
A. It would have to be, yes; you would have to draw off that much at least.
Q. Now then assuming that this draw-off valve in the engine room was not used merely to draw off a squirt can full of gasoline to prime the engines, but was used habitually to draw off in five gallon lots, gasoline, and transfer it to other boats, what do you say now

about whether or not in your opinion it was a proper thing to have that draw-off valve in the engine room, used in that way? Was it in your judgment, proper?

A. I still contend it was proper.

Q. You do?

A. Yes, sir; there is too many other dependencies on it.

Q. From the examination that you have made of the Seminole at various times, have you been able to form an opinion as to what it was that caused the explosion and fire on the Seminole?

A. No, sir. I wish I did know.

Q. Well do you concede that it was an explosion of gasoline vapor?

Mr. Underwood:

I object to the witness being asked to concede anything, if your Honor please.

The Court:

I think that is well taken. He is not in position to bind anybody by his conclusion.

Mr. Botts:

I will withdraw the question.

Q. In your opinion, was that explosion caused by gasoline?

Mr. Underwood:

I object to that. He said he hasn't been able to form an opinion.

Mr. Botts:

He is on cross-examination; I am trying to find out just what opinion he has.

The Court:

It may be repetition; I will overrule the objection. Repetition will less burden the record than to have extended arguments.

A. I can't say that I assume that it was gasoline that caused an explosion. I won't say it could have—or I should say, did. Gasoline could possibly cause the explosion.

Q. Well do you know of any other substance which could have possibly caused that explosion?

A. Yes, there are other substances.

Q. All right, what?

A. Sewer gas.

Q. Wasn't any sewer available in the bilge of the Seminole, was there?

A. I don't know. There is another gas given off by the decomposing of seaweeds; giving off marsh gas, better known as marsh gas.

Q. What is known as marsh gas?

A. I believe it is a hydro-sulphide.

Q. Marsh gas is methane, isn't it?

A. I am not sure.

Q. Are you—do you mean to suggest that there might have been methane or marsh gas present in there, that caused that explosion?

A. I am not assuming anything, Mr. Botts.

Q. I say, are you suggesting that?

A. I am not suggesting it; no, sir.

Q. Well I want you to tell me,—you are here as an expert, I want you to tell me in your expert opinion, what other possible substances than gasoline might have caused that explosion?

A. Mr. Botts, I am here as an expert on the construction of a vessel, not on gases, or explosive gases.

Q. Well you have expressed an opinion with reference to explosions. I just want to know now if there is any-

thing else that in your opinion might have caused an explosion in a boat, with which you are familiar,—generally, I mean, your being familiar with boats generally; and you suggested that there is such a gas as sewer gas or marsh gas?

A. Yes.

Q. Do you mean to suggest that that gas might have been present in the boat and caused the explosion?

A. There is a possibility of it going in there.

Q. How could it have gone in there?

A. Through open windows.

Q. And how could it have gotten down in the bilge of the vessel?

A. By settling.

Q. And for it to settle there, it would have to be heavier than air, wouldn't it?

A. Yes, it would have to be heavier than air, to settle there, naturally.

Q. You brought in marsh gas or methane; don't you; don't you know as a matter of fact—do you know as a matter of fact what the specific gravity—or the weight of methane is, relative to air?

A. I know that both of them are slightly heavier than air—I mean, lighter than air, but I don't know just what the specific gravity of either one of the gases are.

Q. Either one of which gases?

A. The ones you just mentioned; marsh gas or sewer gas.

Q. Well the marsh gas, methane, and the sewer gas, are all one and the same, aren't they?

A. I don't believe sewer gas is the same as marsh gas.

Q. Marsh gas and methane are the same, aren't they?

A. I don't know.

Q. You don't know. Well then you don't mean to suggest as a scientific possibility, that methane or marsh gas could have caused this explosion, do you?

A. I am not assuming anything, Mr. Botts. You asked me the question and I had to answer it somehow or other.

Q. You could say you don't know, if you don't. You brought in sewer gas; now what is sewer gas?

A. I do not know the formula of sewer gas. I do know that sewer gas is explosive; I know that.

Q. Then it was just a pure guess without anything,—you didn't intend to propound that as a scientific probability or anything of that kind?

A. No, I did not.

Q. Well then are you able now, from your experience in boats, to suggest any possible explosive mixture other than gasoline, that could have been present in this boat and caused this explosion?

A. No, I don't believe I can.

Q. All right; then if it was a gasoline mixture that caused the explosion, can you suggest any other sources from which that gasoline vapor may have been emitted, and thus been present, other than the draw-off valve that we have mentioned.

Mr. Underwood:

If your Honor please, I object to that as purely speculative.

Mr. Botts:

He is an expert boatman; I am asking him.

Mr. Underwood:

Well it is speculative. It could have come from one of a thousand sources; could have been deliberately placed there.

The Court:

Let's see if I catch the question; read the question.

(The question was read by the reporter.)

The Court:

I think that is all right. I will overrule the objection. —Do you want the question re-read?

A. If you please.

The Court:

He starts out with the assumption; if it was from the gasoline vapor, could it have arisen from any other source than the draw-off valve.

(The question was again read by the reporter.)

A. Well there is any of a dozen places or more. Might have had a leak in the line; might have been a faulty valve somewheres. Might have been a leak in the tank. Might have been a thousand places.

(By Mr. Botts):

Q. All those things. All right. Now then—

A. Someone might have opened a valve and left it open.

Q. Well if that draw-off valve was opened and left open, either deliberately or inadvertently, that would still be from the draw-off valve, wouldn't it?

A. Yes.

Q. And still be a hazard, however it was opened?

A. You could have called leaving a shut-off valve to the tank, or the fuel line, a hazard, too, under the same conditions.

Q. In your testimony, you testified that these tanks,—assuming that all of them were mounted in the same way, with the one that you removed,—were mounted on wooden pads, I believe you used the word, pad?

A. Pad?

Q. Or, cushion?

A. Yes.

Q. And my notes indicate that—and to the best of my recollection, you said that you considered wood the best substance for a pad of that kind?

A. I did.

Q. Any why?

A. Because the wood is softer than metal, and prevents ——it make a softer cushion for the tanks to sit on, less chance of chafe, and the wearing of a hole into the tank.

Q. But isn't it true that if there was a slow leak in the tank, down into the pan where this wooden pad was sitting, that the wood itself would, absorb the gasoline and be in the nature of a sponge, retaining the gasoline and giving off the fumes from time to time, and yet concealing the quantity of gasoline? Wouldn't that be true?

A. The wood would absorb gasoline by capillary attraction, but being more surface from those bits of timber in there, there would be more surface for evaporation; therefore the gasoline that had leaked into the pan would evaporate that much quicker and be dissipated by the circulation of air around it.

Q. If there was a circulation; or it would descend into the bilge of the vessel if there was circulation, wouldn't it?

A. If there was not circulation.

Q. Then if the vessel was closed up tight and it gradually leaked into that pan and was absorbed in there, and then that broad surface for evaporation would cause the gasoline fumes to evaporate and go down into the bilge, wouldn't it?

A. It would only make it go down there quicker, is all. It would all go there eventually, but it would get there quicker with the wood.

Q. Now then do you consider it a proper installation of gasoline tanks such as were in the Seminole, to install those in such a manner that it is impossible to inspect them for possible leaks?

A. I don't think it is impractical.

Q. Do you consider that a proper method of installing large gasoline tanks such as were in the Seminole?—That is to install them so that they are not capable of being inspected for leaks?

A. Why yes, it is perfectly proper; it is quite common,—and proper.

Q. Wouldn't the fact—strike that. It is a fact that gasoline tanks sometimes leak, isn't it?

A. Practically most any thing is apt to leak.

Q. Then a gasoline tank designed to hold a large quantity, say, 400 or 500 gallons of gasoline, if it should leak, would become a very dangerous installation, wouldn't it?

A. If it leaked it would be dangerous, yes.

Q. And for that reason isn't it a better practice to have gasoline tanks installed so that they can be inspected for leaks? Isn't that a better practice?

A. You would have the knowledge that there was a leak in that tank, just the same, whether you could inspect it or not. The only thing inspection would do, would be to find out where it was, that's all.

Q. How would you have that knowledge, if it was a slow leak, a seeping leak, down in there? How would you acquire that knowledge?

A. By odor.

Q. And suppose it is in a rather a close tank room such as we had in the Seminole, where, when the vapor escaped it would drop down into the bilge; isn't it entirely possible it could go down there without any odor being apparent?

A. I don't think it could; it might, if no one was aboard, yes.

Q. Well I will ask you this, now; not referring to the extent of the added hazard, but to the fact of whether or not there is an added hazard; isn't it true that in in-

stalling large gasoline tanks in such a manner that they cannot be inspected, adds a certain element of hazard to the entire situation?

A. I don't think so, because you wouldn't look for a leak until you knew that there was one.

Q. You mean, if tanks were so they could be inspected, you wouldn't inspect them until you found out they were defective? Is that what you mean?

A. I say that, yes. That is human nature.

Q. Isn't it dangerous procedure?

A. No, I don't think so.

Q. You don't think so, you would rather wait, if there was danger of a gasoline leak, until the leak had developed, and perhaps fumes discharged in the bilge, before you went to look for it? You think that the better practice? You don't, do you?

A. I am not saying that is the better practice; I am saying that is the common practice.

Q. Common practice may not be good practice. Now the point I am getting at, that sort of a situation would add another element of hazard, wouldn't it? Now be frank; wouldn't it?

A. Yes.

Q. Sure it would.

A. It would be easier to leave all the gas tanks out and put said aboard her, and not leave any gasoline aboard at all; there would be no hazard in that; and leave the gasoline tanks ashore.

Q. I am trying to get the added element of hazard in this situation on the Seminole; and tanks that couldn't be inspected would then be some added element of hazard, wouldn't they?

A. I don't think so, no.

Q. Well you just said that it would. Which way do you want the question answered?

A. I still insist that the lack of inspection on the tank would not be any great hazard to the situation at all.

Q. I didn't say, great; I said, any; not great or small, but it adds some?

A. Well I say great. I admit there may be a small amount of hazard.

Q. Then it would be some small amount of hazard, we will put it that way; but not, in your judgment, a great element of hazard? That's the distinction you make?

A. That is the distinction I make.

Q. Very good. Now then let's get at this: Do you consider soldering the joints on large tanks such as were in the Seminole, a proper practice?

A. I do.

Q. You consider that proper?

A. Considering the pressure that those tanks had to undergo, soldering would be quite sufficient.

Q. Now you mean soldering on steel?

A. Soldering on galvanized iron.

Q. All right. Now then isn't it true Mr. Munroe that solder requires or is commonly applied by the use of an acid in connection with the solder?

A. That all depends on what you are soldering on; whether you are soldering on copper or soldering on—you can use—

Q. Soldering on galvanized iron?

A. You can solder on galvanized iron with a resin flux, or you can use a ready-prepared flux that has a small amount of acid in it.

Q. All right now; then isn't it true that when solder is applied to steel or galvanized iron, that there is very frequently caused by the solder, or other causes, a rusting underneath the solder, that has a tendency to cause the solder sometimes to flake?

A. Theoretically you might get such condition, if your solder was not properly applied, yes.

Q. I believe that my best recollection is that in connection with the tank that you examined, you stated that

after you examined it—strike that off "after you examined it"; that when you first examined it there were traces of solder above the point where solder now shows, on the vertical seams; and that between the time when you first examined it, and the visit that the Court made to the place, that the corrosion or some other cause had caused some of that solder to flake off. Didn't you say something of that kind?

A. I said nothing about the vertical seam.

Q. Well somewhere on that tank, that the corrosion had caused previous signs of solder to be eradicated by flaking?

A. I said that concerning the rivet heads at the bottom.

Q. I see; well I didn't recall the exact point.

A. On the outside of the bottom.

Q. Then the solder used in applying solder to these tanks, was of such a character that it did flake off by corrosive causes?

A. Accentuated by the heat of fire. Without the heat of the fire that wouldn't have occurred as readily, or possibly at all.

Q. Then isn't it true, especially on large gasoline tanks, that solder is a poor method of safeguarding the seams?

A. I would not say it was a poor method, no, sir.

Q. Well do you think it is the best method?

A. I don't say that it is absolutely the very best method.

Q. What do you consider the best method?

A. Welding is by far,—or brazing is by far the most superior method; it is absolutely tight.

Q. Other than leaving the seams entirely unreinforced, that is just with nothing but the rivets to hold them, what method of attempted safeguarding, if any, is worse than soldering, if you can think of one?

A. Most anything is worse than soldering.

Q. What?

A. I mean just not putting anything at all there, is worse than soldering.

Q. Eliminating doing nothing, is there anything,—the next worse thing is soldering, isn't it?

A. No, sir, I won't say the next worse thing is soldering.

Q. What is the next worse thing?

A. Patching up with chewing gum, trying to caulk it with a piece of twine or cotton.

Q. That isn't an ordinary recognized method is it?

A. You didn't say, recognized method.

Q. All right; you tell me what ordinarily used method other than doing nothing at all, is worse than soldering?

A. The next worse thing would be caulking it.

Q. You mean, solder is the worse?

A. No, sir, I do not say solder is the worse, I say caulking is worse than soldering. It has less chance,—beg pardon, there is more chance of leak in a caulked seam than there would be in a soldered seam.

Q. How is a seam caulked?

A. It is caulked with a fairly blunt edged tool, that has been described a thousand times here in Court.

Q. And then they just—the caulking is used by taking a tool and driving the metal into the seam?

A. No, not into the seam.

Q. Would you mind just taking a pencil and illustrating just how it is caulked? If you don't drive the metal into the seam, just exactly what does it do?

A. (Witness draws.)

The Court:

You had better put that on a fresh sheet of paper; they are liable to want that to go in evidence.

A. We will assume that your rivets are in here. In order to caulk this seam, you use a fairly blunt edged

tool at this point, not going in on the edge of the plate; on the edge of the plate, forcing this part of the metal over against this other plate, in that manner.

Mr. Underwood:
Before we go farther—

A. That is not driving the metal into the seam. If you drove one metal into the seam you would drive it down this way and expand the seam,—open it.

Mr. Underwood:
Will you indicate on there, please the seam? Draw an arrow to it—let me do it. Is that the seam, there?

A. That is the seam.

Mr. Underwood:
I will draw an arrow there and write "seam". And this next is the caulking tool.

A. That's your caulking tool.

Mr. Underwood:
That point there is the original edge of the metal?

A. That's the original edge of the metal.

Mr. Underwood:
Draw an arrow there and say, "Original edge of metal". Is this point here, the point to which the metal is forced by the caulking tool?

A. That is the point to which the metal has been forced by the tool. In other words, you sort of try to split this plate and expand it.

Mr. Underwood:

The last point I have indicated by an arrow, and at the end of it marked "Point to which metal forced by tool".

Mr. Botts:

All right.

Mr. Underwood:

Do you offer that, Mr. Botts?

Mr. Botts:

Well I am perfectly willing to let it be filed and charged to me as my exhibit. Just mark that as my next exhibit.

(Said sketch was admitted in evidence and marked Pilkington's Exhibit No. 15.)

(By Mr. Botts):

Q. My understanding is that you say you consider caulking a riveted seam,—I mean soldering a riveted seam, as superior to caulking a riveted seam, is that right?

A. I do.

Q. Now then you are familiar with the procedure in making the steel hulls of vessels, where the hulls are riveted, are you?

A. I know the construction, yes.

Q. And those, then, since it is a superior method, are of course soldered, are they?

A. They are not.

Q. How are they secured?

A. They are caulked, in the manner in which I described.

Q. And will you explain to us, if soldering is superior to caulking, why they caulk the seams of a vessel, rather than solder them?

A. Because we were talking about containers of gasoline, and not the side of a vessel.

Q. Well the tightness of the joints is more important on which type,—a vessel or a gasoline drum?

A. A gasoline container.

Q. And you think then that the solder will make a tighter joint than caulking?

A. It will.

Q. As I understand it, you have never had any experience in the making of steel hulls on vessels?

A. No I have not.

Q. And that is just your opinion, that the caulking of a joint is less effective than soldering?

A. I suppose you would call it my opinion.

Q. Now if the solder, by reason of corrosion caused by acid and atmospheric conditions, and so forth, should cause a flaking of the solder, at a soldered joint, wouldn't that add a leakage hazard to that container?

A. Yes.

Q. And that couldn't possibly occur where a joint is caulked, could it?

A. Certainly it could.

Q. It could?

A. Yes it could occur there, though there wouldn't be the effect of an acid there, that's right.

Q. It wouldn't be as likely to occur then we will put it that way, in a caulked joint, as a soldered joint.

A. A leak is just as apt to occur in a caulked joint—more so in a caulked joint than it would in a soldered joint.

Q. You have testified with reference to a drain line,—an overboard drain line from this pan underneath the tanks. The purpose, I take it, was to drain overboard any gasoline that might leak into that pan; is that correct?

A. I believe so, yes.

Q. Now then did you trace the outlet from that drain line, to see where it went overboard?

A. I couldn't find any drain line except where it came out of the pan. Apparently it had been destroyed, if it was there.

Q. Well I will ask you this; suppose that the outlet of that drain line was six or eight inches above the bottom of the pan, and two or three inches above the top edge of the sides of the pan. Then such a drain line wouldn't be at all effective in draining gasoline, if there should be a leakage, would it?

A. You say, the outlet—

Q. The overboard outlet is two or three inches above the top of the sides of the pan, and five or six inches above the bottom of the pan?

A. No, that would be impossible to make such a thing as that work.

Q. Yes; and if such was the connection, then it would be improper, or at least would give no added safety, would it?

A. Well it just wouldn't work.

Q. Just wouldn't work; all right. Now then you testified that it was customary in this area to put drain lines, or drain valves, draw-off valves, whatever you want to call them,—in engine rooms of gasoline vessels. Am I correct in that?

A. I said, of boats of the type of the Seminole.

Q. Well is there any other boat, except boats of the type of the Seminole, that it is customary to put draw-off of drain lines in engine rooms?

A. I don't know of any.

Q. Now then name some boats in the Miami area that are of the type of the Seminole?

A. Well there is a good many of them.

Q. Well name some upon which you can personally say, from your own observation, that have draw-off valves in the engine room.

A. I don't know that I can name—specify any particular boats. I don't recall the names of boats that I have seen with them.

Q. Then upon what basis did you make the assertion that such a custom existed?

A. Because I have seen it.

Q. All right, specify when and where?

A. I just told you that I don't recall the name of the boats that I saw it on.

Q. Well tell us when and where the boat was that you saw, that was of the type of the Seminole, that had a draw-off valve in the engine room?

A. I don't know that I can tell you where the boat was located. It was here in this vicinity, this locality, but just where she was at the time that I saw her, I couldn't tell you.

Q. Now you have testified to a custom. What do you mean a custom,—that it was customary? Do you mean it has been repeatedly, habitually,—that is custom, isn't it?

A. It is not done now as much as it was several years ago.

Q. It has come to be recognized as improper practice, has it?

A. No, sir, that's not the reason they discontinued it.

Q. All right, now, tell us one boat, one single boat, if you can specify, from which you draw your conclusion of the custom in that respect, that you say exists?

A. I cannot name any one specific boat.

Q. And you can't name any place where you saw it, nor any time when you saw it?

A. No I can't.

Q. That is a pretty indefinite basis to make an assertion of a custom, isn't it?

A. I do know that it exists,—or rather did exist; I won't say that it exists at the present time, but it did exist.

Q. Well, we will leave the custom there. Now then do you say that that custom, of putting draw-off valves in the engine room, exists with reference to boats of a type other than the Seminole?

A. I answered you once before, no, on that.

Q. It is only of the type of the Seminole, is the only ones that you know that is a custom?

A. Those big houseboats that were used for fishing around the Keys and Cape Sable and Shark River and that vicinity, where they have to get gasoline for their small launches.

Q. Did you ever, as a marine surveyor, make a survey of a vessel for your employer for whatever purpose, in which you found a draw-off valve in the engine room?

A. A draw-off valve such as the type that we are discussing now?

Q. Well, a draw-off valve.

A. In the Seminole?

Q. A draw-off valve,—of any type of valve; just draw-off valve?

A. I think you could find a draw-off valve in any boat right even today.

Q. That isn't the question I asked you. I said, in your surveys of boats, which you have made as a marine surveyor, have you ever found a draw-off valve in the engine room?

A. I can say I have, yes.

Q. When?

A. Now that depends on, if you are talking about drawing off large quantities of gasoline, I will say, no, such as those valves that were on the Seminole as a draw-off valve. But there are other valves where free gasoline could be gotten from the main tanks.

Q. All right, but not designed as a draw-off valve; is that what you mean?

A. Not designed primarily as a draw-off valve, but nevertheless it was a valve and it was in the line.

Q. But you have never found, in surveying a vessel, found a large draw-off valve designed for drawing off large quantities of gasoline?

A. No, sir.

Q. Well now then, what kind of of a draw-off valve have you found? What was the purpose of installation of these that you said could be used as draw-off valves?

A. In the old type motors, a draw-off valve under the bowl of the carburetor, or, in the newer boats, a draw-off valve in the bottom of sediment bulbs,—sediment traps, for the purpose of drawing off sediment and the water that has accumulated in that bowl.

Q. And that's the only thing that could be characterized as a draw-off valve, that you recall finding; is that right?

A. Yes; you could get any quantity.

Q. And that is—

Mr. Underwood:

May he finish?

A. You could draw off a large quantity of gasoline in there, through that small valve, if you took the time to do it.

Q. But those valves were designed primarily for other purposes, were they not?

A. Other purposes than what? Other purposes than drawing off gasoline?

Q. Than drawing off gasoline. They were designed to clear the pipes or clear the sediment bulbs, or sediment chamber of the carburetor, weren't they?

A. Yes, that was their purpose.

Q. And so they were not a draw-off valve. You could draw gasoline from them, but they were not draw-off valves, were they?

A. You could fill a squirt can from them, for priming.

Q. Would a valve that was inserted for the purpose of cleansing a line, drawing of sediment, would that be a —sediment and water, would that be a suitable place from which to draw off gasoline for a squirt can, to use for priming?

A. Why certainly; after you had drawn off the water, you could draw off the water, dump that overboard, and then get pure gasoline.

Q. And you have never made a survey, though, where you found a real draw-off valve?

A. Not a real draw-off valve.

Q. If you had, you would have recommended that they do something about it, wouldn't you?

A. Not necessarily.

Mr. Botts:

I am trying to get through my memoranda; I think I am practically through. I couldn't remember all these questions. I made them weeks ago, and I have to read them. There are some other questions; I can see now I have some other questions.

(Thereupon at 12:32 o'clock P. M. hearing was recessed until 1:30 o'clock P. M. of the same day.)

3556 Miami, Florida, November 14, 1939, 1:30 P. M.

Afternoon Session.

Thereupon, WIRTH MUNROE, a witness in behalf of the Respondent Phipps, resumed the stand and was examined further as follows:

Cross Examination (Cont'd).

By Mr. Botts:

Q. Mr. Munroe, with reference to these tanks that were in the Seminole how, if at all, would it be possible

to cut or remove either the bottom or the top of the tank and then reinstall it; would that be possible?

A. It would be possible to remove that end of the tank by cutting off the rivets and punching them out at the bottom.

Q. There is no evidence on these tanks that these rivets had been cut off?

A. If all new rivets were put in they would look just the same as original rivets.

Q. How would you cut them off before you punched them out?

A. You probably would have to cut them off with a cold chisel.

Q. Wouldn't cutting them off with a cold chisel necessarily leave a mark on the side of the tank?

A. Not necessarily.

Q. You think it would be possible to—

A. I think so; I think it would be possible to take them off without marring the sides of the tank.

Q. Now in your testimony with reference to these tanks you made this statement, "if there was any leak in the tanks it would certainly show up in the pan." Now if there was just a slow seepage or a very slight leak, it wouldn't show up in the pan, would it?

A. Not in the form of liquid, no.

Q. It would not show up in any form, would it?

A. I don't suppose you could call it directly in the pan, no.

Q. When you made the statement I just quoted you you referred to a very substantial leak.

A. I was referring to a substantial leak, yes.

Q. You were not referring to a slight leak or seep which might occur by reason of long usage of the tanks?

A. It wouldn't refer to seepage which would just wet the surface of the tank,

Q. In testing these tanks, Mr. Munroe, you stated that you made a hydrostatic test.

A. Yes.

Q. And, as I understand it, Mr. Munroe, you said that during the course of that test there was leakage around the bottom or outlet opening of the tank.

A. There was a leak in the bushing in the outlet of the tank due to a crack that had been put there by screwing in the fitting.

Q. Mr. Munroe, isn't it true that that leak in that bushing might have been an old crack that was reopened?

A. No, sir; that crack was put there at the time that I—not myself, but my helper—screwed the fitting in; my helper screwed it in.

Q. How is it possible for you to say at this time that that was not an old crack reopened rather than a new crack that was caused at that time?

A. Because, sir, when it occurred I distinctly heard it snap.

Q. And that would be true if it was an old crack that was reopened and extended a little?

A. No, sir; an old crack would not snap.

Q. Suppose there was an old crack all the way across that bushing and it was snapped off, there would be a snap, wouldn't it?

A. It would have snapped somewhat but not with a sound.

Q. How much more than somewhat was this snap?

A. This was a very loud report, very distinct. I examined it afterwards and could see the clean metal all the way through the top of the crack.

Q. All you could see was top of the crack, wasn't it; you didn't take the bushing out, did you?

A. No.

Q. All you could tell from the surface was that there was a crack across it?

A. Entirely a new crack across the surface.

Mr. Botts:
That is all.

Re-Direct Examination.

By Mr. Underwood:
Q. If these tanks had seeping leaks, how could that be detected?
A. By odor; by the odor of gasoline partly.
Q. In the modern boats or new boats that are built today are the tanks originally placed where they can be inspected on all sides?

Mr. Botts:
I object to that as immaterial.

The Court:
I am in doubt about that. I will reserve ruling on that. Answer the question.

A. The tanks in the modern boats are not in positions where they can be easily observed or examined. They are usually put under cockpit floor, under the wings and sometimes under tanks, with woodwork or joiner work around them.
Q. What kind of tanks are these as to material of which they are constructed?
A. A majority of them today are iron and steel and copper; I would say that a majority of them are copper.
Q. As far as access for physical inspection is concerned, does it make any difference whether they are copper, iron or steel?
A. No, it makes no difference about examining them.
Q. Have you had any experience previously with a can similar to that which was produced here this morning, which has been marked Exhibit 137?

A. Yes, I have had had experience with a can of this type.

Q. Do you own one?

A. Do I own one?

Q. Yes.

A. No, I don't own one.

Q. What has your experience been with cans of that type?

A. There have been several of these cans used by boats in my vicinity, in the vicinity of my shop, and they have very short life.

Q. What happens to them?

A. They very soon rust out.

Q. Do you know why that is?

A. Well, it is a straight steel tank that is not protected with any galvanizing or tinibg or anything.

Q. Soldered?

A. I don't believe these are soldered.

Q. Are they caulked?

A. I don't know what the construction of the tank is at all.

Q. Are they galvanized?

A. They are not galvanized; just plain steel, black steel.

Q. If you were going to provide gasoline on the Seminole for priming the motors and contemplating using cans of that type, what would you have to consider in determining how many of these you got?

A. Depending on how long you were going to be away from the supply of gasoline.

Q. How many times you might have to prime the motors?

A. Yes, how many times you might have to prime the motors.

Q. You might have to have a great many?

A. Yes, considering the fact that you use about a quart of gasoline to prime both motors each time you start.

Q. Now you were asked whether you could see any evidence that the lower crown of the gasoline tank which you saw had been at one time removed and replaced. Could you see anything that indicated that it had not been removed?

A. No.

Q. In other words, could you tell from anything you saw whether it had been or had not been?

A. I had no way of telling whether it had been removed or not.

Q. You were asked whether the heads of the rivets could be taken off by chiseling; do you know whether they could have been burned out?

A. Burning them out would have been a very poor way, considering the tanks had gasoline in them at previous times.

Q. Could they have been burned out with an acetylene torch?

A. Yes, but it would have been very poor practice to try it.

Q. Getting back to these draw-off valves, is it your opinion that the hazard, to use Mr. Botts' word, incident to drawing off gasoline with drawoff valves greater or less than the hazard of doing it otherwsie?

A. I don't believe I get quite all of your question.

Q. I will try to rephrase it: which in your opinion is the greater hazard, whatever hazard there may be in drawing off gasoline, from the draw-off valves or arranging to get the gasoline in the engine room in some other way, such as a tank on deck or a number of these cans such as Exhibit 137?

A. I consider the use of draw-off valves as being the lesser hazard.

Q. Now do I understand that you are at the present time proprietor of a repair yard?

A. Yes.

Q. When did you begin to run that repair yard?

A. About 1932 or 1933; I have forgotten the exact date.

Q. What association did you have with it before that time?

A. My father opoerated it before that, and I worked for him.

Q. What was the nature of your responsibility with your father; who operated it; who was in charge of the repairs?

A. My father really had the final say-so, but long in the latter part of his ownership of it, I really did most of the work and he merely backed me up on it, you might say.

Q. In other words, by a gradual process you took over your father's business?

A. Yes, I gradually took over his business.

Q. From that time on, Mr. Munroe, will you tell us whether the repairs done there have been made under your supervision?

A. Well, ever since I have had anything to do with it at all, ever since 1932, all the repairing that has been done has been under my supervision.

Q. Has the work done at that yard included repairs to motors or replacing motors or anything of that sort?

A. It has been replacing or repairing of motors, installation of new tanks, installation of new motors, and I might say the complete rebuilding of hulls.

Q. Is that the kind of work that has been going on at this yard under your supervision?

A. There has been work of that type, but not all of it.

Q. Has that been a steady business with you or on rare occasions?

A. No, that is a steady business; it has amounted to roughly a gross business of about twelve or fifteen thousand dollars a year.

Q. Have you ever built a boat that was not merely auxiliary but propelled entirely by "motor"?

A. Small launches, open launches, and besides the one that is under construction at the present time.

Q. Did you build a boat called the Grampus?

A. I did.

Q. What was her power?

A. She had a six-cylinder 88-horsepower Universal gasoline motor.

Q. Did she have any other source of power?

A. You mean "compulsion" power?

Q. Any kind; would she sail, in other words?

A. She would sail with auxiliary power. The engine room is also equipped with another motor, though; it has a four kilowatt generator.

Q. How long was she?

A. She was about 60-feet.

Q. What did you have to do with the construction of her?

A. I had complete supervision of the construction; I was on the job from the time her keel was laid until she was delivered to the owner; I assisted in delivering her back to Miami.

Q. Who drew the plans?

A. I drew the plans.

Q. Who decided the layout of the gasoline supply system?

A. I did.

Q. What kind of tanks—who decided that?

A. I decided the type of tank.

Q. Mr. Botts asked you something this morning about steel ships in the course of construction or otherwise. Where were these that you had in mind, those that you looked at; what was your purpose in looking at them, and under what circumstances did it occur?

A. Partly in the plant of the Electric Boat Corporation in Groton, Connecticut where they were building submarines for the United States navy, and also the construction at the Herreshof plant in Bristol, Rhode Island.

Q. What I want to get you to tell us is whether that was idle curiosity or something more; if so, what?

A. While I was at Bristol it was part of my education, because I was then an apprentice or assistant to Mr. Herreshof, Mr. Herreshof, Senior; M. G. Herreshoff, I should say, as there are so many Herreshofs now; and whenever we went through a yard he would naturally explain in detail all of the construction that was going on, explain it in detail to me; he was my instructor.

Q. In your surveying business are you from time to time ever employed by the Marine office of America?

A. I am.

Q. Do you make surveys for them for insurance purposes?

A. I do.

Q. On cross-examination by Mr. Matteson in October you said it was not good engineering practice to have a feedline run from a port trap over to an auxiliary; do you remember that?

A. Yes.

Q. From what standpoint was it not good engineering practice?

A. Because you would be feeding your auxiliary motor with the refuse that would be caught in this trap.

Q. Is there any fire or explosion hazard involved in that type of connection?

A. No, none whatever.

Q. Now when you are designing boats, Mr. Munroe, and considering what ventilation you shall provide for her in the way of windows, portholes and otherwise, I would like to know whether you make any calculations as to the amount of gasoline vapor that has to be removed by that natural ventilation?

A. No, sir.

Q. Do you assume any leakage in tanks or gasolines in order to determine how much ventilation an engineroom ought to have?

A. No, we don't determine that.

Q. What is the purpose of providing ventilation?

A. The main purpose of supplying ventilation in the engineroom or any other part of the vessel is to protect it against condensation on the inside in the case of a steel vessel, and in the case of wood to keep it aired out to prevent rotting of the timber, and in the engineroom to supply the required amount of air for the motors; motors have to have a supply of fresh air in order to run, and if it is a large engineroom there is an engineer stationed in there and it is necessary for him to have air, fresh air.

Q. Now considering the Seminole's ventilation as confined to the engineroom, the two windows on the port side, the one window on the alleyway on the starboard side, two cowl ventilators, the hatch and the skylight,—in your opinion is that adequate ventilation for all ordinary purposes?

A. That is quite sufficient.

Q. Considering that the ventilation of the tank compartment consisted of the four filler holes in the top, the four feedline holes towards the bottom of the bulkhead, the square opening below and the space around the pans,—in your opinion is that adequate ventilation for all ordinary purposes?

A. It is.

Q. In order to tell whether the natural ventilation that I have just asked you about is enough to take care of any seepage or leakage of gasoline creating vapor, what more would you have to know?

A. You wouldn't have to have "any".

Q. My question is, this, Mr. Munroe: assuming the sources of natural ventilation that I have just described

to you, the windows and the cowls and the skylight and so forth, in order to determine whether or not those openings would provide enough air to remove any gasoline vapor that might get in there, what would you have to know about the quantity of gasoline vapor and any other factors?

A. I am afraid I don't quite understand your question.

Q. Maybe I can put it more clearly in another way: if you drop a teasponful of gasoline on top of one of the motors in the engineroom, can you tell whether the natural ventilation from the sources I have mentioned would vaporize that and carry the vapor away and not permit it to get down into the bilge?

A. Well, there would be plenty ventilation to carry away any small quantity of gasoline vapors.

Q. Suppose you upset a 55-gallon drum of gasoline in the engineroom and let it all run out, could you tell me whether the natural ventilation provided from the sources that I have mentioned would carry away the vapor in any particular length of time?

A. I don't know as there is any way of actually measuring that; it could be measured, I suppose; it depends on the length that the ventilation is there.

Q. What in your opinion does that depend upon: you say time is one factor?

A. Yes; it depends on the pressure of the air entering the cowl or ventilator.

Q. In other words, how strong the wind was?

A. Yes; how much disturbance is caused in the engine room to dissipate the fumes, or dilute them.

Q. I suppose the quantity of gasoline or vapor is a factor?

A. Yes, indeed.

Q. How about lapse of time?

A. Yes, lapse of time is a factor.

Q. Bearing these things in mind, in your opinion would any dangerous accumulation of gasoline vapor occur when you draw off gasoline out of these draw-off valves into a can of the type before you on the floor there?

A. Not in my opinion; there would be plenty of ventilation there to carry off any fumes.

Q. How about filling the squirt cans for priming?

A. It would even be less in that case.

Q. There has been some talk of rust inside of these tanks in the so-called "V" at the bottom; can you tell us a little bit about rust; as I understand it, it is a process of oxidation, is that right?

A. Yes, it is.

Q. Does that mean that there is a certain affinity between steel and oxidation that results in rust?

A. In any ferrous metal oxidation is called rust; it occurs much more rapidly in the presence of air; the amount of rust that would be deposited would be determined by the quality of the steel or of the ferrous metal that was used; when it was covered by a liquid, such as water or gasoline, there would be a very, very small portion of rust appearing.

Q. Well, assuming that there was water in the "V" at the bottom of the Seminole's tank due to condensation inside of the tank, would you say that any process of oxidation down there in that "V" would be a rapid or slow process?

A. It would be a very slow process of rust in there.

Q. Why?

A. Because it is sealed by the water and the only oxidation that could take place would be the amount of oxygen obtained from that water that is there; after that had been used up, there would be no more rust.

Q. From your observation on the Seminole of the pans under her tanks, can you tell whether they would shift or not?

A. From my examination of them I would say that they have not shifted any at all.

Q. Are they solid and secure?

A. To all appearances they are solid and rigid.

Q. Did you step in them?

A. I have stepped in them; there is no indication of them having moved at all.

Q. About this hydrostatic test just one more question: is this hydrostatic test recognized as a proper test for leakage?

A. It is.

Q. I think you say, in answer to one of Mr. Matteson's questions, that you would not prefer to install a glass gauge six feet long. What have you in mind about that; what is your reason or what have you assumed about such a gauge?

A. I assumed that that was a gauge that would be unguarded, and it is perfectly possible to put in a tube that long—

Q. How about seven feet?

A. And protect it; yes, even seven feet, and protect it; it would be just as safe as the one six inches long.

Q. Mr. Munroe, I show you Libelants' Exhibit No. 6, a photograph, and ask you to tell me whether or not the holes at the top of the bulkhead between the tank compartment and the engine room, and the holes at the top of the bulkhead at the forward part of the tank compartent, indicate anything to you; if so, what?

A. Those holes indicate to me that there was a beam across there at sometime that that plate was made fast to.

Q. Would such beams across there serve any purpose in stiffening the bulkhead?

A. Yes; they would assist materially in stiffening that bulkhead.

Q. You see the same holes in Exhibit 112 at the top of the bulkhead, between the engine room and the tank compartment, do you not?

A. I do.

Q. They are in line across there?

A. I judge they are; the top is pretty well destroyed now.

Q. Do these vertical angles that appear on the engine-rom side of the bulkhead coming to the engine room tank compartment shown on Exhibit 6 serve any purpose for stiffening?

A. They add considerable to the stiffness of that bulkhead.

Q. In your opinion is that adequate stiffening for such a bulkhead?

A. It is quite sufficient.

Q. Could that bulkhead do any weaving under ordinary circumstances with these stiffeners in it?

A. I don't see how it could. I think these same frames were there when that was a coal bunker, and coal was laid immediately against that bulkhead.

Q. Mr. Munroe, you were asked by Mr. Matteson whether you would pass at the present time this connection between the valve marked Crane 150 and the union which form a part of Libelants' Exhibit number 11, the drain valves, and you said that you would not. What did you have in mind about that connection that you would not pass at this time?

A. At that time I was judging from the fact that this nipple was not the full length.

Q. Do you refer to the nipple between the union and the valve, Crane 150?

A. Yes.

Q. Is that right?

A. That is right.

Q. Can you tell at this time whether all the threads on that nipple were used up in making that fitting at the time of the fire?

A. No, I couldn't say that they were all used up at the time of the fire.

Q. Can you tell whether or not it would leak today?

A. Yes, I could tell whether it leaked today or not.

Q. How?

A. By blowing through it or sucking through it, when it is set up tight. This has been apart—

Q. I don't think the union has; I have never seen it apart, have you?

A. No.

Q. Now, will you see if you can suck through there, covering up two of these opening, and see if you can get any air through there?

A. I can't get any air through there.

Mr. Underwood:

Let the record show that in making that little test I have removed the valve marked Crane 125 from the exhibit, and also the plug, and removed the seat of the valve marked Crane 150, and that the witness blew or sucked, rather, on the end that makes contact with the valve, Crane 125, after covering up the other two openings and holding them tight with his hand.

Q. Suppose you light a cigarette and see if you can blow any smoke through it; take a mouth full of smoke and blow it at the same end, and hold the other two connections.

Mr. Underwood:

Does your Honor see that no smoke, cigarette smoke, comes through there? That is all.

Re-Cross Examination.

By Mr. Matteson:

Q. Mr. Monroe, you were saying that tanks in modern boats are sometimes installed under the cockpit floor or

wings where they can be equally examined in place. What type of boat were you talking about?

A. I am speaking of a great many of these stock boats as manufactured by Chris-Craft, Wheeler and Matthews.

Q. Cruisers and auxiliaries?

A. They are strictly power vessels.

Q. What size are they?

A. Up to fifty feet.

Q. What size would the tanks be?

A. The tanks would probably hold—the total tank capacity—not more than three to four hundred gallons.

Q. How many tanks?

A. Usually about two tanks; 150 to 200 gallons apiece; that all depends on the size of the motor that is installed in the boat.

Q. Such tanks could be disconnected and removed readily, could they not?

A. Yes, I believe they could be; those under the cockpit floor could be removed, yes; you might have to remove the motors first.

Q. Now take engines of the type in the Seminole, do I understand you to suggest that it would take a quart of gasoline to prime them?

A. That is my opinion; I believe it was testified by Schlappi—

Q. I am not asking you about the testimony of any witness; you testified that it would take or you intimated by your testimony that it would take a quart to prime the motors. Now I want to know what you base that on; are you basing that on Schlappi's testimony?

A. No, not entirely, except that he made the same remark.

Q. Are you suggesting that it would take as much as a quart of gasoline to prime the motors of the Seminole?

A. In my opinion it would take a quart to prime both motors.

Q. The purpose of priming is to get enough gasoline into the various cylinders for the initial explosion?

A. That is right.

Q. That is one revolution of the engine?

A. Yes.

Q. These engines at full speed made about 450 revolutions per minute?

A. I don't know what the r. p. m. was; somewheres in that neighborhood; not over five hundred, I don't think.

Q. Can you tell us the gasoline consumption per hour of one of these engines?

A. I don't think I can give it to you exactly; I believe it is in the vicinity of maybe twenty to twenty-give gallons an hour.

Q. You are talking about two engines?

A. I think so.

Q. You don't mean that it would take that much for each engine, do you?

A. No, for the two engines; that all depends on the speed that they are running, of course.

Q. Can you tell us how much gasoline would be consumed in one explosion of one cylinder?

A. No, I couldn't; I could tell you maybe by figuring it backwards.

A. It wouldn't be very much, would it?

A. No, it wouldn't be very much in actual raw fluid.

Q. Can you tell us how much gasoline vapor is produced by a given quantity of fluid gasoline?

A. No, I don't know that offhand.

Q. There is considerable degree of expansion in gasoline fluid by reason of gasoline vapor, and gasoline vapor gives a considerably greater amount of space than the gasoline fluid; is that a fact?

A. Yes.

Q. Still, do I understand you to suggest that it would take a quart of gasoline to prime six cylinders on two motors?

A. Yes, because you always use more raw gas in priming than you would while your motors are running; after the motor is warmed up it wouldn't require the amount of raw gas it would in starting.

Q. Of course there would be a disadvantage in putting in too much gasoline in that it would interfere with the lubrication, is that correct?

A. You would consider that, yes.

Q. What you would do in priming the motors would be to put in the minimum amount that you could to start them, would that be true?

Mr. Underwood:

I object to this; what this witness would do is immaterial; what was actually done is the question, and he doesn't know.

The Court:

It is just another way of asking him what his opinion is. I will overrule the objection.

A. I would say that the amount of gasoline would be determined by practice and use of the motors, and as you use the motors you would know more or less what the amount of gasoline is that would be needed.

Q. Of course, Mr. Munroe, it is also true that there is an upper explosion limit where you get too much gasoline in the cylinder and you get no explosion; is that true?

A. Yes, that is true.

Q. In other words, if you flood a cylinder it is difficult to start it as if you didn't have enough gasoline?

A. You would have to expel a certain amount of it before it would explode; but these were very large cylinders and had considerable capacity. I don't know what the displacement of the motor was for each cylinder.

Q. That was just about what I was going to ask you. Do you know the displacement?

A. I don't know the displacement of the motor offhand.

Q. You were asked a double-barreled question as to whether you would consider a draw-off valve in the engine room a lesser hazard than a can, such as Exhibit 137, or an auxiliary tank on deck, and I think you answered that question by saying taht you considered the draw-off valve the lesser hazard. Will you tell me specifically whether you had reference to an auxiliary tank on deck as being a greater hazard than draw-off valves in the engine room?

A. Taking into consideration the same statement that I made at a previous time, concerning the going on deck to get it, I consider that it would be a greater hazard.

Q. Well, there would be no fire hazard in having an auxiliary tank on deck as a supply, would there?

A. There could be.

Q. Well, of course I suppose there is a fire hazard wherever there is gasoline, but the handling of gasoline on deck would be of very much lesser hazard than handling of gasoline under deck, is that true?

A. I believe you could say "yes".

Q. You don't have any doubt about that, do you?

A. Well, I have seen some pretty terrible things occur out on deck.

Q. I think the vessel called the Grampus was referred to; was that a wood vessel?

A. Yes.

Q. What sort of tank did she have?

A. Tin lined copper tanks.

Q. Of what size?

A. To the best of my recollection they were about 150 gallons apiece; they were molded into the shape of the vessel.

Q. What type of vessel was the Grampus?

A. She was an auxiliary ketch.

Q. Did she have an engine room?

A. She did.

Q. Did she have a draw-off valve in her engine room?

A. No, sir, and the motor had no way of being primed either.

Q. You answered another question, and I am not sure that we got the full implication of it. You were asked about the ventilation of the tank compartment, the four filler holes at the top and so forth, and you were asked if that would be sufficient ventilation for all ordinary purposes. What do you mean by ordinary purposes?

A. I mean the ordinary circulation or ventilation of that compartment.

Q. You mean if there are no leaks?

A. Even if there is a minor leak.

Q. Do you contend that those openings would create any circulation through the tank compartment?

A. I do.

Q. Do you think that would be quite adequate to air it out if there was a leak in the gas tank?

A. A minor leak in the gas tank, yes.

Q. That compartment under the tanks went down to the skin of the ship at the bottom, did it not?

A. That compartment?

Q. I mean the space under the tanks.

A. Yes.

Q. And the engine floor was, I think, about seventeen and one-half inches above the skin of the ship, was it not?

A. As I recall it, that is the measurement; yes, sir.

Q. And this square opening in the bulkhead, the lower part of it was on the level of the floor of the engine room, wasn't it?

A. It was.

Q. Then for seventeen and one-half inches below that, the space below the tanks, that space would be below the level of the lowest ventilation in the engine room, would it not?

A. It would, through that hole.

Q. What circulation do you think would take place that would induce gasoline fumes out of that lower level to—

A. Any movement of air across the top would have a tendency to circulate the air, even down to the bottom of the bilge.

Q. What was over the tank compartment on the deck above; can you tell me that?

A. I don't know.

Q. Do I gather it is your opinion that ventilation of a vessel of the type of the Seminole was principally for the purpose of keeping moisture and mildew out of the vessel?

A. That is the purpose of putting ventilation in a boat.

Q. On a boat that is equipped to operate on gasoline fuel do you say that it is not necessary to plan your ventilation to take care of accidental leakage of gasoline or fumes into the bilges?

A. Why, it is not necessary to figure any accidental leaks.

Q. In other words, you are going to plan your vessel on the theory that there will be no accidental leaks, is that right?

A. That is correct.

Q. And you are going to assume that all of the tanks and fittings will at all times remain tight?

A. Reasonably tight, yes.

Q. And you would plan a gasoline propelled vessel on that principle?

A. I certainly would; I certainly wouldn't make any ventilation sufficient to carry off five hundred or two thousand gallons of gas.

Q. I haven't suggested that, Mr. Munroe. That is all.

Mr. Underwood:

That is all, Mr. Munroe; thank you.

3581 Thereupon, R. C. ALLEY, a witness in behalf of the Respondent Phipps, resumed the stand and was examined and testified further as follows:

Direct Examination.

By Mr. Underwood:

Q. Mr. Alley, do you recall the testimony of Mr. Anderson of the Palm Beach office that certain entries in the books of the Seminole Boat Company were allowed to accumulate for a time before being posted in the books?

A. I do.

Q. Do you recall the fact that that occurred?

A. It did occur.

Q. Are you in a position to tell the reason for that?

A. Yes.

Q. Was it done under your direction?

A. It was.

Q. What was the reason for that?

A. Following the fire which consumed the Seminole the expenses incurred in connection with it were of more than one class; there were the ordinary corporate expenses, and in due course we began to have a lot of litigation expense and, as you know, the suit here now is brought against Mr. John S. Phipps; it is not brought against the Seminole Boat Company; so the question came up as to which expense was chargeable to the corporation

and which expense was a part of the expense of the litigation. We adopted the practice of allowing them to accumulate in a suspended condition in the Palm Beach Company's office, and then periodically separating them into two classes; the latter was done largely by Mr. Underwood. These separations took place at various intervals; I forgot just how many different times we went through the process of separating them, and when that was done the journal vouchers were made up for the corporation, and expenses of the other character were charged to the proper account.

Q. The purpose was to obtain legal advice as to which was properly chargeable against the company and which against others?

A. That is correct.

Q. Do you recall for what purpose—I think it has been offered in evidence or marked in some way—the release that Mrs. Abel gave?

A. Yes.

Q. I think there has been some comment on the fact that that release is of the Seminole Boat Company. Who prepared that release?

A. You or your office prepared it; whether you did it personally or not, it came from your office.

Q. Did John S. Phipps have anything to do with the preparation of that release?

A. No.

Q. Or with reciting what names of persons to be released should be inserted in it?

A. No.

Q. Now in your position as Vice-President of the Seminole Boat Company have you had anything to do with the payment of taxes by your company, in the making of returns, tax returns?

A. I had this to do with it: it is my custom to see to it that the corporation files the various classes of returns which it had to file; there were a number of them.

Q. What can you tell us, first, about the Federal Income Tax Returns?

A. It naturally had to file a Federal Income Tax Return.

Q. Do you know of your own knowledge if that was filed each year since the corporation was formed?

A. I do.

Q. How about the Florida Capital Stock Tax?

A. Well in the early days of the corporation that was not required, but I think since 1931 it has been required; it has been filed since 1931 regularly. There was no Capital stock Tax prior to 1931.

Q. From the time the Florida Capital Stock Tax became effective as a tax has the Seminole Boat Company made a return and paid that tax?

A. It has each year.

Q. How about the Delaware Capital Stock Tax?

A. I didn't have very much to do with that excepting to know that someone was attending to it.

Q. How about the Federal Capital Stock Tax?

A. Since there has been a Federal Capital Stock Tax returns were made and filed.

Q. By the Seminole Boat Company?

A. Yes. I don't recall the exact year that began; I think it was 1933.

Q. Were they made and filed by the Seminole Boat Company?

A. Yes, by the Seminole Boat Company.

Mr. Underwood:

That is all.

Re-Cross Examination.

By Mr. Matteson:

Q. Mr. Alley, at the time this release that you speak of was prepared by Mr. Underwood's office, was Mr. Un-

derwood's office representing John S. Phipps in this litigation?

A. Well, I don't recall whether there was any definite arrangement at that particular time that he was employed specifically by John S. Phipps; I don't recall the date of the release or the date of the litigation against him.

Q. Mr. Underwood's office has been acting for John S. Phipps ever since this litigation against Mr. Phipps has been instituted?

A. I assume that probably he has been acting for John S. Phipps and all others connected in any way with his corporation since the first time he was employed. Wherever there is a loss there is usually a lawsuit and usually they pick out the party who has the most money; so naturally anybody that was remotely or directly connected with the Seminole Boat Company, you might say, would be protected.

Q. Now, when you said that Mr. John S. Phipps knew nothing about this release, I take it that you meant simply that as far as you know he knew nothing about it?

A. That is right; I didn't tell him anything about it.

Q. You mean that you yourself never discussed it with him?

A. I never discussed it with him, no.

Q. Who was it that paid this Delaware Capital Stock Tax; you say some one else was taking care of that?

A. That was delegated to Mr. Weiss in the New York Office, or Mr. Ruelbach Anderson; I think his exact function was to see that it was filed; he did not prepare it.

Q. It was taken care of by someone in New York?

A. That is right; he mailed it here for signature.

Q. These expenditures that you have spoken of that were held in suspension, they were made in the first instance by the Palm Beach Company, I take it?

A. Yes; I think most of them were made by the Palm Beach Company; I don't recall that the Palm Beach Com-

pany paid anything directly to Mr. Underwood's firm; there may have been something at that time—

Q. Between the time that these items were disbursed by the Palm Beach Company and eventually allocated, how were they charged on the books of the Palm Beach Company?

A. They were charged in the expense account; some of them may have been charged directly to the Seminole Boat Company, because obviously they were expenses of the Seminole Boat Company; to a large extent they were suspended, as I recall.

Q. They were not charged to any other account?

A. Simply to expense account.

Q. I think you said you consulted Mr. Underwood and you made a division on several different occasions?

A. Yes. In a number of cases there were journal vouchers made up subsequent to the fire, I believe.

Q. Journal entries were made up for each year?

A. No, I think they were more than that; I have them here before me, however.

Q. They were made up in any event yearly or—

A. Yes.

Q. I take it that these allocations were made after consulting Mr. Underwood within these periods?

A. That is right.

Mr. Matteson:

That is all.

Re-Direct Examination.

By Mr. Underwood:

Q. I take it that your employment of my firm, from what you say, was for the benefit of "To Whom it May Concern"?

A. Yes.

Mr. Underwood:
That is all.

Mr. Matteson:
No further questions.

(Witness excused.)

3587 Thereupon GEORGE W. GIBBS was called as a witness in behalf of the Respondent Phipps, and having been first duly sworn, was examined and testified as follows:

Direct Examination.

By Mr. Underwood:

Q. Where do you live?

A. Jacksonville, Florida.

Q. What is your business?

A. I am an engineer.

Q. What is your principal business or occupation?

A. Manager of the Gibbs Gas Engine Company of Florida.

Q. Is that company named for you?

A. Yes.

Q. How long have you resided in Jacksonville?

A. Since 1911—since about 1910.

Q. What was your education, if any, along engineering lines?

A. The Georgia School of Technology; I hold a degree of B. S., Batchelor of Science, in the art of mechanical engineering.

Q. Do you know what year you got that?

A. 1908.

Q. How long have you been in the engineering business?

A. Since the day I left school; and before that I was employed as an engineer while at school in my senior year, and since that time I have been continuously in business.

Q. What type of engineering work have you done over the years?

A. Worked very largely in connection with internal combusion engines and hulls of vessels.

Q. Hulls of ships?

A. Yes, which includes fire fighting apparatus, the design of fire boats, stationary fire fighting apparatus such as used to protect municipal docks, warehouses and things of that kind. I have also acted in a consulting capacity in the past with such people as Mr. Louis Shane of the Southeastern Tariff Association, the engineer in the south who determines rates or rates reflected by risks; have consulted with Mr. Booth, president of the National Underwriters Association—I believe that is the correct name—in connection with the conversion of submarine chasers into fire boats for the protection of harbors.

Q. What type of equipment does your company have for the construction or repair of vessels?

A. We have a drydock that cost $100,000.00, one hundred ton capacity; a marine railway, and drydocks sufficiently large enough to lift almost any yacht that floats.

Q. Does your company have facilities for construction of vessels?

A. Yes.

Q. How many at one time?

A. Eight or ten.

Q. Have you built any vessels?

A. Yes.

Q. When did you personally begin to have supervision of the construction of vessels?

A. Along about 1911.

Q. What type of vessels have you constructed at that yard under your supervision?

A. At that time we designed them and had them built in other peoples' yards.

Q. When you say you designed them, can you tell us whether they were designed under your supervision?

A. They were.

Q. You had other people build them?

A. Yes.

Q. When did you begin building them yourself?

A. In 1916 or 1917.

Q. Will you tell us approximately how many vessels over the years have been built under your supervision?

A. Several hundred.

Q. What types of vessels do they include?

A. Include what I would say are the finest types of hulls; we don't do any work that goes into the low price work; the work is for the government; 95% of our work is for the government, the oil companies or the rich yacht owners; I mean the yacht owner who will pay, for instance, one hundred thousand dollars.

Q. Have you built any gasoline propelled vessels?

A. Yes.

Q. What types of gasoline propelled vessels?

A. We built submarine chasers, 110 feet in length; sixteen.

Q. Sixteen of those?

A. Yes; ten for the American government and six through the American government for the French government.

Q. What type of motive power did they have?

A. They had 220 horsepower Standard gasoline engines; three in each hull.

Q. What was your personal connection with the design or construction of those vessels?

A. I made the estimates of cost, with the assistance of an able staff, and personally looked after the details of the construction and had charge of the organization of the personnel.

Q. What other types of vessels propelled by gasoline have been constructed under your supervision?

A. We have built more boats for the Coast Guard, Army, Navy and other branches of the United States government than any builder in the southern states, and perhaps the fourth builder in America.

Q. That your company is the fourth largest builder of vessels?

A. Of small vessels, meaning up to 110 feet.

Q. Have you built any tankers?

A. Yes.

Q. What types of tankers?

A. We built tankers for the Standard Oil Company of New Jersey, for the Gulf Refining Company, for the Seaboard Oil Company—they have three or four names; I think it was the Pure Oil Company we built them for; we also built a great many for Cuba for carrying sugar; these Cuban boats were intended to carry sugar, and they were quite large vessels.

Q. In the construction of tankers do you have to consider the hazards of inflammable oils?

A. Yes.

Q. I noticed out of my hotel window a little gasoline supply station off to the side; did you have anything to do with that?

A. We built that, and also the Texas Company, the boat that was used here by the Texas Company.

Q. The one I speak of is for what company?

A. The Standard of Kentucky.

Q. You said something about building fire boats. Can you tell us something about that?

A. We built a fire boat for Galveston, and as I remember it the price was $208,000.00; it was a steel fire boat.

Q. Did that construction consist solely or only partly of steel hulls?

A. Entirely steel construction with gasoline engines.

Q. I mean all of this construction you have just spoken of; was it all steel hulls?

A. Yes.

Q. Have you built any wooden hulls?

A. Yes.

Q. You have?

A. Yes; the "Miller" was a wooden tanker and, as I remember it was about 150 feet long.

Q. Carrying fuel oil and gasoline?

A. Yes; she had tanks inside of her.

Q. By the way, are you building any ships today?

A. Yes.

Q. What kind of ships?

A. We are building some ships for the army—we have just completed—the contract is not exactly finished because there are some drawings to be submitted; we built 16 rescue boats for the Coastguard; just before that we built, I think, the finest ships that the Coastguard owns; five of the 30 mile boats, 80 feet—

Q. Are these boats capable of 30 miles—

A. 1600 H. P. cruisers, 80 feet, 30 miles.

Q. These 16 boats for the Coastguard—

A. They were just delivered.

Q. Are they to be gasoline propelled?

A. They are gasoline propelled.

Q. In addition to ship construction, does your company do any repair work?

A. That is the bulk of our business.

Q. Have you had occasion to repair yachts from time to time?

A. A great many.

Q. Gasoline propelled among others?

A. Yes.

Q. Have you seen them yourself?

A. Yes, sir.

Q. Been down to their engine room?

A. Yes.

Q. Are you familiar with the general type of construction and layout of engine rooms of gasoline propelled yachts?

A. Yes.

Q. Gasoline line fittings and so on?

A. Yes.

Q. The type of gasoline tanks they have?

A. Yes.

Q. Are you doing any work on any yachts now?

A. Yes.

Q. How many in a general way and briefly what sort?

A. We usually have from two to nine at the yard.

Q. How many are there now?

A. There are two there today.

Q. Two yachts?

A. That I know of, and I think there were three others on the way. How many are there today I don't know; I do know there are at least two there today.

Q. They were there Saturday when you were last there?

A. Yes, and I hope they are gone.

Q. Now, Mr. Gibbs, have you been aboard the Seminole since the fire?

A. Yes, sir.

Q. Do you remember ever being aboard her before the fire?

A. Yes, sir.

Q. When was that?

A. When she was at our yard when we did extensive work on her.

Q. Do you recall when that was?

A. Before her gasoline engines were put in her; it was when she was a steam yacht; I think it was about one of her first trips to Florida.

Q. That was a number of years ago?

A. Yes.

Q. Since the fire you have been aboard of her here at Miami?

A. Yes, sir.

Q. On two or three occasions?

A. Yes.

Q. To what extent have you examined her?

A. Well, I have examined her to see if I could find what her construction was, what the installation of the gasoline power consisted of, and to find if I could any cause for the catastrophe, and I have hunted for such things as I thought might be of interest in determining whether the boat was faultily constructed or not.

Q. Have you been down in the engine room?

A. Yes.

Q. Looked in the tank compartment?

A. Yes.

Q. Looked over her hull forward of the tank compartment?

A. Yes, but not to any great extent. I didn't understand that there was anything up there in question.

Q. Have you looked at her hull abaft the engineroom?

A. Yes, but not in much detail. I did observe where the gasoline engines probably were.

Q. Did you observe where they are now in the engineroom?

A. Yes.

Q. Where the windlass is up forward.

A. Yes.

Q. The location of the auxiliaries in the engine room?

A. Yes.

Q. Have you observed what remains of the gasoline feed-line system?

A. Yes.

Q. The manner in which the gasoline tanks were constructed, in a general way?

A. Yes, sir.

Q. How they were situated in the tank compartment?

A. Yes.

Q. You understand that the gasoline tanks had inverted crown bottoms and could not be entirely drained?

A. Yes.

Q. In your opinion is that a proper or improper condition under the circumstances?

A. I think that is entirely a proper condition; I don't see how it could have been done any other way.

Q. There has been some suggestion in the case that water condensing in the tanks will settle in the bottom and possibly cause corrosion. In your opinion would that process occur in any substantial degree in these tanks?

A. No; the corrosion would be absolutely negligible from any such cause.

Q. Why do you say that?

A. In the first place, practically every tank of that type in a yacht is installed exactly that way; in the second place, the amount of corrosion is caused by oxidation knitting with the metal, causing rust, and you have various stages of the process. The water which would undoubtedly come from the atmosphere on condensation would sink to its lowest point, and then it would become a protective fluid preventing further corrosion; it would have a very minute amount of oxygen in it free; that is a very great distance from any place that could have ever been affected by air in the fluid, and the water itself, which I believe and in fact know, would have been as high as the drain close to it, and with the amount of oxygen that got up in there, it would have been almost negligible. I would expect to see almost a shiny surface it was if blue-black steel.

Q. Let's assume a particular square inch of that surface in the "V" at the bottom of the tank does become rusty due to oxidation down there, is that process a continuous one?

A. No.

Q. What happens to it.

A. If the air is held away that becomes in itself a protective coat.

Q. What?

A. Rust.

Q. Can you give us any example of that?

A. Well, red lead itself that you put on bridges, some forms of it, is ground rust and linseed oil.

Q. What about red lead that is put on ships?

A. The same thing.

Q. You mean in effect?

A. I mean in effect that there is a form of paint that is ground rust that may be produced in a chemical way, but in fact it is rust with an oil holding it together.

Q. The purpose of red lead is to prevent rust?

A. That is right. It is like—metal will only yield so much oxidation, provided it is impervious below; water, for instance, cannot burn. The reason water cannot burn is because it has already burned; it has oxidized; water is oxidated hydrogen; hydrogen and oxygen unite and you have hydrogen and oxygen; H_2O is water, that is, ashes of water; water is the ashes of two other substances which combine, and having combined they cannot combine further, and on that theory one of the best things you can do to a plate is to clean it and let it rust, with a fine coat of rust, and then cover it and keep air from it.

Q. Did you observe the filler pipe of the Seminole, or do you understand that the filler pipe of the Seminole was a two-inch pipe and vented by the use of a half-inch pipe?

A. Yes.

Q. In your opinion is that a proper or improper condition?

A. I believe those are about the right sizes; I believe if I had been doing it I would have made an even smaller pipe as a vent.

Q. Is there any disadvantage in having the vent pipe smaller than the filler pipe?

A. On the contrary it would be very much a disadvantage if you had your vent pipe a larger pipe.

Q. If your vent pipe is large, what is the disadvantage?

A. Then you have convection setting in to change the nature of the air that is on top of the top portion of the tank.

Q. Does that mean it facilitates the evaporation of the gasoline?

A. It would facilitate the evaporation and tend to cause condensation under certain conditions. The airplane, for instance, the minute she lands they immediately fill her tanks, the idea being to prevent water from getting into the tanks through the tiny vent that the airplane tank has and to prevent excess condensation where that water might get in; it might get in the carburetor.

Q. Assuming that the filler was a two inch pipe with a half inch vent, in your opinion was that sufficient to take care of the outward movement of the air from the tanks?

A. I think it would be quite sufficient. Of course you could deliberately slow the gasoline going into your filler pipe, and you might, under high pressure, put it in faster than you could vent it, but it would have to go in very fast—too fast for the venting of air. Air travels with very little friction; it comes out of a hole in almost no time as compared to the time required for a liquid to go through the same passage.

Q. Now did you see any pans under the gasoline tanks?

A. Yes, I saw them.

Q. How many did you see?

A. Two pans; two under each tank.

Q. You mean two tanks under each pan?

A. That is right.

Q. Did you observe in a general way the size and shape of these pans and the material of which they were constructed?

A. Yes.

Q. Did you observe any overboard drain from these pans?

A. No.

Q. Did you observe any fittings from which they may have been drained?

A. No; I heard there were; I regarded the pans as so much unnecessary construction. I thought I would be in a position to remember what they were like; anyway, I wasn't much concerned.

Q. From your experience with vessels burning gasoline for fuel was it reasonably necessary to have any pans at all under those tanks?

A. They were the first pans I have ever seen in my life, and I have perhaps seen as many ships as any living person, with the possible exception of an insurance surveyor.

Q. Have you ever installed any drip pans on any gasoline tanks for the Navy or Army or oil companies or anybody else?

A. Never. I would as soon drink water with a big glass to catch the drip off my lips as a little glass. I can't conceive of any justifiable purpose of these pans there.

Q. Did you observe how the gasoline tanks themselves were bedded in the pans and secured?

A. Yes.

Q. What did you observe, in a general way, as to that?

A. That, in my opinion, was a most excellent job; I think that that was even done better than anything; I can conceive of no load on these tanks that would ever have made it necessary to fit wooden supports up to the shape of the concave and convex parts of the tanks; convex and concave must be construed from the viewpoint of where the tanks are; concave with respect to the bottom, the fitting of the wood to the bottoms of those tanks was a very careful job, and in itself practically would have prevented any shifting.

Q. In your opinion?

A. Yes, forward or aft.

Q. In your opinion were they adequately secure?

A. They were. All that you could see; I saw a splendid fastening at the bottom of the tanks, as well as a splendid fastening about 15 inches up, and then the columns were burned off. I think that one might assume, from what existed, that those columns were joined continuously up to the top of the tanks, tending to hold the tanks rigidly. I don't know that those things were there, because they were burned up; at least we could so surmise—

Q. From your experience in ship construction is it a fact that what you saw leads you to believe that they were there?

A. Yes. I would say that half of that amount of stiffening would have been quite sufficient for that job.

Q. Did you observe that the tanks rested on wooden bottoms?

A. Yes, sir.

Q. Anything improper about that?

A. I think that was highly proper.

Q. Considering the possibility of leakage from the tanks, do you think that these wooden bottoms were proper in that construction?

A. I would not have given any consideration at all to any possibility of a leak in these tanks, and I would have put no form of support in with any thought whatever of leakage of fuel out of these tanks.

Q. Did you observe that they fit very closely to the bulkheads in the tank compartment?

A. Yes, I did; the frames to the tanks were grouted and fitted.

Q. Do you understand that it was not possible for a man to circulate freely around these tanks to examine them?

A. Yes, I do.

Q. In your opinion was that a proper or improper condition?

A. With those tanks it was totally unnecessary for them to be subject to inspection.

Q. Why?

A. Because the tanks were good for a hundred years in their present condition, long after many ships of that age would be lost. The tanks were made for some other purpose, and they were very much heavier. Now you have only to look at this gasoline tank to see the gauge of it—

Q. Exhibit 137?

A. Yes.

Q. In your opinion is it necessary for tanks to be installed such as on the Seminole so that they can be subject to visual inspection?

A. It is not.

Q. What has the practice been?

A. In some installations the tanks are subject to inspection, but that is more accidental than by design; it just works out that way; but in the finest ships afloat, many of them, the tanks are put in like the flue in a building; they are under floors, under joiner work, and I myself have just built a boat for Mr. Ellis and the tanks are built with very extensive joiner work, and it is not contemplated that they will ever be inspected; they are covered with a coat of red lead and they are made of steel plate, and I would say that at least 60% of all yachts afloat are built with tanks—built into the ship with no view of ever inspecting them or seeing them again.

Q. Are you familiar with the modern construction of stock boats?

A. Oh, yes.

Q. Are those tanks generally subject to physical or visual inspection?

A. No.

Q. Does it make any difference in your opinion as to the need for visual inspection, whether they are made of copper or galvanized iron or steel or what sort?

A. Well, a tank in a ship is not made because of the need of a "boat"—tanks must be used in places not used for cargo, whether human or dead cargo; it is therefore a most simple thing to design a tank to do almost nothing at all. We design tanks up to three-seven hundred pounds pressure per square inch; the yacht requires a tank designed up to four and five pounds per square inch. It is no difficult engineering job at all to design a tank that should be good for a hundred years in a yacht whose life would be 25 years.

Q. Mr. Gibbs, in your opinion is a hydrostatic test an adequate test for such tanks?

A. Of course it is.

Q. In your opinion would it be necessary in a vessel like the Seminole to subject the tanks to a hydrostatic test at any periodic intervals?

A. I would do that in case of a stray bullet from the gun of a huntsman piercing the hull of the ship, and there was some possibility of an abnormal accident like that causing a leak, or if there had been an accident in which the boat had run into another boat, or came into collision with another boat, in which I suspected that some strain came on the tanks, sufficient to throw the piping out of alignment,—then I would subject these tanks either to a hydrostatic test or I would pull them out; it is no great problem to lift the tanks out and remove a hatch in the case of such an accident. Barring such accident, I would never think of testing something good for eight to twenty times the required load that had been permanently installed.

Q. Now, Mr. Gibbs, remembering that the bottoms of these tanks were inverted crowns and the tops of them were also rounded, which properly would be placed at the bottom of the tanks, installed?

A. They should have been installed as they were; first, because you have your supports as far as possible from the center of gravity of the tanks, which is the law in any structure; the other reason is that that wedge-shaped place that has been referred to in the evidence received the water which in itself was a protection for the rivets.

Q. Which way could the tanks be more readily and better secured against motion?

A. My first answer would cover that, with that support for your tank as far as possible—in other words, if you support it the other way you would only have one point of contact.

Q. It has been stated that the rivets in these tanks were not welded. From your observation can you express an opinion whether they were welded or not?

A. The only place that there is much evidence of welding that I ever observed is where you have an old rivet in a tank that has rusted or reason to suspect a leak. Rivets have been used for a good many years, and there is no reason for a rivet to leak at all.

Q. In your opinion was it necessary to weld the rivets on these tanks?

A. I would object very seriously to having old rivets welded.

Q. For what reason?

A. For the reason that the very nature of the welding operation would have a tendency to destroy the thin edge of the rivet; it might apparently be sound. I have seen welding done in this feather-edge space, and where you have an improper amount of heat you merely create an unforeseen fracture and this feather edge breaks off. A rivet has a feather edge and the applying of heat at that very thin place is a most dangerous thing in my opinion. When the rivet is heated it should be thoroughly covered with the metal; it is almost impossible to make a welding of thin plate where one laps the other.

Q. Could you tell from your observation whether the seams of these tanks were caulked?

A. There was nothing about them to indicate that they were not caulked. A caulking iron is a very narrow tool for that kind of work—practically a square edge—which I could see on the tanks, the bottom portion, where there was room for such an iron. I can see no necessity for having caulked these tanks at all. These tanks, like all other tanks, are a type that are put under a very heavy pressure test, a test of possibly 100 pounds pressure; that determines whether they should be caulked or not; under a pressure considerably greater than the working pressure or working load.

Q. Have you calculated the pressure at the bottom of these tanks when filled with gasoline?

A. Yes, approximately three pounds; I am not giving it to you exactly, but in fluid, any fluid, is about two feet to the pound.

Q. Now in the light of the thickness of the material and the spacing of the rivets, was it necessary in your opinion to caulk these tanks?

A. No. I would like to explain what caulking is: you find a leak and you caulk it; if you do a good job, you may never touch the caulking iron again. The way these rivets are spaced I can conceive of no need for caulking at all. Where we caulk is where the hydrostatic pressure shows a leak, then that part is caulked. You do it that way.

Q. In tanks of this sort for use in containing gasoline, is there any rule for the spacing of the rivets?

A. Oh, yes.

Q. Will you tell us about that, please; what the rule is and why?

A. Of course, in spacing the rivets you must know the purpose for which the tank is built. That is the prime thing. First, to determine the tank's strength you get as efficient joint as it is possible to make, where the

strength is sufficient. If you had, for instance, a single row of rivets you would have a joint that could not be very efficient, because of the holes cut for the riverts—the rivets would go cross-section of the plate and the plate would give in between and crack, in the short distance between the holes in the plate. Now if you have double rows of rivets—sometimes three or four rows of rivets—the distance between the holes is increased, also the required number of rivets; so the rule for the spacing of rivets, where strength alone is required, the pressure is determined by an equation. In the matter of where strength is not the item, where the item is resistance to corrosion and resistance to leaks, there the rivets are placed singly in one row in order that the heads of the rivets almost touch each other or come so close to each other that, acting as a clamp, they then draw the two places or plates closely together and prevent the necessity of caulking or any other means of making a tight joint.

Q. For the purpose of preventing leaks it is desirable, is it not, to have the rivets as close together as possible?

A. That is right.

Q. And yet for strength, if you get them too close you destroy the—

A. —the tensile strength of the plate itself.

Q. By making holes in it?

A. Yes.

Q. Sort of like you would in a perforated piece of paper?

A. That is right.

Q. Considering the weight of the volume of gasoline that could be contained in these tanks and the head of pressure per square inch that would be on the bottom seam, in your opinion was there any necessity for double riveting the bottom seam?

A. None whatever; that would be ridiculous.

Q. In your opinion were the rivet holes unduly far apart?

A. No.

Q. Were they too close together?

A. No; they could hardly have been too close together for that problem; I would say they were spaced about right.

Q. Were you able to form any opinion from your observation as to whether the rivet holes in those tanks were punched or drilled?

A. There would be only one way to do that and that is to cut out a rivet and then make a microphotograph of it or look at it through a microscope. It wouldn't make a bit of difference whether they were punched or drilled for that purpose.

Q. Can you tell anything about any small irregularities in the line of the rivet heads as to whether the holes were punched or drilled?

A. Certainly not. You could take a gang punch and punch a plate like that; where everything is in line you can punch many holes at once; a man could take a punch that had four punches in it and punch four holes at one time, and it would be just as easy to throw the rivets out of line with a punch as it would with a drill. I will say, however, that if the rivets are out of line at all, it is just like as if they were—in other words, it is not a perfectly dead straight line, and that argues the fact that they were probably drilled. I don't believe that any shop today, with any tank of that kind, would permit drilling. The drilling was done with an old Stevens punch and ream or drill. When you take a thick piece of plate or boiler you have a tendency to distort the edge of the plate with this terrific pressure and you are apt to tear the metal apart. That requires that you ream out—you drill the hole and then ream the distorted section of the hole, and in that way you cure that trouble. In the matter of water tanks under these minute pressures, with the size of the height of the head, and the fact that the plate is so thin that you don't injure the metal when you

shear it, shear the hole,—under those conditions I don't think there is a tank manufacturer in the country that doesn't punch his plates.

Q. Can you get just as tight a river whether you punch and ream or drill it?

A. It would make no difference.

Q. Are they equally satisfactory?

A. Certainly, for this pressure.

Q. Looking at these tanks as a whole and bearing in mind the details which we have discussed, in your opinion were they proper tanks for the carriage of gasoline in the Seminole?

A. Entirely proper; much more desirable and much greater strength than was necessary. They apparently were designed for a purpose other than that of holding gasoline, and the purpose for which they were designed had more severe requirements than the purpose for which they were used.

Q. Now, the axis of these tanks was vertical, was it not?

A. Yes.

Q. In those cylindrical tanks were the stresses parallel with the axis of the tanks as great or greater than those at right angles with these stresses?

A. The stresses tend to rupture the tank, lift the top from the bottom, that is, lift one side from the other side; the stresses tend to rupture the tank and if the tank were to burst due to pressure it would burst in one of these two ways; nearly all tanks subject to pressure have two rows of rivets in their vertical seams or more, and half as many in their horizontal seams.

Q. Is that a recognized physical fact?

A. It is as simple as two times two is four; materials are placed to resist strains, and when a structure fails it fails in what is known as its weak section.

Q. Is that something every engineer learns in stresses and strains?

A. Every schoolboy in a technical school learns that; that is the first thing he looks at and he knows it for the rest of his life; it is the ABC's of design; find your weak section and provide for it; determine where it exists.

Q. I call your attention to a valve on a section of pipe, marked Libelants' Exhibit 2. Have you seen that valve before?

A. Yes.

Q. Can you tell us whether or not in your opinion that is a proper type of valve for the gasoline feed-line on the Seminole?

A. Most assuredly. It is like nearly all of them that are used for the same purpose; I will say that 95% of the valves used for that purpose are like that.

Q. Can you tell us whether or not that valve would leak now?

A. I don't think this would leak now under any pressure—of course whether it would leak now or not would be determined by whether it had a composition seat or a ground seat; if it had a composition seat and it is has been through a fire, that is destroyed. If it is a ground seat it would perhaps hold the gasoline pressures, the pressures that would be required in that yacht; this was probably for, in my judgment, around 135 or maybe more pounds pressure, liquid pressure.

Q. Does it make any difference in your opinion whether a valve has a ground seat or composition seat for use in a gasoline feed-line?

A. Very little. The only thing I would be particular about is not to have a rubber seat where gasoline is used, but any other form of composition I think would be all right. We have used them both for many years—in usually what is known as the globe type of valve.

Q. Now on this same exhibit 2, the next fitting beyond the valve, apart from the T, is a union, is that correct?

A. Yes.

Q. There has been some suggestion in the evidence that that union has been expanded. Do you see any evidence of that?

A. To my eyes I don't think it has been; there are some wrench marks on it that would create an optical delusion, but if you will look at the other piece turned to me you will see that that is cylindrical and not tapered. We are usually accustomed to looking at tapered things, and we are so accustomed to looking at things of that kind having a slight taper this way, it would appear as if perhaps this burst out this way (indicating); these are the marks of a Stilson wrench. This one seems to me to have no greater —it seems cylindrical.

Q. Indicating the metal end—

A. I can't see that that has expanded at all; in the first place, if it were expanded I think you would see quite a wide crack—because there is considerable pressure in there, and I don't think you could stretch that and I don't think you would crack it. Even if it were cracked here (and I can't see the slightest sign of it), you could still drive it up tight, because you would have a great deal of metal which acts as a reinforcing agency.

Q. Do you see anything about this union that would indicate to you that it leaked?

A. Nothing at all; there is not a thing about it to show that that is defective at all.

Q. Look at the female part; do you see anything about that which indicates that it would leak?

A. No; I think that would be good for 125 pounds pressure this minute, although it has been through a fire; it looks to be in splendid condition; I can see nothing wrong with it at all, except dirt.

Q. Mr. Gibbs, do you understand that there was in the Seminole a pair of valves for the drawing off of gasoline?

A. Yes, sir.

Q. And as a matter of practice in a vessel of that type is there in your opinion any reason why there should not be such a contrivance in the engine room?

A. No, sir.

Q. What are your reasons for that?

A. The absence of such a contrivance as that would have made necessary, as a practical matter, a procedure which would have been even a much greater hazard to the ship. I regard this as the best solution of the problem.

Q. Now, Mr. Gibbs, before we go further with that, let me ask you a question or two about your familiarity with gasoline engines. Have you ever built gasoline engines?

A. Yes, sir.

Q. Did you design one yourself?

A. I designed several gasoline engines.

Q. Did you develop some new type of gasoline motor?

A. Yes.

Q. Gasoline engine?

A. Yes.

Q. Tell us a little more about that.

A. I designed a seaskiff with a two-cycle engine, similar to the engine now being used on these midget racers, and I designed a heavy duty four cycle engine.

Q. From your experience with motors are you able to express an opinion as to whether or not the motors of the Seminole would have to be primed?

A. I think that that was largely a matter of habit, depending on the skill of the engineer; it relates to the adjustment of the carburetor, the setting of your spark lugs and the "hotness" of your spark and so forth. Certainly engines would have been a very useless piece of apparatus if provision had not been made for priming. I think that the engineer on the Seminole did the wise thing when he provided for priming, and unquestionably he did prime liberally and almost without exception when he started his engines.

Q. From your experience would you say that it was necessary to prime these motors when they were cold?

A. From my experience, and I have owned two of similar engines myself, I think it is very necessary to prime them.

Q. How about when they are hot?

A. Well, sometimes you may have to prime them more then than at any other time.

Q. Depending on some of the considerations which you just recently mentioned?

A. Yes; depending on the fact that you have lost your mixture; it is a very temporary thing—it is governed by the moisture, mixture, heat and other things.

Q. I show you a device; can you tell me what that is?

A. That is a priming cup made for the purpose of priming engines.

Q. It has already been marked in evidence, but it does not bear a tag. Is that a proper priming cup in your opinion?

A. Yes; that is the universal type.

Q. Now considering that it is necessary at least sometimes to prime the Seminole's motors to start them, does that have a bearing upon the desirability of having draw-off valves for gasoline in the engine room?

A. A very great bearing.

Q. Tell us what that bearing is and your reason?

A. From my experience with the operation of gasoline engines, from the time I used to run them as a kid up to the present time, priming of large engines, particularly this type, is quite necessary, especially where the air has been let out. When she loses her air it is a very difficult thing to get it again. In most of the boats, where there has been no provision such as this, the engines have been primed by the breaking of the gasoline line, a most dangerous practice. Of course you might have your priming squirt cans, but it is not always necessary to prime an

engine. Take your automobile, you used to prime those, but you don't have to do it much any more. The grade of gasoline has more to do with it than perhaps anything, but the point is that the operation, one that is not fixed and necessary and variable, calls for being unprepared with a squirt can full of gasoline—for instance, your squirt can may be full and you may use it and you may not; you may think it is full and you rush to it, and you find that you don't have it, or something has happened to it, maybe a neighbor yachtman has come over and borrowed it to get enough gasoline to get him to town, and it is gone. What does he do? He does exactly what Mr. McCoy said he did; he breaks his line to get gas, just as Mr. McCoy said he did, takes the frying-pan and puts it in the line and—

Mr. Botts:

I object to the reference to what Mr. McCoy said he did.

The Court:

Don't refer to any other testimony.

Mr. Matteson:

As a matter of fact, Mr. McCoy did not say that he drew off gasoline in any such fashion.

Q. Mr. Gibbs, in your opinion, in view of the necessity for priming the Seminole's motors, it is better to have a supply of gasoline or place to draw it off in the engine room or elsewhere?

A. By all means it should be in the engine room, where you have a man skilled in its use.

Q. Now assuming that gasoline was drawn off from the tanks of the Seminole and used in a number of fishing boats and outboard motors, in your opinion is it better

that it be done from a drawoff valve in the engine room or elsewhere?

A. It should be done in the engine room.

Q. Why is that?

A. For many reasons. In the engine room is a man who is skilled in the use of gasoline and in the use of tools. That is the place most easily protected and equipped to handle this gasoline, and so long as gasoline must be used there it would be better to use it from one central station by a skilled man than to have it at large on the vessel.

Q. Now can you tell us from your experience with yachts and houseboats in Florida waters whether or not it is customary for vessels to have such a device?

Mr. Botts:

I object to that; what is customary on other vessels doesn't make it safe.

The Court:

Of course what is accustomed is involved in the formation of his opinion. That is part and parcel of it. I think now he is testifying as an expert from a theoretical standpoint as to what is safe. I think you had better confine this and exclude what is the custom on other vessels. Read the question, Mr. Colman.

(Preceding question read by the Reporter.)

The Court:

Now, I am going to overrule you, Mr. Botts. That goes to the quality of the testimony. That is a good question asked of an expert. I think that is all right; you may answer the question.

A. I will say that I have seen it many times. I have had it in my own boats and on boats of perhaps the most

careful operators. I know that they use it in the most expensive boats, and even in those vessels using Diesel engines with crude oil, gasoline has been piped into the engine room so that the engineer could have complete control of the use of gasoline. In the olden days most all carburetors had a petcock built into the bowl in order that gasoline could be drawn off; it is almost a universal practice to catch gasoline in a sponge or rag when you reach around to prime the engine. I personally have done it many times.

Q. Now getting down to these two particular valves themselves, Exhibit 11; did you notice that one is Crane 150 and the other Crane 125?

A. Yes.

Q. Have you examined these valves?

A. Yes.

Q. In your opinion are they proper valves for that purpose?

A. Yes.

Q. What does the 150 and 125 mean?

A. Indicates the pounds of water pressure they carry.

Q. Water or anything else?

A. Yes; possibly not steam.

Q. Roughly, what is the margin of safety on these valves for the comparative head of gasoline on the Seminole?

A. Roughly it is about 3000 per cent; these are three thousand times as strong as necessary.

Q. You mean three thousand per cent?

A. Well, they are required to hold four or five pounds and they hold 125 pounds; say an average of 130 pounds, and four into 130 goes about 30 times, or better than 30 times, so they are better than 30 times as strong as necessary.

Q. Now have you observed that one of these is a ground seat valve and the other a composition seat valve?

A. Yes.

Q. Does that affect your opinion in any way?

A. No, sir. I think if I were going on a long cruise I would take the ground seat valve, if I was at a place where I was apt to lose my source of supply I would take care of the ground seat valve in the field a little better. This is the composition seat, and it is a splendid valve with a floating seat.

Q. Do you see anything about that valve today that indicates any leakage?

A. Of course this will leak without the seat.

Q. Apart from the absence of the seat?

A. Apart from the seat it looks to be in very good condition; it is a first-class valve.

Q. Do you know of any such thing as a valve especially made for gasoline?

A. I never heard of it until I came into this trial, and I don't think I have heard of it since. What I have seen in catalogs would lead me to believe that there was no such thing. I know in filling stations and places like that handling gasoline they have a valve, but never, until I came here, have I recognized that there was a thing called a gasoline valve. Now I am not referring, of course, to throttling valves or so-called plug valves where motor throttling has to be done.

Q. Now, Mr. Gibbs, turning to the connection between the valve marked Crane 150 and the nipple, do you observe the condition of the nipple between these two?

A. Yes.

Q. Do you see anything wrong about that?

A. I would say that the threads are a little too close; seems to be pretty good threads, but the threads are so close that that nipple was a little small to crew this thing, but if it didn't come to the shoulder it could be screwed until the taper goes on across and passes it and becomes tight. Now the engineer, in setting up or using that nipple, had to do one of two things, either to cut this shoulder down so that this could be screwed further up

on the tapering threads, or to see that he had the equivalent of a ground fit; he had a minus edge here and a minus edge here—

A. Indicating the absent edges of the valve and the nipple?

A. Yes; his other edges are simply to tighten that up, to have what is the equivalent of a copper connection which is used in copper tubing.

Q. Do you see any reason why that valve would leak at that point?

A. No; I think we can say that there is no reason for that to leak at all; it makes an excellent job, and I think that would be good for 100 pounds pressure today, which is 25 times more than required. Incidentally, there are two valves on that job.

Q. I am just coming to the next valve now. Turning now to the valve marked Crane 125; that is a ground seat valve, is it not?

A. Yes.

Q. In your opinion is that an adequate valve?

A. Yes; I have examined this carefully and I think it is good for 125 pounds today, and 20 more years of service.

Q. I call your attention to a nick in the plug of that valve. Does that have any effect on the ability of the valve to hold?

A. I don't think that is a nick; it looks a little to me as if that was in casting, that when this thing was in the process of being cast that that was a place where the metal didn't flow at that point, but that has nothing to do with the tightness of that valve, because that is not the seat.

Q. Where is the seat?

A. The seat is the place that attaches on here (indicating)—

Q. Referring to the seat in the valve bowl?

A. Yes; I don't think, just from my eye, that that seat would touch this area at all (indicating).

Q. Referring to the area of the nick?

A. The area affected by the nick, yes.

Q. All right.

A. I get that from the fact that the valve is as tight as possible right now.

Q. How can you tell that the valve is tight now?

A. Have somebody blow in it.

(Thereupon the Court blew through the valve.)

Mr. Underwood:

Did you get any air through?

The Court:

I don't think so.

A. Anyway, I think that will hold 125 pounds just as it is now.

Q. Is there any simple test we could make to see whether or not that nick comes in contact with the seat?

A. Yes, you could take calipers and measure in there; I don't have any with me. You could put a mark—

Q. How about a piece of chalk?

A. I think that would show it. Of course that is a floating seat, too, and the minute it impinges on something it stops, so it doesn't tend to scratch the shoulder any, but when we take it, to where it is supposed to seat, it went right there and stopped short. Now we will take it where it doesn't quite touch; it is tight now; now that is too tight; now take that up a little bit. Now take this and just turn it around, let up on it just a little bit; slack it up; tighten it a little bit—slack it up.

Q. What does that show as to where the chalk is worn off?

A. The chalk is worn off a great distance from where the flow is.

Q. Before you take any of the chalk away tell us approximately what the distance is—

A. Maybe 1 8th of an inch.

Q. Will you indicate to the Court where the contact was?

A. Right here. It will show a little more if we run it around; if you run it around it will show a ring, but you can tell by the eye that the diameter of that nick—that the circle in which that nick occurs, is much greater than the diameter of the seat. That seat is a rather small thing.

Mr. Matteson:

Won't you get a good impression if you screw it down tight?

A. You can; do you want me to do that?

(By Mr. Underwood):

Q. Yes; go ahead.

A. All right; that shows it—you have to give it a little twist; it is pretty hard to twist this thing with your hand.

The Court:

Let me see it.

A. The float is here, sir; it is maybe half an inch away from the area affected.

Mr. Underwood:

May I make a statement on the record?

Mr. Matteson:

Yes.

Mr. Underwood:

The witness marked with chalk the bottom portion of the plug; then inserted it in the valve and made contact

between the plug and the seat, and turned the plug will in contact with the seat to obtain a mark on the surface with chalk to show where the plug was in contact with the seat; having done that, he withdrew the plug from the bowl of the valve, and the whole thing was examined by the Court and counsel. Is that an agreeable and acceptable statement?

Mr. Botts:

No, I won't agree to any statement you make. I won't agree to a thing that you say.

Mr. Underwood:

You do that on general grounds and not on the ground that my statement is inaccurate?

Mr. Botts:

I don't know whether your statement is accurate or not, but I won't agree to it.

(By Mr. Underwood):

Q. Mr. Gibbs, did you hear my statement?

A. Yes, sir.

Q. Is that a fair statement of what you did?

A. Yes.

By the Court:

When you put your finger in there, what part of it did your thumb come in contact with?

The Witness:

Back here.

The Court:

Back of the chalk mark?

The Witness:

Yes; you can see it. That is the only part that you can reach.

The Court:

That is up by the chalk mark?

The Witness:

Yes; the seat is covered. We can take a great deal of chalk and mark it back on there, and then you can crush a ring right down.

(By Mr. Underwood):

Q. Mr. Gibbs, in your experience, where such a device is in the engine room of a vessel, is it customary to have one or two valves?

A. One; I have never seen two before.

Q. Now assuming that the line which led to these valves came out of the feed manifold at the starboard end of the feed manifold and turned back 180 degrees and ran to port, and that it was supported amidships by the sides of the tank; that it straddled the square hole in the bulkhead between the engine room and the tank compartment; that the valves you have before you were a few inches to port of that,—in your opinion was that line adequately supported against the weights involved?

A. You would have to tell me what the size of that line was before I could answer that question, also the approximate distance between—

Q. Assume that the line was of a size that appears in Libelants' Exhibit 2, which I believe is a quarter inch brass pipe.

Mr. Matteson:

Referring to the line that was attached to the drain valves? I don't know that it was that size?

Q. We will start all over again. What size pipe would you say it was that led into the valve marked Crane 150 on Libelants' Exhibit 11?

A. I think that is 3/8ths. I have got to get my own glasses. I can't see anything very well without them; but anybody can tell you that; that maybe half inch; I guess that is half-inch; I would say that is half-inch; yes, that is a half-inch pipe.

Q. Assume that the line that led to these drawoff valves was half inch pipe, that it led from the starboard end of the feed manifold a distance of about six feet athwartships to a point where it passed through and was supported by the two upright sides of the tank, can you tell me whether or not in your opinion that was adequate support to hold that pipe against vibration or leakage?

A. If there was as much as one support about approximately the middle that was more than adequate.

Q. Something has been said about the union between these two drain valves being inserted the wrong way. What is your opinion as to that?

A. I have never heard of a union having a right and a wrong way.

Q. If there is a claim of leakage inside of that line, is the pressure affected more by its moving in one direction than in the other?

A. Not that I know of. You might get some theory of certain projectile equations of current and so forth, but as a practical matter I would say absolutely not.

Q. Now specifically about the angle of the ground seat and the plug of the ground seat valve in Exhibit 11; is there anything wrong about the angle; would an angle flatter or finer be better?

A. No.

Q. Would it make any difference?

A. No. The only effect, with these pressures involved, the angle would have would be to increase its efficiency as a throttling contrivance. In other words, you have an opening of 1/32 of an inch, and with a very sharp angle you could turn this more distance and only slightly increase the opening, whereas, if you had a perfectly flat

seat it would be the other extreme, and to open it the least bit you would practically give it an upright flow, and you would either have your valve running wide open or shut entirely; so a taper is given for two reasons; one, it tends to center itself and to make a wedge-fit, and the other is it increases the throttling; whether it is a fine taper or a flat taper is purely a matter of how much you want to throttle your valves.

Q. Has it anything to do with the tightness?

A. Certainly not in the realm of anything up to 100 pounds or 150 pounds.

Q. Do you understand that there was in the Seminole a glass gauge by which to tell the quantity of gasoline in the tanks?

A. Yes, I understand that there was such a thing.

Q. You have not seen it, of course, because you have not been there since the fire.

A. All right.

Q. Assuming that there was a glass gauge that ran from the feed manifold approximately to the head of the tanks, can you tell me whether or not in your opinion such a device is proper or improper?

A. I think that that is the proper thing, and if properly protected it is one of the most accurate things, and I think that as of that day the only thing that was accurate at all. There are complicated things where you pump air in them to get the pressure head of gasoline, but when you are dealing with such small heads there is not much accuracy in these machines, and it takes a long time to get a reading.

Q. From your experience is that method of telling the amount of gasoline in tanks the customary method?

A. I have seen it done. As a rule, they don't have their tanks right there where it is easy to get at them. This is the method that would suggest itself. Most tanks are covered up, and joiner work is beneath floors—this is a method that would suggest itself; in this way you have a

daily reading on the tanks and it is practically in front of your eyes.

Q. Is there any fire hazard involved in that fitting, if the glass doesn't break?

A. No; you have them on every boiler, steam boiler.

Q. How high pressure do they sometimes use such fittings?

A. They go as high as 330 pounds; 330 pounds—300 pounds.

The Court:

We will stop now.

(Adjournment taken to 9:15 A. M., Nov. 15, 1939—the following day.)

Wednesday, November 15, 1939.
9:37 o'clock A. M.

3629 Hearing was resumed pursuant to adjournment of the previous day; and thereupon the witness GEORGE W. GIBBS was recalled and further testified as follows upon continued direct examination.

By Mr. Underwood:

Q. Mr. Gibbs, in your opinion which would be the better practice in carrying gasoline for use in priming the motors of the Seminole; carrying it in a squirt can that had to be refilled from the gasoline supply system, or to carry it in such a can as this, Libelants' Exhibit 137, I think it is?

A. Well it would be impractical to fill directly from that can, at all, and I would therefore think that it would be a safer thing to get a device which would safely and quickly fill a squirt can. Those things are primed with squirt cans invariably.

Q. Could you fill the priming cup from that instrument, directly?

A. It could be done, but it wouldn't be practical to do it, without spilling a good deal of gasoline.

Q. Will you compare the size of the nozzle of the can with the aperture of the priming cup?

A. Yes, sir; if you lifted that up, these hangers are very high, and if you held this up it would be hard,—and tried to put that over in there, it would,—you would most likely in lifting this heavy thing, being no throttle on it, you most likely would overflow it and flash all over the engine. With the squirt can you can mete a drop at a time, or a small amount; and furthermore, with a squirt can, you know how many squirts to put in the engine where your engine starts best.

Q. Now what kind of a valve does this can have in it?

A. I don't know.

Q. Will you open it up and look?

(Witness removes valve from can.)

A. That is a plug valve.

Q. Is that what is called a rotary valve?

A. No,—it might be called a rotary valve; you rotate it to make the connection; rather, in order to open it or shut it. There apparently is an orifice from here into the body of the tank, which registers with this; and this appears to be a ground joint, and there is a spring there. That undoubtedly is used to hold it down tight and prevent leakage.

Q. What can you say about the flexible length of hose there; is that a satisfactory arrangement?

A. Well our experience with that has been that it is when it is new, but that it isn't a permanent thing at all. It is made out of thin sheets that are formed in that shape; it is like the others I have seen; it has a soft packing of

asbestos or something of the kind,—it is a combination of a fibre and a metal, and usually they break right in here. A thing that isn't flexible at all as a rule, you don't attempt to bend it; where you have something that is flexible, you depend upon the flexibility, and you reach it, and you grab it, and you would have a tendency to top that right here.

Q. Are they satisfactory so far as leakage is concerned, over a period of time?

A. No.

Q. Now Mr. Gibbs, in your opinion is it reasonably necessary to have a shut-off valve in the gasoline feed line at the carburetors, when you also have one, as in the Seminole, just below the feed manifold?

A. That is largely a question of taste, or the wishes of the operator. I myself prefer one valve to do one job. One might think that one valve is shut, so he wouldn't have to shut the other; but where there is one definite valve to shut; it would be more definitely used.

Q. Assuming in the case of the Seminole there was in each feed line, just below the traps, which in turn were just below the manifold, a stop valve, in your opinion was it reasonably necessary to have another stop valve in the feed line at the carburetors?

A. No.

Q. What in your experience has been the purpose of having another stop valve at the carburetors, in installations where that is the case?

A. Well you put the stop valve at the carburetor, it is usually a little nearer to the engineer; he can shut it off without walking back, a very short distance he would have to get at that valve?

Q. Is there any fire or explosion hazard in not having such a stop valve at the carburetor?

A. No.

Q. And when, as in the case of the Seminole, the stop valves below the traps, which is below the manifold, were

shut, was there any substantial head of gasoline in the carburetors?

A. No.

Q. In your opinion, was it necessary to have drip pans under the carburetors on the Seminole?

A. Drip pans have certain advantages, but the construction of those carburetors, where the intake came out of a clutch housing, I would not say that it was necessary.

Q. What is the ordinary capacity of a drip pan under a carburetor?

A. They usually are about fourteen inches by five, by five-eighths, in size.

Q. What is the depth?

A. Five-eighths.

Q. And do they serve any purpose whatever if there is no leak in the carburetors?

A. Where you haven't got a manifolded—where there is no leak in the carburetor? They would serve none, where there is no leak in the carburetor,—no leak anywhere else.

[Q.]A. Do back-fire arrestors serve any purpose so far as fire and explosion is concerned, except when the motors are running?

A. No.

Q. Mr. Gibbs do you understand that the feed line,—gasoline feed line system was made up of brass pipes and fittings, from the tanks?

A. Yes, sir.

Q. To the main motors?

A. Yes.

Q. In your opinion is that a satisfactory, sufficient arrangement?

A. Yes.

Q. Something has been said in this case about the use of copper tubing. In your opinion, does either have any marked superiority over the other?

A. I think the brass pipe has a marked superiority over copper.

Q. And what are your reasons for that?

A. It is harder, more susceptible to what I would call a practical joint. A thread cut in copper is not a good thread, you can twist it off or mar it. The brass pipe makes practical fittings, universally used. The thin copper, of course which is used for this purpose, cannot be used with a thread, without some form of adapter. The copper tubing is used largely in the interest of cheapness; stock boats and boats that are originally planned and constructed; but not, as a rule, in converted boats; it is a very difficult thing to take a copper tube and run it around other obstructions that exist in the boat at the time of the installation of the new machinery. Copper mashes when you try to bend it, it becomes flat; and when it becomes flat, it restricts any little sediment or dirt that might come through. The operator will try to relieve that restriction, he will step on the tube, he might drop a wrench on the tube, and he tries to make the tube again round, where it has been flattened or dented, and that is a very dangerous thing to do, to a thin tube.

Q. Which is stronger, brass pipe such as in the Seminole, or the ordinary copper tubing that is sometimes used?

A. Brass pipe.

Q. And can you get a satisfactorily tight joint in brass pipe fittings?

A. Certainly.

Q. In your opinion, which is the better for use on such a vessel as the Seminole?

A. Screw-type fittings, such as were used in the Seminole, in my opinion are better than such fittings as are normally used in copper tubing.

Q. Does the possibility of injury from vibration have any bearing upon which is preferable,—brass pipe or copper tubing?

A. I would not say that the copper tubing would lend itself,—that there is any advantage in the use of copper tubing; for the reason that copper tubing, you can usually go over great distances without separating. You have a long thing which has a tendency to vibrate. In installations of copper tubing we often provide for the joining two points, for instance, the tanks and the carburetor, and then you use this rather flexible thing, to lay where it will, reeve it inside and out, in making your turns, by bending the tube. And as a that job isn't as securely fastened as where you take the rigid, heavy pipe and make your turns with L's and fittings.

Q. Is brass pipe any more susceptible to damage by vibration, than copper tubing?

A. No.

Q. Assuming that vibration has an effect on brass pipe, to loosen up fittings, would you anticipate any such loosening during a period when the vessel was laid up, in storage, and motors not running?

A. No.

Q. Could you tell from your examination of the Seminole's gasoline feed system, whether the joints were tinned or soldered?

A. No.

Q. And why not?

A. Either solder or tin has a very low melting point, and the presence of any heat,—appreciable heat, would melt it off.

Q. Is it necessary in brass pipe installations such as on the Seminole, to provide coils to absorb vibration?

A. I have seldom seen them in connection with copper pipe installations.

Q. You mean, brass pipes?

A. I mean, with brass pipe installations.

Q. How long has copper tubing been in use, in your experience?

A. May I go back to that other question?

Q. Certainly.

A. The only place there are coils being put in engines with all classes of piping now, where the engine is mounted in rubber, and where the entire engine shakes, and floats,—such as a Plymouth floating power there is some confusion as to the presence of a coil; that is not due to any vibration in the pipe line, or in the ship; but you have a fixed point, and an engine that is joined to it; and the engine moves, and the distance between the engine and that fixed point varies; therefore taken up in coils.

Q. That is because of the movement of the motor itself on its rubber seat?

A. The motor itself. It has nothing to do with the normal alleged vibrations of the ship; and we could name a great many instances of modern installations where rubber is being used, in what you call floating engines, or floating power. But aside from that, very seldom that the coil has ever been used with brass pipe. However it has been used with copper tubing, due to the fact, as I have previously stated, that copper tubing is more a connection between one point and another; more like a line, a piece of wire, and very, very flexible. The other is more of a rigid, fixed installation.

Q. Well how long has copper tubing been available for general use?

A. Well there is nothing particularly new about it; it has been available for many—before I was born; a great many years. The fittings, there are modern fittings that have brought it into a little more general use, that is, more practical to be used by an amatuer. In recent years it has come into greater uses because of the fittings an amatuer can use, than it was in the past, when it called for either brazing or soldering. Its use is very likely with stock boat job, where cheapness is the prime factor.

Q. Well which is more expensive, brass pipe—

A. Brass pipe is much more expensive.

Q. And which is more expensive so far as the labor cost of installation is concerned?

A. Brass pipe is much more expensive.

Q. Did you observe the holes in the bulkhead between the engine room and the tank compartment from which the filler lines ran?

A. Yes, sir.

Q. And through which the lines to the feed manifold ran?

A. Yes, sir.

Q. The square opening below?

A. Yes, sir.

Q. And the spaces around the tanks?

A. Yes.

Q. And at either end?

A. Yes, sir.

Q. Between the pans and the bulkhead?

A. Yes.

Q. Taking those apertures into consideration, in your opinion was that tank compartment adequately ventilated?

A. It was well ventilated.

Q. Then what is your view as to the need for ventilation in such compartments?

A. Well there was certainly no necessity for the degree of ventilation that existed there. There is no objection to it. The only need for ventilation was to probably prevent dry rot of the wooden bracing members that were inside.

Q. Well in your experience Mr. Gibbs, in the design and construction of ships which are propelled by gasoline motors, is provision for ventilation made in view of potential leakage in the gasoline system?

A. No.

Q. What are the purposes for ventilation?

Mr. Matteson:

Excuse me, may I have the last question?

(The preceding question was read by the reporter.)

(By Mr. Underwood):

Q. What are the purposes for providing ventilation?

A. Primarily in order that people in the vessel could live and breathe. Other reasons are the providing of air for the motors,—the gasoline engines, internal combustion or steam engines; boilers; air is required wherever combustion exists. Also for the comfort and for the preservation of cargoes. Without ventilation you would have great heat,—or uncomfortable heat, and destruction of cargoes of perishable nature. The ventilators as are normally known are not provided with a view to saving a ship in the event of gasoline leaks.

Q. Well now would there be, in your opinion, any circulation of air in this tank compartment, having in mind the apertures that I described to you a moment ago?

A. Yes, they have; and very small ones, quite large enough, high, and there were larger holes low, in this tank compartment; and wherever there is a difference in temperature there is a movement of the,—whatever the gas was whether it was air, which is a combination of gases, or whether it was a vapor of any kind.

Q. Well now turning to the engine room, do you have in mind the two cowl ventilators, and the skylight, the engine room hatch, the window on the starboard side of the alleyway, the window on the port side through the hull of the vessel, and the window in the engineer's room: In your opinion, was that adequate ventilation?

A. Quite.

Q. And what would be the effect of ventilation, natural ventilation, through those sources?

Mr. Botts:

I object, on the ground that this witness is not qualified as an expert along those lines.

The Court:

I think that goes to the quality of the answer. I overrule the objection.

A. Will you read the question?

(The question was read by the reporter.)

A. The effect would be to completely relieve that engine room of all gases that might exist in it; whether it be nitrogen and oxygen, the principal component parts of air; or any other gas.

Q. Do you understand that the cowl ventilators extended only a few inches below the raised trunk of the engine room, and did not extend into the bilge?

A. Yes.

Q. In your opinion was it necessary, to obtain adequate ventilation of the bilge, to have ventilators run down into the bilge?

A. No.

Q. Why is that?

A. For this reason; such ventilators would have tended in no way to bring about a more rapid discharge of the gases. In mentioning gases, I mean not necessarily gasoline fumes. I mean such gases as compose the air, and that might be in the engine room; but gases, not liquids or solids.

Q. Well, in gases, do you include gasoline vapor?

A. As a gas.

Q. Have you made any experiments to satisfy yourself on that point?

A. I have.

Q. Will you describe that to us?

A. I have taken a container,—two containers of like size, deep pots, and have put known quantities of gasoline in those pots. I have put in one of them, ventilators extending to within one-half diameter of the surface of

the liquid; that is the pot where the draft enters. The other, one diameter from the surface of the liquid. One ventilator faced the air,—the current of air; the other ventilator was against the current of air, tending to cause a vacuum in that ventilator. I have observed the flow of air through the intake ventilators, to a point where a very distinct and continuous ripple occurred on the surface of the raw gasoline. The gasoline evaporated faster in the copper pot without the ventilators, than it did with the copper pot with the ventilators.

Q. When you performed that experiment with the two vessels holding gasoline, how far apart were they?

A. Side by side; eight inches apart.

Q. And were they equally close, or not, to the source of the breeze?

A. It was in a tunnel, or rather in a hall, in which there was a stiff breeze such as the breeze that you have today; and at one time it blew a note book off of the shelf. There was free opening.

Q. Were the two vessels of equal size?

A. Of exactly the same size.

Q. Did they have the same quantity of gasoline?

A. Exactly the same quantity.

Q. Which one evaporated faster?

A. The one without the ventilators.

Q. Those ventilators that you speak of, in what shape were they?

A. They were made of the general shape of the cowl ventilator; they were made up of pipe, which we had a street L,—rather a straight L; and to them was screwed two pieces of three-eighths inch pipe. Of course the opening of the air was much larger than the size of the pipe,—quarter inch pipe,—three-eighths; and the two containers were two ordinary drinking glasses; identical drinking glasses.

Q. Now in your experience Mr. Gibbs, in the design and construction of vessels propelled by gasoline motors,

is it customary for the architect or anybody else to sit down and assume an amount of leakage of gasoline and provide ventilation for the removal of the vapors?

A. No.

Q. Is that factor taken into consideration?

A. No.

Q. If you were considering provision for ventilation to care for possible leaks in a gasoline line, what factors would you consider?

A. I would want a provision for a cross-draft, above all forms of ventilation.—Will you read the question again?

Mr. Underwood:

Mr. Bryant, will you read the question?

(The question was read by the reporter.)

A. I would like to have my whole answer withdrawn.

The Court:

You don't think your answer is in response to the question?

A. I didn't understand what the question was.

The Court:

It will remain in the record, but it will remain with your comment. Now you may proceed.

A. Now will you read the question to me?

(The question was re-read by the reporter.)

A. I would consider the close connection of the gasoline lines to cross-drafts, such as windows. The primary factor that would be foremost in my mind would be taking advantage of convection. I am convinced that the most effective method of ventilating a ship is by means

of large openings high in the ship which enable cross-drafts. I have previously described an experiment which I made. Contrary to what one would suspect, the vessel with no assistance towards ventilation was a more thoroughly ventilated vessel than the vessel containing artificial assistance to ventilation. This experiment has convinced me that natural ventilation, which will occur in an engine room by the finest number of baffles,—in the presence of cross-drafts, is ideal ventilation.

Q. Mr. Gibbs if you were asked to provide ventilation to remove gasoline vapors from the engine room of the Seminole, would you have to know, or would you not have to know, the quantity of gasoline vapors that you were going to have to remove? In other words, does the amount of ventilation to remove gasoline vapors, depend upon the quantity of the vapor?

A. It does; and the time in which you have to remove it.

Q. Well suppose the—assume that the gasoline system of the Seminole leaked gasoline at the rate of a teaspoonful a day; would the natural ventilation through the sources that we have discussed, carry away such vapor?

A. In my opinion, unquestionably.

Q. Well suppose you spilled the contents of a 55 gallon drum of gasoline in the engine room, would natural ventilation carry away the vapor from that?

A. Unquestionably, in time.

Q. Can you give me any idea as to how long that time might be, or what does that depend upon?

A. It would depend upon the cross-draft.

Q. Does it depend upon how fast the wind blows?

A. To some extent.

Q. Does it depend in any measure upon the change of temperature over the day and the night?

A. Exactly, the length of the day, summer or winter, with long days or short days; or, the moisture in the air,—the humidity.

Q. Now you have spoken of convection; will you tell us how this convection operates, with particular reference to an engine room such as the Seminole?

A. Convection refers to the movement of gases as the result of the specific gravity of the gases or weight per unit volume; or, by differenee in temperature of the gases. Practically wherever gases exist, there is continuous and violent movement. Where this continuous and violent movement exists, it is only necesasry to take time, with a cross-draft, to sweep them from the vessel; whereas you might have a certain gas in one section of that vessel, if movement is continuous and universal, that gas must reach the place where it is affected by the cross-draft. Therefore the cross-draft is the essential thing for the removal of a gas from a containe.,—engine room, or bottles. There would be only one way to hold a gas in a bottle, that is by the application of a tight stopper.

Q. Well now, assume you have got a quantity of gasoline vapor in the bilge of the Seminole, laid up under a shed, such as you have described; what would be the effect of convection on such gas vapor?

A. Will you repeat the question?

(The question was read by the reporter.)

A. With a quantity of gas vapor in the engine room—

Q. Or, the bilge?

A. Or, the bilge. Convection would cause all gas, wherever it exists, where it is free to move, to move to a position where it would mix with the incoming and outgoing air in the boat. Even where there would be, no wind; convection would cause a general intermingling of the gas inside of the engine room, and when the inside gas gets hotter than the outside air, the expansion of that gas would cause some portion of that gas to leave the engine room. Where the temperature of that gas inside of that engine room was colder than the air,—than it had

been previously, it would contract and cause the air to enter the room through whatever opening there happened to be. And that new air would mingle with the gas within the engine room, and when expansion set in, by the difference in temperature, and increase in temperature of the engine room, then there would be pushed out of those orifices the gasoline or vapor, plus even some of the air that had been just recently brought into the engine room, and that would go out. However, the cross-drafts, or the convection currents, which not only exist in the engine room but at all places where there is an atmosphere, would cause drafts to hold the process back, much more violent than the processes due merely by the expansion and contraction of the gases in the engine room.

Q. Assuming you have spilled a quantity of gasoline, we will assume a quart, and to begins to evaporate and forms a gasoline vapor; do you know whether that vapor remains static, or whether it in turn continues to dilute?

A. It continues to dilute.

Q. To what extent?

A. To an extent dependent upon the laws of convection, and the—that is the answer.

Q. What becomes of it finally?

A. It finally is dissipated into all sections of the atmosphere.

Q. Does it remain as a gasoline vapor at all?

A. No. It may reach a cold place and under certain conditions become a gasoline again.

Q. You mean it could be precipitated again?

A. Oh, yes.

Q. By becoming colder?

A. When it goes below its point of saturation, or dew point, and hasn't already mixed with—become so diluted with other gases, which of course it probably would.

Q. Do you understand that the switchboard of the Seminole was made up of open knife switches?

A. Yes, sir.

Q. In your opinion are they proper switches for a vessel propelled by gasoline motors?

A. Yes. That opinion is based on the fact that it is practically universal practice, or was at the time; no switches known to me that were as good, as of that date.

Q. Are they in common use today in such installations?

A. Yes.

Q. In your opinion, is it proper to have the main switchboard composed of such switches in the engine room itself?

A. Yes.

Q. In closing,—in your experience in closing such switches where the voltage in 110, is there any spark?

A. No.

Q. When do you get a spark on such knife switches, if you ever do?

A. You get a spark when you broke a switch, if at all. It would be only—if you had a current which would tend to burn the carbon, gasify it, and leave it as a gaseous conductor, it would become brilliant in the burning, and there a thing that was very minute would affect the nerves of the eye in a way that would look like a very violent spark.

Q. How big a spark do you get when you open such a switch, ordinarily?

A. Well a good clean switch, it is usually visible to the eye,—usually isn't, but I have seen them.

Q. How big is it?

A. It is extremely small, with 110 volts.

Q. Compared to a pencil or a pen?

A. I would say about the head of a pin, would be a large spark.

Q. What becomes of it when you close the switch,—that kind of a spark?

A. When you open the switch?

Q. No, when you close the switch. As I understand it, you don't ordinarily have a spark when you close such a switch; is that correct?

A. That is correct.

Q. When you do get such a spark, as when you open a switch, does the spark last long enough to go any place, or does it stay there, or what becomes of it?

A. It is almost instantaneous; it isn't nearly as long in duration of time as it appears. The persistence of vision is a factor. I have never known of a measurement of that; it would be almost measuring the speed of electricity.

Q. It is as fast as that?

A. Quit as fast, and then some.

Q. Have you had any experience in getting vessels ready to be laid up for a time,—vessels propelled by gasoline?

A. Yes.

Q. In your experience, it is necessary to remove the gasoline from the gasoline tanks?

A. No.

Q. And is it customary in these waters to do that?

A. It is sometimes done that way, and sometimes done other ways.

Q. What is the reason for your opinion that it is not necessary?

A. There are many catastrophes that can happen to plants in Florida, where they are subject to hurricanes and fires. On the same principle that you take your automobile to a storage lot or garage, and you don't take the key with you; you give the operators the full chance to maneuver your automobile out of danger. And there is considerable advantage in having it in ships, so that she can be taken out of danger, and quickly. We have done it both ways. The time of lay-up has a good deal to do with it. If the boat is to be laid up for several years, or indefinitely, a good thing to do is to take the engines

heads off and cover the parts with vaseline, in order that the parts don't become what you call frozen, or rusted.

Q. Assuming that the Seminole was to be laid up for a period of months, in your opinion would it be necessary or required to remove all the gasoline from the tanks?

A. No. We have such a yacht into storage now, and they are requiring us to turn the engines over at periods, to avoid the necessity of what it known as this freezing process, or any rusting that might get under those valves, by the mere presence of atmosphere.

Q. Does the fact that the Seminole had batteries which had to be charged from time to time, have any bearing on this point?

A. As I say, that is more or less a personal equation. If you wanted your batteries charged, of course you should have had gasoline, some gasoline in the boat; at least I would have wanted it. I don't know whether there was any there or not.

Q. Now assuming that the Seminole had been laid up for a period of two months, under a shed, and that June 24th, 1935 two men went aboard, passed through the alleyway from the after deck, forward to the engine room, and that one of them entered the engine room through the alleyway window and walked back to the switchboard, and that there was no odor of gasoline; is there any reason why he should not have closed the switch on the switchboard?

A. None whatever.

Q. Why do you say that?

A. For the simple reason that that switch was made for service, to begin with. The modern houseboat, or houseboat of that day, the day that she left the shipyard, used equipment available which made it a usable piece of apparatus.

Q. Now assuming that—

A. And the owner's representative certainly had the right to believe that it was a normal piece of machinery.

Q. Assuming that the Seminole had been in operation up to the 15th of April, and was laid up on the 15th or 16th of April and that during that period of operation, no leaks had developed or were apparent in the gasoline system, anywhere; and then two months later, approximately, during which she had been laid up under this shed, this man went aboard and went into the engine room and threw these switches to get light; in your opinion, should he anticipate the presence of gasoline vapor?

A. No.

Q. Why do you say that?

A. Well because, with considerable experience of many years, I have seen and known men who have gone aboard vessels and done that very thing, just as they would go into their house that they hadn't been into for a long time, and strike a match, even in the kitchen, where the gas it quite as dangerous as any gasoline fumes, exists, strike a match or put on a switch which might start up the electric refrigerator, which would be the same thing. I do not believe a man could be expected to assume that there is a defective situation, under those conditions. I also know, in my experience in this line of business, of almost no case where a boat has ever caught fire in the midst of a lay-up due to any gasoline fires. I have made investigations with people who have operated many, many boats, such as government agencies, the Navy and the Coastguard, to find that nearly every fire ever known to exist as the result of a gasoline explosion, has been at the time of the filling of the gasoline tank, or, when a boat is in service: Practically never at a time when she is laid up.

Q. Now Mr. Gibbs, if you don't have any leaks in operation, is it reasonable to expect any leaks when she is laid up and not being operated?

A. Certainly not.

Q. Now turning to another subject, I show you Libelants' Exhibit 97, the so-called regulations governing marine fire hazards, put out by the National Fire Protection Association. Are you familar with those rules?

A. I don't know what they are, sir; I can't tell you. I familiar with most accepted practices in the construction and repair of boats.

Q. Well, do those rules represent an accepted practice in ship-building and ship keeping down here?

A. I haven't read them. I may have read them somewhere else.

Q. In your experience in the construction and repair of ships, are those in common use down here?

A. Not that I know of. A great many of the people that have yards today,—men that work in them, work in our yard; I don't think that I have ever been in a shipyard in Florida that I haven't had men that were trained in our yard, which has been in existence almost twenty-eight years.

Q. Have you ever used those rules as a standard of practice?

A. No. I may have used something that may be in this book, but I have no knowledge that the causes that actually did our work, is embodied in this book.

Q. You mean you may have done some of the things that are suggested in that book, but not because the book said so?

A. Well I haven't seen the book so I don't know.

Q. You can't say. Now I show you Libelants' Exhibit 24, which is called Regulations for the Prevention of Explosion and fire on Motor Boats, by the Bureau for the Prevention of Explosion and Fire on Motor Boats. Did you ever hear of those before this case came on?

A. No.

Q. Have you ever used those as a standard of practice in your work?

A. No.

Q. Do you know of anybody else who has?

A. No.

Q. Now I show you Libelants' Exhibits 101 and 101-A; Lloyds Rules and Regulations for the Construction and Classification of Yachts. Have you ever used those as a standard of practice in the construction and repair of any vessels?

A. Only where an owner would specifically want his stuff done according to those rules, would we do it. I think we have possibly done that; that is, have taken sections of those that the owner wanted done in accordance with Lloyds; and I have understood at the time that he wanted to take out insurance, where the job should be done in accordance with Lloyds specifications.

Q. Are they a commonly accepted standard of practice down here?

A. It is practically never that we have referred to them or have been asked to.

Q. Did you observe from your examination of the Seminole, the condition of the wooden timbers in the floor of the engine room?

A. Yes.

Q. What did you find that condition to be?

A. They would indicate that there was not much heat down in the lower part of the ship; because wood acts—

Q. First let's get the condition as you observed it, of the wooden members, the foundations of the engine and the stringers across the ship, and so on.

A. Well the wood was intact.

Q. Was it burned up?

A. Not that there was any quantity of it. Of course there were charred pieces, there were cinders; where they came from I don't know.

Q. Did you observe the wooden supports on which the tanks rested?

A. Yes, sir.

Q. Were they consumed or affected by fire?

A. No. You mean by that, those pads that go underneath the tanks?

Q. The 4 x 4's, if that was their size, on which the tanks themselves sat?

A. Yes.

Q. Were they burned at all?

A. Not that I know.

Q. Are you able to form any opinion, from the condition of those wooden pieces, as to the extent of fire in the bilge?

A. Those things, the wood which burns readily, and which did burn in the—for instance in that tank compartment the charring seemed to be the result of intense heat in the higher portion of the ship. You could see a stanchion, the top burned off and the bottom in perfect condition.

Q. How about in the bilge of the engine room?

A. In the bilges in the engine room, would indicate to me that there was no fire down there; in fact I am almost certain that there was no fire in the bilges.

Q. Assuming that the tanks, gasoline tanks of the Seminole, were partially filled with gasoline when the fire occurred on June 24, 1935, what would be the tendency of the heat to which those tanks were subjected, as to its effect upon the gasoline in the tanks?

A. The heat would tend to vaporize that gasoline and send it through the openings—

Q. You mean, the vents?

A. The vents.

Q. Assuming that the tanks were, say, less than half full of gasoline, after such a fire of three or four hours' duration, would you expect to find any gasoline there at all?

A. No, if it lasted three or four hours I would not.

Q. From your examination of the Seminole did you see any evidence of a violent explosion?

A. No I didn't. I have seen explosions.

Q. Did you find any structural plates that were ripped or torn apart?

A. Not as you would see in an explosion. I found tears, but they would be accounted for; one particular tear, by the wrecking crane that picked up the top of the house.

Q. Did you observe the condition of the bulkhead between the engine room and the alleyway?

A. Yes.

Q. And how do you account for that?

A. Well if the roof were fastened to that bulkhead, and if that bulkhead,—if that roof fell, in the general debris it would have bent that—if it was anything like that, and the roof was up here, it would have bent the top in, and then when the wrecker came and lifted the roof, it would have bent it back at the place,—at the deck line.

Q. In order to shorten this, can this condition be accounted for by heat during the fire, or the removal of the steel deck head, as well as by explosion?

A. Of course the heat, all of those parts were possibly red and soft; the heat would have had very much to do with the appearance, because they were quite soft.

Q. Did you notice any substantial distortion of the after bulkhead of the engine room?

A. No.

Mr. Underwoood:

That is all.

(Brief informal recess was had.)

Cross Examination.

By Mr. Matteson:

Q. Mr. Gibbs, at the very first, the vent pipe that was used to vent the gasoline tanks on the Seminole,

which I think was half-inch pipe, I think you said that that would offer very little resistance to the flow of air through it?

A. Yes.

Q. And the fact there is little friction involved in the passage of air through a pipe; is that correct?

A. Yes, sir.

Q. So that with a half inch vent you should have a ready and quick adjustment for variations of temperature between the tank and the atmosphere; is that correct?

A. Due to the variations of temperature—yes, sir.

Q. You don't subscribe to the theory then, that a vent pipe of that size would restrict the passage of air from the atmosphere to the tanks, or vice versa?

A. Yes, the smaller the pipe, the greater the restriction to the passage of—to the interchange of air from the tank to the atmosphere, due to convection.

Q. Well, I gather from what you said that any restriction would be negligible.

A. No; the restriction in the positive pressure of the piston, gasoline piston, we will call it,—the displacement of the air by the filling with gasoline, the restriction under those comparatively high pressures would be negligible in that size of pipe. That size of pipe, however, would be of an appreciable size when it came to the slow interchange of air from the tank to the atmosphere, due to the convection of currents.

Q. You agree that there is practically no friction to the ingress and egress of air afforded by that pipe?

A. At those velocities yes, sir.

Q. Or, at any velocity?

A. Any velocities considered, no, sir; at very high velocities the friction becomes quite great.

Q. At low velocities it would be negligible?

A. Yes, sir.

Q. And any velocities—

A. That we are considering.

Q. Any velocities arising out of gradual changes in temperature, would be very low?

A. That's right, sir.

Q. And in such case the resistance to the passage of air, would be negligible?

A. Yes, sir.

Q. Are you familiar with Kent's Mechanical Engineers' Handbook?

A. I know what it is.

Q. Do you regard that as a standard work?

A. I regard that is a very excellent note book. I don't subscribe to everything that is in it; but there is much in it that serves as a good guide to an engineer.

Q. It is recognized as a standard work on the subject, is it not?

A. Oh, yes; he is recognized for exactly what I have just stated.

Q. And you don't know of any other work that is better, on the subject, do you?

A. Well I know of many articles that are written by engineers, as those articles are written, that are more to be relied upon than the articles in that book.

Q. On special subjects?

A. Well on the subject of general engineering; the modern—I mean new discoveries and applications that apply to general principles. As a matter of fact the book is made up of such research, and it is a very good book; very good guide.

Q. Now with respect to the subject of ventilation in a gasoline boat, you have given us certain views with respect to it. Have you ever written any articles or published any books or discussions with respect to the subject of ventilation of gasoline vessels?

A. I have not.

Q. Can you refer us to any standard works that support your views with respect to the necessity of ventilation in a gasoline vessel?

A. Well I could refer you to the trade journals I keep up with, and the articles there are based on practical experience, and written as a rule by architects and engineers that I regard of great capacity. I have employed a great many architects, who have discussed those things with me, and I have—could refer you to a number of those magazines, those trade journals, as the source of much of the information that I have got. Of course as a student at the Georgia School of Technology, we had a thorough course in ventilation, and in the internal combustion engines, and all fundamental laws that affect it; design and operation.

Q. First of all, the trade journals that you refer to, what trade journals do you refer to?

A. I refer to Motor Boat, Motor Boating, or any of the current journals. I could not tell you that I read an article on ventilation in Motor Boat, it might have been in Motor Boating, it might have in the Rudder, or it might have been in Diesel Progress, Pacific Motor Boat; but those various technical journals, I read; it might have been even in some civil engineering journal, that often takes up those discussions.

Q. Now can you refer us to any particular articles that have appeared in these journals, that are the source of your views?

A. No.

Q. Or, that support your views?

A. No, I don't know that I could refer you to any article specifically on those subjects, that I read monthly, —as to the date and the name of it. I could refer you to some articles written by Mr. Taylor in Ships Lines; but I don't know the month or the magazine that it came in, except it was a technical magazine.

Q. Of course we are not particularly interested in Ships Lines here. Can you refer us to any articles relating to ventilation of motor driven vessels?

A. Perhaps if you would tell me what phase of that, I might be able to recall some person who has written on the subject.

Q. Well, any phase of ventilation in a gasoline driven motor vessel?

A. Well, I can recall one article, was once read on ventilation through a fan, a Sirocco fan, to be built in the fly-wheel. I regard that article as of no particular value, but it had in interesting study. The man who wrote it I don't know.

Q. And where did that article appear?

A. In some one of these trade journals.

Q. You spoke of the name of one of these trade journals, and at one time I understood you to say Motor Boat, and the other, Motor Boating. Are they two magazines, or are they the same one?

A. They are two different magazines.

Q. And do you include them both in the trade publications that you refer to?

A. Yes. The articles in them are usually written by naval architects, some of them by engineers; the most enlightening articles I have read in sometime, by a Mr. Max Angas, Captain in the Navy, in Motor Boating.

Q. And you regard Motor Boating as a reputable, reliable trade paper, do you?

A. Well, I do regard it as a very valuable paper. I don't subcribe to all articles written in the paper; but I regard it as a source of valuable information.

Q. And why would you pay any particular attention to an article in such a magazine? Is that because articles appearing there are selected by competent editorial staffs for publication?

A. Well I would pay attention to them, because nearly everybody, a great many people rather, connected with my profession, which is a small one, are men known to me; their backgrounds are known to me; their work is known to me; their successes are known to me, and their

failures are known to me. And I have myself an experience which would enable me to form some judgment as to the value of the articles. I particuarly am interested in these magazines, that might be called popular magazines, and not quite such technical, although I read them too as engineering; some of the papers from the Mechanical Society of Naval Architecture, or the American Society, at 41st Street, New York,—or several of those purely technical journals.

Mr. Underwood:

That is a reference to the American Society of Mechanical Engineers?

A. American Society of Mechanical Engineers; or the papers of the American Society of Marine Engineers and Naval Architects. I am particularly interested in these so-called popular magazines, because they carry as advertisements, the modern devices obtainable on the open market, such as ventilators, and ventilating devices, with discussions of the valves of those devices, by their own engineers; and I consider the source of such information as more up to date, out of those places, than you would get out of papers and discussions from the engineering societies; which are usually discussed quite sometime after they are put in practical use.

Q. You would regard an article appearing in Motor Boating, for instance, as prima facie entitled to weight, would you not?

A. Absolutely not. I would have to know who wrote it. It might be a good article, and I might not read it, might not know the man,—it might not attract me. But motor boating, as those popular magazines, are quite apt to write articles on spectacular things, like submarine battleships, and things of that kind. But one of the most valuable articles that appear in those magazines, are discussions of new devices that are in the magazines, written

by the manufacturers of the devices, on the engineering part of it.

Q. Do you find that a magazine such as Motor Boating, we will say, publishes unreliable articles?

A. Oh, I think it publishes many articles of impractical things. I won't say particularly, Motor Boating, but I think all of those popular magazines do. You see them this month, and you never see them again; but they are interesting at the time.

Q. Now I want to get back to my first question. Can you refer us to any specific article in any of these trade papers, having to do with ventilation of gasoline driven vessels?

A. Not from my memory. I could go over my files and look up things that I know about.

Q. Well I would be glad if you would do that for us Mr. Gibbs.

A. Well I haven't even got them here.

Q. Could you obtain them by communicating with your office?

A. I might and I might not. We subscribe to the Rudder and the Motor Boating, and the Motor Boat; and there is another journal that we subscribe to. Sometimes we keep them, sometimes we don't. But I will say briefly, that my knowledge as an expert is the result of 28 years of application to my business. What I have learned has been by frequent visits to my fellow boat builders, to other yards, to the factories; DeLavergne Machine Works; the engineering departments of manufacturers for many classes of goods that our company has sold. These matters of discussion on ventilation are common with us, just as cancer would be common with a group of doctors. To tell you that I read a certain article entitled a certain thing, by a certain man, dealing with a certain thing,—I have read many such articles, but I don't recall at this time just what the article was. I regard myself as a trained engineer who has applied himself to his business;

and my source of information is the result of that application, and construction of considerable articles that have been successful.

Q. Are you through?

A. Yes, sir.

Q. Well now you have told us that, I think, in substance, before Mr. Gibbs.

A. Yes, sir.

Q. But it still does not get to the point that I have in mind. I want to know if there are any published articles, books, or any authorities to which we could refer, on the subject of ventilation of gasoline boats, that you can tell us about?

A. You mean a treatise on ventilation?

Q. A treatise,—whatever you want to call it?

A. Well I know of no book that I could recall by name, or authority on the subject of ventilation.

Q. Now you spoke of studying—

A. Except the general books, such as physics; a treatise on thermo-dynamics; and the fifty-four subjects, some of which bear direct on the principles controlling design of ventilation.

Q. Now Mr. Gibbs you spoke of studying ventilation at Georgia Tech; can you tell us what text books you used there on the subject of ventilation?

A. By name I probably could not. I can tell you there are fifty-four subjects, and I can tell you what all of them had in them. But the name of the professor, or the man who wrote them, I couldn't give you instructions to wire and get a book. But there were some fifty-four different subjects,—even articles in French, on ventilation, that I have read; the ventilation of trains, in Paris,—or rather, in France.

Q. Well we are interested to get as much light on this subject as can. We appreciate your experience, and all, but we would like to know what authorities there are in this field that we can refer to, aside from Georgia Tech.

that you can't remember the text books you used there. What text books are there on the subject of ventilation for gases?

A. All right, sir, I will refer you to a book which you can get very quickly right in Miami,—the Encyclopedia. Look up the question of convection. You will there learn that all gases—

Q. I don't need you to tell us what we will learn there?

A. You will see it is fully discussed, and the explanation to such facts as I have expounded,—in that one paragraph; the cause and theories.

Q. You refer to the Encyclopedia Britannica, on the subject of convection?

A. The encyclopedia that I looked up in Mr. Anderson's office; I can't tell you whether it is the Encyclopedia Britannica or not. I was not concerned with the man that wrote the book, or anything; but the definition of convection, there I found a full treatise. In Mr. Anderson's office there is such an encyclopedia.

Q. When did you look that up?

A. I looked that up while I was waiting in his office to be called.

Q. And the article that you refer to contains merely a definition of convection?

A. It contains a very thorough discussion of the process of convection as applied pretty generally in the world; showing the causes of winds and so forth and the movement of atmosphere. Distinct application here.

Q. Will you obtain that book and bring it back after recess this afternoon so that we can look at it?

A. Yes, sir.

Q. Now is that the only text book or treatise on the subject of ventilation that you can refer to?

A. No, sir.

Q. All right what else?

A. I can refer you to physics,—a treatise on physics.

Q. What treatise on physics?

A. Any that has ever been written, providing it dealt with the question of heat.

Q. Well can you find such a book and bring it here so that we can examine it this afternoon?

A. I don't know whether I could this afternoon. I have no source of getting a Physics, unless I go to a book store.

Q. Well I would be very interested, Mr. Gibbs, to examine any article or any authority that you say supports your views of ventilation and convection; and I want to give you the opportunity to produce any authorities of that kind whatever, that you think will be helpful on this subject?

Mr. Underwood:

If your Honor please, I don't think it is up to the witness to go out in the open market and produce books, even at counsel's request.

Q. Or if you will refer us to one, a specific one, we will try to get it?

A. I refer you to the encyclopedia, that I will bring, which covers the basic principles on which ventilation in this ship depends.

Q. And you think that will be all that is necessary to support your views?

A. No I do not.

Q. —on the subject?

A. I think that a lifetime of application to my business, such as I have applied, will give you the ability to exercise the judgment,—or any other person, with my facilities, to exercise the judgment which enables me to make my statements.

Q. Of course we will have to give you credit for that, Mr. Gibbs; but of course in every field of science there are standard works, and I would like to know whether there are any standard works that you refer to in this field?

A. I will tell you that I am not much concerned with remembering the names of the authors of articles that I read; too much to think of, to do it. I am able to retain those articles that I have read, and what is in them has been of more interest to me than the exact date on which they were published.

Q. Now can you tell us what the vapor density of gasoline vapor is, with respect to air?

A. At the same temperature, gasoline density is greater than air.

Q. Can you tell us how much greater?

A. I think, slightly.

Q. When you say slightly, you mean ten per cent or fifty percent or—

A. Possibly ten per cent; you could probably find it in decimal points, depending upon the quality of the gas. There is a gas that would have a certain density, and another that would have a different density, depending upon the gasoline. The variations are extremely slight; we are splitting hairs. But I will tell you that gasoline vapor is heavier than the gas composed of nitrogen and oxygen, which is air, which is the combination of those two gases. That your gasoline vapor is heavier, and for purposes of this analysis I would be willing to concede that it is appreciably heavier.

Q. Well now I don't want a concession, Mr. Gibbs; I want your view—your facts.

A. Well I state definitely that the gasoline vapor is heavier than the air.

Q. How much: Is that difference slight or great or appreciable? How much?

A. It's—the exact amount I do not know. I don't recall those figures.

Q. Well now something was said about—

A. But as I have looked it up and as I remember it, it must be about, some ten per cent heavier; that is as my memory serves me. But anyway, heavier.

Q. As I understand convection, convection is an effect, —a rising effect of gas produced by heat; is that right?

A. It is produced by the difference in specific gravity, which is usually produced by heat.

Q. That is if you have a mass of gas that is homogeneous, and the bottom part of it becomes heated, the—

A. It becomes what?

Q. The specific gravity becomes less?

A. Per unit of volume.

Q. Per unit, and consequently it rises in the mass?

A. Yes.

Q. And other gas falls to take its place?

A. Yes.

Q. And that creates a circulation; is that right?

A. Yes.

Q. And whether any gas will rise—

A. You said, if it is homogeneous.

Q. Pearhaps—I meant, all the same, a single,—I am supposing that this gas is the same gas and the same density?

A. Remains intact. We will say, if it is in that shape, it holds that shape.

Q. Let's assume, just to be theoretical, suppose we have a cube, a cubical container, that is absolutely tight, on all sides, and it contains a perfectly pure gas?

A. Yes.

Q. So that it is exactly alike inside?

A. Yes.

Q. Then as I understand it, the definition of convection is that that is the effect produced by heat, which causes the gas at the lower part of the container to become less dense and rise in the container; the denser gas is taking its place?

A. Yes.

Q. And that causes circulation?

A. Yes.

Q. Is that the theory?

A. Yes.

Q. Now whether any gas rises with respect to another one, depends upon its relative density, does it not?

A. No.

Q. Assuming of course that there are no extraneous forces acting on it?

A. Well, it might if there are no other extraneous forces, or other conditions.

Q. Speaking purely from a theoretical point, the rising of one gas with respect to another, is caused by their relative density; the lighter gas rising and the heavier gas falling; is that right?

A. Yes; and assuming there is no such thing as what we know as a mixing.

Q. You have told us, Mr. Gibbs—before I get to that, what is the flash point of any liquid? Can you tell me that?

A. Yes.

Q. Can you define that for us?

A. What is that?

Q. Just define it for us.

A. The flash point is the point at which ignition occurs—the temperature at which ignition occurs.

Q. Well if you have gasoline vapors with a mixture of air, so that it can burn, do I understand you to say that the flash point is the temperature that you would have to reach to cause the burning? Is that right?

A. That is what is commonly known.

Q. Now I would like to ask you if you consider flash point and ignition point, identical?

A. That is what I would consider it.

Q. Well what would you say of this definition of flash point: "Flash point of a liquid is the temperature at which it gives off vapor sufficient to form an ignitable mixture with the air contained in the vessel used"?

A. Well that is as I was trained, a highly different thing. That might be considered a point at which a liquid becomes a gas, which is known as the point of evaporation. In steam it is 212. Now you might speak of throwing the water on a stove, and it will flash at 212, if you call that the point of flash. The flash that I have been familiar with is the point at which it will explode,—or it will ignite. But what is commonly known in our text books, the point of evaporation,—the point at which a steam or any other gas changes place from a liquid to a gas,—evaporating.

Q. Now, the definition which I read to you, of flash point, is the one which appears in this Libelants' Exhibit No. 136, a publication—

Mr. Underwood:
For identification?

Mr. Matteson:
It was offered in evidence, but it is only for identification so far.

Mr. Underwood:
I have objected to it.

Mr. Matteson:
Entitled, Fire Hazard Properties of Certain Flammable Liquids, Gases and Volatile Solids, published by the National Fire Protection Association; and I show it to you here and ask you if that is the correct definition of flash point, or if it is not?

A. It might be. It might even be that in some accepted interpretations of the word, flash, that don't use the commonest expression. It could well be said that a point of evaporation might be classed as flash, by—in that paper.

Q. Well I call your to the definition of flash point, which appears in Kent's Mechanical Engineers' Handbook at page 4-45?

Mr. Underwood:
What edition?

Q. The 11th edition; which reads, "Flash point is the temperature at which oil must be heated to give off sufficient vapor to form an inflammable mixture with air". Do you say that is not a proper definition?

A. That is—whoever wrote that particular article, it is what he has called a definition of flash point. Flash is an English word, that may mean several things. You know a flash, when you throw a match on a piece of gunpowder, there is a flash. The flash point of gunpowder is the point of ignition. My definition of flash, is the point of ignition. Kent, or whoever wrote the article, can say the point at which the liquid changes place from the liquid to the gas. But I will say that as far as the infallibility of one man's nomenclature, that any gas, gasoline, turned into a gas, with the proper combination of air and heat, is explosive; but I don't see where temperature has got a thing to do with it except with ignition considered.

Q. Well Mr. Gibbs, you have told us here that you have been educated as an engineer, in a highly reputable technical school; that you have been practicing as an engineer for some twenty-eight or more years; that you are a builder of vessels, a builder of gasoline propelled and gasoline carrying vessels. And what I want to know is, after all this experience whether in all of it you have ever heard this definition of flash point to which I called your attention, before?

A. I have heard of flash point of lubricating oils; flash point of all kinds of oils.

Mr. Underwood:
May I look at that definition?

Mr. Matteson:
Have you a different one, of the older edition?

Mr. Underwood:
Yes.

A. Mr. Matteson, in my profession there are English words that have all kinds of application. The broadest sense of flash, means fire,—ignition. There are other kinds of flash, but if you want to know what I know about fuels, and would tell me what you meant by flash, I could tell you whether I knew anything about fuels.

Q. Let me ask you this Mr. Gibbs: Isn't it a fact that all inflammable oils are rated by flash points?

A. They have either that, or points of evaporation, points at which they change.

Q. Well now just let me get this straight. Throughout your profession, wherever you have to deal with an inflammable oil, inflammable oil is rated by its flash point, in those words, is it not?

A. Those are manufacturers' terms, that concern the quality of the oil. You get them mostly from oil salesmen, that would come in, to describe an oil for a promoter, for me, and I would ask him questions about it. If he used flash point in that form, we would probably understand each other. But—

Q. Isn't it true, Mr. Gibbs, that when you have to comply with government requirements with respect to different classes of inflammable oils, that those requirements are based on the flash point tests of the oil to be used?

A. Oh sometimes they tell us that the oil by a test must be of such and such a description; they will give us the specifications of the oil. We turn it over to the oil company.

Q. You say it is only a sales term?

A. No, no; that is unquestionably a technical description of the evaporating points, as given in that definition of oil,—of a fuel; and not intended to be the ignition point.

Q. I can't say whether it is a definition of an ignition point or not, Mr. Gibbs; but you are qualifying as an ex-

pert here, and I want to find out whether you know the meaning of technical terms in your profession. If you were called upon to install a fuel oil installation for the use of oil with a flash point of not less than 150 degrees, what would that mean to you?

A. A flash point of not less than 150 degrees? Do you mean that the liquid would remain? If I saw those low numbers, I would ask for a more specific definition of the word, flash. It would mean that was the point at which the liquid evaporated, or went into a gaseous form.

Q. You say if you saw the term, you would have to inquire—

A. Identify it, with 150 degrees, I would instantly know that they meant the point of evaporation. We have many new terms in the oil profession; cracked oil,—we have all kinds of new terms as in the manufacture of oil, which haven't concerned me, because I can get the information from time to time.

Q. If I understand it, Mr. Gibbs, this is your field?

A. Right.

Q. Building vessels for carrying of oil?

A. Right.

Q. And propelled by inflammable oils?

A. That is right.

Q. And do you mean to tell me that never until today have you seen this definition of flash point that I have given you?

A. Yes I have heard the flash point discussed, and I have heard it discussed by reputable engineers, as the point at which conflagration takes place.

Q. And you say that if you saw in a technical work or in a set of governmental regulations, or anywhere else, the term, flash point, that you would not instantly know that it meant exactly the definition that I have given you?

A. I will say this Mr. Matteson, that the characteristics of a fuel,—a manufactured fuel, that there is little oc-

casion ever for any expert on ventilation to know of a manufactured fuel put on the market.

Q. You say there is no occasion,—

A. There is little occasion for a man to know those specific technical specifications.

Q. Now you have built tank vessels, subject to the rules and regulations of the United States Department of Commerce have you not?

A. Yes.

Q. Built them to conform to those specifications?

A. Yes.

Q. How recently have you done that?

A. Well, we have been converting them, changing them over; we do that all the time.

Q. Well now I have here the United States Department of Commerce, General Rules and Regulations prescribed by the Board of Supervising Inspectors of Tank Vessels, and I call your attention here to page two, the regulation under H, subdivision 2; there is a regulation preceding it, and this number 2 describes the type of tank to which it is applicable, and it says,—a tank either empty or used to carry a liquid having a flash point of 150 degrees or above,—what does that mean to you?

Mr. Underwood:

Just a minute please. I don't want to object to the question, I just want to make it clear that the reference is to page 2 of the general rules and regulations prescribed by the Board of Supervising Inspectors, Tank Vessels, November 10, 1936.

Mr. Matteson:

I have already stated that.

Mr. Underwood:

I didn't so understand it.

A. Well, that would mean to me that at that point a gas would become—a liquid would become a gas.

Q. Well why would it mean that to you, if you don't so understand the meaning of flash point?

A. Because that would immediately identify those low terms. I know the properties of fuels,—combustion—basically. I know that those temperatures are approximately the temperatures of evaporation of such an article.

Q. Well now this does not say anything about what kind of an article it is. It simply says, to carry a liquid having a flash point of 150 degrees Fahrenheit, or above; it does not refer to gasoline or molasses, but I just says, a liquid?

A. Well, any liquid that I am familiar with, there is in it a gas at temperatures around that, or slightly higher. That in the range of evaporation temperatures. And I can conceive the word flash meaning a news item over the radio; a conflagration; or anything.

Q. We are all familiar with quite a number of uses of the word flash, Mr. Gibbs.

A. That's right.

Q. But what I want to know is, how much you know about the technical terms of the profession in which you claim to be an expert?

A. Perhaps many of them, terms of the profession, that the use I would give to you would not be the use that you would find in a paragraph of some man's article.

Q. Now as a matter of fact, I call your attention to the fact that right in these same regulations, you go farther down the definition of flash point appears; it reads: The term, flash point, indicates the temperature in degrees Fahrenheit at which a liquid gives off an inflammable vapor when heated in a Tagliabue tester. Now you say that you are not familiar with that definition of flash point?

A. I have another interpretation. I am thoroughly familiar with what it is,—the point of evaporation. The

term I was taught was the point of evaporation, the point of boiling, it is known in physics; it is known in Kent's as the boiling point of liquids. That is the flash point, as that definition says, is the boiling point of liquids; the transfer from a liquid to a gas. The name that an engineer knows, the boiling point.

Q. I see, and you don't know it as the flash point?

A. I did not recognize that as the flash point.

Q. May I look at the early edition of Kent that you have?

Mr. Underwood:

Yes, in a few minutes.

(By Mr. Matteson):

Q. Now what is the flash point of gasoline, can you tell me?

A. It varies, depends entirely upon what the gasoline is.

Q. Well within what limits does it vary?

A. Oh, it will run from 90 to higher, run lower than that.

Q. What is the lowest flash point of gasoline that you know of?

A. Well, others might run as low as 50 or 60.

Q. Well, I am not talking about ethers.

A. Well, other gasolines.

Q. Petroleum ether you are talking about?

A. Well, the various forms of petroleum products have various names, but as a matter of fact they vary; the points at which they become a gas, varies from one temperature to another. Now I don't know the temperature of that which becomes a gas at the lowest temperature, and I don't know the temperature at which is the highest temperature; I do not carry such figures in my head.

Q. Well; I appreciate you can't carry specific figures in your head, but you must have a pretty good idea about

these things, I should think, within reasonable limits. Petroleum ether is another name for benzol, is it not?

A. Dozens and dozens of names of liquids kindred to gasoline and kerosene.

Q. Now I am talking about gasoline, and it is your understanding that the petroleum product that is ordinarily known as gasoline, has a flash point of around 90 degrees?

A. It has various temperatures.

Q. What would you say would be the lowest? What is the range?

A. I would be guessing, in any event.

Q. You suggested 90 degrees; do you want to change that or correct it?

A. I say that there could be a gas that would have a boiling point of 90 degrees.

Q. Well what would you say would be the lowest that you would expect to find?

A. I wouldn't say.

Q. Well, 75?

A. I wouldn't say.

Q. You have no idea?

A. Oh yes, I have ideas?

Q. What is it?

A. I have ideas that gasoline could have what you call a flash point, which is not the accepted term,—the boiling point, of as low as 75 degrees.

Q. You think that would be the lowest?

A. No I don't it might not be the lowest.

Q. Well what would you think would be? You have been building tank vessels and gasoline engines?

A. The builders of tank vessels have practically no requirement to know the exact time at which a gas goes into a liquid, within any such margins as those, unless it was a special job.

Q. Do I understand that you want us to understand that you have no technical knowledge of the qualities of gasoline?

A. No, sir, I don't want you to understand any such thing. I have a very fair knowledge of all the properties of gasoline and fuel oil.

Q. Well now we have determined what flash point is; I want your idea of what the flash point of commercial gasoline is?

A. I will—it is somewhere around the atmosphere, as a rule, in order that it be a fuel that is applicable to internal combustion motors. If the temperature is quite low, we will say 75, it would evaporate very quickly and would tend to make a quick starting motor; it is used in airplane motors and things of that kind. There are many newly developed motors that—some for quick starting, with various characteristics. In my profession, if I were designing a motor for any particular thing,—purpose, I would call in the oil man and make known my requirements.

Q. I don't want to interrupt you, but we seem to be taking a lot of time by going off with explanations here. What I want to know is this: What, as a man dealing with gasoline, is your idea of the flash point of gasoline?

A. Well my idea of the flash point of gasoline was, as stated,—was the point at which combusion took place.

Q. And where is that?—No, eliminating that. Now we get back to the technical definition of flash point that I have shown you here in three different places. Now let's use that. Now what is your idea—

A. What I have been taught, is boiling point, what I know as boiling point, or point of evaporation.

Q. You can call it anything you like, I have given you the definition of it. What is it with respect to gasoline?

A. It varies.

Q. What is your idea of it?

A. I have ideas that it varies around atmosphere, above and below; temperature of the atmosphere, above and below.

Q. And you say that would be around 75 to 90 degrees?

A. And higher; with particular—with the low grade of oils.

Q. And you wouldn't expect to find it any lower?

A. Flash point? Why I might find it as low as—away lower than that, very much lower, maybe 22 below freezing.

Q. Now we seem to be getting somewhere, Mr. Gibbs.

A. It depends entirely upon what it is offered and called as gasoline.

Q. We seem to have gotten from 75 to 90, and down to 22?

A. I say it is possible. I am not a manufacturer of oils, but I say that it is conceivable to me that oils could be made with a very low flash point.

Q. Again I refer to this book which has been marked for identification as exhibit 136, a publication of the National Fire Protection Association; Fire Hazard Properties of Flammable liquids, containing a tabulation of the properties of various liquids; and under Gasoline, on page 27, you see a column, Flash point; and you see under that, several figures, each with a reference which I can tell you refers back to the authority from which that flash point is taken; and I call your attention to the fact that flash point of gasoline is rated anywhere from minus 45 degrees, to zero by these authorities?

A. I think I told you it may go [illegible]y down below freezing.

Mr. Underwood:

Let it also appear that the definition of the gasoline referred to is C5H 12, to C9H 20; gasoline made up of five parts of carbon and 12 parts of hydrogen, to gasoline made up of 9 parts of carbon and 20 parts of hydrogen. That is my understanding of those chemical terms.

(By Mr. Matteson):

Q. And I call your attention to the authorities to which this refers back, Nos. 2, 22, 26 and 28, which I refer to over here. No. 2 is Interstate Commerce Commission Regulations, Bureau of Explosives—pamphlet No. 9 of 1922. No. 22 is Underwriters Laboratories, Inc., Report SI 528, on propagation of flame in pipe, and effectiveness of arrestors; 1919. No. 26, entitled Factory Mutuals—Properties of Flammable Liquids, Gases and Solids—April 1, 1930. And No. 28, publication entitled, Underwriters Laboratories, Inc.,—Method for the Classification of Hazards of Liquids—1929. Now in view of this have you any doubt now that the flash point for gasoline is somewhere between minus 45 degrees and zero?

Mr. Underwood:

If your Honor please, I want to put in a qualified objection to that question. I have objected to the introduction of this document in evidence on the ground that it is not properly proved, and not proof of the facts therein contained. I merely want to state that I stand on that objection, and I don't want to, by not objecting to this question, be in the position of allowing what Mr. Matteson proposed to draw from this document, to come into the record as proof of any fact.

The Court:

All right, let the witness answer.

A. These authorities quoted here, I have not read them. I therefore am not in position to tell you what is the lowest point at which a gasoline will become a gas,—the lowest temperature; but as I have said, it might be something extremely low, even below the freezing point of water.

Q. You have told us that you know quite a bit about gasoline, here, and the point of evaporation seems to be

quite an important point that is involved. You started out as high as 75 or 90 degrees, and now we seem to be down quite a bit. I want to know what your idea of the evaporation point of gasoline is,—the flash point of gasoline?

A. It depends entirely upon the gasoline.

Q. You say there is no—

A. You might as well say, how tough is steak,—about the same question.

Q. You say there is no recognized standard for the flash point for gasoline?

A. No, I say there is a definite and a specific point of evaporation on any fuel sold, with a certain chemical composition, which is invariable.

Q. And what is the flash point of kerosene?

A. I don't know; it would be considerably higher than gasoline.

Q. Have you any idea what it is?

A. No.

Q. Now, Mr. Gibbs, I think we agreed that outside of physical forces, the cause of one gas rising with respect to another, is relative density. When you say that relative density of gasoline and air is different by approximately ten per cent, that means that they are not very far apart, is that right?

A. Well that is very far apart, as far as one being heavier than the other.

Q. Well you have spoken of a tendency which you say there is for gasoline vapor to become dissipated by contact with air?

A. Yes.

Q. Now is that fact, that there is no more than a difference of ten per cent in their relative densities, a factor involved in that?

A. I wouldn't say so.

Q. Well of course if on the other hand gasoline vapor was three or four times as heavy as air, that tendency

would be reduced to a minimum if it didn't actually disappear, wouldn't it?

A. It would never, in my opinion, disappear, for the reason that you can take a very narrow test tube, a long cylinder column, where the process of convection would be greatly retarded, and put gasoline in it, however small, and smell it, instantly.

Q. What I am getting at is this: if you had two gases that were as far separated in their relative densities as three or four times, you wouldn't expect them to mix readily, would you?

A. It would be a factor of the speed at which they would mix; yes, sir.

Q. You wouldn't expect one gas, three or four times as heavy as another, to mix readily with the other gas, would you?

A. My judgment would be that it would not mix as readily.

Q. You wouldn't expect it to mix readily at all, would you?

A. Yes, sir.

Q. But that tendency would be greatly reduced if there were that difference between their densities?

A. I have never performed any experiments, or read of any, but I would suspect that that would retard the tendency to mix.

Q. Now as a matter of fact do you know that relative vapor density of gasoline vapor to air is three to four times?

Mr. Underwood:

If your Honor please, I object to that unless the density of the gasoline vapor is included in the question.

The Court:

I will overrule that objection; I think the witness is able to take care of himself. If there is any wanting ele-

ment in your question, why let the witness call attention to that.—If you can't answer the question, you think there is some necessary element that you ought to have incorporated, why then you call attention to it, Mr. Gibbs.

A. Yes, sir. This is one continuous sheet, isn't it,—all these pages?

(By Mr. Matteson):

Q. Yes.

A. Will you explain it to me, what the meaning of the table is?

Q. Well we will go back to the beginning of the book, and it defines vapor densities. Vapor density is the relative density of a vapor as compared with air, a figure less than one, indicating a vapor lighter than air; a figure greater than one, a vapor heavier than air. Vapor density figures in the table have been calculated:

A. That then describes the—

Q. The relative density.

A. When it says, vapor density, I couldn't understand that without this definition.

Q. Well you know generally the technical terms of your profession?

A. I know generally this book in which that is given as the rule for that column—what that column means.

Q. Vapor density does not mean anything to you as a technical term in your profession?

A. Oh, yes.

Q. What does it mean?

A. Density—it could mean a specific gravity.

Q. Isn't vapor density—

A. It could mean, it could be a coefficient; it could mean, with respect to some other thing. It could mean—in this instance it is told to mean with respect to not water—air, probably at the same temperature, at sea level.

Q. Isn't that the way all gases are rated in your profession?

A. What?

Q. Density, with respect to air?

A. It could be.

Q. You don't know whether it is or not?

A. Oh yes, I do.

Q. Well, is it?

A. In this particular thing that seems to be a common use of it.

Q. Isn't that generally so in your profession?

A. I wouldn't say so. I would say that that would be the logical description of it; but just given this column, "% in air ref."; I would need more—well I know now what vapor density is given.

The Court:

Let's get back to taw; what is the question?

(The last question was read by the reporter.)

A. This wouldn't mean much to me, when it refers to a gasoline that must evaporate at minus 45 degrees, which is—have you got one that would show it at normal temperature, of a more commonly used gas?

Q. Let me put it this way. The gas which would evaporate at the lower temperature, you would expect to be a lighter gas, would you not?

A. Not necessarily; I don't know that.

Q. Wouldn't you expect that to be so?

A. Well that refers to your—you mean, the gas itself?

Q. Yes?

A. I wouldn't necessarily think that would follow.

Q. Well now the question I asked you was, is it not a fact that gasoline vapor is actually three to four times the density of air? Now I have shown you this book?

A. With this table, that very low flash point, what you term flash point, states definitely that it is from three to four; that is in this table. My own knowledge, I did not know that exact point, for that exact flash point of gasoline.

Q. If as a matter of fact gasoline vapor, instead of being ten per cent above the density of air, is three or four hundred per cent above the density of air, that would have considerable to do with your theory with respect to the ventilation of gasoline vapors, would it not?

A. No it wouldn't affect it in any way at all; because the principles do apply today, and have always applied, and a denser article might work slower than a less dense article, with a relative mixture, and difference in weights. At the same time, as I told you, any figure of density that I might give, would be purely a guess, and a guess of ten per cent greater specific gravity, as I told you, which of course was a guess at the liquid gasoline, is—

Q. You don't consider the difference between ten per cent, and three or four hundred per cent, a material factor?

A. Liquid gasoline of course is a very different thing from the gas that comes from gasoline.

Q. Naturally, and we are talking about the gas that comes from gasoline?

A. Well my supposition of ten per cent is, as I remember it, from having seen it, was the gasoline.

Q. Well Mr. Gibbs, you are a technical man, and this publication that I have shown you seems to indicate the density of gasoline vapor is three or four times that of air?

A. I think that is probably true; I don't think there is any question about it,—what you have shown me; that the other gas which I confused with the liquid, either in your question or my memory, that I think it is probably three or four times as heavy per cubic foot as the same of air would be; I think that is probably true: Could be.

Q. Well now when you first told us that the difference was only ten per cent, do you say you had something else in mind?

A. I had the specific gravity of gasolines; just gasoline as against the water, for instance, as a standard.

Q. What is the specific gravity of gasoline, with respect to water?

A. I would think that gasoline is heavier than water, by a little; somewhere between one and ten per cent. Very slightly.

Q. Now Mr. Gibbs, we went over this very very carefully together, and I don't see how there is any misunderstanding. Isn't it a fact that when you told me the difference in specific gravity between gasoline vapor, and air, was ten per cent, that that is exactly what you meant?

A. I meant—I told you that I did not know; that my general guess was; and the general guess was based unquestionably on what—the figures I had recalled on the liquid, rather than the air, and vapor.

Q. Now again, speaking from the purely theoretical point of view, we agreed that one gas would rise against the other, when one was lighter or less dense than the other. We agreed as far as that, did we not?

A. If you could hold the two gases together,—I mean if you had a thin membrane that you could hold one,—a balloon, for instance, you could put your gas vapor in one, and the air vapor in the other; and this one was filled with gas vapor, and you brought a balloon in here filled with air, it would rise, the air would rise; and if you could hold them so they didn't mix with each other, that would—your gas vapor would stay at the bottom forever, and would never move, if you could keep the intermixing or any exterior force from causing that to rise.

Q. Right. Now whether one will rise with respect to another, then, depends on their relative densities?

A. And their ability to remain intact.

Q. Yes. Now if you have a gas that is three to four times as heavy as another, you have the heavy gas in a lower layer, the lighter gas in an upper layer, you will have to heat the lower gas sufficiently to expand it three or four times before it would become equal in density to the gas above, if the gas above remained at the same temperature; would you not?

A. You would have to heat it enough—I don't know what the relative rates of expansion of the gas vapor to the air, are, but I think they are the same; but for the purpose of this question—

Q. It doesn't make any difference what the temperature is; you have to expand it three or four times before you get it to the same density as the lighter gas?

A. Assuming it remains intact.

Q. That's right?

A. That is right.

Q. And you would have to assume that the temperature of the lighter gas, during the process, remained the same?

A. What is that?

Q. In order to make the denser gas of the same density as the lighter gas, you would have to expand the heavier gas by heat, three or four times its original volume, while the temperature of the other remained the same?

A. That is right.

Q. Now that fact alone, if you had a layer of dense vapor below, and a lighter vapor above, would tend greatly to restrict the tendency of the two to mix, would it not?

A. There is a tendency to separate them—the difference of specific gravities; that tendency exists, with other tendencies.

Q. Well now do you say that the lower gas would rise above the lower level of the upper gas, before it had been expanded to a point where their densities were equal?

A. Some of it would, yes; eventually, all of it.

Q. And what would cause all of it to do it?

A. The mixing with the other gas.

Q. Well, the heavier gas would have no tendency to rise in the air with the lighter gas, at all, until it had been expanded three or four times, would it?

A. Oh, yes it would. It would become—every carburetor that operates, takes from—takes in gas vapor and air.

Q. By power suction, does it not?

A. Oh, it sucks air, free to get at, and it could take the air alone,—if this question of specific gravity was the controlling factor; you have air—gasoline vapor created in a tiny point; and you have in a great area, air; and as this suction occurs, or absence of pressure, air goes up thoroughly mixed, becomes what is known as a good mixer,—a homogeneous mixture. It is the property,—it is the mixing—

Q. Now will you explain to me,—eliminate outside air currents, or forces,—how the heavier gas—why the heavier gas would rise into the area of the lighter gas before it reached the density of the lighter gas?

A. Very well, sir. There is a tendency in all gases, to mix,—all fluids; just as you would put a tiny bit of litmus on one side of a car tank; and in almost no time, the other side of the tank,—you can pull a test tube full of liquid out of the other side of the tank and it is colored; meaning that this tiny speck of litmus,—a well known experiment in physics. A bit of musk may be put over there, and almost instantly it is mixed thoroughly and has come away over to this place here. Any moving picture theatre you go into, if you will merely gaze in the lighted portion where light hits the dust, and all air is filled with dust, otherwise there would be no light except in the direct ray,—you will see a tremendous turbulence in there,—in the moving picture auditorium; showing that rapid currents of the air, the motion of the air. There are in the bottom portions of the theatre, all kinds of gases,—those breathed from the audience,—of various densities. But

there is a general mixture of all of these things; and as one body, the air currents rises, due to convection.

Q. Just a minute, Mr. Gibbs, I am perfectly willing you should go on indefinitely.

A. I thought you asked me to explain it.

Q. In a moving picture theatre such as you have been talking about, you have ventilation of course, do you not?

A. Well it rises and falls.

Q. Yes; to begin with, you have induced ventilation, of course?

A. Not all of them; some of them do,—most of them.

Q. You have to have some in all of them?

A. Well that is just one general—the moving picture relies on the principle of convection, in the design of its ventilators.

Q. And you don't suggest that there is any serious difference in density between the various gases that are in the air in the moving picture theatre, do you?

A. Why I think there is some, the exact amount I don't know. But I do know this, that if you put a few drops of gasoline in a bottle and smell it, that that gasoline has left its condition of a liquid, gotten out of that bottle, it has become a vapor, it has mixed with air, and has arrived at your nose almost instantly, and it came from the bottom of the bottle.

Q. Do you know the reason for that?

A. Yes, sir.

Q. What?

A. I know that as those gases rise in that gasoline, as they become a gas, that there is also air, and that there is no sharp disaphragm between them, and that there is a mixing; and I know that the difference in temperatures that exist caused the air to pick up, with its affinity of one gas for another,—causes them to circulate in that bottle. The smoke, it is coming out of your cigarette, you can see

it, but you can't see smoke still in this room; and you could not see the air in the bottle still, because of convection. The difference in,—we may say that one bit of the air,—forgetting the vapor, is slightly different in construction from the other bit of air; and that as both are heated below, the lighter one rises, and this turbulence—

Q. Are you assuming that heat is applied to the bottom of this bottle that you are talking about?

A. Yes, sir, heat is applied by the changes of temperature,—I mean, by heat, temperature that exists in all places on earth. There is probably different heat here, from here; but as air moves without friction, or almost without friction, you have it in a state of instability. To prove that, I performed an experiment as I have described. What happened is, that ventilators did exist in the glass without ventilators; that the air established itself, the colder part probably by the outside of the glass; the colder area, perhaps went in, and the hotter part came up in a natural ventilator in the middle, with no obstruction. As this turbulence, like the foam on soda water, for instance,—as this turbulence went over the top of the glass, the draft or air swept that away; and as air and gaseous vapors do not occupy themselves in straight lines that are fixed, but they mix with each other, due to the fact that convection causes them to mix. There is convection going on at all times in gas vapor alone. If for instance you had a bottle with gas vapor in it, subject to heat, maybe the coldness of this table now, and the heat of the table later, and could put smoke or some dust inside of that, it would be very turbulent, due to convection. Now if you had turbulence in a liquid, we will say, assume a condition where two inches of the bottle was gasoline vapor and three inches of the bottle was air, you would have rapid turbulence in each one of those two strips, and there would be a mixture where they would go together. And with the mixture, which is recognized fact, that gasoline vapor mixes with air, otherwise you couldn't run an engine.

Q. Well of course your gasoline vapor and your air are mechanically mixed in an engine, are they not and they remain mechanically mixed for an appreciable period after mixture, so that this revolution or turbulence of the air operating under this principle of convection, and your gas operating under the principle of convection, where they do mix they remain mixed for an appreciable time, as is proved by the presence of the mixture from the carburetor to the engine. If they did not remain mixed for some period you couldn't go to an engine that had been suddenly stopped, and apply a spark, as much as an hour later, and have an explosion. When you once mix vapor with air, you have something that is fairly stable. I don't mean to say that they won't dissociate themselves, although I don't know that they will to any marked degree, —quickly.

The Court:

I think we had better deal with solids a little bit now, get away from gases.

(Thereupon hearing was adjourned, to be resumed at 2:00 o'clock P. M. of the same day.)

Miami, Florida, November 15, 1939, 2:00 P. M.

Afternoon Session.

3698 Thereupon: GEORGE W. GIBBS a witness in behalf of the Respondent Phipps, resumed the stand and was examined and testified further as follows:

Cross Examination (Cont'd.)

By Mr. Matteson:

Q. Mr. Gibbs, you were saying this morning that a mixture of air and gasoline vapor in a cylinder of a motor

exploded by the carrying of a spark an hour later, is that what you said?

A. I said approximately one hour later; I have seen it done.

Q. If that were so, the car would start when you turned on the ignition, wouldn't it?

A. It is possible for it.

Q. You never knew one to do that?

A. I say I have known motors to start like that.

Q. You were also saying something about the affinity of air for gas; do you say that there is such a thing?

A. I say that in the presence of a turbulence at any time there is a mixture which remains to some extent—which remains to a large extent stable, not permanently stable, but for a period of time.

Q. If you had such a mixture of a heavier gas and a lighter one, if you left it awhile, it will settle out?

A. Not always; for instance, oxygen and nitrogen remain stable.

Q. Instead of making the question general, with reference to gasoline vapor and air, if you have a mixture of the two, the gasoline vapor will gradually settle out of the air, will it not, if there is no turbulence?

Q. Yes.

A. If there is no turbulence?

Q. Yes.

A. And no convection operating?

A. It may.

Q. Well it would, wouldn't it?

A. My experience shows that if it does, it is a very slow process; I have no experience that would indicate that it would.

Q. You spoke of some gases that had exploded in a gasoline motor after it had been standing for an hour; you have never seen such a thing to occur after it had been standing twenty-four hours, have you?

A. The reason—no—the reason would not be the lack of instability; it would be the fact that the piston rings changed the conditions in the engine; allowed the mixture to run out.

Q. Unless there is some fluid in the motor, the piston rings won't leak, will they?

A. There is practically no such thing as a tight piston ring; there are piston rings which produce tightness. One of the claims of the piston ring manufacturers is that after a long period of time the engine will suddenly stop, due to the fact that the piston rings were alleged not to leak.

Q. Getting back to this question of affinity; do you say there is affinity in air and gasoline fumes?

A. Under particular conditions there is a tendency for a diffusion of gases, which are within the same walled vessel.

Q. And that, however, is a mechanical mixture, either through convection or some other cause, is it not?

A. Probably; I am not chemist enough to tell you.

Q. You do not suggest there is any affinity between air and gasoline fumes, do you?

A. You mean any chemical affinity? Would you give me your definition of the word "affinity".

Q. As you use it; you suggested that there was some affinity between them; what do you mean?

A. I mean a tendency for the mixing of them for some reason.

Q. And that to which you refer is a mixing through mechanical means?

A. That is my opinion; it is either through mechanical means or maybe through some chemical process, of which I am not familiar; some chemical process that might set up. I do know that gases do mix.

Q. Of course it is true, is it not, that the explosive range of gasoline vapor mixed with air runs from about one and one half percent to six percent?

A. Six and one half percent.

Q. Yes.

A. Depending somewhat on the gasoline. You mean explosive mixtures?

Q. Yes.

A. Yes.

Q. And consequently diffusion up to the point where the mixture becomes leaner than one and one half percent, makes the combination more dangerous, does it not?

A. Not if it is too lean.

Q. Perhaps I don't make myself clear: pure gasoline vapor not mixed with air, is not explosive, is that right?

A. No, but to answer that I will have to have your definition of the word "explosive". It is combustible and will burn, but it will require a mixture of oxygen to have it turn rapidly enough to call it explosive, what is known as explosive.

Q. Let me get this right: if you had in a container, say in a cylinder of a gasoline engine, gasoline fumes with no air at all, pure gasoline fumes, and you set a spark to that mixture, would anything happen?

A. It would be fire-proof and nothing would happen.

Q. In other words, you would have to have some air present in order to have any burning at all?

A. You would have to have the oxygen that is in the air in order to cause combusion.

Q. So that as you add oxygen in the air, in mixture with gasoline fumes, the more air you bring in the more dangerous it becomes, until it passes the limit of one and one half percent?

A. Ninety-eight.

Q. Of ninety-eight?

A. Ninety-eight one half percent.

Q. Yes, if you look at it from that way; if it gets to be more than ninety-one and one half percent air, it becomes progressively more dangerous as you add air to it, is that right?

A. Yes, but you would have to have up to ninety-three or ninety-two or ninety-one and one half percent.

Q. When you reach ninety-three one half percent?

A. To ninety-eight and one half percent.

Q. In that range you get a violent explosion?

A. You get a most explosive mixture.

Q. Below the ninety-three one half percent you get a burning, is that right?

A. Not burning. I refer to the burning as a slow combusion, based on the rapidity with which oxygen can be supplied; for instance, if this were a solid tank of gasoline vapor and we applied a match here, that would burn as fast as the oxygen in the air could reach it, and finally burn up slowly; in order for it to explode, the oxygen must be there ready for oxidation at all points within the wall.

Q. Now we were talking about the mixture of gases where the air is mixed with gasoline fumes. In such a case, the oxygen would be present all through the mixture, would it not?

A. You mean for a homogenous mixture?

Q. Yes.

A. If it is homogenous there is the same amount in one tenth of a cubic inch as there is in the whole business.

Q. Of course; this sort of situation we are talking about is where the two gases become mixed, is that right?

A. Yes.

Q. Now the extent of the burning will depend upon the amount of oxygen available in the mixture?

A. You mean the violence of the explosion?

Q. No; I say the extent of the burning; I am talking about a situation where you have less than ninety-three percent of air. The extent of the burning will depend upon the amount of oxygen present?

A. Where you have less than enough oxygen.

Q. Less than enough for an explosion, but you still have oxygen in the mixture?

A. No burning at all in that instance.

Q. Let's talk about a situation where we have a mixture that consists of ten percent gasoline fumes, gasoline vapor, and ninety percent air; do you say there would be no burning at all in a mixture of that kind?

A. No.

Q. No burning at all?

A. You might possibly get some burning if it were hot enough, but in an open room there would be no burning.

Q. In other words, if into a container that contained ten percent gasoline vapor and ninety percent air you introduced a spark or flame, you would have no burning at all?

A. No.

Q. Why is that; how do you account for that?

A. By the very nature of the answers to the first question; the range between ninety-three one half percent and ninety-eight percent is the only explosive range.

Q. I am not talking about explosions at all; I am talking about burning. You say that if you had a mixture of ten percent gasoline vapor and ninety percent air introduced into a flame or spark, you would have no burning?

A. I would say there is no burning, but if you had some form of mixing or burner that would add oxygen to where you get in that range, it would burn; it throws it back into the same range to where it is diluted or overrich, and in neither of these situations is there danger of burning or explosion.

Q. Neither burning nor explosion?

A. No.

Q. Do you understand, Mr. Gibbs, that I am talking about a mixture of gasoline vapor and air which contains oxygen, all mixed up together, so that it is, as you call it

a homogenous mixture, and you say that a spark or flame will have no effect whatever on a mixture of that type?

A. No.

Q. Can you refer us to any treatise or text-book that would give us any information on that subject?

A. Merely the information brought out in the definition or description of the explosive points of the mixture.

Q. Do you recognize no difference between explosion and burning?

A. Oh, yes, I can; the burning is the application of the right amount of oxygen to cause combustion; burning is slow where the air can't get at it; you may take a room full with that rich gas and pour it out to where the proper amount of oxygen could get it, then it would burn; but if you only poured it in the presence of heat, with no better mixture than you had, you would not get burning in my opinion. I never performed the experiment; I am just giving you my opinion.

Q. Would your answer be any different if you had this mixture and it was open to the air, so that air could be admitted gradually?

A. If the air could be admitted, I think it would soon reach the place where explosion or burning would be possible.

Q. In other words, if you had the bilge of a boat filled up with a mixture of ten percent gasoline fumes and ninety percent air, and a spark or a flame were intrcduced into that mass, what would happen then?

A. Nothing.

Q. Nothing at all?

A. If it was out of that range.

Q. You understood my question was referring to an open bilge, did you not?

A. Yes, sir.

Q. So that there would be air within the mixture I am talking about?

A. That would be a homogenous mixture, ninety percent air and ten percent fumes.

Q. I understood you this morning to say that the only purpose of ventilation in a gasoline vessel in the engine-room was to furnish air for the men and air for the engine, is that right?

A. Well, it has, of course, general purposes, allied purposes; if there is some disagreeable odor of gasoline—in other words, the sole purpose of ventilators is to change the air, cool the air or settle the air in a vessel. That is what I am trying to say.

Q. Could you see any purpose in applying ventilators to a gasoline boat for the purpose of removing gasoline fumes from the lower parts of the vessel, or in the bilges?

A. I assume that it has windows—ventilators are the result of earl use, even long before the use of power inside of boats, internal combustion engines, before the days of internal combustion engines.

Q. You say that such things are no longer used?

A. No; I say that they are used for a very important purpose. They may assist slightly in some cases, but as a means of removing gasoline fumes, cowl ventilations are not as effective as people think they are; they are most inefficient, but assuming you have windows now—if you have no windows, then they are essential; you must have openings.

Q. Now do I understand you, Mr. Gibbs, from the point of view of a designer, that it would be impracticable to design ventilators for the purpose of removing gases from the bilges, because you couldn't determine how much gas you might have to remove?

A. No. I don't remember that I said that. I can tell you my opinion about that.

Q. You were asked some questions by Mr. Underwood and you answered them, and the effect of your testimony seemed to have that import, as I gathered it. Now, Mr. Gibbs, I want to be sure we understand each other on it.

Do you say that it would be impracticable to design ventilators for the purpose of removing gases from the bilges and lower parts of a gasoline boat, because it would be difficult to determine how much gas you might have to remove in a given time?

A. I would say that it would be impracticable to desgin a ventilator that would remove an abnormal condition, of gas inside of a boat.

Q. What do you call abnormal; what is that?

A. Like in the case of a collision or where some heavy piece of machinery is dropped on the gasoline line—a condition like that; you might have a leak that might dump the contents of a container into the bilge of your engine room; force-draft ventilators in my opinion could be designed which would be much better than windows—if you have no windows you could use what is called a ventilator.

Q. I think we can readily agree on that, a condition could arise which would precipitate the contents of one of these five-hundred gallons tanks in the engine room bilges,—nothing would take care of that. I am not talking about a case of that kind. I am talking about a case that might arise where there is a slow leak in a gasoline tank or feed line or some connection resulting in gasoline fumes settling in the bottom of the ship in a determinable quantity: do you say that it would be impracticable to design ventilation to take care of a situation like that?

A. I think that you could design ventilation which would aid the situation if such a situation resulted, but that a designer would not contemplate, in the design of his ventilation, such an accident, because the amount of it is undeterminable. The assumption that you are going to have gasoline leaks in a boat assumes that you don't know how to design a boat or can't properly construct it to start with,—except in the case of an accident—

Q. Your rule of design then is to make your tanks and your connections and your gasoline lines so perfect that

throughout the life of the boat that there will be no possibility of any leaks occurring, is that right?

A. Yes. Of course you provide windows and other means of ventilating such things.

Q. Now as a matter of fact, Mr. Gibbs, you know that there is no gasoline boat in existence that does not sometimes have leaks in her feed line connections or somewhere in the gasoline system?

A. No, I don't know that at all.

Q. Did you ever know a boat throughout her life that you never had to tighten a connection to take care of a leak in the gasoline at any time?

A. I know of a great many boats that I don't think ever had a wrench on that important thing known as the fuel line.

Q. You suggest that such a hazard is so uncommon that a good designer would not take it into consideration at all?

A. I think that a good designer would take it into consideration and he might try to apply a remedy for any normal thing that could happen.

Q. What do you call normal?

A. It may be that in fueling they failed to shut the gas off and it might slip down and jamb through the window or in some way get in the boat. I think that can happen. I think you want a system of ventilation that tends to keep the air cool; maybe that is your point, or my point; to keep the boat cool and supply the air for the engines, and I think that is a far greater service than the clearing of the room of fumes; I might say that the ventilation system is not ordinarily designed with the view of taking gasoline fumes out of the boat. In recent years there has been considerable work done on power methods of clearing a boat under the circumstances that you say might happen—leaks—but the ventilation I am referring to is non-mechanical not power driven ventilation.

Q. Of course there are other ways besides leaks that you might anticipate that gasoline would get into the bilges of a gasoline boat?

A. Yes.

Q. You referred to the practice of washing down engines with gas?

A. Yes; a bucket turns over.

Q. Or the bucket turns over?

A. Yes.

Q. The handling of gasoline in an engine room may create fumes?

A. Yes, sir.

Q. For instance, you referred to this five-gallon can—if it were repeatedly filled under this drawoff line and discharged outside of the boat, you would have a discharge of gasoline fumes in the engine room every time the gasoline can was refilled?

A. If that was filled outside of the engine room?

Q. I said if it were filled repeatedly in the engine room?

A. In the engine room?

Q. Yes.

A. You mean from the drawoff cock?

Q. That is what I said.

A. Yes.

Q. If there had been times that this gasoline can were placed under the gasoline drawoff and filled with raw gasoline, which was delivered outside of the vessel, and the can brought back and put under the valve again, you would have repeatedly discharged the gasoline fumes in the engine room each time that process was completed?

A. Where from?

Q. From the can itself?

A. No.

Q. You say no?

A. Yes.

Q. If you filled a can like that with gasoline and poured the gasoline off and put the can down on the floor, you would have a can full of gasoline vapor?

A. That depends on where you pour that gasoline off. Do you mean that you pour the gasoline off inside of the engine room?

Q. No, outside the engine room.

A. If you pour the gasoline can outside of the engine room you would put the bottom of the can higher than the top of the can in order for it to pour off, and gas vapor being heavier than air, it would pour out and the air would take its place, so you would carry back into the engine room a can filled with air.

Q. Pure air?

A. There may be in that case some intermingling, but it would be pretty pure air; that is, if there is anything to the weight theory.

Q. I am ready to assume with you, Mr. Gibbs, that when you pour off the contents of a can full of gasoline, that the whole contents of the can goes out, including any vapor in it at the time, but you do have that can and though you empty it, you do have that moisture of gasoline, do you?

A. Not very long, if you carried it outside and dumped it; you might have an odor, but it does stay long.

Q. It doesn't stay long because it evaporates?

A. Yes; it evaporates very fast.

Q. Evaporates inside of the can, doesn't it?

A. It evaporates while it is going out and while the air in coming in; as that stuff flows out it is followed in with air; it is just this turbulence right over the top of the can; the air rushes up over the top and replaces it. Now there is some intermingling of the stuff, but the air would go in through the top, would go in through the top of the stream of the gasoline, and would dry it up. I don't think you would carry back even a moist can, probably not even a damp can.

Q. Then I take it, according to you, that after you had discharged the contents of the can of gasoline and turned it upright again, it would be perfectly safe to drop a match in it?

A. That depends on the interval; it might be perfectly safe; it would in a very short time be perfectly safe.

Q. Mr. Gibbs, would you be willing to take this can down to the gasoline station around the corner and fill it with gasoline, and then empty it out and let it stand for one hour and then drop a match in it?

Mr. Underwood:

I object to that, if your Honor please; I don't think that Mr. Matteson—

The Court:

Overruled. Answer the question.

A. Would I be willing to do that? I think I would.

Q. I hate to ask you to do it, Mr. Gibbs, but—

A. I will state that I have already done it, but it was after a little longer period than an exact hour.

Q. Then if a gasoline tank has been open to the air through one or more of its openings for a reasonable length of time, I take it that it would be perfectly safe to apply a spark to it without any particular preparations at all?

A. Did I say that?

Q. I am asking you.

A. No.

Q. Why not?

A. In the handling of a case like that you exercise every known precaution, in fact, in all cases; and a shop like ours, like any other good shop, takes no chance on leaking gases. I can conceive of conditions that would cause a gas to be non-homogeneous, where one little section of the gas is all right and the other isn't. You might walk in an underground cellar that has been closed up, and walk

all around, and then all of a sudden certain conditions arose which would get to a narrow range of explosive mixture which accentuates the rest of it. Now in a large ten thousand gallon steel tank that they wished to use for gas, green gas, we were asked to make it gas free in order that certain repairs could be done, and the rule for that is to run steam through it 24 hours; after that we fill it completely full of water; when that is done we put a heavy pressure on it, and if leaks show up anywhere, we caulk the leaks. We have just caulked some oil leaks in a very expensive steam yacht, and that has been done by filling the compartment with water completely, and the leak has been repaired below the surface of the water; in other words, the void where the gas or fuel was has been displaced by water or by something else, and when you do repairs you take into consideration the fact than an explosive mixture might be lurking at some point, and when confined it is pretty dangerous.

Q. Then you don't thoroughly trust your theory of ventilation through convection, do you?

A. I do trust it in a given element of time. In a given length of time all gas would eventually leave; practically all gas would eventually leave a pace that wasn't confined.

Q. What element of time would be required?

A. What element of time would I require?

Q. Yes, what element of time would you require?

A. Depending on the amount of the leak; if it was the kind of gas that would come off of that—I don't know how it is referred to—but with these drain cocks the element of time would be very, very little, because the small amount of fumes that would come out of that tank would practically mix with the air and be wafted out like smoke coming off of a cigarette.

Q. I think you must be talking about something different from what I said. I am talking about a tank that has to be worked on, not any valves anywhere.

A. Oh.

Q. You said that any gasoline fumes in a tank that had been used for gasoline would be dissipated under your convection theory?

A. In time. But vents in a gasoline tank are extremely small at the top—sometimes at the bottom—the holes in the average gasoline tanks are extremely small.

Q. Now you have got holes in the tanks of the Seminole that have been open for a period of three or four years; would you consider it was safe to work on those tanks without preparation of the tanks?

A. Did you say for a period of years?

Q. For the period from 1935.

A. I think it would be perfectly safe. I know as a matter of routine that we wouldn't allow it done in our plant and I don't think any other boatyard would.

Q. Why?

A. Because when we permit it to be done today on my judgment, and tomorrow, 20 minutes after the gas left the tanks or the Seminole's lines—we have rules and fire drills.

Q. What is the purpose of these rules?

A. These rules are to leave nothing to the judgment—nothing of that nature—to anyone, but to go through the motions of complete inspection through displacement and steam them for a great period of time.

Q. You have described to us the method of preparing a tank for heat work by the application of steam for 24 hours?

A. Yes.

Q. That is the usual requirement for such work, is it not?

A. Yes, 24 hours is the usual requirement.

Q. You would not work on a tank such as one of these in the Seminole in your yard without having gone through that process of steaming it for 24 hours, is that right?

A. No, I would: it depends on the element of discipline and routine; I would not hesitate to work on that tank

after we had done two or three other things to it, which would not take us as long as 24 hours; the 24 hour period was in order to make it more than sufficient. Where human life is at stake, with the abnormal things—putting this intense heat in a *vented* surface. Now we put water in the tank and work on it below the level of the water, and that is in order to prevent us from burning through and getting a flame inside the tank. It is only for the outside crevices that we heat.

Q. You caulk a tank that is partly filled with water, do you?

A. Oh, yes.

Q. You wouldn't burn out a rivet with that method?

A. No, sir. If there was water in it you couldn't because the water would—you could get intense heat enough to do it, but that is not normal shipyard practice, at least none that I am personally familiar with.

Q. Now I think that you said engines of the type of the Seminole, as large as the engines of the Seminole, require priming?

A. It is possible to start them perhaps without priming, if you have enough air, but the practical thing is to prime them.

Q. As I understand your testimony, Mr. Gibbs, you said that in any vessel where you had gasoline engines as large as those in the Seminole, that it was necessary to make provision for priming the engines, is that right?

A. Oh, yes; it is a practical operation and an engine builder builds them that way.

Q. And that is true of engines built today as well as of engines of the age of the Seminole's engines, is that right?

A. Yes, every internal combustion engine may be primed. They are not primed as much as they were for certain mechanical reasons I will explain, if you wish me.

Q. Don't bother about that. Wherever you have engines of the size of those on the Seminole it is necessary to make provision for priming the engines?

A. You are entirely right.

Q. I think you said that you built a number of vessels in your yard, gasoline propelled, with engines as large of larger than those in the Seminole?

A. Yes.

Q. You say provision was made for priming with respect to those engines?

A. Yes.

Q. Well, what vessels have you built up there recently with provision for priming?

A. Well, the vessels that we have built recently are Diesel engines; in fact, nearly all "engines" that we are building is Diesel, but we are building a tugboat with a hundred horsepower gasoline engine with provision for priming it. I don't know the name of it; the owner will give it its name.

Q. Why is it that Diesel engines are coming into more common use than gasoline engines?

A. Because they run on a cost of about—anywhere from about one-fourth to half the cost of the gasoline engine, and because they are more free from fire hazard.

Q. Why is that?

A. Because they burn oil which is hard to cause to burn when it is locse.

Q. Why is there this difference in burning quality between the oil used in a Diesel engine and gasoline?

A. One is more volatile, and the other is the tendency for the gas to get away. I have known ships with oil in the bilge, heavy oils, where people are smoking and where there was a Scotch boiler running, as a matter of fact.

Q. The fire hazard is substantially less with a Diesel boat than with the gasoline boat?

A. Yes, sir.

Q. What is the flash point of the oil used in the Diesel engine; can you tell me?

A. I don't know; I know generally that it is higher than that of the gasoline and the more volatile fuels.

Q. About what is the flash point?

A. I don't know that: I am not a chemist; I do not know their chemical contents, but I know their general properties, and for the specific figures applying to those properties I would ask a chemist or the man responsible for its manufacture, regarding those things.

Q. Of course if a gasoline engine were perfect in all its parts there would be no fire hazard in connection with a gasoline engine, would there?

A. You mean even in the filling of the tanks? If there were no possibilities of any leakage of gasoline in a gasoline boat, there would be no fire hazard.

Q. And if a gasoline boat is properly—

A. Just a minute; I would like to correct that. She might get into a general conflagration, in which case she would be more dangerous than any other type of boat from outside sources.

Q. You were speaking of filling; the filling pipe is, of course, a part of the general installation, is it not?

A. I wasn't referring only to that. I have had a great deal of experience with the operation of boats for both pleasure and commercial purposes, and very often a man will go to a filling station or depot and get a can of gasoline and put it down in his boat, and kicks it over and drops it; so with the Diesel job, if it was Diesel oil, and you kicked it over in the bilge, you would have very little danger of fire or explosion in the room. You might be working on your gasoline and had one of these big cans and you might drop it, one of these square cans; I have known this thing to drop and crack a soldered seam and you put soap on it to stop that leak. If you are handling gasoline aboard a gasoline boat, you have a boat that is more dangerous, more suseeptible to fire hazards; than one handling something which has a very low volatile point.

Q. Below the deck, I take it, there would be no difference in the danger between the Diesel boat and the gasoline boat?

A. Assuming there were no leaks?

Q. Yes.

A. Yes, if there were no leaks.

Q. I gathered from your previous testimony that leaks in a gasoline boat were so unusual that it wasn't necessary in the design of a boat to make any provision for removal of fumes that might come from that source. Do you adhere to that testimony?

A. I think you gathered something that I didn't intend to testify. I said that the lines could be made tight, but that it would be impossible to anticipate just what kind of a leak would occur, and that ventilation provided for air to the engine, which is many millions of cubic feet, and that it is quite sufficient to do that with ventilators of the non-power type.

Q. Now, Mr. Gibbs, isn't it a fact that the possibility of leakage from gasoline lines or connections below deck is a well recognized and serious hazard in gasoline vessels?

A. Well, it does happen in vessels, but not in good ones, but there is no apparent need, no need, to be apprehensive for leaks in lines that are properly designed and installed. Some vessels are like junk automobiles and fires occur from things of that kind.

Q. If a gasoline did occur in a vessel would you call it a junk vessel?

A. I would have to know the cause of the leak.

Q. Well, in the ordinary course that is nothing extraordinary to understand?

A. Well, it would not be an unknown case. We could drop a hatchet or hammer on the line, and you could go there tomorrow or any other day and rap on a pipe and cause a leak, but at that time you could take a pump and dry your bilge out and repair the leak. One of the most dangerous things known to life is a gas stove, and those lines are put in where even they can't be inspected and they never leak; if they are tight to start with, they remain tight. There are cases where perhaps that doesn't

apply, but no one ever thinks to have an inspector come out to see whether their gas pipes are leaking.

Q. Would you call seepage from such connections such an extraordinary hazard that it doesn't have to be anticipated at all?

A. It is a most unusual hazard; in other words, the primary purpose of the ventilator would take care of any seepage that occurred, and you wouldn't add additional ventilation to take care of such leakage; if you had a major accident which created a leak, it could be corrected by the repair of the leaking part, but a ventilator—oh, I think what I have said covers it.

Q. Do you build gasoline pleasure vessels?

A. Oh, yes.

Q. Name one, for instance?

A. The Fortuna is one.

Q. What size is she?

A. 80-foot houseboat, similar to the Seminole.

Q. What sort of engines has she got?

A. Murray & Tregurtha.

Q. Do you build any stock type of pleasure vessel?

A. We built a great many—our only stock boat today is a steel tug which may be operated with either gasoline or Diesel, at the option of the buyer; and a power seaskiff which we make in great quantities, which are gasoline driven.

Q. Are those vessels piped with brass pipe?

A. The little engines are practically without piping; they only carry a gallon, and they have a small copper tube from the top of the carburetor.

A. I didn't ask you that; I asked you whether they vessels are piped with brass pipe.

A. They are little one-horse seaskiffs, and the whole thing is built in that—there is a small copper tube that goes from the tank to the carburetor.

Q. On the gasoline tug boats what do you use?

A. On the gasoline tug boats we use brass pipe, and in the Diesel iron pipe.

Q. Iron pipe?

A. Yes.

Q. Of course there is considerable distinction between Diesel oil and gasoline as to the pipe to be used, is there?

A. Yes.

Q. What is the difference?

A. The difference is in the corrosive action of the two. Diesel oil is very bad for copper tanks.

Q. Why is that?

A. Probably due to the presence of sulphur in the oil.

Q. And you get sulphur in gasoline to some extent?

A. I think some of it does have it; it is not supposed to be there, but some of it has it but nothing like the extent to which it is in the crude oils.

Q. You will find some of it in all gas?

A. I think it is possible to find some small quantity in gasoline, but very small.

Q. Has the Fortuna got copper tubing or copper piping in her?

A. I don't remember that detail, but unquestionably she would have had it and brass pipe when she came from us.

Q. Do you know where she is now?

A. No.

Q. Can you tell us the name of her owner?

A. Her owner is dead; it was Mr. Richmond Talbot of the Port of New York.

Q. Have you belt some gasoline propelled tank vessels?

A. We built the Leslie, at least it was built under our supervision, and she had large Palmer engines with brass pipe; I remember that distinctly.

Q. Was she a tank vessel?

A. Yes.

Q. What size?

A. 110 feet or thereabouts.

Q. Who was she built for?
A. Built for the Gulf Refining Company.
Q. When was she built?
A. As near as I can recall, about 1914 or 1915.
Q. Have you built any tankers recently?
A. With gasoline engines?
Q. Or steam.
A. Nearly everything we have built has had Diesel engines, passenger or otherwise, with the exception of government vessels, and we have built a great many of those.
Q. What government vessels have you built with gasoline engines recently.
A. We built 16 rescue boats of 200 horsepower Kermath gasoline engines.
Q. What size were they?
A. 30-foot boats, about 26½ miles.
Q. Are they open vessels?
A. They are semi-open; the engines are under cover, sort of a box, and the pilot steers from the semi-open house and the forward part of her was closed, where he can go in and sleep.
Q. Have you built any larger vessels than that for the government?
A. Yes, we built some 80-foot, 30 mile boats, 1600 H. P.
Q. Were they gasoline driven?
A. Yes, sir.
Q. They were for the costguard, I understand?
A. That is right; they were for the Coastguard.
Q. How recently did you build those?
A. Just a little while ago; just a little bit prior to the last contract on the rescue boats.
Q. Are these 80-foot boats in service now?
A. Yes.
Q. Any of them in this vicinity?
A. I don't know.
Q. Do you know the names of any of them?

A. They only have numbers; they have no names. They are known as 80-foot, 30 mile boats; I don't think there are any others; I think we are the only ones that built them.

Q. They have an engine room, do they?

A. Yes, they have an engine room.

Q. And their engines require to be primed, do they?

A. Oh, yes; no, they don't; there is provision for priming but they don't—none of these boats would I say would fail to start unless primed.

Q. But, as I understand, it was necessary in connection with them to make some provision for priming?

A. That is right.

Q. What make of engines were they?

A. Vimalert. Mr. Matteson, may I make a statement about priming and avoid a great deal of discussion later on.

Q. I think we understand each other, however, I have no objection.

A. What?

Q. I have no objection, but I think we understand each other.

A. Well, priming and choking are the same thing, answer the same precise purpose; you may either take gasoline and pour it in the head or you may, if you have enough electricity, cause a vacuum, a high vacuum, in your intake line and increase the suction on your gasoline and take a very rich mixture into the head of your engine, which serves the purpose of priming, however, all engines that act through a choke, as does the automobile, have means of priming, including the present day automobile.

Q. I am not sure that I can understand you. I understood you to say that all engines of this size required priming, and we are talking about only one thing and that is priming through a petcock; for instance, take these engines here, the Vimalerts, is there provision made there for priming through the petcock, a petcock?

A. A provision for supplying gasoline through the heads with a choke, which is the same general thing; it would seldom be done.

Q. Nevertheless, provision was made for priming through the petcocks, if that were necessary?

A. On that big engine it was necessary then and would be today if such an engine were built.

Q. And there was provision for that on these 80-foot boats you spoke of?

A. Yes, sir.

Q. How were the gasoline tanks located on those 80-foot boats?

A. The exact detail of that I don't remember.

Q. What kind of tanks did they have?

A. They were of an everdura metal, a metal thought to be the very finest form of metal, but a metal that I understand today is not so highly considered as it was then.

Q. That is a non-ferrous metal?

A. It is a combination of silicon and bronze; it is called silicon bronze.

Q. That would be non-ferrous?

A. That is true.

Q. What shape were those tanks?

A. I don't offhand remember that.

Q. What was their capacity?

A. I don't remember.

Q. What kind of piping connections were there in the tanks and the motors?

A. In those 80-foot boats, as I remember, was tubing.

Q. Copper tubing?

A. Yes, rather heavy copper tubing.

Q. They were built according to the Coastguard specifications, were they?

A. Yes.

Q. And the specifications called for copper tubing, did they?

A. In that instance they were built according to the Coastguard specifications. We had nothing to do except carrying out the specific specifications.

Q. Did they have drawoff valves in the engine room?

A. Those particular boats, I don't think they did.

Q. What provision did they have for ventilation in the engine room?

A. They had mechanical blowers; Yes, I know they did.

Q. How were they installed?

A. Through a row of conduits and electric meters; the entire ship was mechanically ventilated with force-draft.

Q. And these blowers; where did the gas go; go to the bilges?

A. That detail of those boats I don't recall, but most likely they did. The floor part was very high, and the engines sat up on beams and carried the—

Q. To the best of your recollection they had forced ventilation to the bilge?

A. I am not prepared to make any statement on that at all; I don't recall the arrangement.

Q. Could you give us the specifications of those boats?

A. I don't think there would be any objection to it, but we are not giving out any specifications without permission of the government at this time.

Q. I understand that you have not built any gasoline tankers lately?

A. Not within the last few years have we built any.

Q. So far as conditions in the engine room are concerned in a gasoline driven motor tanker, do you say that the requirements for ventilation for safety are any different than they were on the Seminole?

A. You mean installation, complete installation?

Q. Yes.

A. I would say entirely different.

Q. Why would there be any difference?

A. In the first place, a tanker has but one duty to perform, and the Seminole had many duties to perform; the tanker has a skilled crew, with no passengers, and the Seminole had passengers and a crew that was unskilled and undisciplined, as well as a crew that was under no supervision of the government in any way.

Q. I gather from that, Mr. Gibbs, that the requirements for safety in construction would be higher in a vessel of the type of the Seminole than there would be in a tanker, for the reasons that you have given; is that correct?

A. In which would be higher?

Q. In the Seminole than in the tanker?

A. Yes, they would be different; the question of that drawoff valve I think was peculiarly essential in the Seminole as compared to a gasoline tanker, although in that particular thing a drawoff valve would have been all right there, in fact, in any boat with gasoline engines, if it were for priming alone I think that would be a good thing.

Q. And you would say that a drawoff valve would be as proper in a tanker as it would on the Seminole?

A. If there were a danger at all in connection with it, with the drawoff valve, it would be less indicated in a tanker than in the Seminole, because you don't have to handle gasoline for purposes other than the priming of the engines. I think that there is some slight danger to the drawoff valves for gasoline in the engine room, provided you could completely do away with it. Now you could put enough batteries in a tanker to speed the engine so that the inefficient method of choking would give you your gasoline for priming. These engines that were air-cooled—and that was the only way at the time that was developed—had a very limited amount of air; it is not practical to have much, and they had to start, without the necessity of the slow process of fueling, which involves a large amount of machinery and air compression in order to suck up a little richer mixture than is otherwise used.

With the tanker I would probably go to the expense of installing the engines and eliminating what you might say was the smallest hazard, because when a tanker explodes in a congested area it explodes many thousands of gallons of gasoline, of fuel; it is carrying a much more dangerous cargo, than the human or just pleasure passengers.

Q. I take it that you agree that there is some degree of hazard about a drawoff valve; is that right?

A. Oh, yes.

Q. And in your opinion that hazard, if it existed, would be greater on a yacht than on a tanker because you don't have this experienced personnel on the yacht as you do on the tanker?

A. Not only that but as a practical proposition a tanker is a valuable thing, earning a great deal of money, and goes far more than a yacht, and under such an arrangement you could go to the electrical device which would perform the operation of priming.

Q. Assume for the moment that we have drawoff valves in both of them.

A. If you had the same kind of an engine I would say that even in the tanker a drawoff valve would have been a satisfactory way of getting that priming fuel.

Q. As I understand it, the Seminole customarily carried fuel in her tanks, not only for herself but for the purpose of supplying gasoline to other vessels that might be in her company?

A. She was a mother ship of a fishing fleet, as I understand it.

Q. In other words, she carried fuel not only for her own consumption but for the consumption of other vessels?

A. Yes, sir.

Q. And to that extent she might be regarded in the sense of a tanker herself, is that right?

A. Well, no; she carried a small; we know what she carried and we know what a tanker carries; a tanker car-

ries her entire displacement with fuel, every available inch of her is tanks.

Q. 2000 gallons of gasoline is a very substantial quantity of gasoline, and if it is set free and on fire by explosion or other accident—

A. Well, it is not as great a quantity as ten times that; it is a considerable amount of gasoline, but nearly all yachts carry that much. The Seminole is not materially different from other yachts; the Seminole had no range, no distance to go; the average yachts takes fuel to carry it for a great distance where gasoline cannot be obtained, so that she can return.

Q. The hazard to lives on board and property in the vicinity, you would not minimize in the case of an accident to a vessel like the Seminole?

A. I would not minimize it.

Q. You would not?

A. She would be like any other yacht lying at a dock; her fuel would be less than in some yachts.

Q. You were drawing a distinction between a tanker and a yacht like the Seminole, as I gather it, based on the degree of hazard in the presence of a relative quantity of inflammable oil carried on board?

A. Yes, I would say the greater the weight of the amount of combustible fluid the greater the hazard.

Q. By the same token, Mr. Gibbs, you would not say that the amount of gasoline carried on the Seminole was a negligible hazard, would you?

A. Well, it was the same hazard that would exist in any yacht of her size, no greater.

Q. Is that right?

A. Yes; most of the oil, as I understand it, was for the use of outboard motors which would take as much as two gallons at one time, maybe five, the big ones ten.

Q. Are you familiar with the government regulations with respect to the construction of gasoline propelled tank vessels?

A. No; I know generally some of them.

Q. I gather from your testimony that you would not hesitate to install on a tank vessel a drawoff vessel.

A. I would hesitate if the Department of Commerce refused to let her sail if I didn't obey one of its rules, and the first thing I would do would be to get the requirements, providing that the oil company giving us the contract asked us to do it, but in all our work, in nearly all of it, we merely work to blueprints, and those things are looked after by the designer. Where we design a ship, or collaborate with the architect employed to design a ship, we find out what the requirements are, whether it is Lloyds, the Department of Commerce or the Republic of Honduras.

Q. Isn't it a fact that is respect of tank vessels the Department of Commerce has made regulations prohibiting the use of outlets for drawing gasoline from the engine room compartment?

Mr. Underwood:

I object to that; that is the same thing we had yesterday. I object to it on the further ground that the proper way to prove such regulation is not out of the mouth of this witness.

The Court:

Let me hear the question read.

(Preceding question read by the Reporter as above recorded.)

The Court:

Isn't that the same question we had yesterday, Mr. Matteson?

Mr. Matteson:

I think it comes in a different way, because this witness has testified as to the relative hazards between tank ves-

sels and a vessel of the type the Seminole was, so that we have a standard of comparison between them. He has also represented himself here to be a competent builder of tank vessels, and such vessels would have to be built subject to these regulations. I am asking him about his knowledge with respect to those regulations. It seems to me that this is a different question than we had before.

Mr. Underwood:

In the first place, this witness has not said that the hazard is greater on the Seminole than it would be on a tank vessel. He said precisely the reverse; in the second place, this doesn't go to the question of the witness' qualifications, because he said he has not built any tank vessels in recent years, and it is in the record that these regulations are dated 1936. On neither of these two grounds is this admissible. It calls for a comparison between two vessels of totally dissimilar construction and use. He refers to regulations not in force at the time this fire and explosion occurred. Moreover, it is a matter of proof and government regulations ought to be proved properly and not proved by this witness. It is the same thing we had yesterday when your Honor sustained our objection.

Mr. Matteson:

I am questioning this witness with respect to his knowledge of the accepted practice in a field with which he is supposed to be familiar.

The Court:

Gentlemen, I want to limit the inquiry as much as possible, in order to complete the case, but notwithstanding the desire of the Court to limit the inquiry as much as possible, I don't think the cross examination should be unduly limited. I think we ought to try to confine the inquiry as to what was required in good construction of the

Seminole, and then next inquire as to vessels of that type. We have gone considerably into other character of vessels. It may be that this has some relevancy. I am not going to sustain the objection as excluding it entirely, but I make these remarks to indicate the views of the Court. I doubt that it has much relevancy, but there is a possibility that it has, so I will let it go in. You may answer the question. Read the question.

(Preceding question read by the Reporter as above recorded.)

A. I don't know.

Q. Now, Mr. Gibbs, I think that you have testified that you make it a practice to keep abreast of the literature dealing with the field of boat building that you are particularly interested in?

A. Yes.

Q. Are you a member of the National Association of Boat Builders?

A. No.

Q. You know that organization?

A. I have been invited to join it, but it is so far away, where we can't get any benefits, that I have declined the invitation, this year in writing.

Q. What is that association?

Mr. Underwood:

I object to that; it is utterly immaterial.

Mr. Matteson:

I am developing the source of information available to this gentleman.

The Court:

All right; I will overrule the objection.

Mr. Underwood:

No; that is not the purpose of the question. It appears that the National Association of Boat Builders is a subscribing member of the National Fire Protection Association which has made some rules, and what Mr. Matteson wants this witness to do is to help him prove that the National Fire Protection Association is all right and then argue from it that the rules are all right. I don't think that this is any part of this case at all. There is a proper way of proving these things, and I don't think he should try to inject this into this case in this back-door method.

Mr. Matteson:

I will say—

The Court:

I will try to confine it.

A. Do you refer to the Association, the secretary of which is Mr. Parver, who holds the National Motorboat Show every year.

Q. I believe that is right.

A. Now read the question.

(Preceding question read by the Reporter as above recorded.)

A. It is an association of men who build boats and engines; its members are principally manufacturers of engines; not many boat builders are members of it. Its principal purpose, as I understand it, is to give a motorboat show each year as a business proposition, and charge people, who are not members of the association, for space in the show and to profit by the recipts of the association. As we have been exhibitors at the show we were asked by the secretary to join it, and we were told of the advantages relating to the dividend that we would get from the

receipts of the show. I think that our company at one time was a member, when we manufactured engines, but I am not sure of that at all. Another one of their purposes is to protect the industry against adverse legislation relating to the merchandising of products; they go for increased tariffs on engines and boats and the elimination of outside competition.

The Court:

That is just your understanding?

A. I have worked with them as a member of the committee in Washington and I have been—

Q. I don't want to interrupt you, Mr. Gibbs, but you have given us enough of description, unless you want to add something.

A. If you want the complete story I will give it to you. Now that I have gone into it I recall very definitely that that body had a meeting in Washington and called on Senator Fletcher—

The Court:

I do not think it is necessary to go into that any further.

Q. Do I understand that it was an organization that would come under the classification of a trade association in this particular trade?

A. Bounded together for largely merchandising purposes and the betterment of their business, but, as far as I have been able to detect, not for the dissemination of technical knowledge.

Q. I understand that your information with respect to problems involved in your business of boat building has come from conferences with other people engaged in the same line of business, among other things?

A. A very small part of it has come from that. I have been visited and attended various conferences called by

the government; have discussed technical problems with nearly all the branches of the government. My knowledge has come from the construction of the finest types of ships that are built, to the extent of many million dollars worth.

Q. I didn't mean to eliminate the other things that you have mentioned. You have suggested a few here. I believe you said that in the design of a gasoline propelled vessel it is not necessary to give especial attention to the ventilation of the bilges for the purpose of removing possible accumulations of gasoline fumes there?

A. I didn't mean to make any such suggestion.

Q. How would you summarize it?

A. I meant the ventilators going into the bilges, where there are holes in these bilges, under the floor boards, would not greatly increase the speed with which gasoline would dissipate, and if there were sufficient holes elsewhere—

Q. And consequently, in view of your view of it, ventilators—

A. I said non-power driven ventilation, acting on the principle of convection.

Q. In other words, you don't think it is important to have ventilators that rotate air to the bilges for that purpose?

A. No; not non-power ventilators.

Q. Do you think it is important to have power ventilators that extend to the bilges for that purpose?

A. I think that they could be of material assistance if you knew you had leaks or likelihood of leaks, a good method of protection in obviating some dangers.

Q. As I understand it, your view generally with respect to motorboats was that it was not important where you had overhead ventilation, but have either natural or power driven ventilators reaching to the bilges?

A. No, I don't say that power driven ventilators were not of material aid. I tried to convey the impression that gasoline lines could be made so well that these power

driven ventilators would have been unnecessary, and that any increase in the ventilation required for the supply of air to the engine and to the crew would not be of much effect.

Q. In other words, in the average vessel you think it is not important to have either natural or force-draft ventilators to the bilges?

A. Well, I think natural ventilation to the bilge through a cowl ventilator is possibly a dangerous thing.

Q. Would you say it was undesirable?

A. It is undesirable. That is a cowl ventilator without force-draft, you say? I think that the improper handling of a force-draft ventilator is a dangerous thing. I don't think that there is any system of ventilation that will cure the danger of a leaking system of gasoline supply, whether it be power, whether it be force-draft or whether it be natural ventilation, and I have my reasons for saying that.

Q. Can you refer us to any discussion or authority, any reputable authority, which supports your view on that point?

A. Discussions that I have had with the highest type of authorities that I know of, but I cannot refer to names; discussions with the various departments that I have dealt with, such as the Coastguard and the Army. I am almost in continuous discussion on technical details and methods developed for the design of power plants and hulls. Just whether Admiral Johnson of the Coastguard told me the things I am now telling you, or whether it was Commander Thiel or Commander Furey, I cannot say, but I can tell you that that source of information has been of great influence on me in the determination of my views on this question of ventilation, and from that source I have learned of accidents that have resulted, and changes have been made which I think will even go back into those rules and become a part of them.

Q. When I asked the question I was not referring to personal conversations with people you regard as authority; I was asking you about anything published in print anywhere that you can refer to that would support your view that natural or force-draft ventilation through ventilators leading directly to the bilges was either unnecessary or undesirable?

A. I cannot give you the date of this published account, but there is a published account of a fire and the destruction of a yacht as a result of the use of a force-fan type of ventilation. Now that was a written report; I don't know the publication or the date, but I do know that the boat was destroyed.

Q. All right; now, as I understand you, Mr. Gibbs, you make it your practice to keep yourself familiar with the literature that would cover such a subject, is that right?

A. Yes. I don't see all things, but I see a good deal of literature, and there is some of it that I don't have the time or the inclination to look at.

Q. Are you familiar with the publications of the National Fire Protection Association dealing with this subject?

A. No.

Q. Don't you think that publications of the National Fire Protection Association dealing with marine fire hazards on boats of this type would be an important thing for a man in your position at least to have knowledge of and be familiar with as a part of the learning on the subject?

A. I do not. I could read many magazines that are completely unbiased, that have no particular business, that would better give me what I need, that is, the truth; I mean facts that help me mold my judgment.

Q. Can you think of anything that would be more informative on the subject of marine fire hazards than a report of a committee of experts who had made a careful

study of the subject and made recommendations, specific recommendations, which were published by the National Fire Protection Association?

Mr. Underwood:

I object to that on the ground that it calls upon this witness to compare two indefinite things.

The Court:

He says he didn't read that literature. You can ask him why he didn't read it, and let him tell it in his own language. I will sustain the objection.

Q. Why have you not considered the publication of the National Fire Protection Association?

A. In the first place, I never had been invited to consider it; I have never seen it and I didn't know of its existence; in the second place, the marine fire underwriters I know something of and respect for a certain viewpoint. I have also worked with their branches, as stated in my qualifications, on technical matters that they are experienced with, but I am inclined to think that there are other sources that would give you much more accurate knowledge as to design. I further have the idea that people with the insurance viewpoint, dealing with methods and procedure, are inclined to tell you of methods of the past, past methods up to the time of the printing of the circular, and they are not inclined to do the research work that a man from another viewpoint than that of insurance would do. Such information as I think would be valuable to a boat builder would come from the man with the means to build a great number of boats. I can think of no greater or better source of information available to me than the naval architects of New York, the captains and operators who operate various boats of all kinds, and the purchasers of boats in government circles that I have an opportunity to confer with.

Q. Do I understand that your point of view is that an expression of opinion by an underwriter's representative is not worthy of consideration, even if only for the purpose of—

A. By no means; I think that the underwriters have in that book a lot of very sound sense, but I think I have discussed everything that i n that book, enough to fill six of these books, with men whose daily life is the development of such ships as we are now studying.

Q. I understood you to say that you had never seen this book.

A. I have never seen it, but I have it here—certain things that underwriters might ask for. I get a good deal from the manufacturers of materials. For instance, the Pyrene extinguisher—the underwriters have approved it, and it is fine, but I knew it was good three years before they approved it, and if I had gone by the underwriters books or book the ships that have been saved by Pyrene extinguishers would have been destroyed.

Q. By the same token, Mr. Gibbs, do you think that you appreciate the hazards and the necessities of this type of vessel sooner than the underwriters would?

A. I think it is entirely possible that I would. I have been given commissions, several commissions, to do things that hadn't been done before, because I was selected as a man with the knowledge and ability to do them. For instance, I built the first engine that the underwriters would ever approve for fire fighting under their label. They didn't tell me how to build it; I built it and it is in use today.

Q. Well it is your understanding then that these underwriters' views on subjects like these are inadequate, is that right?

A. I think, by the very nature of it, that they cover a period that has passed; I have seen many moving pictures of their methods, methods of fire prevention; I think

that we are not bound by their rules; our engineers are in a position to get the facts quicker than some underwriters. I don't say that is always the case, but that is my opinion. I think that where we are not bound to obey the rules, that our engineers are in a position to get the facts quicker.

Q. Well, I am not suggesting that you do not obey any rules, and I am not suggesting that you are bound by any rules, but wouldn't you consider a publication of an organization like the National Fire Protection Association, dealing with hazards of this type, a part of the literature on the subject worthy of your consideration?

A. I think it would have much of interest to me but not of greater interest than other things?

Q. Now is it your idea that the National Fire Protection Association is an underwriters' association?

A. No; it is my opinion that they operate in many ways, as the Southeastern Tariff Association, so-called, the one that operated here, but I think it is under another name; they were in the engineering department and with nothing whatever to do with underwriters except to confer with them. I think that the Underwriters subscribed to their stock, or just what the financial set up is I don't know, but that was my understanding at the time.

(Recess.)

Q. Well, do you know Mr. Luders, the head of The Luders Construction Company?

A. Oh, yes.

Q. And they are a reputable firm of yacht builders, are they not?

A. I regard Mr. Lauders as a rather eccentric person, as having a good deal of dealings with him; I know him very intimately.

Q. Do you know the firm of Henry B. Nevin at City Island, New York,—do you not?

A. I know of them; I have never met Mr. Nevin, although I think that he sells our products.

Q. They are one of the outstanding yacht builders of the country.

A. I would say that I am not familiar with his boats, to call them right offhand. I think he bears a reputation of being a good man,—that is, the firm, a good firm.

Q. And do you know Mr. L. B. Jackson, the Chief Engineer of that firm?

A. No.

Q. Do you know Mr. George F. Crouch, the Naval Architect of that firm?

A. Extremely well. I know Mr. George F. Crouch; I don't know what firm he is with.

Q. And what do you know about him?

A. I know that I gave him a commission once to design a boat for me, and I have discussed with him many technical matters relating to period vibrations in crank shafts, Diesel engines; I know what his background is.

Q. And do you know Mr. L. B. Jackson, the Chief Engineer of Fairbanks-Morse Company?

A. I think I know him; if he is the former engineer of the Gulf Refining Company.

Q. And he is a reputable engineer?

A. He has a very responsible position. I am not in position to say that he is a scientist, a good engineer; he is probably an excellent executive, if he is Chief Engineer of the Fairbanks-Morse Company.

Q. Do you remember Mr. J. L. Crone, who was the supervising inspector of steam vessels in the New York district a few years ago?

A. No.

Q. Do you know Mr. George A. Smith of the American Bureau of Shipping?

A. Well wasn't he formerly with the Bethlehem Steel, Secretary of the Marine Association.

Q. I don't know.

A. I know one Mr. Smith, and I think that is the same one, I am not sure.

Q. And he is a competent man in that field, is he not?

Mr. Underwood:

Which Mr. Smith is a competent man?

A. The Mr. Smith I know spends more of his time in organization of shipbuilders, and meetings, and sort of chamber of Commerce work as applied to this.

Q. This is the Mr. George A. Smith who is connected with the American Bureau of Shipping?

A. Well I think that would be a different man.

Q. What is the American Bureau of Shipping?

A. The American Bureau of Shipping is an association which has to do with specifications of vessels, somewhat similar to Lloyds, in the Bureau of Veritas.

Q. It is the American Classification Society, is it not?

A. I built nearly a million dollars worth of ships under them.

Q. Are you familiar with their rules?

A. With some of them. When I get a job, the American Bureau of Shipping, if the architects haven't drawn the specifications and leaves this up to me, I familiarize myself with their rules as of the date. Unless I have such a job I don't go into it.

Q. Now you say you know of no view opposed to your own with respect to this subject of bilge ventilation in the engine room in gasoline yachts?

A. I have not made such a statement.

Q. Well would you say so?

A. I don't know what other people's views are.

Q. You never have known of any opposed to those you have expressed?

A. You mean, people that differ with me?

Q. On this subject, yes.

A. Well tell me what the specific problem is, and if I know someone that does differently from the way I do, I will call his name.

Q. Well you offhand know of no one, is that it?

A. I offhand know of no one who differs with me on a technical problem?

Q. On the problem of bilge ventilation in a gasoline yacht?

A. Well I have not discussed this particular thing with Mr. Crouch, if that is what you mean, so I think that he would agree with my views, as we do agree on most things. But I cannot,—I haven't discussed it and I don't know. I have discussed with Mr. Crouch a great many engineering problems, and I think we see alike on those things.

Q. Would you accept Mr. Crouch's view on a point such as the requirements of ventilation in the bilges of a gasoline yacht?

A. If he gave me reasons; I would change my view if he gave me what I regarded as a real reason. But I am not,—would not change my view unless he did. I have thought very deeply on the matter of the movement of gases, and I have been right in most instances, even to the extent of saving people's lives,—or rather seeing them killed when my advice was not taken.

Q. Now if this pamphlet, Libelants' Exhibit 97, and the views expressed therein, were the result of joint efforts of a committee whose membership included the men I have just mentioned to you, would you consider it was entitled to considerable weight?

Mr. Underwood:

Wait a minute, may I have that question read, please?

(The question was read by the reporter.)

Mr. Underwood:

I object to that as incompetent, irrelevant and immaterial, calling for speculation.

The Court:

Now read the question again.

(The question was re-read by the Reporter.)

The Court:

No, I will have to sustain the objection to that; I think, that is your case, Mr. Matteson. I think the standard is, if you have a set of rules that Mr. Gibbs differs with, if he has testified in any detail in a different manner, that you can question him. If a set of rules adopted by a certain association on particular points, set this up, do you agree to that; or, if your answer is different, if you testified differently from that, can you explain it? You might question him about that, but I don't think that you are entitled to ask this question. I sustain the objection.

Q. The men whom I have named you would not consider underwriters' representatives, would you?

A. I don't know the conditions under which they wrote that book.

Q. I am not asking that.

A. If they were employed by the underwriters, to write it, I would say they are underwriters' representatives.

Q. As far as you know, they have no connection with underwriters?

Mr. Underwood:

I object to that as completely speculative; in proof of nothing.

The Court:

I think that is well taken.

Mr. Matteson:

I will withdraw the question.

Q. As I understand it, although you have been dealing with this subject for a long time, you never have given any consideration to the views expressed in these two pamphlets, Libelants' Exhibit 97, and the earlier edition of 1926, or the later editions of the same publication?

A. The only time I was putting regular time on the underwriters' pamphlets, was when they gave me a specific job that I was required to do to meet their specifications, and with those details I familiarized myself perfectly. I regard those things as information which can be got elsewhere quicker and less biased,—with no disrespect to the underwriters at all, but from a view other than theirs.

Q. Now I would like to come to the point of corrosion. I understand your theory with respect to corrosion in a tank which has water in it, is that the oxygen and the water have completely combined, consequently there is nothing to oxidize the iron; and where water is placed adjacent to iron it will not rust: Is that right?

A. No; there is oxygen in water; you can take it out,—I mean, free oxygen. But the water that would occur here by condensation would have oxygen in it. That is where man and most animals living in water, live,—oxygen-breathing animals. There is a limited amount, however, it is in very, very small quantity, and a layer of water,—a tank completely filled with water would show practically no rust at all.

Q. Well then do I understand a tank completely filled with water would not rust?

A. Oh, yes, but to a very small extent; that is the same water.

Q. Now what produces corrosion besides oxygen?

A. Corrosion is produced as I know it,—I mean, oxidation, corrosion is oxidation, it is sometimes called,—is produced by oxygen; a combination of oxygen with the steel, if that is the thing that you speak of as rusting. It is augmented by many things, but that is what corrosion is. We are speaking of iron, aren't we?

Q. Yes. Now condensation in a tank in the vicinity of sea water, would contain a certain amount of salt, would it not?

A. From sea water?

Q. Yes?

A. I don't think a great deal. There may be some slight amount of salt in the water.

Q. And that is indicated by such a thing as the more extensive corrosion of steel window frames or other steel objects nearer to the sea than further away, is it not?

A. Well the wind, I think that's liquid water, in most instances, where the wind actually picks up, as it did at Miami, the salt water, and carries it away. The evaporation of the salt water picks up no salt, and which comes from the ocean,—the salt water.

Q. Well in the evaporation, the water containing salt will carry some salt with it, will it not?

A. No, sir.

Q. If you wanted to distill salt water you would have to distill it two or three times to get it clear of salt, would you not?

A. If you distilled it too rapidly, you could drive over with a mechanical current into your atmosphere; but the method of making salt, or distilling water, is evaporation. Evaporators sometimes leak.

Q. Acids will extend corrosion, will they not?

A. Oh, yes.

Q. And electrolysis?

A. Yes.

Q. —will bring about corrosion?

A. Yes.

Q. And surface deposits on a steel plate will assist in corrosion, will they not?

A. Anything containing acid, would; or some things would prevent it; some things could increase it. Oil would not be—some forms of oil with sulphuric acid would not help any,—could cause corrosion.

Q. And carbon dioxide tends to cause corrosion to, does it not?

A. Well as I have stated, I am no chemist; but I do not believe that carbon dioxide would cause corrosion, unless there was some other element there to break up the carbon dioxide and to make the molecule of oxygen available for its combination with the metal. I do not think C02 would cause corrosion, although the very metal itself might break it down. It is possible, but I am not chemist enough to answer that question.

Q. Well that is a recognized hazard in connection with boiler water,—too, is it not?

A. Well it possibly is. As I say, I am not a chemist.

Q. Now as a matter of fact, iron oxide induces corrosion, does it not?—Encourages corrosion?

A. Iron oxide?

Q. Yes.

A. Iron oxide, as I know it, is corrosion,—one form of it.

Q. But when present, it tends to induce further corrosion, does it not?

A. It depends; it does at the surface of water, or between air and water, as they call it. If it remains wet and tends to suck the air in, and if it is porous, it might. I don't think that anybody knows, from what I have read of corrosion, exactly what happens; it is galvanic and chemical, and there are theories as to what does it. But one thing, the way that it is usually protected is to cover it with an impervious pigment and to keep any other oxygen from getting at it; because in order to have rust, you must have oxygen to combine with the iron, and to change the pure iron or steel, whatever it is, into a ferrous oxide, which is rust.

Q. And you would remove all of the rust, or iron oxide, before you applied such coating, would you not?

A. Not necessarily. If I could block oxygen or air from getting to it, I think the use of that as a pigment would probably be a very good thing. I have seen it done, and have seen ship operators insist on it.

Q. Now it is a fact, is it not, that rust in boilers is considered as a hazard increasing the danger of corrosion?

A. Oh, rust anywhere is a bad thing, except perhaps when it might be used as a form of a paint to be mixed with oil, to make it impervious to the entrance of—

Q. Do you know of any paint that is prepared with iron oxide?

A. I have—as I say I am not a chemist, but I have been told from time to time that one of the older and better known paints was in effect ground rust and oil; not treated by taking rust, maybe and grinding it, but by making it.

Q. What paint is that?

A. Well, I have been told it is red lead, supposed to be red lead,—by competent people.

Q. Well, red lead is a sort of lead, is it not?

A. Not as described to me.

Q. Well you say that any kind of red lead is iron oxide?

A. That is the way it was described to me; that's what I have been taught, that red lead was, and not a lead. However that is—in dealing with paints I go to a reliable paint builder, a paint maker, and where the owner leaves that matter up to me, I in turn refer it to a reputable paint builder and get his characteristics on it.

Q. You don't of your own knowledge know of any paint that is made with iron oxide, do you?

A. Only what I have been told. I am not a paint manufacturer or chemist.

Q. Well you know that ordinary water tanks are highly subject to corrosion, do you not?

A. Well, they rust, but not very fast, when they are completely filled with water. It is when you let the oxygen in.

Q. Would you say that ordinary water tanks would last a hundred years?

A. No; it would depend upon the thickness, of course, how long they will last.

Q. What is the thickness of an ordinary steel water tank?

A. It is as high as a house.

Q. The thickness?

A. I mean by that, that the thickness of an ordinary steel water tank is determined by the diameter of the tank, and the shape; and that therefore I could not tell you what the thickness the tank would be, without knowing the size.

Q. Well an ordinary tank of a two-story house, what would be the ordinary size, thickness, of such a tank?

Mr. Underwood:

I object to that if your Honor please; the witness says he needs to know the dimensions of the tank.

Q. Well, say, 100-gallon tank?

A. Now I need to know the shape.

Q. Cylindrical?

A. What?

Q. Cylindrical, as most of them are?

A. This has to be cylindrical,—with a foot diameter and ten feet high, or six foot diameter and one foot high?

Q. Suppose you describe a typical tank then and tell us what its thickness would be?

A. I know of no typical water tanks for a house; there all kinds, they run all the way from a gasoline barrel to a cypress tank.

Q. Well what I am getting at Mr. Gibbs is just this; we all know a water tank, because we have had experi-

ence with them in our homes. Now I would like to have some standard of comparison for the durability of such a tank, and the durability of this tank on the Seminole which you say was good for a hundred years.

A. Well the tank that is used around a farm, with a two-story house, we have a windmill; that is usually made of sheet metal, galvanized. I have heard of one of those being made of metal that wasn't galvanized. If you were making that, if you did, you would make it thicker, to resist corrosion, and you might keep it painted, or put lime inside of it to block corrosion. But I know of water tanks that where at least, to my certain knowledge, are forty-two years old, and it never had any new plates in it,—right here in this house.

Q. Of course that would be fresh water entirely, wouldn't it?

A. Yes, that is drinking water.

Q. Of course there are certain acids in gasoline, are there not?

A. You could develop acid in gasoline, with other things. I am not a chemist and I don't know what the make-up of the gasoline is; but what I have learned of chemistry, elementary chemistry, that you get in my course of training, would indicate to me that the combinations do not exist as acids.

Q. And there is, I think you agreed with me this morning, an element of sulphur in gasoline,—usually present in gasoline?

A. That isn't the make-up of gasoline, that is an impurity.

Q. And sulphur tends to attack steel, does it not?

A. Sulphur, when it is capable of taking with it the other elements which would make of it acid, sulphuric acid, that would have a tendency to change the form of the iron and produce a new substance,—one of which would be rust, others would be too, most probably.

Q. And all of those things would contribute to corrosion, would they not?

A. From water,—or from gasoline?

Q. Yes?

A. If you put gasoline that was filled with sulphur, here, a very poor grade of gasoline, on account of impurities, I think its tendency would be to cause some rust.

Q. Now this matter of condensation in a tank is a continuous process, is it not?

A. Well it isn't so very continuous. If you take a very small weight of moisture, would come into the air, with your tank.

Q. Granted that, it goes in, day in and day out, and as temperatures change, does it not?

A. Yes.

Q. So that whatever it amounts to, you have your supply continuously renewed?

A. Yes, but it is almost distilled water; it is a very, very pure form of water.

Q. Yes, and water absorbs oxygen, does it not?

A. Not much. Water absorbs anything; it is a solvent of all other materials; gold, platinum, anything else; but slightly, and only very slightly.

Q. Well it is a well known fact that you can verify, is it not, that water absorbs approximately one-twentieth of its volume of oxygen?

A. I don't know that, and I don't think that is true, but I don't know; I am not a chemist.

Q. Well whatever oxygen was absorbed by this condensing of water, of course would be carried down with it until it reached the bottom of the tank, would it not?

A. Yes, but it would not necessarily rust the tank when it got there.

Q. Of course it would contribute to the supply of available oxygen?

Q. And you might set up combinations of acids which would eventually cause some part of the oxygen to con-

tribute to corrosion; but the mere fact that oxygen was in the water, does not mean that there would be any great amount of corrosion.

Q. Well as I understood you, it is oxygen that starts corrosion, primarily?

A. That is true, but it does not mean if you had a bucket of oxygen with a bucket of iron, that you will get any particular corrosion. That is a chemical process, and just how it acts I don't know.

Q. Now I think you have said that this water that would accumulate in the bottom of the tank would to a certain extent make a seal?

A. That's right.

Q. When the moisture first comes into a tank with the atmosphere that is drawn in, it usually condenses on the sides of the tank, does it not?

A. Yes, sir.

Q. And of course there is no seal against the action of the moisture on the sides of the tank, is there?

A. That's right.

Q. And there is a plentiful supply of oxygen there to assist in rusting; that is correct, is it not?

A. Yes, there is some oxygen there, and under certain conditions that would supply oxygen which is necessary to rust; but it does not follow that the oxygen goes into rust, it may go into the water, or the gasoline.

Q. Now of course it would be anticipated that the level of the liquid in these tanks would rise and fall?

A. Yes.

Q. As the gasoline was used?

A. That's right.

Q. And isn't it a fact that the area of exposure and then covering, and exposure, and covering against the steel object—

A. You mean, that is called wind and water?

Q. Wind and water; that is the point where there is usually found corrosion, is it not?

A. Yes, sir, right on the edge where it is kept damp and seems to form some kind of a batter; there is a theory that that is the galvanic action, is rapid at that point. It is only a theory, and the experts state it is thought, not known; but they know it rusts more around wind and water which is exposed to air.

Q. There would be nothing to protect the side seams of this tank against corrosion of that character, would there?

A. The element of time would protect it, and the thickness of the plate, and the weakness of the air,—of the impurities in the air.

Q. In view of that do you still say that this tank as installed on the Seminole would be good for a hundred years?

A. I do.

Q. Did you ever know a tank so installed on a boat, to last any such length of time?

A. I have never known of a—

Mr. Underwood:

I will concede that the witness isn't a hundred years old, if your Honor please.

A. Almost.—Did I ever know of such a tank a hundred years old?

Q. Yes?

A. I have known of a good many pieces of iron that are many hundreds of years old, exposed to rust and wind and water and rain, and protected by rust. History shows them, they are on exhibition today.

Q. I think that you said that this yacht that you spoke of, you were building, that you built the tanks into it so that it was built up with joiner work?

A. It is covered with joiner work.

Q. It couldn't be removed without interfering with the structure of the ship?

A. Yes, sir.

Q. Of course that was true on the Seminole, was it not? Those tanks could not be removed without removing parts of the structure of the ship?

A. I don't know what the top was, but the logical way would be, to take the deck off.

Q. Isn't it a fact that the captain's cabin was directly over the tank compartment on the Seminole, in the plan?

A. I don't know, but if it was, it would have merely been like other boats.

Q. That is the only way that you can suggest that these tanks could have been removed, is through the top of that compartment, is that right?

A. Oh, no, those tanks as I saw it, could have been moved by unbolting that bulkhead. As I remember it, that bulkhead was bolted together, the bulkhead facing the engine room; I may be mistaken, but whether that was so or not, you could have cut those rivets and taken that out. I think that may have been the easiest way to do it.

Q. You would have to remove that bulkhead, would you not?

A. Yes, you would have to remove one of the walls to let your tank out. I see bolts here, but it would seem to me that—and there were evidently bolts here.

Q. Well the testimony is that the single plate in the middle was fastened by bolts, and I believe that the rest was riveted.

A. Well I don't know the size of those, but I judge, —it occurred to me at the time that that was left bolted up, just like a door,—a temporary door, to pull that out and take those tanks out if you wanted to.

Q. Now I call your attention to this, the opening from the number two tank is exactly at the left hand edge of the bulkhead, and of the number three tank is exactly at the right hand edge. In other words, the plate covers the distance from the middle of the number two tank t

the middle of the number three tank. Now considering the closeness with which those tanks were spaced in that compartment, you wouldn't be able to take them out through that opening, even though they were removed?

A. No, you are quite right about that.

Q. And if the bulkhead were taken out, you would have to remove the batteries and the shelves that were attached to it?

A. It might be.

Q. And the auxiliaries that were immediately in front of it, would you not?

A. It might be. But on the assumption that what you say is true, the removal of that would not have assisted greatly; you would have to open another seam, to give you the least trouble from the tank; and then I am not sure that it could be done, because I don't know how they were fastened in the top; it may be they were fastened there where they couldn't pull outside.

Q. Well of course it would be impossible to fasten that bulkhead in place with the tanks in place, would it not? That is you wouldn't be able to get inside of the tank—

A. If it is riveted; you can re-rivet the tanks from the inside.

Q. The bulkhead?

A. The bulkhead, from the inside. It would be a difficult thing. That was probably done, and the tanks probably slipped in through the top when it was built.

Q. That is the only practical way that you see, is through the top of the compartment, is that right?

A. That's what it would appear.

Q. Now there is one thing that you spoke of as an atrocious practice; that is the practice of drawing off gasoline in the engine room through the bowl or through the connection on the bowl of the carburetor?

A. You mean, by breaking the line?

Q. Well my impression was that you referred to some adjustment on the carburetor, through which gasoline could be obtained; but whatever it was, you tell us?

A. Well in the absence of a source of gasoline for any one of the many purposes that it is used in an engine room, it is quite common practice to take a wrench and open up the union, and then let the gasoline come out of the line into a cup, or onto a sponge or a rag. And I have been on a great many ships where a little gasoline was needed, to wash the dirt off your hands; "Wait a minute, I will give it to you, just a moment"; and he would reach down and open up the line, and, "Here", hand you a rag; I would wipe off my hands, hand him back the rag. He tightens up the cup. A thing you would see on a great many ships in this harbor, where the unions were pretty well worn from that practice.

Q. Now you describe that as an atrocious practice?

A. I do.

Q. Why do you consider it an atrocious practice?

A. Because it is not known at that time how well those unions are made up; and unions are not made for that kind of use, unions are made to be put together, a few times in the life of the union. They are not a valve.

Q. Well what would the hazard involved, be?

A. The hazard involved would be that the union wouldn't be made up tight; that he might have a small wrench to do it with, instead of the larger wrench; and it would further be the hazard of requiring maybe one man to tighten it, while the other man took the oil out,—and the division of responsibility.

Q. And would there be the hazard of spillage and leakage of the gasoline?

A. There would be the hazard of—usually you spill a whole lot of gas when you wet your rag or put it into a can; and every time you do it, you jerk your joints;

you usually lift it up; it is down here, and you lift it up until you can get it under the cup.

Q. Do you consider that spillage of gasoline a hazard?

A. I consider the wilful, I mean the running of gasoline in a stream, out in the boat, is a thing that should not be done. I think that any leakage in an engine room is a bad thing, at all.

Q. And you consider drawing gasoline in the engine room—

A. I don't call that leakage.

(Thereuon, at 5:03 o'clock the hearing was recessed until 9:15 o'clock A. M., of the following day, to-wit, November 16, 1939.)

Thursday, November 16, 1939, 9:27 o'clock A. M.

Hearing was resumed pursuant to adjournment of the previous day; the witness, MR. GEORGE W. GIBBS, was recalled and further testified as follows upon continued

Cross Examination.

By Mr. Matteson:

Q. Mr. Gibbs, the coolest part of a vessel is usually the bilge, is it not?

A. Not always.

Q. Well I mean, the average conditions, that is true, is it not?

A. No, I have known them to be very hot.

Q. I am talking about the lower part of the ship, in contact with the water; that is ordinarily the cooler part of the ship, is it not?

A. Depending upon the construction of the ship, whether it was wood, or steel; and the rate of transfer

of heat out of the bilge into the water, if the water be colder than the ship. It is quite possible for the water to be very much hotter than the inside of the ship; you can have a temperature considerably higher than the ship.

Q. In southern waters it is usual that the air is warmer than the water, is it not?

A. Warmer?

Q. Yes?

A. Sometimes it is and sometimes it isn't. That is what makes the wind,—sea breeze one time and land breeze another; one at night, and the other in the day.

Q. Well the wind is dependent on the variations in temperature of the air, is it not?

A. The winds along shore are dependent upon the difference in temperatures on the shore and the ocean. If the ocean is cold, those airs that are cold over the ocean, they settle, and the hot airs on the land rise, and there is a circle there, and it is reversed, depending upon whether it is night or day; at least that is the theory of Dr. Manfried.

Q. It is the difference in temperature,—the air, not the water, that makes the wind?

A. Well that temperature of the air is caused by the water.

Q. Well perhaps that may be so, that the temperature of the air is to some extent affected by the water,—the land that it is over; but it is temperature of the air that makes the wind?

A. Over a hot building, for instance, the air is heated and gradually rises, and then that causes the wind to flow, to fill the gap, caused by the rising of the hot air; and wind is caused by these convection currents, which of course affect the temperature.

Q. Won't you concede that under ordinary circumstances, the lower part of the hull of a ship, that is in contact with the water, in this climate, is cooler usually than the upper part of the ship?

A. It would depend largely upon the time of the year. I have never actually gauged that, but I have known of a very cold ship, especially if she is still, in a very warm current, right here in this section, the water was very hot and the air was extremely cold.

Q. Perhaps you will go as far as this with me, that at times at least the lower part of the hull of the ship, the bilge, is the coldest part of the ship?

A. I think unquestionably that there are such times.

Q. I have turned to this article that you referred me to on convection, in the Americana Encyclopedia. I notice it begins,—when the air in contact with a hot stove becomes warm, it expands and grows lighter than other air, owing to unbalanced forces the hot air rises to the ceiling and then spreads out to the walls, where it becomes cool, and thereafter contracts and becomes dense.—You don't suggest that the bilge of a ship is like a hot stove, do you?

A. No. It is to the extent that there is a different temperature; it is a difference of temperatures that causes the convection. It might be relatively like a hot stove.

Q. Well now if the bottom of the ship was actually cooler than the upper part of the ship, then you wouldn't have any convection of air, gas from the lower part of the ship to the other, would you?

A. Oh, if it was cooler?

Q. Yes?

A. If it was just one plate, and they had absolute uniform temperatures, with no extraneous forces, you would have no motion.

Q. And if it was cooler, you would have no motion, because cold air would stay at the bottom; isn't that true?

A. The tendency of cold air at the bottom and hot air at the top, would greatly retard convection, to some extent. For instance, if your floor was a hot stove, your

plate was a hot stove,—I mean, a cold plate, and if your ceiling was a hot stove, your tendency there would be a tendency to retard the convection?

Q. You admit that it would be retarded under such circumstances?

A. That would be the tendency, yes.

Q. Now it would, as a matter of fact, in the absence of extraneous forces such as you were talking about, stop it completely, wouldn't it?

A. Assuming a homogeneous temperature, without baffles or plate, the hypothetical situation of that kind, I say would retard it.

Q. I am talking now just purely from the theory of convection. Of course there may be other things, such as induced ventilation and so forth, but I am just talking about the theory of convection alone. In constructing a ship you have got to anticipate that there will be times at least when the forces, conditions, will be such that the forces of convection will not operate at all, haven't you? Or at least, as you say, be greatly retarded?

A. We would have to consider practical observation, and if one happened to know that at no time had air apparently,—or gas apparently been still, you could practically eliminate the thought of that theoretical condition, where convection didn't set in. One would realize that they had never seen smoke, for instance, stand still, regardless of how quiet the room was,—the uniform temperature. We would be forced though to think that theoretical conditions would never exist.

Q. Of course when you see smoke, you know it is coming from a hot stove or fire, don't you?

A. And therefore you would think it would rise, but it don't, it falls, in most instances,—many instances.

Q. Now I read you one sentence from this article on convention. I would like to have you call my attention to

anything else that you consider bears on the subject of ventilation, in the article?

A. It is a short article; will you read it to me, or someone lend me your glasses?

Mr. Botts:

Here are some; they are bi-focals; can you read with those lower lenses?

A. Shall I read it out loud?

(By Mr. Matteson):

Q. I don't care about your reading the whole thing, but you may if you wish. I asked you to point out anything in it that you considered pertinent to the subject of ventilation?

A. I can tell you from memory; there is another example given of convection in the handling of liquids.

Q. Well let's see if I can find that?

A. It is in the second paragraph.

Q. Is this the sentence: Convection phenomena also occur in liquids. A large vessel of water supplied with heat, at one side of the bottom becomes, through the action of convection currents, uniformly heated throughout.—Is that what you have in mind?

A. That is the sentence of interest in this matter.

Q. Well there is nothing in this article at all about ventilation, is there?

A. It is the entire basis of ventilation. It is as important to ventilation as friction is to the design of machines. It is the background of all ventilation,—the ABC's of it. As illustrated in this second paragraph, when you discuss water, the slightest change in temperature of water will cause rapid convection, or motion and movement. Bear this in mind, a slight change in temperature of water, one degree for instance, does not increase the volume of the water. 1/195th, or one gallon

in 500, as it does with other gas. It increases its volume practically nothing,—an infinitesimal amount. Yet with that tiny decrease in specific gravity, due to the expansion of the water by almost nothing, but with the variation so slight that one cubic foot of water weighs practically nothing less than the other, we will say a 20th part of an ounce in 100 pounds; and that difference of temperature in a fluid,—and a gas, and a liquid or both fluids, causes the theory of convection that would let a bit of litmus here show up over there in a tank, in a remarkably small time. All ventilation is based very largely on the theory brought out in this short article. It is a theory known to me since I was in college; brought back to me attention in many discussions with people on ventilation. And I regard that as a very splendid definition of the basic laws which are extremely important in the study of ventilation.

Q. Now I asked you yesterday, Mr. Gibbs, and I ask you again now, if you can refer us to any authority which supports the view that the theory of convection will be adequate to exhaust from a room or compartment, gases that are heavier than air?

Mr. Underwood:

If your Honor please, I think we have been over all that once.

The Court:

Well we won't go into it extensively; it is repetition, though Mr. Matteson. If we can save more time, let the question be answered.

A. I know—can recall no authority who has, or which has specifically expounded the theory which I have expounded. I wish to say however that this failure on my part to recall this authority, is just as my failure to

give you other specific information where I did not bother to remember just what engineer had discussed the matter with me.

Q. Now we will leave that subject for the time being.

Mr. Botts:

If the Court please, it seems to me that, since the witness gave this as his authority, and the sole authority for his theory, that it would be appropriate to have that article, not read now, but to copy it into the record; because he gave that as the basis for his authority, and it is the only one he has given.

Mr. Underwood:

If your Honor please, it is just another example of one's inaccurate memory. The witness made no such statement, and it does not appear in this record. What he said, was, I called it to his attention after he had given me his views about convection. I don't have any objection at all to putting this piece in the record if Mr. Botts wants it there, but I don't think it ought to go in on that basis, because that is not the true basis.

The Court:

It is open here if anybody wishes to examine it.

Mr. Botts:

If he gave any authority, I don't recall it. If it is agreeable, we will have that photostated and filed.

Mr. Underwood:

I have no objection, just so you get the book back to Mr. Anderson.

Mr. Matteson:

If there is no objection, let the stenographer assign a number to it, and we will furnish the photostat copies as soon as it can be arranged.

Mr. Underwood:

You are offering that now, and giving it a number?

Mr. Matteson:

Yes.

(Thereupon the said encyclopedia excerpt, to be substituted by photostat thereof, was admitted in evidence and filed as Libelants' Exhibit No. 138.)

(By Mr. Matteson):

Q. Now Mr. Gibbs, I think in referring to these gasoline tanks on the Seminole, you said that you considered that they were built for some other purpose than the storage of gasoline. What did you have in mind with respect to that?

A. I had in mind that the thickness of the plates suggested pressures far in excess of the pressures that were required for this job. It is an opinion based on the thickness of a great many plate tanks that I knew of.

Q. What more strenuous purpose do you have in mind that it could be used for?

A. I could have any one of a thousand uses requiring great pressures.

Q. Well, name one of them?

A. A water tank with the pneumatic system, for instance.

Mr. Botts:

You mean what is known as a pressure tank?

A. It is known as a pneumatic system tank. You put air in one end of a tank and water is in the bottom.

Mr. Botts:

But the air is then put under a pressure?

A. Yes, sir; sometimes you put a pump, and sometimes it is occluded with the suction in the water. That is a

tank that requires tremendous strength and tightness; and I have seen such a tank as that, used for the purpose.

(By Mr. Matteson):

Q. In other words you think it would be suitable for an air pressure tank?

A. That's one of the uses. That is one of the most terrific services that a tank can be called upon to do, is to serve in that particular purpose. Of course there are literally thousands of others. You asked me to name one.

Q. And if it were used for such a purpose, how would you make it tight against the terrific air pressures that you are talking about?

A. Against what?

Q. Against the heavy air pressures that you are talking about?

A. Well they are made to be right, by the close spacing of rivets, and the heaviness of the plates.

Q. Isn't it a fact that the air pressure tanks are double riveted?

A. It would depend entirely upon the pressure that you would operate under. It would vary back to the place where you sacrificed tightness for strength. Those systems usually operate at around 62—well a maximum of 60 pounds; equivalent to most city pressures.

Q. Well would you approve such a tank for air without welding or caulking?

A. Most assuredly,—when you say without caulking, I would permit caulking when the tanks were tested, as is usual with a riveted tank; but I would insist on hydrostatic pressure, which these tanks are put under, which guarantees their tightness under pressures far in excess of working pressures. When I had it inspected on that basis, I would be satisfied.

Q. How long, in your opinion, should a hydrostatic test be applied, to be effective?

A. I would be satisfied with a hydrostatic test of an hour. We actually in our work use a longer time than that; as a matter of fact I would be satisfied with five minutes.

Q. As a matter of fact, in your practice, how long a time do you use?

A. It depends upon the instructions of the people who employ us. They may ask us to leave it on for twenty-four hours, or thirty-six.

Q. That would not be unusual, would it?

A. What is that?

Q. Twenty-four to thirty-six would not be unusual test?

A. I would think so. I can conceive of no reason for a much longer test, a hydrostatic test.

Q. What would you say was the usual length of time?

A. I would say there is no such thing that I am familiar with.

Q. All right. Now do I understand you to say that caulking is only used when leaks have been discovered?

A. No, I wouldn't say that.

Q. Well that is the way I understood it yesterday. Do tanks of this type ordinarily some caulked?

A. Not necessarily. It would depend somewhat on the design of the tank. But what I said yesterday was that tanks under test are often caulked at the point where seepage appears, even with the fluid inside of them, under the hydrostatic test, and only there.

Q. Well as a matter of fact, isn't it a fact that standard tanks for the storage of fuel oil and gasoline, usually come either riveted and caulked, or riveted and welded?

A. A great many tanks do come welded. In fact that is the popular way to make tanks today, because welding is quite accurate; is advanced. Just a few years ago a good engineer wouldn't think of accepting a welded tank, he demanded a riveted tank, at a high price.

Q. Well my question was, Mr. Gibbs, isn't it a fact, as far as you know, that tanks of this type, for the storage of fuel oil or gasoline, are either riveted and welded, or riveted and caulked, and come that way?

A. It is not a fact.

Q. And that is true today, is it?

A. Did you say, usually come?

Q. Yes?

A. It is true today.

Q. What?

A. It is true today.

Q. It is true today that they do not actually come that way?

A. Well I don't say that they would not, in the test. Now the important thing is the test, and if they develop a weakness anywhere, that weakness is repaired. I would think caulking would be the way that it is usually done. I haven't seen all the tanks in the world, but under my observation, the tanks that I have seen, are not usually welded or caulked; perhaps 80 per cent of all the tanks today are welded tanks, but that didn't apply just a few years ago.

Q. Well now I am making it double-barreled; either eliminate welding, and call it caulking. You say that it is not customary for tanks of this type to be supplied by the manufacturer in one way or the other, either welded or caulked?

A. I didn't say it wasn't customary. I said that—tried to say that it wasn't the universal rule; that they could be caulked, they could be welded; there would be various opinions on it.

Q. Do you make tanks in your own yard?

A. Yes, sir.

Q. Now about these tanks on the Seminole, you observed one of them when we were out there in October. Did you see any evidence of caulking on the outside of that tank?

A. I saw the—my observation of the heads would indicate that there was plenty of room for a caulking iron, and that they might have been caulked.

Q. Well if they were caulked, you would certainly be able to see it, would you not?

A. You would not.

Q. Well caulking is a surface operation, is it not?

A. But the surface operation at the bottom of a crack, can't be observed by looking directly over it, where there is a general corrosion of the water or the mud or the stuff that was on those tanks. A microscope, by cleaning that out, or sawing that section away, would show us; but there was no evidence to me that they were not caulked in the heads, that particular place that was pointed out. I can draw a picture and show you.

Q. I particularly called your attention, in the presence of the Court—

A. Exactly.

Q. To the head of the tank?

A. They said this wasn't caulked, and I looked and made a mental note that it might have been; because there was lots of room to put a caulking iron there.

Q. You didn't say so at the time, did you?

A. I wasn't asked to say so.

Q. Don't you remember that when it was called to your attention that there was no evidence of caulking on the outside, you borrowed this man's glasses to look at it, and your reply was, well you can't say that they are not caulked on the inside?

A. No, I don't recall any such thing; if I borrowed his glasses to look at it, and did make a remark, I think was that you—in fact I know that it was, you can't say that it was caulked there.

Q. Now of course that would apply to the top of the tank. Now at the bottom of the tank—

A. That was one of the spots under consideration.

Q. Of course we will concede that you couldn't see the inner edge of the seam at the top of the tank. At the bottom of the tank you can see both edges of the metal, can you not?

A. Yes.

Q. And it would be impossible for that seam to be caulked on the inside?

A. I would not—you mean from the outside?

Q. From the inside; I mean, it would be impossible?

A. Harder.

Q. —to be caulked from the inside?

A. Yes, you are right there.

Q. And you could not observe or call to the attention of any of those present, any evidence of caulking on the lower seam, could you?

A. I saw no evidence that there was no caulking.

Q. Well now when caulking is done, a section of the metal is separated and pressed away from the main body, is it not?

A. Not necessarily.

Q. And part of the edge that is originally there, is destroyed and pressed away from its position, is it not?

A. Not necessarily; the metal—the whole bit of metal is compressed, causing the two pieces to adhere closely, rather than to have them apart. But you don't have to separate them in order to mash the metal in,—to draw them tight.

Q. And you mean to say that you can look at a tank and not be able to tell whether it is caulked or not?

A. I am putting it backwards; I say it is most difficult to look at a tank and say that it wasn't caulked.

Q. Now when a rivet is removed from a piece of work, and replaced, isn't it a fact that the hole is usually reamed out, and a larger rivet put in its place?

A. Well not always. We remove a great many rivets now with acetylene, and we simply touch the center of

it, and it practically collapses under the heat; we confine our destruction to the center of the rivet, in a small rivet.

Q. Don't you recognize that it is a good practice to cut the hole out after that has been done?

A. Not unless the hole is injured, and when you pierce the shank of the rivets, the heads fall off; or you could just tap them and they come off. That is the way rivets are commonly removed.

Q. You say it is common practice in your yard to restore rivets of the original size, after rivets has been removed in one way or another?

A. Depending entirely upon the place it is being used. If we were putting a Scotch boiler, with very high pressure, subject to terrific stresses or service, we probably would examine it, and if necessary make it an electric job. But I can see no reason whatever to change the size of rivets unless the holes are injured; and we don't do it in our yard unless ordered to do so by the man employing us.

Q. Would you put back a rivet without reaming out the hole, in a gasoline tank?

A. I can see no reason why you wouldn't, unless the hole was injured.

Q. It would be very difficult to get a rivet out without injuring the hole, would it not?

A. I don't see where there would be any difficulty to it at all.

Q. Now with respect to the bracing of the tanks; these wood separators were between 1 and 2, 2 and 3, and 3 and 4 tanks, were they not?

A. I saw it between two tanks, and I assumed that that was the method of bracing the tanks.

Q. They act as separators; they come between; is that right?

A. They act as locks to the tanks, to practically tie the four tanks,—assuming that what I saw here, and I

couldn't see anything that was burned,—was that this construction was carried through; the whole process would have served as a lock, locking the four tanks, if it ran across the four, making a unit out of the system.

Q. You spoke of there being no objection to there being wood, as foundation of the tanks. Were you assuming in that that the tanks would not leak,—did not leak?

A. No, I didn't take that into consideration at the time—that any leakage that might come on the wood. I have seen a great many tanks installed on wood; nearly all of them are in wooden ships; and I could see no objection to the wood there, regardless of whether they leaked or not. Of course I didn't figure on them leaking, but if there had been a tank that definitely did leak, I wouldn't change the wood there.

Q. You would not have changed it?

A. No.

Q. How was this ship stiffened, fore and aft, as to her structure? Can you tell me that?

A. I have no idea, but I paid very little attention to that; I mean, I wasn't asked to observe that. Just generally speaking it was sort of it—struck me that an examination would have shown it was partly Isherwood system; I mean by that, that it seemed to have fore and aft stringers treated as a beam.

Q. You refer to the—

A. Very small resemblance.

Q. You refer to the port and starboard deck stringers along the side?

A. What is that?

Q. Refer to the port and starboard deck stringers along the side?

A. No, I refer to the scantlings that run fore and aft on the ship. I just have a hazy recollection of seeing shelves, stringers, and things like that, seem d to me to be ample, but I didn't go into that at all.

Q. Did the ship have any center line girder?

A. I didn't observe any part of that.

Q. Did she have any keelsons?

A. I made no observation as to that.

Q. That would have a great deal to do with whether the ship was stiff or whether she had movement in her structure in a seaway, would they not?

A. The strength of the ship?

Q. Yes.

A. I might have been asked to do that, but I wasn't.

Q. If the ship has considerable movement in her structure in a seaway, that of course will place considerable strain on her fittings, will it not?

A. It would depend entirely on how the fittings are placed, the length of them; if it is in a section of the ship with no flexure it wouldn't have much. I would simply state that I might have hunted for these strength members, which I saw some of them, which were apparent. Were it not for the fact that the ship was of deep girth, and of steel, and there is almost no movement in a steel ship,—the ones I have seen, with the short length and her girth:

Q. You would say she would have no—

A. —deep molded depth, instead of girth.

Q. You would say she would have no movement in her structure?

A. I think the movement would have been inappreciable from the standpoint of causing distortion to any inside equipment.

Q. If there were some such motion, it would tend to put a strain on her connections between her gasoline tanks, her feed lines and her engines, would it not?

A. I wouldn't say so in the Seminole, because the stuff was all right together. If the tanks was in the extreme bow, and the other equipment was at a place where there was actual variation from the alignment,—

a straight line, for instance, and a distance from a straight line, there might have been some tendency for a strain. But that was not the case here.

Q. It is a fact is it not that if the ship has a tendency to have a movement in her hull due to lack of stiffness, amidships is the point where that will be most apparent?

A. Oh, no. It would be most apparent in what is called the point of greatest flexure. You may have a perfectly straight line in the area of the engine room, and the whole bow and stern can go up and down, and if your staff is concentrated around the engine room there is no need of any strain. However, that steel hull, as I observed it, permitted of no vibration of the hull or machinery at all. It was easily much stronger than any wooden hull I have ever seen in my life.

Q. I think you said that in designing a vessel you did not need to take into account the possibility that pipe line connections might vibrate or work loose on the gasoline lines, and that you have known many vessels that have never had a wrench placed to their pipe lines, in their lifetime; is that right?

A. No, sir, that is not right.

Q. Well tell me what your view on that is?

A. I said that those—in the design of a vessel, that those materials were put in in a way that they would give no trouble, with a very distinct appreciation of the fact that improperly installed they might give trouble; and that there were no secrets as to what you had to do to make it permanent and sound; and when you didn't do it you simply didn't obey what would be indicated by proper design.

Q. Then I think we are on common ground. Then if you had a vessel where you had frequent trouble from pipe lines coming through,—coming loose and leaking through vibration, you would consider that the pipe lines were not properly installed, is that right?

A. Why I would have to know what was the cause of that trouble.

Q. Well I think you just said that there was no secret or difficulty about designing a vessel so you would eliminate that trouble?

A. That is quite true, sir.

Q. Then if that condition exists, it follows that she hasn't been properly designed and put together; is that right?

A. No, that would not follow.

Q. Well what does follow?

A. It would follow that certain things might have happened, to take a perfectly good, sound job and injure it. For instance, sabotage might set in there. A man,—lazy operator, might break a line in order to secure gasoline. If he did such a thing it would probably be the wise thing to put a cut-off line in the engine room so that it would not be at the mercy of his disobedience to your instructions.

Q. You spoke of the hazard of breaking a pipe line to draw off gasoline in the engine room; and you do consider that a serious hazard, as I understand it?

A. Yes, I think that is a dangerous practice.

Q. And the danger is the possibility of leakage of raw gasoline into the engine room, is it not?

A. That is right.

Q. Now what would you say of the practice of attaching a rubber hose to a—we will say this draw-off valve that was in the engine room of the Seminole, and flowing the gasoline out through the hose, through a window that was higher than the cut-off valve, which of course made it necessary, when the operation was discontinued, to break the line by detaching the rubber hose at the valve; would you say that was also an atrocious practice?

A. Why, no; there is no difficulty at all to bringing that hose in and completely emptying that gasoline out,

without putting any part of it into the engine room. I suppose you mean that he pulls it apart and lets what gas is in the hose, run down into the boat. That is unnecessary, and it isn't done by even boys, that I have seen filling gas with a hose.

Q. How would you do it?

A. I would—when I ran the hose into the tank, or wherever it was outside of the ship, I would seal it, the end of the hose, with my thumb, and then I would bring that end of the hose right back to the cut-off place where it is fastened; I would put the two pieces together, and I would draw them down like that, and then I would take them out of the engine room. You wouldn't have to take the hose into the engine room; I would hand the two ends out of the window, and I would either put it in the tank of the small boat that I was filling, or drop it overboard. But I would not waste it; it is not a whole lot, but I would simply take one end into the tank of the boat that I was filling, remove my thumb, and carry it in.

Q. And you think as a practical matter that you could perform that operation without spilling any gasoline at all in the engine room?

A. I have done similar things repeatedly, getting gasoline from my automobile for my wife; in lending gasoline to people.

Q. And you think that is an entirely different matter than breaking a gasoline connection on a copper pipe, and keeping your thumb over it to prevent a leak?

A. The great danger with that,—breaking a line, is of course the fact that you have no vessel you can stick under it, and you may reach the frying pan, but usually the vessel available is something like a coffee can; and when you break that coupling you lift the pipe up high, you strain the fittings, and then you get your gas, and perhaps you have,—of course you are putting it into a

very wide, open can, to start with, where you have some gas fumes come off. You put it back and tighten up your coupling, and if you have the right sized wrench you tighten it up tight; if you haven't got the right sized wrench you perhaps don't. But you make a very improper use of a union. If you are going to do that, you would provide a valve, and when that operation is repeated there is going to be one time when you don't draw up your connections tight enough, in which event you will have a continuous leak. Of course you wear the parts every time you do it, and have an awful good chance to burr it.

Q. The difficulty, I take it, with respect to breaking the pipe, is that someone would be negligent in doing it?

A. The most careful man, that deliberately twists a whole pipe line, is going to injure that, regardless of whether he is negligent or not. But even the best man can't make up a coupling continuously over a period of years, without injuring the—wearing the threads and wearing the faces of the union.

Q. Well now this practice which you have described as atrocious, results, as I understand it, in a hazard of spilling gasoline on the floor or into the bilges, which will evaporate there and form gas, gas fumes, which are dangerous; is that correct?

A. That practice would result in a possibility of a continuous stream of gasoline into the bilges from a line that may have crystallized and parted; or from a very serious injury to another portion of the pipe line.

Q. You suggested at one stage of your testimony that the engines of the Seminole might be washed with gasoline. Would you approve of such a practice?

A. Well that has always been done and I approve it as a necessary, practical thing to do; a thing that can be done with safety if the danger is recognized, which it is, with such an engineer as you could hire, and probably did, for this type of vessel.

Q. I see. Well, the gasoline used for washing the engine of course would evaporate very promptly, would it not?

A. That is one of the purposes of its properties; that is required for washing.

Q. Exactly, the tendency of the gasoline fumes so released, would be to fall into the bilges, would it not?

A. At the time of the washing,—which, by the way, is usually in a machine shop, once a year. You don't wash engines like you wash your face. The washing, Mr. Matteson, refers to the washing of a part that has been taken out, and it has gotten grit all over it, and you wash it and oil it before you replace it, in order to keep grit out of the inside of the engine.

Q. Well weren't you referring to the use of a sponge with gasoline to mop off the exterior of the engine and clear it up?

A. Oh, no, sir; no, sir.

Q. You didn't refer to that, when you were speaking of washing?

A. Why certainly not. I referred to the proper operation of the engine.

Q. Now can you tell us, Mr. Gibbs, by reference to any standard work, or, of your own knowledge, what the relation is between liquid gasoline and gasoline vapor, as to volume? If you want to refer to Kent on the subject, I think I have the place?

A. Could you postpone that until I get my own glasses? I can't see with those.

The Court:

Try mine.

A. I can tell you, for any purpose that you wish.

Q. At 32 degrees, it is 22.3 cubic feet per gallon according to the figure that I reach here?

A. Thirty-two degrees, that is the temperature of the—standard temperature of freezing; is what?

Q. 3.6 per cubic feet per pound; 22.3 cubic feet per gallon?

A. 23 pounds a gallon? Is that the weight of it?

Q. No, 23 cubic feet per gallon.

Mr. Botts:

That is 23 cubic feet of what?

A. That is absurd.

Mr. Underwood:

Just a minute, let me read this.

A. Mr. Matteson, if you give me the weight of a cubic foot of one and of the other, that is all I want to know.

Mr. Underwood:

Do you want to put in the record what Mr. Kent says, or do you want to take Mr. Gibbs' word?

Mr. Matteson:

I don't care about Mr. Gibbs.

Mr. Underwood:

Just read this into the record from page 4-61 of Kent's Mechanical Engineers Handbook, entitled Power, 1936. It says, "Typical significant properties of gasoline are, volume as vapor at 32 degrees Fahrenheit .760 mm, 3.6 cubic feet per pound, 22.3 cubic feet per gallon; air required for combustion of one pound of gasoline, 15.3 pounds."—Do you want any more?

Mr. Matteson:

No, sir.—Your Honor, we have just read into the record the relationship between liquid and gas.

Mr. Botts:

Did you hear what it was?

The Court:
No, sir.

Mr. Matteson:
It is 22.3 cubic per gallon of liquid gasoline.

The Court:
Let me see if I catch that; just read what was read into the record, Mr. Bryant.

(The foregoing quoted excerpt was read by the reporter.)

(By Mr. Matteson):

Q. Now I want to ask you a question or two about this safety can; what is your objection to this?

A. My experience has shown that these things are not practical,—a flexible tube.

Q. Of course that could be eliminated entirely, could it not?

A. You mean, someone could invent a new one?

Q. No; cut it off with a hack saw, if you didn't want it?

A. Oh, that is a suggestion; but whether—

Q. I mean that is not an essential part of the arrangement, is it?

A. A man buying it, he doesn't know what is essential. It may be a very ingenious thought; I don't know whether an engineer would have it. And besides, an engineer would think this was all right. I know that it isn't.

Q. Well it would be all right until it wore out, wouldn't it?

A. It does not immediately snap off. It ruptures right in here, and the tiniest little bit, and then it leaks, out here.

Q. Of course the only time there would be any gasoline in this flexible tube that you are speaking of would

be at the time there was actually gasoline being poured out of the can; that is right, is it not?

A. Of course.

Q. That is right?

A. What is that?

Q. The only time you would have any liquid gasoline or any other kind of gasoline in this flexible tube, would be when you are pouring out?

A. No, you might pour it out like that, see, and immediately drop it like that, and it is full of gasoline.

Q. Of course it will run immediately back into the tank, will it not?

A. It probably would. It might be like that, and it wouldn't run into the tank; then that wouldn't run into the tank, none of it, and you might twist it.

Q. If it were used as it was intended, it would be placed on its base and the gasoline would run back into the tank, and then you would put this across in the socket it is intended to be placed in, would you not?

A. Of course, the suggestion that this be cut of, might be considered a fine thing. If you cut it you would leave it off. There would be no suggestion to bring it back and lock it; that is why this length is put there, probably. But do you know whether there is any gauze in here?

Q. No; but there is a valve that closes when the outlet is turned around, it shuts off from the tank, does it not?

A. Do you know if, while handling this gasoline in the engine room, it would spark, or anything happening to hit that vent before he turns it off, that conflagration may set in and destroy the ship,—that this thing is in effect a bomb, infinitely more dangerous than that?

Mr. Underwood:

Referring to the draw-off valve?

A. Referring to that can.

Mr. Underwood:

I am sorry; the can; excuse me.

Q. Do you regard the can as a bomb?

A. No, not in any way.

Q. I am referring to the filling can?

A. That can is in no way a bomb, compared to this.

Q. Why not?

A. You build no pressure in there. I have repeatedly dropped a match in an engine cylinder and had the explosion, just simply a very gentle explosion, which would occur in that. In this however, the minute your pressure started to build, you would compound the effects of your explosion, and such a thing might wreck this room.

Mr. Underwood:

When the witness said "that", he referred to Libelants' Exhibit 13; when he said "this", he referred to Libelants' Exhibit 137.

(By Mr. Matteson):

Q. Now I think you told me yesterday, Mr. Gibbs, that if there was not as much as 93 per cent of air mixed with the gasoline fumes, there was no danger of ignition at all; is that still correct?

A. There is not as much—I would say there was no danger of explosion. It is possible to burn in a plant slowly, what we know in the cylinder of an engine as inefficiently; weak explosion or slow burning.

Q. You told me yesterday, Mr. Gibbs, very specifically that in a mixture at less than 93 per cent of air in it, no ignition at all whatever would take place. Do you change that?

A. No, I mean it is possible to cause a burning, but not—a very slow burning, which I think under glass would show it probably a slow movement of a portion of the stuff,—not all of it.

Q. Now this flexible tube has a brass outlet, has it not?

A. That appears to have a brass nipple on the outside, for the sole purpose of keeping this jagged thing from cutting you. That is what is called trim.

Q. Well a brass end would not strike a spark from anything, would it?

A. Well, I never heard of brass, and metal doesn't very often.

Q. When you were referring to a spark, you were referring to some spark from some other source?

A. I was not considering a spark made by this striking.

Q. And the spark from some other source in the engine room would explode gas no matter where it came from, wouldn't it?

A. It would explode—

Q. Whether it came from this, or whether it came from something else?

A. It depends entirely upon the atmosphere that it is in.

Q. Well, isn't a fact that whether this is safe, or any other contrivance in the engine room is safe, depends upon the negligence or the carefulness of the engineer or the man who is handling it?

A. No. We often have devices that apparently are the answer to great problems, and they prove elements of great destruction; like the original forced draft ventilating systems.

Q. Well, do you think you could design a can for this purpose that would be satisfactory, Mr. Gibbs?

A. I think I could design one that would be more satisfactory than that; in fact I think I could buy one on the market that would be more satisfactory than that.

Q. And one that you would think that would be reasonably safe if carefully handled?

A. Well, I can't say that it would be safe. I say it would be more safe than that.

Q. As a matter of fact there isn't anything that is 100 per cent safe, where you have gasoline involved?

A. There is nothing in the way of a large can in an engine room, carrying gasoline, that would meet with my approval at all. I have never seen it.

Q. Now you referred to the gauge of the metal in this can, yesterday, and you referred to this rim around the bottom of the can. Do you regard that as indicating the gauge of the metal of which this can is constructed.

A. I don't think—I can't see, but this may be double here; a piece to hold the bottom in. You really ought to have a section through this. I suspect that this is a wrapped joint; but you can tell from hitting the gauge of this, and this too; I know approximately the gauge of that; this is separate from the tank.

Q. Now this bottom rim as a matter of fact is something entirely separate from the tank; it is put around the bottom for the tank to sit on as protection, is it not?

A. Certainly, and probably heavier gauge than the tank.

Q. This you realize, do you, is a seamless, welded steel tank?

A. I don't know that it is. If I had a section through it, sawed in two I could find that. Is it printed there?

Q. Yes, it is printed here; seamless welded steel, guaranteed leakproof. Do you think that label is misleading?

A. I would be inclined to think that the label is intended to be true. They say, seamless welded; it means it has seams and they welded them; and yet it has no seams.

Q. Do I understand you to say, Mr. Gibbs, that the proper way to install a gasoline tank, galvanized iron, which is cylindrical, and has one convex and one concave end, is to stand it on the concave end?

A. It is to stand it as those tanks in the Seminole were stood; as that tank there is stood, exactly like that.

When you say, concave or convex, I just want to be sure that we have our viewpoint on that.

Q. I am talking about the way the Seminole tanks were installed.

A. That is the correct way to install any cylindrical tank; the only way I have ever seen it done.

Q. The only way you have ever seen it installed?

A. Yes, any tank of that kind, except horizontally, and at angles sometimes up or down; but if it is vertical, invariably that way.

Q. You say you have seen them horizontally?

A. I say they might be. Yes, I think I have seen them horizontal.

Q. Well, of course, if you installed them horizontal, you would eliminate this crevice around the bottom that we have been talking about, where the sediment would accumulate, wouldn't you?

A. Oh, no. You would perhaps not have it at the top, but you would have it at the bottom; depends upon where you drew off, of course. If you drew completely off,—there would be a very peculiar case, to ever install a tank that way, where you had definite limitations as to the shape of the tank space.

Q. Of course these tanks could have been installed horizontally, with cradles, one above the other; couldn't they?

A. No, I don't think that would be a practical thing at all.

Q. Do I understand you to say they regard pans under such tanks, as totally unnecessary?

A. Not only totally unnecessary, but I think those pans were not pans,—I don't think they were installed as drip pans, if that is what you mean.

Q. You think it is not necessary to put pans of any kind under such tanks?

A. I certainly do think that it is unnecessary; could serve no purpose.

Q. Did you ever, in your construction of vessels, install pans under such tanks?

A. Never.

Q. Now isn't it customary in tanks of the size of this one,—of these tanks in the Seminole, when they are used for a purpose like the storage of gasoline, to have openings in their sides or ends, through which access can be had to the interior of the tank for the purpose of cleaning?

A. That would depend, Mr. Matteson, on whether you are buying a stock tank of sufficient thickness to prevent any injury to the tank by failure to clean—or rather, injury to the ship; or, whether you bought a tank of the size, for the pressure, where the thickness would be an element of corrosion—the thickness of the plate or sheets, would be an element of corrosion.

[Q.]A. Then as I understand your point of view, it is that there would be corrosion in these tanks, but you think if the thickness of the metal were such that it wouldn't go through in a hundred years?

A. I didn't say there would be corrosion of any appreciable amount. But I believe the thickness of those tanks was sufficient to let them last a hundred years. The hundred years period I meant to indicate a period vastly greater than the life of the vessel,—which might be a hundred years; I mean, the life of the tanks.

Q. Have you ever installed tanks similar to these, galvanized iron cylindrical tanks, in your vessels, with access plates on their exterior, to provide for cleaning on the inside?

A. Yes, sir.

Q. Under what circumstances did you do that?

A. When the specifications called for it; when they put them on and put them there, and we left them off. As a practical matter, it is usually that that is done in an extremely large tank, when a man actually gets in the

tank; and almost invariably they are flat tanks, which are subject to tremendously high unit pressures in the metal.

Q. You haven't seen them in cylindrical tanks no larger than those in the Seminole?

A. I have seen manhole plates in cylindrical tanks, it seems to me, of about the size of the Seminole; but not often.

Q. Those tanks are large enough to take a manhole plate, are they not?

A. You could make them with a manhole plate, but I don't think that they are stock tanks like that with manhole plates, except when very much heavier made, for other purposes.

Q. I appreciate sometimes you build vessels to specification. Do I understand that when you design—prepare the specifications yourself, you don't make such provision of an opening for the cleaning of the interior of a cylindrical galvanized iron tank?

A. We do and we don't. It depends entirely upon what the situation is at the time. If there is available a tank of very heavy metal without a manhole plate,—probably twice the metal, without the manhole plate, and others of a four or five pound tank, with the manhole plate, I could advise the owner to take the bigger tank. Of course that would mean that we had a ship like this, with ample room for the tank; that weight wasn't a factor. But a great many things enter into your decision as to what tanks to use.

Q. Well if you regarded the tank as a permanent installation for the life of the vessel, you would probably want access plates on the exterior of the cylindrical galvanized tank?

A. It would depend a great deal, with my work, as cost. I could afford to withdraw the tanks, take the heads off and examine—or without that, simply pull those

plugs out and wash them out and get—determine any sediment inside; and I have repeatedly done that,—examined tanks in that way. But it isn't—I wouldn't regard it as essential with a big, oversized tank such as that, to actually get inside of it.

Q. I am getting away from the Seminole tanks just a minute; I am asking what you do?

A. If I could get a heavy gauge tank, at a price favorable, or much cheaper than a light gauge tank, with a manhole plate in it, I would take the heavy gauge tank, in many instances.

Q. Well do I understand then that if you regarded your tank as a permanent installation, good for the life of the ship, that you would not go to the expense of providing access plates on the tank?

A. Many instances not.

Q. What instances would you do it?

A. We would do it in instances where the vessel was of a high speed nature, or one requiring the minimizing of weights, in which case we would be working on a narrower margin of strength in the tanks, and where inspection would be advised. And where I would have a boat, comparatively speaking, of unlimited displacement, a boat where weights meant nothing as to speed, I would be inclined to accept a very heavy gauge tank without a manhole plate, if there could be a substantial saving in money.

Q. Then if there was—to get back where we started, if you regarded the tanks as permanent installation, didn't require inspection, good for the life of the vessel, you would not go to the expense of providing access plates on the tank?

A. No, for the reason that the remote instance of tearing the joiner work or woodwork, in which the tanks are encased, it would be no great trick to get into the tanks, either by removal of the rivets or the opening of a hole in the tanks.

Q. Yesterday I was asking you to name some of the yachts that might be comparable in size to the Seminole, that you had built. I think you named the Fortuna; can you name any others for us?

A. We built——you mean, the exact shape of this?

Q. No; comparable size?

A. Well I guess we built a lot of boats; I would have to think back; but I recall instantly a boat larger than this boat possibly, maybe ten or fifteen feet, but the "Colonel", for Col. E. H. R. Greene of Miami.

Q. What was the name of that vessel?

A. She was not a steel boat. Her name was the "Colonel".

Q. Called the "Colonel"?

A. Infinitely a more elaborate boat than this.

Q. Any others?

A. Built the "Centaur", quite an expensive ship; but she wasn't a houseboat.

Q. How large was she?

A. I don't recall, but the cost was $87,000.00.

Q. Any other yachts eighty feet or larger?

A. Yes, we built a houseboat, I don't recall her length, for a man in New York, who had the Buick agency; I don't remember his name. But the boat was eventually sold down here to a man who is on the Keys; he has a sponge grove.

Mr. Botts:

Perky?

A. Perki; I think it is Perki.

Mr. Anderson:

Perky.

(By Mr. Matteson):

Q. What is the name of that vessel?

A. I don't know the name of the vessel. He named it—I think it has had two or three names.

Q. Who owned the "Centaur"?

A. Glenn Stewart; I don't know what his initials are, but there is a man in the room who does, Mr. Munroe.

Q. Where is the "Colonel" now?

A. The last I saw of her she was bought by somebody from Jacksonville.

Q. Do you know the name?

A. No.

Q. Is she in Jacksonville now?

A. I don't know.

Q. You don't know where she is?

A. No.

Q. And the "Centaur", where is she now?

A. I don't know.

Q. And the boat you built for Mr. Perky, where is she now?

A. I don't know.

Q. Have you named for us all the boats,—all the yachts of any type, over eighty feet in length, that you have built?

A. Oh, no, sir. We build a great many boats for the Government alone, hundreds, running as much in cost as $90,000.00 apiece; many of them. We built the ferry system for the Overseas Highway, and with boats similar in many ways to the Seminole.

Q. I am talking particularly about yachts?

A. Well our experience, we have not built a great many yachts, although we have repaired hundreds of them.

Q. Now have you built any yachts since you built the Fortuna?

A. The Centaur was built since then. We built one this year, a very nice yacht; I don't know the name of that, but it belongs to Mr. Ellis of Augusta; delivered to

him last month. The last I saw of her, he named it "Maybelle", or some such name. Ninety per cent of them have got a "May" in it.

Q. The Centaur was a Diesel engine boat, was she not?

A. I think that she was; I think she had—

Q. And she was 64 feet long?

A. That is at the water line. She was a schooner.

Q. She was approximately 64 feet?

A. I don't remember.

Q. And the "Colonel", was a Diesel engined boat, was she not?

A. You might call it a Diesel engine boat; sort of a semi-Diesel engine.

Q. Now getting back to the Fortuna, what sort of gasoline tanks did you put in her?

A. As I remember it, they were square tanks. There was a boat designed as a yacht, by one of the foremost designers in the United States, Henry J.—Gielow & Orr, I think was the name at the time; but it is now Henry J. Gielow. And almost invariably a boat of her size, when you install tanks, you are limited as to the place you can put them, and they are usually square,—I mean flat surfaced tanks.

Q. It was the Fortuna, as I recall it, where you said the tanks were enclosed in joiner work so that they could not be reached?

A. I did not say that regarding the Fortuna. I said that regarding a ship I delivered last month; and that in literally hundreds of vessels that have come into our place for repairs, that in most pleasure vessels the tanks are simply stuck in some available place good for nothing else, and usually boarded up; under the floors or in the sides.

Q. Isn't it a fact that the main gasoline tanks of the Fortuna were enclosed so that they could not be reached? Or, put it this way; were in an enclosed compartment?

A. The main tanks of the Fortuna? I don't remember that, Mr. Matteson.

Q. Isn't it a fact that she had four galvanized iron cylindrical gasoline tanks?

A. I wouldn't think that that would be the case at all. I don't think that is a fact. Of course the Fortuna has been rebuilt and lengthened; and just what they did since she left our shop, I don't know. But in the original design of the ship, as I say, you may fill all your available space, especially with a thing—occupiable space with a thing like a tank; if you have any extra space to spare, then you cut the size of your ship off, as a rule, either reduce her beam or her length. A designed ship usually has flat surfaced tanks, built for the purpose for which they are intended.

Q. When was the Seminole built?

A. My guess is '22 or '23,—no, wait a minute. No, No; my guess is that she was built about '20; 1920.

Q. Well I didn't mean to try to mislead you; I thought you probably knew. It says here she was built in 1920; is that correct?

A. Mr. Matteson, we built several hundred boats, and we have figured and made intimate study of hundreds of others that we weren't fortunate enough to build. And I can tell you more about a specification of something that we bid on—

Q. Who designed her?

A. Henry J. Gielow, or Gielow & Orr, whichever was the firm's name at that time.

Q. Now you said something about her being rebuilt. I don't find any reference to that in the Register here. Are you sure about that?

A. Regardless of whether it is in the Register, she was rebuilt; whether the Register picked it up or not I don't know.

A. I don't know that; but the Captain came to Jacksonville and showed us a picture of the changed design,—the lengthening of her, and so forth.

Q. Is that recently?

A. No, a long time ago. She was supposed to be one of the finest ships of her size; photographed everywhere.

Q. Why was she altered, do you know?

Mr. Underwood:

I object to that if your Honor please; I think we have heard enough about the Fortuna. We are trying the Seminole case.

Mr. Matteson:

We are testing this witness; the views he has expressed. And the Fortuna is quite pertinent in that respect.

Mr. Underwood:

Well, he didn't reconstruct the Fortuna.

Mr. Matteson:

We don't know that she was reconstructed.

Mr. Underwood:

He says she was, and there is no proof she wasn't. This book is dated 1933, that is six years ago; and what was the reason of the owner altering the Fortuna, is no part of this case. I would like to finish this case.

The Court:

I don't see that it is material.

Mr. Matteson:

If she was such a good boat, I don't know why she should be rebuilt.

Mr. Underwood:

Perhaps the owner didn't like the color of the joiner work; perhaps he wanted a longer boat because his family had increased in size; but what of it?

(By Mr. Matteson):

Q. Isn't it a fact, Mr. Gibbs, that you originally installed in the Fortuna, four cylindrical galvanized iron tanks?

Mr. Underwood:

I object to that on the ground it is repetitious; the question has already been asked and the witness stated he doesn't remember.

The Court:

I overrule the objection.

A. I don't recall that, but we might have done that. It is entirely possible that that could have been done. Because she had an engineer with very positive views; and these rich owners very often do exactly what their captain and engineer tell them, regardless of their ability. It is entirely possible that he thought that these were the proper tanks.

Q. I suppose you still have the original plans and specifications of that vessel?

A. We might, not necessarily. We might have them. We never expected to build another one, because Gielow—we had those drawings from Gielow, and if we built another, we would pay for them; and we probably sent them to him. We sometimes keep them.

Q. Isn't it a fact that those cylindrical galvanized iron tanks were in a closed compartment?

A. I could not answer that.

Q. And isn't it a fact that that enclosed compartment was provided with four cowl ventilators, to ventilate the tank compartment?

A. I don't recall any situation of that kind.

Q. And isn't it a fact that there were six inch lead trays installed underneath the four galvanized iron tanks, in the Fortuna?

A. Not that I recall.

Q. And isn't it a fact that the reason why those galvanized iron tanks were enclosed in a compartment, with joiner work, was because you regarded them as a permanent installation, the same as you regarded the tanks on the Seminole as a permanent installation?

A. There was not one thing done on that boat because I had any wishes in the matter whatsoever. We carried out the instructions of the owner, through his naval architect, Mr. John H. Wells, and his resident inspector, captain and engineer; and the work was done from working drawings; we did exactly what we were told to do; there was no comment.

Q. Did you supply the tanks for that job?

A. As I recall—we probably did, but not necessarily. The owner, I remember, supplied his own bathtub, which was a great piece of vitreous metal; had to be ground away to fit the bow of the boat. We had nothing to do with it.

Q. And isn't it a fact that the cylindrical gasoline tanks which you installed in that vessel, were provided with access plates for cleaning?

A. I don't remember a thing about those tanks.

Q. And isn't it a fact that those cylindrical galvanized iron tanks were installed in a horizontal position?

A. I don't think that they were. I think such an installation would have impressed itself on my memory. I don't remember details for which we are not responsible.

Q. Now assuming that there were some cylindrical galvanized iron tanks installed by you in the Fortuna, would you have considered them a permanent installation, good for the life of the vessel?

Mr. Underwood:

I object to that as speculative, and immaterial.

Mr. Matteson:

Trying to estimate the life of a cylindrical iron tank, in respect to this vessel.

The Court:

Read the question.

(The last question was read by the reporter.)

The Court:

Overrule the objection.

A. It would depend entirely upon the gauge of the tank.

Q. You wouldn't have installed them in a closed compartment, surrounded by joiner work, unless you did consider them good for the life of the vessel, would you?

A. Well, I would have done whatever he had told me,—whatever our instructions were, on that job.

Q. Now Mr. Gibbs, yesterday you were citing us the Fortuna as an evidence of your experience—practical experience in the construction of vessels, on which you based the opinions that you expressed here. Do I understand that now you disclaim any responsibility for anything,—any of the arrangements of the Fortuna?

A. I claim that I had the opportunity of knowing the designing ability of the man who designed that boat. I most certainly disclaim any responsibility for the acts of an engineer or architect, just because I fulfilled his instructions to me. I believe that the knowledge that I gained by seeing the Fortuna and other boats, gave me a viewpoint and gave me experience on making a good joint and doing work properly from a standpoint

of workmanship, with no respect to design. If the Fortuna had been an abortion, I would refer to her with pride, if the work that we did on the Fortuna was done in a workmanlike manner; and would charge the designer with the abortion, if it was the design that was the abortion.

Q. As a matter of fact don't you know, Mr. Gibbs, that in 1937 it was found that the galvanized iron tanks—cylindrical tanks which you originally installed in the Fortuna, had rusted through to such extent that they had large holes in them?

A. No, I do not know that.

Q. You hadn't heard that?

A. No.

Q. And that the tanks had to be completely removed and renewed?

A. I did not know that. And enclosing them or putting them in as they were, was done under instruction, with no calculations having been made by us.

Q. The ventilation in the tank compartment, was that your idea or the designer's idea?

A. Might have been the cause of rusting the tanks.

Mr. Underwood:

If your Honor please, I object to such questions. It is quite clear that Mr. Gibbs didn't design the Fortuna; he said repeatedly he just carried out the specifications.

The Court:

That is a matter of argument. Overrule the objection.

A. I believe that it is easily possible that those ventilators might have let a good big bunch of salt water right into that enclosed place.

Q. And I take it that you would not, of your own volition, have installed ventilation for that tank compartment?

A. Only for the matter of dry rot of the compartment.

Q. Would you have installed it for that purpose?

A. It would depend. If it were metal I wouldn't do it, I wouldn't have any ventilation, with metal containers.

Q. You wouldn't have any ventilation in the compartment at all?

A. Containing tanks, unless it was a matter of dry rot.

Q. You wouldn't take into account the possibility of leakage or corrosion of the tanks at any time during the life of the vessel?

A. Not if the tanks were of sufficiently large gauge, thick enough. I would only be following the practice of stock boat builders, who, even for light gauge tanks, install permanently.

Q. Well will you communicate with your office, Mr. Gibbs, and produce for us so that we can examine them, such plans and specifications as you have of the Fortuna at the time she was constructed?

Mr. Underwood:

May I hear that question read, please?

(The question was read by the reporter.)

Mr. Underwood:

If your Honor please, I object to that. It has no probative value on any issue in this case. At most it is an attempt to get into the record by putting in plans of another vessel, the opinion of the architect who drew those plans, as to what was right at that time, for that particular boat. It has nothing to do with that, even if the plans were here in Court they would be inadmissible as proof of any fact, without the presence of the architect who drew them, so that I could have a chance to cross

examine here and find out what his views really were and why he did it. We have gone very far afield in this case. Actually, your Honor, it doesn't matter whether these tanks were well or badly designed; the question is whether they leaked. No matter how badly designed they were, if badly designed, if they didn't leak it doesn't make any difference as far as this affair is concerned. And of course, by the same token, the Fortuna's tanks are just farther removed from the issue.

Mr. Matteson:

If nothing in the boat leaked, as Mr. Underwood claims, there would have been no explosion.

Mr. Underwood:

That isn't necessarily true; somebody may have put dynamite in there.

The Court:

That is argument; you don't want this in the record, do you?

Mr. Matteson:

No, sir.

(Discussion was had off the record.)

The Court:

Gentlemen, there has been emphasized in this case, throughout, matters the importance of which I didn't appreciate at the time, and matters apparently not sufficiently connected with the relevancy, have been made so much of, the Court is impressed in connection with ruling on the relevancy of certain testimony. I don't know what magnitude is going to be given to it in the ultimate consideration of the case; and just to rule on it and ex-

clude something that might be considered by counsel to be of so momentous significance, I hesitate about excluding it. Certainly, fundamentally, we are not trying the case of the Fortuna, we are trying the case of the Seminole. What appears to me mostly is the matter of administrative policy toward this case, and getting through with it. We have here—it is Thursday, we have Friday and Saturday morning, then we have Monday; and under the arrangement now, if we don't get through with the case you have to submit it to some commissioner to take depositions.

Mr. Matteson:

I would be satisfied to have Mr. Gibbs produce that sometime next week, after we finish the Court session; let me ask the questions of him at that time. It seems to me clearly, where the witness has made statements with respect to these things. I am entitled to cross examine him with respect to them.

The Court:

Here is the possibility of relevancy; Mr. Gibbs has referred to the Fortuna as a vessel which was constructed there at his shipyard; and up until now—until the cross examination, it would appear that the experience that he had in connection with his construction was one of the matters that went into his experience, based upon which he expresses an expert opinion. Now then by cross examination it has been brought out that it was constructed, not only as appears, as I recall from direct examination, where the designer and architect was someone outside of his plant, but now on cross examination Mr. Gibbs takes the position that even though there was, according to his opinion, some wrongful theory in the architect's design, he would follow it. Now just how strong that is as affecting the Court's ultimate opinion as to his views,

is yet to be determined. Just to exclude it altogether, I think it would be error, so I am going to let it go in; but the administrative matter of getting through, is what appeals to me.

Mr. Underwood:

If your Honor please, I would like to make one further remark on the subject. There are only two possibilities: One is that Mr. Gibbs drew some of the plans; the other is that he didn't. Now if he didn't, and just built the boat according to the specifications of the naval architect who did draw the plans, it is utterly immaterial. On the other assumption, assuming that he did draw some of the plans, or was responsible for some of the design, it was 19 years ago; and even if diametrically opposed,—even if he did something then diametrically opposed to what he says today is his opinion, does not impinge on the credibility of the witness' testimony in the slightest. I did things 19 years ago that I wouldn't do today, and vice versa; and I imagine we all have. I have opinions today that I didn't hold 19 years ago, and I imagine we all have. So it does not seem to me, even if we get to these plans and take a lot of time pawing over them, it is going to advance us one iota toward the real determination of the true issues in this case.

The Court:

You will talk that over at noon; let's see if you can get together on it. I want to get through with the case, gentlemen, and if you can work that out some way and see if Mr. Gibbs can get the plans, and let's determine that, and not take up the good time of the Court now; and go forward with this.

Mr. Anderson:

Judge, let me say this, may I? He may have done it wrong 19 years ago, and profited by that experience. I

think I did that a lot of times in my professional career; I am sure we all did. Nineteen years ago a matter came up, we had to do something, and did it wrong; then we found out later we did do it wrong, and that is the basis of our ability to do it correctly today. It has not anything in the world to do with this case.

The Court:

The only possible relevancy there, I think, that entitles it to go in,—there have been mountains made out of matters I didn't appreciate at the time; there may be some relevance. I am not disposed to keep out something that may be of importance that I don't appreciate.

Mr. Matteson:

I think we can take care of the arrangement all right; we might even stop at Jacksonville on the way North.

(By the Witness):

A. As a practical matter, Judge, there is not one chance in a million that those drawings are in existence. The man for whom they were built, died shortly after. It was built under directions of the owner. There is no record in this book, of alterations, which unquestionably did exist, according to Mr. Matteson. This doesn't show it. She went to a location,—was down in the Thousand Islands. We don't make a habit of keeping the drawings that we have had and don't want, by an outside architect. We do make a very definite habit of doing what we are told to do, exactly what we are told to do; because the minute we vary from any dimension of the architect, we would then become responsible. Very often—

The Court:

Do you think you have the plans and specifications back in your plant?

A. No, sir, I don't think there is one change in a thousand that we have got plans that are 19 years old. The Fortuna, well photographed, profusely, and a beautiful ship, with a reputation of being one of the finest ships. The Fortuna was a special ship, to suit one individual bachelor, and a ship that we would probably never build again in the world. There was no occasion to keep the drawings; and I don't think that if it had been an available stock job, that we would keep them over 19 years.

(By Mr. Matteson):

You will be willing to make a search and see what you have, would you not?

Mr. Underwood:

I object to what the witness would be willing to do; I object to this whole business.

The Court:

I think he can answer the question, Mr. Underwood.

Mr. Underwood:

Don't you think that question ought to be directed to counsel, rather than to the witness? I won't advise the witness to produce any plans unless instructed by the Court.

Mr. Matteson:

I have asked the witness to make a search and see if he can produce these plans. If he says he can't, that is one thing; but he certainly is under the obligation to make the best search he can and see if they are available.

Mr. Underwood:

I object to it, on the ground I have previously stated; and I think that Mr. Matteson, at this stage, ought to

be made to demonstrate completely the relevancy of any such fishing excursion before your Honor grants his request.

The Court:

I am not acting on the request now. I think the question is properly directed to the witness,—whether he will do that.

A. I won't answer that until I see—if this is my right, until I discuss it with counsel. Because I regard it as—

The Court

I am not ordering you to produce them; I am directing you to answer the question, to determine whether they are available.

Mr. Underwood:

I think the Court might instruct the witness, so that he may understand that he is directed to answer the question, whether he is willing to look.

The Court:

That is right,—whether you are willing to look, Mr. Gibbs; and answer the question, to see whether they are at your office, and whether they would be available in case the Court did order you to produce them. Is there somebody up there at your plant that you could direct a wire to and ask if they are there, and determine that one thing?

A. I suppose that could be done; that I could wire; but—

Mr. Underwood:

If your Honor wants that done, if you direct that that be done, I will do it, of course. I think that is something

that—I am the one who should be admonished, and not the witness.

The Court:

I may be wrong about that, but I disagree with you. I think the witness is on examination, and I think he is entitled to ask him whether they are back there at his office, whether they could be produced; and with that determined, for the Court to determine how it will be done,—if it is ordered to be done.

Mr. Underwood:

If your Honor directs that we ascertain whether they are there, we will do that.

The Court:

All right, I think that should be done.

Mr. Matteson:

That is all that I have.

(A brief informal recess was had.)

By Mr. Botts:

Q. Mr. Gibbs, can you from your experience give us any estimate as to the amount of gasoline that would be required for a single priming of motors of the type that were in the Seminole,—type and size?

A. My experience would indicate that each one of those cylinders would take about two to three tablespoons full; that that would be about what you would put in there.

Q. Two or three tablespoons full; and these were six cylinder engines, were they not?

A. Yes.

Q. That would be twelve cylinders, which would be something like thirty-six tablespoons, something like that?

A. Yes. That is just my guess. That is determined by actual operation.

Q. Well—

Mr. Underwood:

May he finish?

A. And is determined by the skill of the operator.

Q. In speaking of protecting by the use of paint, you referred to red lead as in effect, rust. Red lead is red oxide of lead, isn't it?

A. I don't know that. I was taught in school, and this of course referred to that time, that one of the best anti-corrosive paints was made of rust—of the elements that compose rust; of iron and oxygen; oxide of iron in some of its forms.

Q. Have you ever heard of iron rust being used in a paint?

A There are many paints that have the various oxides, or component parts of it.

Q. But are they used as a pigment, or as a coloring matter?

A. Well the coloring matter is a secondary situation regarding paints. You can throw anything in there; but it is anti-corrosive, it is covered up with the anti-fouling paints.

Q. Don't you know that red lead is red oxide of lead?

A. I don't know, it may be. I have attended one or two lectures where red lead was said to be a thing which is not even red lead, but as I have said in my testimony, a thing that had been described to me as red lead was essentially not an iron oxide paint.

Q. Did I understand you to say the other day that you would not get a spark in closing a knife switch?

A. I don't believe that you could, with this voltage, in the closing of it.

Q. Was it 110 volts?
A. What is that?—Yes.
Q. It was 110 volts?
A. Yes.
Q. Well you don't know much about knife switches, then, do you?
A. I know something about them; I have tested them.
Q. And you have never seen a knife switch that would emit a spark when it was closed?
A. Never.
Q. Would you be—well I don't know whether it is there now; if it is still there I would show you one at noon and demonstrate it.

Mr. Underwood:
I object to that going in the record, unless Mr. Botts is going to testify.

Mr. Botts:
All right, I will testify.

Mr. Underwood:
I don't think you could qualify, Mr. Botts, as sufficient of an expert.

Mr. Botts:
Yes, sir, I can do that too; and I will before it is through; and I can point you to the switch.

The Court:
We will strike anything from he record,—so far as any probative force, the remark should not be considered.

(By Mr. Botts):
Q. Now then you said the other day, as near as I can recall it, that you saw no evidence of a violent explosion having occurred on the Seminole?

A. Yes, sir.

Q. Did you see evidence of any explosion?

A. No, unless you call a fire,—which I can't say was due to any explosion.

Q. Do you mean to say that there was no explosion on the Seminole?

A. I don't know; I wasn't there.

Q. Well in your opinion as an expert, if there was an explosion, would there be any evidence of it?

A. There might, yes. I think it would depend upon the intensity of the explosion, as to the evidence.

Q. Well then I don't understand you to say that in your opinion there was not an explosion on the Seminole?

A. I merely state I saw no evidence of an explosion on the Seminole.

Q. Would you read the question again. —Either I didn't ask it as I intended, or you didn't answer it?

A. Conclusive proof of an explosion.

Q. Just read the last question, please.

(The last question and answer were read.)

Q. Well in your opinion, from the examination of the Seminole, was there any explosion upon that vessel?

A. It would be an absolute guess on my part. I saw nothing—no evidence to indicate an explosion.

Q. Now you say that these large tanks had been tilted out of plumb; how would you explain that?

A. Well I saw that many things had been jerked apart; not by explosion, but by the operation of the wrecker. A fire as great as that, beams perhaps falling all around, from the shed, and the removal, possibly theft, by the junk thieves; and many reasons—particularly the operation of the wrecker. When you wreck a thing of that kind, you usually hook on to it with some form of crane and jerk the whole thing up as a mass; and there is evidence that that was done.

Q. I am referring now particularly to the distorted situation of the large and heavy tanks, where they were

tilted out of plumb, and evidently not in the original position?

Mr. Underwood:

If your Honor please, I object to the question on the ground that that is not the evidence. The evidence shows that only one tank was shifted out of position,—not all of them.

The Court:

Well I think the best way to handle that,—Mr. Gibbs is a very intellectual witness; and if there is any part of his cross examination that does not incorporate some factual situation, Mr. Gibbs, you call it to our attention. I overrule the objection,—the technical objection.

Q. You say that the presence of a tank, or other tanks bent over—one or more of those tanks was out of plumb and appeared not to be in a situation as originally installed; at least one or more of them?

A. Yes, I think that is true.

Q. All right. Now then those tanks, under the evidence, appeared to have been mounted on steel supports, fastened to the bulkheads, with metal, probably, I believe steel pans underneath them?

A. Yes.

Q. Your observation confirms that method, does it?

A. As I recall it, that is essentially what was done.

Q. Now then can you explain how that tank or tanks, if more than one was displaced, could have been displaced and put in its present position without an explosion of some sort?

A. Oh, yes. In the first place, I don't see just how an explosion inside the engine room would have pressed those tanks towards the explosion. They were tilted, as I understand it, towards the engine room, were they not?

Q. I don't recall that; I think the photographs would show. I don't recall that.

A. As I remember, they were tilted inside, and not out. That would lead me to believe that unless the explosion was from in a ship, where it isn't supposed to be,—the possibilities of an explosion,—that the explosion theory wouldn't carry there. Another reason that could exist for the tilting of the tank, is the usual field, is the fact that that theory would have no such a structure as that. It is almost impossible to lay a vessel up anywhere, without a watchman there all the time, that the stuff isn't stolen, or examined with a view to stealing it, or making an offer to the owner for its purchase. And it appears to me that somebody—that if the wrecking operations didn't get that tank hooked up by error, or some other way, when they pulled it up, that possibly some junk dealer did it, to try to make an offer and buy the tanks, as good tanks. He wouldn't be much interested in them unless they were intact. But around any calamity like that you have armies of junk dealers.

Q. And you are propounding now a theory that that tank might have been displaced by mechanical means applied to it by some human force subsequent to the fire?

A. Yes; either by the wreckers, accidentally or intentionally getting it the easiest way to clear the wreck; or it might have been done by some person viciously or innocently, with a view to determining the value of the property, with a view to stealing it or purchasing it.

Q. Now you heard the testimony, I believe, of the very first, or one of the early witnesses, that there was in fact an explosion on that vessel, didn't you?

A. I didn't listen to all the testimony, and I don't recall that particular thing. I might possibly have heard it.

Q. Mr. Gibbs, assuming that there was an explosion upon the vessel Seminole immediately before the fire

started, would the fact of such an explosion be a reasonable explanation of the present distorted or unnatural condition of one or more of those tanks?

A. The assumption, coupled with my observations, would lead me to believe that that tank was not displaced due to any explosion. Even if there was one,—any possible explosions in that boat; basing that opinion on the idea that the explosion took place, if at all, in the engine room.

Q. And you just think there wasn't any explosion?

A. I didn't say that; I said I didn't think that the tank, the position of the tank, could possibly be evidence of an explosion in the engine room.

Q. Well was there evidence, from your observation, of a fire sufficient to have been the cause of that tank being put out of position?

A. No, sir. I think the fire might have melted the tank to a liquid form and not exerted any force in the world that would have tilted it as it was. I can only conceive of manual effort on the tank to displace it in the manner it is displaced.

Q. Suppose we would assume that that tank was in its present position the morning after the fire; what explanation could you give of that, if it were a fact?

A. That someone had gone there in the night and put it in that position.

Q. But I will say, the morning of the fire, and before the fire was extinguished on there, suppose it was in that position; what would you say?

Mr. Underwood:

I object to that on the ground it is speculative; on the ground there is no evidence in the record to support it. I refer particularly to Respondents' Exhibits 3-X, 3-W, which show the four gasoline tanks of the Seminole on the afternoon of the day of the fire, while the fire depart-

ment's streams are still on them, and show no displacement whatever of No. 1 tank.

Mr. Botts:

If you can't see it, you have very poor eyes, that is all I have to say. I can see the distortion of these tanks now.

Mr. Underwood:

That raises another issue in the case. I don't wear glasses, and Mr. Botts does.

Mr. Botts:

And I can see the distortion right now.

The Court:

Let's read the question.

(The last question was read by the reporter.)

The Witness:

Is that a question?

The Court:

Just a minute, the Court has a burden here. I am not ruling whether there is or is not a distortion. Technically ruling, I overrule the objection.

A. Will you read the question to me?

(The last question was re-read by the reporter.)

A. Just the last part of it.

The Court:

Do you understand what he means?

Q. The distorted position.

A. I would say that regards,—meaning people's removing rubbish, or the wreck, possibly to hunt for the body, or for any other purpose, had caused the situation; or that possibly the water had floated,—that this tank floated; would be the best possible answer. If the boat was sunk, and if the tank had no gasoline, it is possible that one side of the tank was restricted and the other side was not restricted and it floated into such a position. I think that an examination at the time would have disclosed the real cause of twisting the tank. I cannot conceive of an explosion being the cause,—any force it would exert, putting the tank in that position.

Q. Well if there was not an explosion upon that boat, from your experience as an expert, have you formed any theory as to what caused the fire, if there wasn't an explosion?

A. I have very definite theories. I would like advice of—

Q. You are here as an expert?

A. —of counsel, as to whether I am permitted to give them.

Q. I am asking you to propound some theory other than that of an explosion, which will explain this fire?

A. The theory is, espionage. The more I think of it, the more that theory persists in my mind.

Q. By the deceased Mr. Abel, I suppose?

A. No, sir; by someone who might profit by such a disaster.

Q. And who could be in that category?

A. I would prefer not to make any speculation, but I have in my mind many people who would be tremendously interested in destroying that ship.

Q. And destroying this boat yard and all these other yachts?

A. Absolutely; not—

Q. Well, that's a new one.

A. I have another theory; Mr. Botts, you have asked for various theories; I have a theory that possibly carelessness on the part of other people might have had something to do,—even without authority.

Q. But I am trying to get the origin of a fire without any explosion on that vessel; the fire originating so rapidly that it would blow a man's leg off and cause his death, in that engine room?

Mr. Underwood:

I object to that question; on the ground that there is no proof that anything blew anybody's leg off.

Mr. Botts:

Well, the man came out without a leg; that is proof.

Mr. Underwood:

And the proof also is that he was found at a spot where the concrete would have been above him; and great slabs of concrete on his body; it is possible that the concrete severed his leg. There is no proof that his leg was blown off at all.

The Court:

I think we are getting into the realm of speculation there. That objection is well taken.

Q. I believe that is a good way to leave your explanation of this fire, anyway. You made the statement yesterday that gasoline was from one to ten per cent heavier than water?

A. That is just a guess. It is probably—of course the gasoline is much lighter than water; it was an error that I made. The gasoline is about, around four per cent lighter than water is.

Q. You have looked that up since yesterday, haven't you?

A. No, I didn't. I have repeatedly made other testimony showing that the water went to the bottom and that the gasoline rose to the top. All my testimony is filled with the position of the water in that tank, as to being heaviest and at the bottom portions.

Q. But you did make the statement yesterday that gasoline was from one to ten per cent heavier than water, didn't you?

A. Well I probably made a great many errors.

Q. I think so.

A. In the way of calling of words quickly. But I certainly do know, and did know, that gasoline was lighter than water.

Q. Do you recall any other instances in which your testimony may have been equally careless or ill-considered?

A. I don't regard that as careless. The misstatement of a word, because I could certainly catch that, and almost any person in the world knows that gasoline is lighter than water, and that oil floats on the top of water; and it is not conceivable to me that I would be held responsible for making the—calling the heavy the light; an error there.

Q. Now then I understand the engine room floor of this vessel was at a level lower than the floor of the surrounding staterooms, fore and aft, and the passageway that was on one side of the engine room; is that correct?

A. I think it was, yes.

Q. Now does the term, the bilges of the vessel, does that refer—and I am asking the question so I won't use the term improperly,—does that refer to the entire space underneath the floor of the vessel, and between that and the hull structure of the vessel? Is that what is known as the bilges?

A. Well I have known it to refer to two different things, depending upon what you are talking about. A vessel has square bilges, or abrupt bilges, that refers to the change from the approximate side of the vessel, to the bottom of the vessel. But when you refer to the bilge of a boat, with reference to where you store things, that usually refers to the entire bottom of the boat underneath the floor boards.

Q. Well then that would be an understandable use of the term, to refer to that entire space underneath the floor of the vessel, as her bilge or bilges; am I right?

A. I would think that is what you are talking about.

Q. It is in that connection that I am going to use the term, and I wanted to be sure that we understood each other on that.

A. Well I would understand that; unless you were on the outside of the ship, talking about her lines.

Q. Now then, Mr. Gibbs, the bilges of this vessel would have been a little bit lower right underneath the engine—

A. Excuse me; when you say, bilges, you get back to the corner; two things; the bilge, you mean the bottom?

Q. All right, the bilge then. In this boat, the bilge of the boat was defined on its upper level,—on its bottom level by the hull of the vessel, and on its upper level by the floor of the vessel, which was lower underneath the engine than in any other places; is that correct?

A. I would say one boundary was the bottom of the hull; the other boundary would be, in this boat, the first plane that it struck, which in this instance would be the floor of the engine room, or the floor of the boat.

Q. The floor of the boat; but the floor of the engine room was somewhat lower in that small space, than the floor of the boat, as I understand it?

A. Yes; they called that the bilge of the boat.

Q. Do you recall how much lower the floor of the engine room was than the floor of the other part of the same deck?

A. It is considerably lower, I think; the whole engine room floor.

Q. Two or three feet lower, wasn't it? A couple of feet?

A. As I remember it, about 20 inches lower than the forward end of the ship; and would probably vary due to staterooms or some—the drawings of the ship I have never seen, but the stateroom might be low or high.

Q. Then the bilge of this boat was a relatively confined surface, confined,—I mean confined area, confined by the hull of the boat, and this floor; that is true, isn't it?

A. That is true of most boats; but not nearly as confined as apparent, because usually there is a pretty large hole right under your engine,—clutch and so forth; because you don't put your engine bed on top of your floor.

Q. But I am speaking of this particular boat, that the bilge was a substantial enclosure, wasn't it?

A. Not nearly as much as would appear to laymen.

Q. Does the floor appear different to an expert than it does to a layman?

A. Yes; a layman does not conceive of things that he does not know of.

Q. A solid floor is a solid floor?

A. No, sir; a layman would think that an engine was put on the top of the floor.

Q. Well, I am not questioning about how the engine is mounted. The solid floor of that vessel above the bilges was a solid floor, whether observed by an expert or a layman, wasn't it?

A. You mean, a continuous floor?

Q. The floor that was there?

A. I won't say it was a continuous floor; I would think there were parts of it in which the continuity was broken up, that was not apparent to the eye.

Q. But it was solid, wasn't it?

A. Except for having holes, it was solid.

Q. And where were those holes?

A. They were possibly at various places.

Q. Do you know that there were holes?

A. I think so.

Q. Where were they, if you know?

A. I think they were under the engine; and around various other places that I could list in going over the drawings to refresh my mind. But there was of course—the floors had floated away, or had been dissipated in some form,—the coverings, I mean; so that we cannot know definitely where all of the holes existed. But it is safe to say that there was a very substantial hole in the vicinity of the engine room, in making the engine room common with the bilge and the boat. And that probably existed wherever it was not necessary for men to stand.

Q. Now then you are just making an assumption now without any knowledge of the fact, are you?

A. That is based on practice. I never have in my life seen someone floor up between the engine bed, of any engine.

Q. Now—

A. Neither have I seen them, in a case like that, try to avoid opportunities of ventilation by putting floor boards underneath walks, or in positions where the foot could not get, to trip, to fall.

Q. All right; now if in the bilge of this vessel, by some carelessness or otherwise, gasoline vapors should have been deposited, which I believe you stated yesterday, by reference to the authorities, were approximately three times as heavy as air,—will you explain to us how

those relatively heavy vapors would have been exhausted or removed from the bilge?

A. Yes, sir. Those heavy vapors in my opinion do not remain as independent or a distinct vapor, long. The tendency is to mix immediately with the air. The reason for such an opinion is to some extent based on the fact that the minute a bottle containing a small amount of gasoline is opened, the nose is sensible of the presence of gasoline in the bottle, meaning that the vapor, some of the gasoline itself, which formed a vapor, has mingled with the air and gotten to the nose. It was only the presence of the article itself, on the nerves of the nose, caused the sensation of smell. The theory of convection would cause the intimate contact of your vapor with your air, and then it would be swept into the air, with the general mixture, as can be proved by merely taking an open pan or cup with gasoline in, and in a very short time it isn't there any more. The theory that the gasoline goes into vapor and remains in the cup,—well, does not hold; because the only way to keep gasoline in a container is to make it absolutely air tight; because if there is an opening, it is gone. I have had considerable experience with efforts to keep gasoline, and one of them is the little skiffs that we sell; we have people complain sometimes that they did not run—the gasoline didn't last as it should have. They have it corked, and we find that a little vent hole is sufficient to let a considerable amount of gasoline out. Invariably those complaints come from people that haven't used their boat in a period we will say of a week. That happened with us. We put the gas in, immediately use it, they will get as much as ten hours use out of the given amount of gasoline. I have already testified as to the ease with which a gasoline vapor becomes a mixture, and on the fact that convection exists wherever there is any change in temperature for any cause whatever. The conclusion that I draw is that

wherever there is motion, there is tendency for a mixture of gases. I do not believe—it has been my experience that a vapor has only to come in the presence of air, to rapidly become a mixture. And if you will check up on the specific gravity of vapor, which is heavy, as compared to air, you will find that air,—that the explosive mixture, for instance, or a mixture of air and gas vapor, is extremely light, a little bit heavier only than air itself. And as soon as there is a mixture, to all practical purposes you practically have,—for specific gravities, you practically have in your bilges a gas of the same density as the air; it is actually about I think fifteen per cent,—or much less than that. You can readily see that if one is three times as dense as the other, and if it only takes about five parts of gasoline vapor to nineteen parts, or maybe twenty parts of air, to make an explosive mixture, that you are only putting a tiny bit of heavy gas and an enormous amount of light gas, and that the resultant weight of the mixture, which is explosive, becomes practically the weight of the air. Therefore there is very little difference in the air, and air-vapor, explosive mixture, as a practical matter, and with convection theories in view.

Q. Is that all?

A. Yes.

Q. Now then it is true isn't it, that there would be a less tendency to have the gasoline vapor mix with air, in an enclosed area, than there would out where air currents were freely circulating; isn't that true?

A. I would think that the circulation within the closed area would perhaps be just as rapid as the circulation in the larger enclosed area, relatively.

Q. Do you mean to say that in a tightly closed room, that the air currents circulate as freely as they do outside? You don't mean to propound that theory, do you?

A. Not with the same speed, but with the possibility—it would be hindered by the friction of the holes.

Q. All right, let me see if I understand you. Do you mean to say now to seriously contend, that if we would take this room, or any other room, and close it tightly and leave it without any moving object in here, and it remained at a uniform temperature, that there would be as substantial a circulation of the air in that tightly enclosed, quiet room, than there would if windows and doors were open?

A. You mean, if all parts were of uniform temperature?

Q. I say, that the temperature remains at the same temperature, and is tightly closed, that the circulation would be as free as it is where it is open with windows and doors?

A. Why certainly not. There would be—if you had a breeze blowing through, with another kind of temperature, in the air that came in, it would have the temperature change. Or if you had openings and with various cold or hot winds coming down, you would create those things that I said about convection.

Q. What I want to see if I can get you to express an opinion,—and I don't like to cut off these long explanations, but I would like for you to answer me, and then any explanation you want to make will be perfectly all right. Now let's take the bilges of this vessel, underneath a floor, comparable in a way to the slab of this table, and the area underneath it, with perhaps some small openings, which you have theorized, it is covered solidly; do you mean to say that gasoline vapor in that area would be dissipated as freely as it would had the floors been removed?

A. No; I think the floors would have been a deterrent on the—

Q. On the rapidity of dissipation of the vapor, wouldn't it?

A. Yes, sir.

Q. Now do you have in mind the testimony which was —and the difference from one of these handbooks, that the expansion coefficient of a gas is approximately 1/491; I

believe, of its volume, for every degree increase in temperature?

A. At 32 degrees.

Q. At 32 degrees?

A. Yes that is right.

Q. And the expansion coefficient would not be relatively changed very greatly, if it was from 80 to 81 degrees, than it would from 30 to 32, would it?

A. No.

Q. So for purposes of illustration, it would be—could be treated as approximately the same, couldn't it?

A. Oh yes.

Q. All right. Then if there was gasoline vapor, and we will take the lowest figure, three times heavier than air,—down in the bilges of that vessel; how great an increase in the temperature would have been required to bring that gasoline up—that gasoline vapor up to a temperature under which your convection,—the law of convection, would have operated to raise it up into the upper—to the overlying layer of air?

A. Oh a very very slight amount of heat would cause motion,—considerable motion; and wherever that motion existed it would occur at an opening. Wherever that opening existed, it would contact the air, and meet counter currents; and you would put that into an air mixture, which would immediately become extremely light, as compared to the air, of almost the same specific gravity; and you would get—it would be swept up with convection into the general atmosphere, from the bilge to the engine room, and from the engine room to the atmosphere.

Mr. Botts:

Well I will have to go into that a long time.

(Thereupon the hearing was recessed until 2:00 o'clock P. M. of the same day.)

Thursday, November 16, 1939, 2:10 o'clock P. M.

(Hearing was reconvened pursuant to the noon recess, and thereupon the witness, GEORGE W. GIBBS, resumed the stand and further testified as follows upon continued cross examination.)

By Mr. Botts:

Q. Mr. Gibbs, I call your attention to a folder headed, "Fire and Explosion Risks", and I will ask you if you are familiar with that work?

A. I don't think I ever saw that. I have read a book a good deal—

Q. Do you think that that is a recognized authority?

A. I would have to look; I have read a book that looked somewhat similar to that, once.

Mr. Underwood:

The book referred to is by Dr. Von Schwartz, translated from the revised German edition by Chas. T. C. Salter, reprinted for the 3rd edition, London, 1926.

A. I do not believe that if a book such as that were available to me that I would read it. It appears to be connected with buildings, rather than marine hulls.

Q. Now we were discussing a situation where there is a closed room, entirely air tight, in which there is air, and a quantity of gasoline fumes. Now I want to ask you whether or not in that situation, in your judgment, there would occur immediately or eventually, a complete equalized mixture of gas and air, so that the mixture at the top of the room would be equally impregnated with the gasoline fumes, as would the bottom of the room?

A. In my judgment it would.

Q. It would?

A. The mixture would become homogeneous.

Q. Now do you have any authority whatsoever for that statement, other than you own unsupported opinion?

A. I cannot recall any written statement that I have read, reiterating such a conclusion, that I have read. I question whether that exact problem has ever been presented to any man.

Q. Now it is a fact, isn't it, that in order for a heavier object to be lifted in a lighter,—as for instance, if there was water, and a heavier object was—an object heavier than water, at the bottom, some force would have to be applied to lift it to the surface, wouldn't it?

A. It would depend upon the nature of that heavier object. For instance if it was a piece of lead, it probably would remain in the bottom; but if it was a liquid of lead it might—or a gaseous lead, and the water became a steam, that became converted into the gaseous form, there would be in my opinion a homogeneous mixture resulting. But the liquid is a very different proposition as far as the mixing is concerned. We speak of liquids and solids.

Q. All right, now then, let's get to the exact question that I asked you; that if we have any mobile substance such as a liquid, with an object of greater specific gravity than water, at the bottom of that liquid, some force will have to be applied of some sort in order to raise it to the surface, wouldn't it?

A. Certainly.

Q. All right. Then if we have in a room filled with a gas of some sort, whether air or otherwise, and in the bottom of that room was we will say a container of equal specific gravity with air, but within that container was a heavier gas, some force would have to be applied to that gas in that container, to lift it to the top of the room, wouldn't it?

A. You mean the heavier gas, isolated from the rest, in a sealed container?

Q. Yes?

A. Yes, sir.

Q. Now then as a general thing, it is a law of physics, is it not, that any object at rest, irrespective of its weight, if it is raised to a higher level, force of some character will have to be applied to it, won't it?

A. What is that? Any—in order to move one object a force is required—to a different place? Yes, sir; the law of inertia.

Q. Then gasoline vapor is made up of minute quantities of the carbon and hydrogen of which gasoline is composed, isn't it?

A. It is a gas,—with properties of a gas.

Q. Well it is composed of the same substances?

A. You mean to ask me if there are a great many solids finely divided?

Q. No. I said, gasoline vapor is composed of minutely divided quantities of the substance which forms gasoline; to-wit, a combination of carbon and hydrogen; isn't that true?

A. What do you mean by, minutely divided?

Q. Well, small, minute particles?

A. You mean smaller than in the gasoline?

Q. Not necessarily; but whether in gas or liquid, it is carbon and hydrogen, isn't it?

A. It is a carbon-hydrogen compound.

Q. And then that substance, whether in the form of a vapor or of a liquid, would still be a carbon and hydrogen compound, wouldn't it?

A. Whatever its elements are in one state, they probably are the same in the other.

Q. Then let's get back to our law of inerta that we were speaking of a moment ago. If a heavier object is at rest,—if an object heavier than air is at rest in air, some force will have to be applied to it in some manner way, shape or form, to bring it to a higher level, won't it? That is your law of inertia, is it not?

A. To move anything, Mr. Botts, it requires a force; or, to stop anything it requires a force. That is the fundamental law of inertia,—the definition.

Q. Now let's get the specific question I asked you: If any object is at rest, at a given or determined level, in order to raise that object to a higher level; force in some manner, way, shape or form will have to be applied to it, will it not?

A. Energy will have to be applied to it.

Q. All right, energy or force. Now then that law of inertia applies irrespective of the question as to whether or not the object which it is desired to move, is large or small, doesn't it?

A. The law of inertia is universal.

Q. All right. Then if we have a gasoline vapor, concededly approximately three times or more heavier than air, and we have that in an enclosed room, where no external force is applied; when you say that that gasoline vapor, without any force being applied, would rise to the higher level, aren't you then disputing the very law of inertia which you have just expounded?

A. I will have to have the first part of the question over.

Mr. Botts:

Please read it.

(The question was read by the reporter.)

A. I do not say, have not said, that that would rise without any force applied, or changes that assume motion of any kind.

Q. Then how will it become mixed and reach the ceiling of that room?

A. It won't without certain forces.

Q. All right then, now we are getting somewhere.

A. The premise is,—let's understand this, that there is no force of any kind. For instance, the force—which don t apply here, of osmose, where a diaphragm inserted in a tank, with one liquid on one side and another liquid on this

side, and those two liquids transfer through the porous wall, merely because they are separated by a porous wall; a law of physics.

Q. Nothing strange about that.

A. So strange that no one knows why; never yet been able to discover a reason.

Q. Nor do you know the reason why a catalyst operates, either, do you?

A. A what?

Q. A catalyst. Don't you know what that is?

A. Oh yes; if you pronounce it right I may tell you. Catalysis, is that what you mean?

Q. You don't know why that operates, either, do you? How it operates? Then let's—I concede that you know more technical engineering terms than I do; let's confine ourselves now not to exhibitions of expert knowledge on other things, but this particular question?

A. I will try to do that Mr. Botts, and at no time will I make one statement which does not bear, in my opinion, directly on the answer to the question that you put to me.

Q. All right. Then the law of cosmos, or whatever that was, is out?

A. Not in my opinion, sir.

Q. Now then we have gotten to the point that if gasoline fumes or vapor are in an enclosed space, that they will remain inert, or in location at the bottom of the container, unless some force is applied: Is that correct?

A. That is correct.

Q. You say it is?

A. Any bit of mass will remain inert unless force is applied,—or continue in motion unless force is applied.

Q. And we can go further, I take it,—that the object to be moved can only be moved in proportion to the quantum of force applied; is that true?

A. I would like to know what quantum means.

Q. Quantum, amount, extent.

A. Will you read that to me?

(The question was read by the reporter.)

A. Oh, yes, that is true.

Q. Now then—

A. The quantity of force and the—coupled with the friction that must be overcome in the removal, and the—

Q. It still moved in proportion to the amount of force, however that force may be dissipated?

A. But there is the factor of friction which also—it would remove inversely as the friction.

Q. It still is a question of dissipating the force in moving the object, whether in a direct lift, as in a vaccum, or coupled with friction?

A. One element of it is friction.

Q. I think you have agreed, however, that friction in air is rather small, isn't it?

A. It is,—depends upon what forces you are dealing with.

Q. I believe you testified this morning that one gallon of gasoline would produce 23.6—22.6 cubic feet of gas vapor?

Mr. Underwood:

I think that was read from a book, wasn't it Mr. Botts?

Mr. Botts:

Well it is in evidence; he either testified to it or conceded it; I don't know which.

A. One gallon of gasoline would produce—

Q. 22.3 cubic feet of gasoline vapor?

A. Well if there is some authority on that I would be inclined to accept it. I don't know exactly what it is.

Q. Well that was the figure that was produced from this Kent's book this morning, and to which I understood you agreed.

A. Well if that is in Kent's, I would be inclined to accept it. You mean that the vapor, the 20 cubic feet of vapor.

Q. 22.3 cubic feet of gasoline vapor is the result of one gallon of liquid gasoline.

A. Cubic feet?

Q. Cubic feet. Now those were the figures that—

A. All right, in preference to any argument we have got, that is all right.

Q. Do you know the weight of a gallon of gasoline?

A. Not offhand; I know approximately what it is; for all my purposes a pint of gasoline weighs somewhere near one pound.

Q. That would be then—

A. It is about seven and a half pounds, is what it weighs—what a gallon weighs.

Q. Would you be willing to refer to Kent and give us the exact figure, and accept that?

A. It won't vary anything hardly from that. I have used it a thousand times. I can look that up.

(Discussion was had off the record.)

Q. For purposes of my examination I am willing to accept that, because the purpose of it makes no difference, but I didn't want to get anything that was inaccurate in there later. Then if you had 22.3 cubic feet of gasoline vapor in a room, it would take seven and one-half foot pounds of energy to raise that one foot, would it not?

A. It would take some pounds.

Q. Well eliminating our element of friction—

A. To raise it? Unless you had a corresponding column coming down, for instance if this room was filled with that vapor, uniform texture, which it would be, it would take almost no energy to lift that amount to the ceiling.

Q. Granted, but the room that I am calling your attention to isn't filled that way. I am trying to get you to show me how you can supply the energy to fill it.

A. What is that?

Q. Now I am speaking, not if you have a force from above, coming down, and pushing it up; that is energy, irrespective of how it originates, isn't it?

A. If you push,—if you take the whole room, all of it, so there is no counterbalancing column, it would take a certain number of foot pounds to raise it.

Q. All right.

A. Lift the whole thing up, not this up and that down.

Q. It will take seven and a half foot pounds of energy to move a gallon of gasoline—to raise it one foot in height, irrespective of whether that is in the form of gasoline vapor or gasoline in liquid; isn't that true?

A. To raise any weight—

Q. Let's confine it to the question, gasoline, if you don't mind.

A. Gasoline would take a number of foot pounds to raise it, which would be a function of its weight, as though it were steel or shot or anything else.

Q. Exactly; in other words it takes—assuming that weight of seven and a half pounds per gallon, it would take seven and a half foot pounds to raise that gallon of gasoline one foot, wouldn't it?

A. I think so.

Q. And that would be true whether the gasoline was in the form of liquid or in the form of gasoline vapor wouldn't it?

A. Provided it was in a restricted column and there was not a counterbalancing column to take its place.

Q. Well if you have a counterbalance, you are supplying further energy?

A. No, there is no energy, one way or the other, except a slight energy of starting a frictionless body.

Q. Well I would like to argue that question with you, because I know you are wrong; but I won't. Do you mean to tell me that when an elevator counterweight comes down, it isn't supplying energy on its way down?

A. Contrary; I said that it did supply the energy which offsets the desired energy to lift the elevator, just as you have in convection.

Q. Then I misunderstood you; all right. Then if you don't mind now, let's not supply any other factors than those that I put in my question. Then, after you answer the question, you can supply all the other factors that you want to, and give any discussion of those that you want to. Now I am suggesting to you this; that here is a gallon of gasoline, and it is desired to raise it one foot in height. It will take seven and a half foot pounds of energy from some source in order to accomplish that result, will it not?

A. Yes.

Q. And that would be equally true whether that gasoline was in the form of a liquid or in the form of gasoline vapor of equal weight, would it not?

A. Yes.

Q. I also understood you to say just a few minutes ago, and I want to be clear on that; that if we have a perfectly tight receptacle, in which is air and gasoline vapor, —we will say 22.3 cubic feet of gasoline vapor, and the area of that receptacle is,—the square area is 22.3 square feet and it is ten feet tall, and in it is air and 22.3 cubic feet of gasoline vapor, and there is no external force by way of heat or otherwise applied to it, so that it remains in its present temperature; I understood you to say awhile ago that under those circumstances there would be no motion of the gasoline vapor, and that it would remain at the bottom of the chamber, and the air would remain at the top; is that right?

A. No such problem was put to me, as that.

Q. Well then I tried to ask you that question awhile ago, and I thought you answered it. Now then take that

problem and give me your answer. Will the gasoline vapor remain at the bottom or will it ascend to the top?

A. Under the hypothesis—

Q. That is what I want you to confine yourself to.

A. That no forces of any kind—heat,—the principles,—or any other principles of physics which would cause forces to be set up are applied, it would remain there in that condition which could not exist as a practical matter.

Q. All right then, under that hypothetical question the gas would remain at the bottom and the air at the top: all right now, then in order to produce an equal mixture—

Mr. Botts:

There is Mr. Hawkins, and I would rather suspend before I ask this next question, because I have a number of them.

(The witness George W. Gibbs was temporarily withdrawn from the witness stand.)

3852 Thereupon: J. E. LAWTON as a witness on behalf of Libelants', in rebuttal, was sworn and testified as follows:

The Court:

What is your name?

A. J. E. Lawton.

The Court:

Where do you live?

A. 1868 S. W. 17th Terrace, Miami.

Direct Examination.

By Mr. Matteson:

Q. Mr. Lawton by whom are you employed?

A. By the Retail Credit Company.

Q. And how long have you been employed by that company?

A. Since November 1st, 1931.

Q. In what capacity are you employed by that company?

A. As an inspector.

Q. What is the nature of the business of that company?

A. The Retail Credit Company is a national reporting organization; it was established in 1899, with home office in Atlanta, Georgia. We make reports to the home office of various insurance companies, and also for credit purposes.

Q. And upon request, do you make investigations?

A. On direct request from the customer.

The Court:

I expect you had better let the record show that this is a witness for Libelants?

Mr. Matteson:

Yes, sir; just ahead of the testimony, you can say, a witness for the Libelants, in rebuttal, taken out of order.

(By Mr. Matteson):

Q. In April 1935 did you have occasion to make an investigation with respect to the Seminole Boat Company?

A. Yes, sir.

Q. Will you tell me what you did?

A. We received an inquiry, I believe it was from Chubb & Son, an insurance company in Atlanta; the inquiry was on the Seminole Boat Company, as I recall, and H. C. Phipps. I was in Palm Beach as an inspector for the Retail Credit Company for three years, and I had some occasion to know something of the Phipps brothers; so I called on Mr. Roy H. Hawkins, of the Biscayne Boulevard Company, who was their local representative, and the only man I know connected with the organization. I asked

him to please furnish me with the names of the officers of the corporation. Mr. Hawkins gave me the change of name; I believe the change was from H. C. Phipps to John S. Phipps, as the new principal in the business,—at least, an executive in the business. My report was written on the Seminole Boat Company and/or John S. Phipps. It was for insurance purposes, as I recall.

Q. Did you ask Mr. Hawkins for information with respect to the company?

A. Yes, sir.

Q. Did you make a report with respect to your investigation?

A. Yes, sir.

Q. I show you Libelants' Exhibit 106 for identification and ask you what that is.

A. This is a report rendered by myself as an inspector for the Retail Credit Company, to Chubb & Son in Atlanta, Georgia; our account 8957.

Q. Was that document actually written by you?

A. Yes, sir.

Q. Was the information which you received from Mr. Hawkins, incorporated in that report?

A. Yes, sir.

Q. Put it the other way around; where did the information that is contained in that report,—where did you get that from?

A. The only person that would have any local knowledge of the change of the corporation, and its affairs—

Mr. Underwood:

I object to that as not responsive.

Q. Put it this way: What was the source of the information which you received?

A. The source of information was, Mr. Roy H. Hawkins, Secretary of the Seminole Boat Company.

Q. I think you said you interviewed Mr. Hawkins?

A. That is correct.

Q. And what was the date of that interview?

A. I can't say positively but my report was made the same date that I interviewed him; the report was made 4-18-35. Our basis for collecting reports is within four days after they are received. The man was interviewed within four days of 4-18-35.

Q. That would be April 18, 1935?

A. That is right.

Q. Now on the occasion of your interview with Mr. Hawkins, will you please tell me if he made the following statement to you, in words or in substance: "The Seminole Boat Company is a closed corporation, and is not a trading company, and is not engaged in business".

Mr. Underwood:

I object to that.

Mr. Matteson:

I have read the question exactly as I put it to Mr. Hawkins when he was on examination; I asked him at that time whether he had made that statement, and he replied that "I did not say that".

The Court:

The time and place was incorporated in the question to Mr. Hawkins?

Mr. Matteson:

Yes, sir.

The Court:

What is the objection?

Mr. Underwood:

I will withdraw it.

A. That is the information incorporated in my report, and to the best of my knowledge and belief, he did.

Q. And did he also at the same time and place make the following statement to you, in words or substance: "This is a holding company for the Yacht Seminole, which has been in the Phipps family for the past five or more years, and is now principally owned by John S. Phipps, the older brother of H. C. Phipps, the latter being no longer interested in the company or in the boat".

A. Yes, sir.

Mr. Matteson:

That is all.

Cross Examination.

By Mr. Underwood:

Q. How long have you known Mr. Hawkins?

A. I don't believe I met him on more than that one occasion.

Q. Where did this interview take place?

A. In the office of Biscayne Boulevard Company, Fourteenth Street and Biscayne Boulevard.

Q. Where, in the building?

A. As I recall it, Mr. Hawkins' office was the second office on the left as you entered the building. I was kept waiting in the vestibule from the main office; he apparently had someone in his office, because he came out and interviewed me in the reception room or the hall, rather than in his office individually.

Q. Did this entire interview then take place while you were both standing?

A. Yes.

Q. You didn't go into Mr. Hawkins' office?

A. I did not go into his office; I was not seated.

Q. Did you go up or down any stairs?

A. No stairs.

Q. The interview took place on the ground floor of the building?

A. On the ground floor, so far as I know?

Q. Whom did you ask for when you went in?

A. Mr. Hawkins.

Q. Whom did you speak to at first? Whom did you ask for Mr. Hawkins?

A. I did not know the man; I don't know who he was.

Q. What did he look like?

A. I couldn't describe him.

Q. How long did you talk to him?

A. Just asked him for Mr. Hawkins.

Q. Was it a man or a lady?

A. It was a man.

Q. You say that Mr. Hawkins came from a room at your left as you entered the front door?

A. That's correct.

Q. The second room from the front of the building?

A. As I recall it.

Q. When did you first receive any inquiry about this report that you made, after you made it?

A. After I made it? The first knowledge I had that the report would ever be used—

Q. No; just when did you first receive any inquiry about it?

A. I wouldn't be able to state anything definitely; it was within a year after the report was made, to the best of my recollection.

Q. Did Mr. Hawkins tell you that he was 45 years old?

A. No, sir. My estimate of ages are estimates only.

Q. You made in your report the statement that Mr. Hawkins' age was 45; is that correct?

A. That's correct.

Q. That is your estimate?

A. That's my estimate.

Q. Was it your estimate too, when you reported that the Seminole Boat Company is a successful firm?

A. Can I see it a moment?

Q. Certainly.

A. That is based on information I gathered in my investigation.

Q. Did you investigate any place else?

A. Oh, yes.

Q. Oh, this is not entirely based upon Mr. Hawkins?

A. The information—

Q. Is it or isn't it?

A. The information indicated as to the ownership of the business, is based on Mr. Hawkins' statement.

Q. Is this report or is it not entirely based—

A. The report—

Q. Wait until I finish my question. Is it or is it not based entirely upon information that you say you got from Mr. Hawkins?

A. The report is a compilation of facts.

Q. Will you answer my question yes or no, please? Is it or is it not based entirely upon information which you say you got from Mr. Hawkins?

A. The report as a whole, no.

Q. Is it or is it not?

A. No.

Q. It is not. Now did Mr. Hawkins tell you that the firm is successful?

A. I couldn't recall such a statement as that.

Q. Did Mr. Hawkins tell you the future outlook was good?

A. I can't recall it.

Q. Did somebody give you that information?

A. Someone apparently did.

Q. Well do you have any doubt about it?

A. None whatever.

Q. Well as a result of your investigation, you considered that the Seminole Boat Company was a successful business and that it's outlook was good; is that correct?

A. That's correct.

Q. Where else did you investigate the Seminole Boat Company?

A. Our sources of information are confidential, and if you wouldn't care to insist, I wouldn't care to state.

Mr. Underwood:

If your Honor please, I move that the witness' entire testimony be stricken from the record.

Mr. Matteson:

If your Honor please, the testimony of the witness on the pertinent points is certainly directly obtained from Mr. Hawkins. I think we all appreciate that there is a reasonable reticence as to other sources of information; I think they ought to be respected. I certainly think there is no basis for striking any testimony.

Mr. Underwood:

I don't think my right to cross examine this witness is to be circumscribed one iota by his reluctance to go into the sources of his information.

Mr. Matteson:

As a matter of fact, the witness hasn't refused.

Mr. Underwood:

I understood his answer as a refusal.

Mr. Botts:

The witness as I understand stated that unless counsel insisted, he would prefer not to state.

A. That's my statement.

Mr. Botts:

Well is there anything wrong with that?

Mr. Underwood:

No, I just misunderstood the witness, Mr. Botts, or else he changed his view,—one or the other. Withdraw my motion for the present.

(By Mr. Underwood):

Q. What other sources of information did you have?

A. As to the standing, reputation, and character of Mr. Phipps, the First National Bank testified.

Q. How about the Seminole Boat Company? You weren't asked to investigate Mr. Phipps, were you?

A. I was asked to investigate the Seminole Boat Company, and—

Q. And then—

Mr. Botts:

Wait until he finishes his answer.

A. I was asked to investigate the Seminole Boat Company and H. C. Phipps.

Q. Let's leave Mr. Phipps out of it for the moment. What other sources of information did you have with reference to the Seminole Boat Company, besides Mr. Hawkins?

A. The First National Bank of Miami testified as to the character of the organization—of Mr. Phipps.

Q. Of the Seminole Boat Company?

A. Of Mr. Phipps.

Q. Did you hear me ask you to lay Mr. Phipps aside for the moment, and tell me what other sources of information you had about the Seminole Boat Company?

A. I had no other source of information about the Seminole Boat Company.

Q. Then it must be that it was Mr. Hawkins who told you that the firm was successful, and that the future outlook was good; is that right?

A. I have no way of stating whether that is correct or not.

Q. Let me try it again. Did you have any source of information about the Seminole Boat Company when you made this report, other than Mr. Hawkins?

A. None other than Mr. Hawkins; that's correct.

Q. You did in your report make a statement that the Seminole Boat Company was successful and that it's future outlook was good, did you not?

A. Yes.

Q. And is it not therefore the fact that you got that information from Mr. Hawkins?

A. It must be; I didn't manufacture it.

Q. What did Mr. Hawkins look like?

A. As I recall him, he was a large man with dark hair.

Q. Is that as good a description as you can give of him?

A. I saw the man only once, to my knowledge. I wouldn't be able to pick him out and describe him more accurately.

Q. Did anybody introduce you to him?

A. Yes, sir.

Q. What did that man say?

A. I couldn't recall a thing like that.

Q. Did Mr. Hawkins tell you that the Seminole was used in Florida waters in the winter, and around New York in the summer?

A. I believe that he did.

Q. Did he tell you that she is a large, well-equipped yacht?

A. Yes, sir.

Q. Did he tell you that she was capable of ocean travel?

A. Yes, sir.

Q. Did he tell you that she was occasionally used for that purpose—ocean travel?

A. I couldn't recall that.

Q. Will you look at your report, down toward the bottom, and see if that refreshes your recollection? Does that refresh your recollection any?

A. That does not refresh my recollection; no, sir—identify the statement.

Q. Did Mr. Hawkins tell you that H. C. Phipps was proprietor of the Seminole Boat Company?

A. No, sir.

Q. Where did you get the information up here at the top?

A. The information was a description from the inquiry received by my office from Chubb & Son in Atlanta. Our inquiries come in on, we will say a small ticket.

Q. Perhaps I can shorten it a little bit. If you want to go on after you answer this question, and explain, you may. Did the inquiry that came to you from Chubb & Son, describe the Seminole Boat Company,—describe H. C. Phipps, rather, as the proprietor of the Seminole Boat Company?

A. Exactly yes, sir.

Q. Where is the inquiry that came from Chubb?

A. Chubb & Sons have the inquiry.

Q. Did you send it back to them?

A. We send our inquiry to our home office in Atlanta; they send it, at the end of the month, to Chubb & Son.

Q. Have you a copy of it?

A. No, sir.

Q. Will you write to them and get a copy of it for me?

A. I have no authority to do that. I will do anything the Court orders.

Mr. Underwood:

If your Honor please, I don't want to have to incur the expense of going to Atlanta and subpoenaing this document, but I would like very much to see it.

Mr. Matteson:

If your Honor please, I can't see what possible relevancy there is to it. The witness says it described the Seminole Boat Company, H. C. Phipps, Proprietor, on it.

Mr. Underwood:

It has as much relevancy as the balance of the 19-year old boat—what was the name of it?

Mr. Anderson:

Fortuna.

Mr. Botts:

It is purely in impeachment of a prior witness; and that does not go to the impeachment.

The Court:

Well if we had a case with a jury, and were ready to go to trial, I don't think I would hold up the case to get this. Neither would I in regard to the Fortuna. But I have come to the conclusion, about the Fortuna, if Mr. Gibbs had the plans and specifications with him, or if he could have gotten them from his place of business, locally, or over the noon recess, why I would allow him to be examined in regard to them, and allow counsel to look at them; but to require them to be filed in evidence, I should not do that. I think I will follow the same rule here; if the witness can get this information, I think it has a possibility of relevancy and will allow it to be brought in if he can get it. So I will allow counsel to propound the question to the witness, whether he can get it; and if he says he can, let him respond as to whether he will get it or not.

(By Mr. Underwood):

Q. Will you write to them and ask them for it?

A. I will write to them and ask them for it.

Mr. Underwood:

Thank you very much. That is all.

Re-Direct Examination.

By Mr. Matteson:

Q. Just a minute; I think that you said that your ultimate investigation was with respect to John S. Phipps; why was that?

A. In making my investigation I learned that Mr. H. C. Phipps was no longer proprietor of the Yacht Seminole; that it had been incorporated as the Seminole Boat Company, with Mr. John S. Phipps as President, as the principal, and Mr. Roy H. Hawkins as Secretary.

Q. From whom did you obtain that information?

A. Mr. Roy H. Hawkins.

Mr. Matteson:

If your Honor please, there certainly is nothing to be concealed about this; we will be very glad to cooperate, to get any information relative to it at all. It seems to me the facts are perfectly clear, and clear on the face of the report. An inquiry came in describing the Seminole Boat Company as H. C. Phipps, Proprietor. The question is, what were the results of his investigation and talk with Mr. Hawkins; and I don't see that anything is going to be added at all, by adding anything further. I am willing to concede any facts that can reasonably be said to be true; and I am willing to have this filed in evidence; willing to take any steps Mr. Underwood wants, to obtain the original inquiry, or anything connected with it, to satisfy his curiosity to the fullest extent. It just seems to me it is unnecessary. Would any object be served by filing this report in evidence?

Mr. Underwood:

No.

The Court:

All right, you report what you find out, to Mr. Matteson, there; or, if he is not here; you better report to Mr. Dyer; you know his initials,—Mr. Dyer?

A. Batchelor & Dyer; yes, sir.

Mr. Underwood:

Perhaps that could be done by telegram, and we can get through some day.

Mr. Matteson:

Might I suggest this; I would be glad if you will send a telegram for it, at our expense, in order to facilitate it.

A. I shall do so.

Mr. Matteson:

And do you understand definitely what it is that Mr. Underwood wants?

A. Mr. Underwood wants the inquiry ticket, I believe, that covered this—that called for this report.

Mr. Underwood:

The communication that you got from Chubb, that called for that report.

A. That is correct.

(Witness excused.)

Mr. Underwood:

I think also, by agreement, I would like to recall Mr. Hawkins at this time.

3867 Thereupon: ROY H. HAWKINS as a witness on behalf of Respondents, was recalled and further testified as follows:

Direct Examination.

By Mr. Underwood:

Q. Mr. Hawkins you have already been sworn. Did you see the witness on the stand who just testified, Mr. Lawton?

A. Yes, sir.

Q. Were you ever interviewed by him in 1935?

A. No, sir.

Q. Did you ever tell him that John S. Phipps was the Proprietor or the principal of the Seminole Boat Company?

A. No, sir.

Q. How old were you in 1935?

A. 35.

Q. Where was your office in that building?

A. On the second floor of the building; still is.

Mr. Underwood:

That is all.

Cross Examination.

By Mr. Matteson:

Q. Mr. Hawkins whose room is the second room on the left-hand side as you enter the offices of Biscayne Boulevard Company?

A. It is the bookkeeper who usually answers such inquiries as this.

Q. What is his name?

A. Wilson.

Mr. Matteson:

That is all.

(Witness excused.)

3868 Thereupon: GERGE W. GIBBS resumed the witness stand and further testified as follows upon continued:

Cross Examination.

By Mr. Botts:

Q. Now Mr. Gibbs you will recall we were discussing a chamber, the horizontal cross-section of which was 22.3 square feet, and it was ten feet tall; and in that was air to which was added 22.3 cubic feet, or the equivalent of one gallon of gasoline vapor, entirely enclosed, so that no air—outside air currents or anything like that could reach it. And under those circumstances I understand you to say that the gasoline vapor, without the application of some outside energizing influence, would remain in place at the bottom?

A. I said that without the application of any force whatsoever, outside or inside, it would remain at the bottom.

Q. All right. Now then if you applied force which would cause that entire volume of 223 cubic feet of the contents of that receptacle to become an equalized—homogeneous is the term, I believe, you used,—mixture of gasoline vapor and air, some degree of force, from some source, would be necessary, according to your previous statement. That is correct isn't it?

A. Yes.

Q. Now then it is true—

A. If that same thing became a mixture.

Q. Yes. In accomplishing that mixture then, that seven and a half pounds of gasoline vapor at the bottom, would part of it be raised to the top, and part of it be raised midway, so that there would be an approximate raising of four and a half to five,—an average of four and a half to five cubic feet raising of the weight of that mixture, in

order to have part of it raised clear to the top, or nine feet of raising, and the other part only raised a foot?

A. The foot pounds of energy required to do that would be determined by the height of the center of gravity of the—new center of gravity with respect to the old center of gravity.

Q. Well roughly that would be a raising of four and a half feet, wouldn't it?

A. Might be; I would rather imagine, somewhere about that.

Q. And four and a half times seven and a half is thirty-three and three quarters, so it would require some thirty to thirty-five foot pounds of energy to accomplish that mixture, wouldn't it?

A. It might.

Q. Now then if the energy applied to accomplish that was heat alone, then if I understand your definition of convection correctly, the operation would be that of convection would it?

A. If it was heat alone that brought it about?

Q. If that was the energy that was applied, the operation would be one of convection, would it not?

A. Practically speaking, yes.

Q. All right now then—

A. But understand this Mr. Botts; that the application of heat or cold, or the absence of heat, but relative heat is what I imagine.

Q. Well the force would have to come from somewhere, however supplied; it would have to be force.

A. That is right.

Q. Now if you raised the temperature of that body of 22.3 cubic feet of gasoline vapor, assuming it still to be at the bottom of your chamber,—if you raised it one degree it would be raised approximately 1/491, or roughly speaking, 1/500'th of its volume; it would be increased in volume approximately 1/500 wouldn't it?

A. Yes; that is for each 500 cubic feet, one degree of temperature.

Q. Yes.

A. Would raise the volume, increase the volume approximately one cubic foot.

Q. Wait a minute; one degree would raise the volume of that 1/500 of its volume, wouldn't it?

A. That is right, one gallon; did you say, 500 cubic feet?

Q. There are 22.3 cubic feet involved. Now then if we raise that 1/500 in volume.

A. There are how many?

Q. 22.3 cubic feet.

A. Well it would be 1/500 of that.

Q. Which would be some four thousandths, plus, of a cubic foot.

A. Whatever it figures out.

Q. Wouldn't it be almost impossible to heat that to a great enough temperature to raise the volume—the specific grayity of that gasoline vapor sufficiently to equally distribute that throughout the chamber? The heat necessary would be almost prohibitive, wouldn't it?

A. It would be an extremely small amouht.

Q. What?

A. To raise a body of very little mass, a degree of temperature, does not take much heat.

Q. But you didn't understand my question. I am trying now to find out, one degree of heat would raise it about 4/1000 of a cubic foot in volume. Now it is—

A. What do you mean by one degree of heat?

Q. I mean, raising the average temperature of that 22.3 cubic feet of gasoline vapor would increase the volume of the entire mass of gasoline vapor about 4/1000 of a cubic foot in volume wouldn't it?

A. Well if that became—was increased in temperature one degree:

Q. Yes.

A. Then its mass would be increased 1/500; but how much energy are you talking about?

Q. Enough energy to increase it one degree.

A. Which is a very small amount.

Q. All right, I concede that. That isn't the point I am trying to get at. I am not interested in how much energy, I am interested in the results. So that instead of raising that one degree of heat, and instead of having 22.3, we would have 22.304 as the volume, wouldn't we?

A. 1/500 more with the increase.

Q. Which is roughly 4/1000?

A. Yes.

Q. Now then how many degrees of heat would it be necessary to apply in order to decrease the specific gravity of that gasoline to one-third,—of that gasoline vapor, to one-third?

A. Enough to supply that energy required to change those centers of gravity of the new liquids.

Q. You haven't gotten the question yet. How many degrees of heat would be required? How much are we going to have?

A. You have a room filled, have you not, with gas?

Q. Umh hmh.

A. And it takes energy to bring—heat, we will say:

Q. Yes, heat.

A. And heat is energy.

Q. Certainly.

A. All right, but the increase in temperature does not mean energy.

Q. It is the result of energy?

A. It is a matter of what had happened; but you want to know whether there was—whether this could have been done by any forces that could have been conceded.

Q. You haven't understood the question yet, so let me try it again. The specific gravity of this gasoline, for the purpose of this we will take the lowest figure, one-third—I mean three times that of air.

A. Yes.

Q. Now then, in order to raise that so that its specific gravity would equal that of air—

A. The mixture.

Q. Of the air—wait a minute: in order to raise the specific gravity of the gasoline mixture, the gasoline vapor, so that it was equal in specific gravity to air, we would have to raise it approximately one thousand degrees in temperature, wouldn't you?

A. It would be three times its present specific—

Q. Volume. And if one degree will raise it 1/500, five hundred degrees would raise it one; and a thousand degrees—so it would take approximately a thousand degrees of temperature; am I right?

A. That is approximately right.

Q. So that the application of heat alone, you would melt any ordinary receptacle before you could apply that much heat, wouldn't you?

A. What is that?

Q. I say, you would melt any ordinary receptacle before you could apply that much heat, wouldn't you?

A. That wouldn't follow at all.

Q. You say so, but I would like, when you make a statement, if you don't mind, to support it either with authority or reason.

A. Well the minute that you have any change in this closed hypothetical place, you begin to change a substance which is one gas, into a mixture of gases. And with the mixture of gases you get—it is a different proposition; you get your—you have very little difference between the weight of air and the weight of the mixtures; and great ease with which the laws of convection apply.

Q. But the laws of convection, or any other law, require equal amounts of force to lift an inert object, whether it is the law of convection, or an explosion of gunpowder, doesn't it?

A. But you haven't indicated that there is any energy required.

Q. I thought we agreed that heat was energy, or was a manifestation of energy.

A. You are talking about a scale,—degrees of temperature. You don't give the cause of the increase. The cause of the increase might be a match,—a match applied to that area of—I mean the heat that comes from a match might be enough energy to raise that volume from one volume to the other.

Q. Naturally a certain amount of heat will raise a certain amount of temperature; but it isn't going to supply the foot pounds of energy necessary to raise the whole mass, is it?

A. What is that?

Q. A small amount of heat is going to supply the foot pounds—

A. You are talking about foot pounds; you are getting to the element of energy; but the ouly way that you can discuss it at all, is the application of energy to the mass, to raise it up.

Q. It took me a long time to lead you to that conclusion, but I agree with you. Now then, I want you to tell me if you say that gasoline vapor in a container will be raised and become a homogeneous mixture; I would like for you to tell me how it can be done without the application of the requisite amount of energy, from whatever source it comes.

A. It would require a requisite amount of energy from the very start, to bring about that homogeneous mixture.

Q. And isn't it perfectly ridiculous to say that a change of one degree in temperature, increasing that mass 1/500 of a volume, would supply a sufficient amount of energy to accomplish that admixture?

A. No, a change of one degree, plus other forces that set in there, in the practical case like the engineroom of the Seminole, might do it.

Q. What other forces are you talking of?

A. Forces of convection; forces of balanced columns; the forces of—that stand because—

Q. Now Mr. Witness, I am not a fool, and I have studied physics. Now then the force of convection, whence is the source of this force of convection that you are talking about? Is it other than heat?

A. Yes, it is the force of convection—it is due very largely to heat.

Q. Entirely to heat, isn't it?

A. Entirely to heat.

Q. Well then, you talk about force of convection, then you are merely talking in technical language about the force or energy derived from heat, aren't you?

A. Yes.

Q. All right; well then a sufficient amount of heat to raise the temperature of that gasoline vapor one degree, thus increasing its volume by approximately 1/500, would not be sufficient energy to apply the requisite number of foot pounds to raise that several feet, would it?

A. Well, one degree rise in temperature must be considered in the terms of the energy required to create it.

Q. Well—

A. One degree of heat, a rise in temperature of one degree of heat, of water, is a very large unit; of iron, it is a different unit. Depends entirely—

Q. And of gasoline vapor, it is a different unit, isn't it?

A. Probably.

Q. That is kindergarten stuff.

A. It is kindergarten stuff, much of this is kindergarten stuff, but that doesn't mean for one minute that it is not vital stuff.

Q. All right; now then I want you to tell me, let's take the bilges of this yacht Seminole; according to your associate, approximately forty-four, I believe it was—4400 cubic feet in volume was his estimate of it, and that is filled; let's assume there is some gasoline vapor down in

there, maybe the forty-four cubic feet which he said would make it an explosive mixture; there is forty-four cubic feet of gasoline vapor down in that bilge. Now then that is approximately—represents approximately two gallons of gasoline. Now from whence are you going to get the force that will clear these gasoline fumes out of that bilge?

A. Back to the Seminole now?

Q. Umh hmh.

A. All right. There would be continuous circulation below the floorboards.

Q. Why?

A. In what is known as that bilge, due to the heat, and due to the fact that your columns are balanced, and that you do not require much energy for the circulation, because instead of these foot pounds you talk about, the force comes right back; when one goes up, the other goes down, and you have your elevator again; and you can therefore have very violent turbulance beneath the floor of your engineroom. Because then you have a balanced column, and it requires almost no energy, without raise of any temperature, hardly, to create turbulance, at least below the floor of that engineroom. Another thing, the gas that is down below that engineroom floor is not gasoline vapor, it is a mixture; and as a mixture it has a very low specific gravity. It is not the specific gravity that you speak of.

Q. Now Mr. Witness if you want to leave it that way, if that is your explanation, I am going to comment on that when you are not here, and if that is your explanation, I want to give you a chance to add anything to it that you want to.

Mr. Underwood:

If your Honor please I move to strike out those remarks, on the ground that the witness should not be threatened by the great fear of comment when he is not here.

Mr. Botts:

I am just saying, if he wants to leave it that way, I am satisfied.

The Court:

Well I won't strike it.

Q. All right; now then you stated at some point in your testimony that gasoline vapor had a tendency to mix with air, did you?

A. Yes.

Q. Now then isn't it true that where two gases are materially different in specific gravity, that not only they do not have a tendency to mix, but they have a tendency to stay separate; isn't that true?

A. There is a force tending to separate them, but also forces tending to mix them.

Q. What force is tending to mix them?

A. The force of convection, and the currents,—air; certain facts that we do know.

Q. All right let's get back now for a minute to our enclosed chamber, that we had awhile ago.

Mr. Underwood:

I thought you were out of that.

Q. No.

A. I can see no application to that enclosed chamber, to the problem before us.

Q. I am sorry; I am going ahead and ask the question, because I think I will be able to draw some applications; so if you will just humor me by answering my questions. Now let's take that enclosed chamber, and we will assume that outside forces,—blowers or whatnot, have mixed the 223 cubic feet of contents of that chamber into a perfectly equalized homogeneous mixed combination vapor of gasoline and air. Now then that mixture having been ac-

complished, suppose all outside force is withdrawn, and the temperature of that mass remains exactly as it was, so that there is no outside influence whatsoever. I will ask you, wouldn't there then be a tendency for that mass to separate, and the heavier particles, of which the gasoline vapor was composed, to settle to the bottom, and the lighter fractions or parts of air, to go to the top; wouldn't that be true?

A. Yes, sir.

Q. All right; then that being true, it necessarily follows, does it not, that where there are gases, one materially heavier than the other, not only is there no tendency to confine, but there is a tendency to separate; isn't that true?

A. No, sir.

Q. All right.

A. The other question was asked in the case of the Seminole's bilge, was it not, with no restrictions as to no outside forces? You don't allow outside forces in the second premise?

Q. I am discussing now the question of whether or not—

A. You took us back to the sealed room; then you are taking us back to the engineroom.

Q. I took you back to the sealed room, and put it there, and you agreed that the gasoline vapor would settle and the air come to the top, so there would be a tendency to separate.

A. I said there would be a tendency to separation.

Q. Then the tendency, so far as it exists for gasoline vapor to combine with air, would be due to outside forces, would it not, and not to any inherent affinity or tendency inherent in the two substances, to combine?

A. It is my opinion that the outside forces are sufficient to make them mix, but I am suspicious of an inherent tendency, somewhat like that of osmose, to cause

those two liquids to definitely—those two gases to definitely mix.

Q. Well you are not wanting now to retract your answer that in the closed room there would be at least a tendency to separate? You are not—you don't mean to withdraw that?

A. No,—with no other forces.

Q. All right. Then as I understand it you would agree with the statement which I find here in this authority, refering to vapors of high density,—higher density than air, for instance, benzol, that in consequence of this high density, the individual molecules of the vapor adhere more closely and are only with difficulty mixable, or mixed, or soluble in air. Do you agree with that statement?

Mr. Underwood:

May I have the source of the statement, please?

(The question was read by the reporter.)

Mr. Botts:

I am referring to page 32 of the book which was described in evidence a short time ago.

Mr. Underwood:

Not in evidence; you mean, described in the record?

Mr. Botts:

Described in the record, I mean.

A. I would regard that as purely one man's theory, which I think is in error.

Q. Well then you disagree with this statement?

A. I am not convinced by that statement at all.

Q. Well isn't that statement largely in accord with your own opinion expressed with reference to the tendency to separate, in this enclosed room?

A. He gives—that is a statement of not only the fact, but is theory of the cause of the fact. For instance, I should like to know what the density of nitrogen is, and also what the density of oxygen is; and there are two gases which readily mix and become air; that is a mixture. And if those things have varying density, I would think it would tend to explode the theory that the knit molecules, or the closer molecules of one gas would have a tendency to prevent the intermingling with the molecules of the other gas.

Q. You disagree with the statement I have read, is that right? Or do you—are you simply quarreling with the correctness of it?

A. As an engineer, not as a chemist, where they deal with the inner structures of compounds, the statement is—I would think that would lead to a false conclusion. But I am not a chemist and I don't want to be setting myself up against that reasoning; and I don't think that the question to me is fair unless I had read the book, or knew what other facts he had developed, to lead him to make that conclusion.

Q. Well as I understand it then you are not in a position,—you don't care to deny this, nor do you care to accede to the correctness of it. Is that your position, that at this time you want to take neither position?

A. Mr. Botts, one paragraph out of a highly technical book is not anything that one should pass judgment on, unless they see more of the discussion

Q. But is there anything obscure or difficult to understand, about the statement that when two gases such as benzol and air,—and gasoline and benzol are very much of the same type,—I think you will concede that, won't you? Gasoline and benzol are very much the same,—they are both hydrocarbons aren't they?

A. Yes.

Q. All right; that there is nothing difficult about understanding the statement that gasoline vapor, being heavier

than air, would have a tendency to adhere closely together, and would not easily be mixed with air. Is there anything difficult about understanding that?

A. Very difficult for me to understand without reading more of it. For instance we often mix, in liquids, an extremely heavy thing with something that is quite light, and without effort; and I believe it is often done with gases; and I can see no reason why affinity or attraction of a molecule within the gas vapor, and another molecule within the gas vapor, should tend to exclude the molecules of another gas, where the molecules were not so close, when we do know definitely that other, what we call fluids, which means liquids,—and gases, of definitely known differences in specific gravity, do readily mix.

Q. Well then I would like to have you put yourself in one or the other of three categories, with reference to that question: that you agree, that you disagree, or that you are not willing to commit yourself. Now in which one of those three categories will you place yourself, with reference to that question?

Mr. Underwood:

If your Honor please, I object to the question on the ground that it confronts the witness with alternatives—

The Court:

Because what?

Mr. Underwood:

Because it confronts the witness with three limited alternatives.

Mr. Botts:

Well I can ask him three questions if you want me to.

The Court:

I think that is a matter of argument, Mr. Botts.

Mr. Botts:

All right strike out the question and I will ask him:

Q. Do you, Mr. Gibbs, agree with the statement in this question with reference to the mixability of gas vapors and air?

Mr. Underwood:

If your Honor please I object to that as repetitious. He has covered the ground more than once.

Mr. Botts:

I haven't had a categorical answer, and I am trying to get him placed.

Mr. Underwood:

He has answered that question, Judge, three or four times.

The Court:

I think he has answered it, but I don't want to cut you off from your examination, if you can show me:

Mr. Botts:

He answered one time and then he started with a long discussion in which he qualified his answer; and I don't believe that he has ever given a categorical answer, that he agrees or that he does not agree.

Mr. Undrewood:

If your Honor please, he said in effect that he neither agrees nor disagrees; and if Mr. Botts doesn't understand it, that is too bad; but he has answered the question more than once.

Mr. Botts:

I am trying to get him to say he agrees, he disagrees, or he don't know; and I think that's a fair position for this highly technical witness to take.

Mr. Underwood:

He wasn't produced as a chemist, your Honor.

Mr. Botts:

Yes, but he has testified very, very fully about his knowledge of convection, which seems to explain everything; and the mixability of gases. Now he has put himself up as an expert in that, I am asking about the very thing concerning which he is attempting to testify as an expert.

The Court:

I will overrule the objection, and if it is repetition, do not repeat it again.

(By Mr. Botts):

Q. Do you agree with that statement?

A. What statement?

Q. The statement that in consequence of the relative density of gasoline vapors as compared with air, that these vapors tend to adhere together, and are not, only with difficulty, mixed and combined with air. Do you agree with that statement?

A. I agree to it in part; and welcome the authority. That part which says they do mix with air. But I do not agree that the mere fact that the molecules are closer together in one than in the other, that that is the reason why their tendency may persist in keeping them apart.

Q. All right now then, do you agree to this statement: that vapors given off by such liquids as gasoline, from the surface of liquids, tend to sink downward rather than to rise from the surface.

Mr. Underwood:

May I see that, Mr. Botts?

Mr. Botts:

I haven't used the exact words, but it is right there.

Mr. Underwood:

May it appear then, that the statement is not from the book.

Mr. Botts:

It is not in haec verba from the book.

A. Yes.

Q. You agree with that?

A. There is a tendency for them to do that.

Q. Do you agree with this statement; that where readily volatile substances yielding heavy vapors are being dealt with in any apartment, the evolved gases or vapors tend to sink by their own weight to a lower level? Do you agree with that statement?

A. Read the second word in the statement.

(The question was read by the reporter.)

A. Yes.

Q. Now then I understood you to say the other day that cowl ventilators and skylights passing through the top of the engineroom, but not passing into the bilge, together with the windows in the side of the engineroom, constituted an efficient method of exhausting any possible gasoline vapors from the bilge. Did I understand you correctly, in making that assertion?

A. The statement said, as I recall it,—was that this arrangement of ventilators was as efficient an arrangement as could be made without the use of forced draft ventilators.

Q. Well now then do you mean to say that cowl ventilators and the skylight passing through the roof or top of the engine room, coupled with the two windows, one on either side of the engineroom, and the ledges of which it appears were about five to six feet above the floor of the engineroom; do you say that those are—that that method is

or is not an efficient and sufficient method of exhausting or removing from the bilge, a possible accumulation of gasoline vapor?

A. I say that that is the most efficient arrangement that could have been used at that time, with the possible exception of a system of forced draft, which I do not even know was in existence in a practical way, at that time. And that I would regard the ventilator as being sawed off at the top, not extending down, for a distance below the roof, as more efficient than one that did extend down for a distance below the roof.

Q. Now then the question was not whether you regarded this as relatively efficient. The point I wish that you would answer is, whether or not this sort of an arrangement would be actually and practically efficient in actually removing gasoline vapor from the bilge?

Mr. Underwood:

If your Honor please, I object on two grounds; one, that it is repetitious; and the other, on the ground that it does not say how much gasoline vapor, nor does it say in how long a time.

(The last question was read by the reporter at the direction of the Court.)

The Court:

I will overrule the objection. Mr. Gibbs, if you want any other element as a basis,—element of the hypothesis, why then you can ask for it.

A. I would have to know the amount of gasoline to be removed, or gasoline vapor, or mixture, to be removed.

Q. Any amount, whether one cubic foot or one thousand cubic feet?

A. Then I would have to know the time element.

Q. One minute, or a thousand hours, take your choice; tell me about it. Now you are an expert, please don't try to evade.

A. I will not evade Mr. Botts, but I most certainly will answer the question thoroughly. It would not be, in my opinion, sufficient ventilation to remove—how many cubic feet, a thousand cubic feet, did you say?—A very large quantity of gasoline, in a time of one minute. It would be efficient—effective, to remove an amount smaller than that, in a greater period of time.

Mr. Underwood:

The last two or three words of that answer?

(The last answer was read by the reporter.)

Q. In referring to gas vapors such as gasoline vapor, in a compartment with air, would you agree with this statement, with reference to a proper way of removing the gasoline vapors: that in such case it would be fundamentally erroneous to attempt to use a ventilating appliance, working at a higher level, and the floor ventilation then becomes sine qua non. Do you agree with that statement?

A. I do not.

Q. All right. Do you understand the expression, sine qua non?

A. Well no; that—

Q. That without which, is a technical translation; but, that without which the results cannot be accomplished is the meaning of sine qua non in that connection.

A. That without which:

Mr. Underwood:

May I suggest if there is going to be any discussion about that, let's ask Mr. Botts to rephrase the question entirely in English.

Q. I read from the text, and I just wanted to be sure that the witness understood that one phrase.

A. Anybody could speak freely to me in Latin; it is all Greek to me.

Q. Do you agree then that in cases of heavy gases such as gasoline vapors, in conjunction with air—

A. Does that book say, such as gasoline vapors?

Q. It is referring to heavy gases.

A. It does not refer to them developed in continuous and gigantic quantities in factories, as by-products of manufacturing industry, and not incidental leakage of a few drops occasionally?

Q. It makes no such limitations. Now if I may just complete the question, the statement is here that, "In cases of these gases heavier than air, that floor ventilation is an absolutely necessary essential to proper ventilation". You don't agree with that statement, do you?—I have phrased that in English, eliminating the words, sine qua non. I had, in doing so, to rephrase it, to carry the idea.

A. Mr. Botts, I would like to know the quantity. Floor ventilation exists with the—

Q. Well do you concede that in cases of such heavier gases, that floor ventilation is superior to ceiling ventilation?

A. It would depend entirely on the quantity to be removed, and the speed with which it had to be removed.

Q. Well irrespective of the quantity, wouldn't floor ventilation accomplish the results quicker and more efficient, in a given length of time? Wouldn't floor ventilation accomplish the results quicker than ceiling ventilation?

A. Are you speaking of blower systems, or those ventilators we were discussing?

Q. Floor ventilation, whether blower power or otherwise.

A. Well I would have to know what was meant by the words, floor ventilation.

Q. We have got floor ventilation in the yacht Seminole; it isn't necessarily a thing called floor ventilation, which means words without a description.

A. All right, sir.

The Court:

I think it is a little difficult to extract a statement from a book and ask a question as to whether the witness agrees with the statement, when he does not know just exactly what the situation is that is being discussed. If you take it as a separate proposition, disconnect it with a text book, and ask the question, I think it might throw some light. But I don't know, just for the purpose of enlightening the Court, I don't know whether that authority is dealing there with a situation with gasoline engines present in the room or apartment, and I don't know whether he is dealing with boats, I don't know whether he is dealing with factory conditions, or just what it is.

Mr. Botts:

I can answer, so far as my examination shows, that it seems to be—

Mr. Underwood:

I object to any statement on the record as to what the book is dealing with.

The Court:

I just wanted to state the difficulty I was having, and point it out to you. I don't think you ought to put in the record, what is in the book.

(By Mr. Botts):

Q. Let's take it this way: if you had a quantity of gasoline vapors in a room, which you wished to remove without the use of power ventilation, in your judgment would that gasoline vapor be removed more efficiently by an

opening at the level of the floor, or an opening of equal size in the ceiling?

A. In the ceiling; and if there is anything that would cause maximum amount of turbulence in the room, by cross drafts, and that would be done in my opinion more efficiently by elimination of the foot to the ventilators; I mean by the foot, that part that is below the ceiling.

Q. All right; that is all right. Now would you say that, assuming gasoline vapors had collected in the bilge of the Seminole, that that vapor would be more difficult to remove from that location because it was covered with the floor of the engineroom and the deck; or would it have been more easy to remove if that flooring was absent, and it was entirely open up to the air.

A. If it was entirely covered with the floor it couldn't be removed.

Mr. Botts:

Now if you will read the question please; he didn't understand it, I don't think.

(The question was read by the reporter.)

A. If it was covered it couldn't get out. If it was partially covered, as is usual with an engineroom floor, it could get out. Whether it could get out more freely, which is very doubtful, from those two compartments, one covered by a roof and the other by a floor, with many large holes in it, is a question of the direction of the currents, as aided by baffles, such as floors. As is the air that enters the chimney of an old-fashioned lamp, which smokes, and nearly putting a diaphragm in, air rushes down into the hot chimney and then up out of the hot chimney and your flame is bright, and no carbon is formed. Such baffle construction might be an aid to circulation in the bilge and also in the engineroom.

Q. Then as I understand it your position is that the existence of this floor covering vast majority of the area above the bilge, would be in your opinion an aid to clearing the gas from the bilge?

A. There are conditions under which it would.

Q. I am speaking about the conditions of the Seminole, now. With those conditions, do you say it would or would not have been an aid?

A. I don't know where the holes are—were, in the floor, so I can't make a definite statement.

Q. Then you don't know whether there were any holes or not, do you?

A. I do know that there were definitely a number of very large holes.

Q. If you don't know where they were, how do you know that to be a fact?

A. I understand from the testimony there was still another, and I know where many of them were; I know the location of many holes in there.

Q. Do you say the existence of that floor was an aid to remove the gas from that bilge, or not?

A. What I say is that the existence of the floor, with those holes, had a certain beneficial property in the removal of those gases. I do not believe however that the gases would have been removed as readily without the floor, or without the roof in the ship. I think an open ship,—I mean no roof, no engineroom floor, that gas vapors or gas mixtures could have been more readily removed.

Q. Now it is true, isn't it, that if there were gasoline vapors in that bilge, that the level of the top of the combustible or explosive mixture would have been practically constant throughout the whole bilge, wouldn't it?

A. You are speaking of the Seminole?

Q. Yes.

A. No, not true at all.

Q. You mean with those gases, there would be one place where the gas mixture would be richer than it would in others; is that it?

A. I think that the time any gas vapor hit the—got in the bilge, that it was an air mixture, that there was continual current in that floor—below that floor, and also in the engineroom, and also within the shed of Pilkington; and I don't think there was any opportunity, unless some freak of nature had a dead calm possibly some night, with fixed temperatures; even then I question the condition that ever could occur to prevent very violent—very rapid currents of *mixture*, tending to clear the ship of gases—gasoline vapors.

Q. Now then let's come a minute to this tank. You said that in general practice, in installing tanks that you made a hydrostatic test, and if leaks developed you caulked the leaks, is that correct?

A. Depending upon the kind of tank. If it is a copper tank and the leak developed, we clear it of—we take the liquid out which we put in for the test, and we either weld it, if it is copper, any other metal that will stand the weld,—or we tin it.

Q. Suppose we take a galvanized tank such as the Seminole, how would you cure leaks in that?

A. If it is a matter of plate, we would probably caulk that, if it developed a leak, if it is a riveted tank, or thicker than a plate, we would caulk it. There are other ways to do it, however; you could put solder over the tank.

Q. Do you think soldering is a proper method of—soldering on the outside, is a proper method of stopping a leak in a tank to be used for gasoline?

A. I merely say that about—the statement of the Government men is you haven't done a job if you don't solder, completely, the edges of your tanks, whether it needs it or not; to cover all corners of sheet metal tanks with solder. Nearly all tanks are made covered with sold-

er. It may be completely wrong, but that's the way, it is considered good practice.

Q. I just asked if in your opinion that was good practice?

A. It is infinitely better practice than welding, I think.

Q. And is it better than caulking?

A. It depends entirely upon the condition, the place in the tank, and so forth.

Q. Now then let's refer back to this rubber hose for drawing off gasoline out of the engineroom. Do you approve that as proper practice on a boat, to run a hose out, connect it to a draw-off valve in the engineroom, run a rubber hose out and then disconnect it and put the hose away for future use?

A. I can't conceive of a much better way than—

Q. Don't you concede the very grave probability that in doing that, in disconnecting that hose, that a certain amount of gasoline would be spilled into the engineroom?

A. No. The man used to taking a fuel like gasoline, he knows he has got his hose filled with it; just as you go to a filling station and you see how carefully each time they do it; they have the old style hose they used to get it into the tank, just lift up and let it run through.

Q. You approve that as proper practice, do you?

A. No, I say I approve that as probably the best practice that would have answered—that would have served the Seminole in the duty that she had to perform—the best available practice. I don't think that the presence of gasoline in the vicinity of the Seminole was tended to make her safe as compared to a sailboat. I think that was the best method of serving those yachts. I think not very greatly superior to using a can of this type.

Mr. Underwood:

Indicating Exhibit 13.

Q. Then as I understand from your last answer, the drawing off of gasoline, either by hose or can, does add an

element of risk as compared—using your comparison, as comparable with a sailboat, for instance; it adds an element of risk, doesn't it?

A. Yes, the presence on the boat of gasoline at all is an element of risk, as compared to a boat without gasoline.

Q. And drawing it off in the engineroom would add a risk, as compared with not drawing it off in the engineroom—or not drawing it off at all, wouldn't it?

A. It would not add an increased risk if that duty was substituted by any other way or method of getting gasoline to the fishing fleet, from the ship.

Q. But suppose they don't take it off at all, that would be safer than to take it off even in the most careful way, wouldn't it?

A. I think so. I think if there is no gasoline needed for priming or any other thing, it would be safer.

Mr. Botts:

That is all.

Re-Direct Examination.

By Mr. Underwood:

Q. Just a few questions, Mr. Gibbs. In your experience in the construction and repair of vessels propelled by gasoline power, or tank vessels to carry gasoline, has it been necessary for you to know the flash point of gasoline?

A. Never.

Q. Does the flash point of gasoline enter into the calculations that you have had to make for the sizes of tanks, or the type of feed lines, or anything of that sort?

A. No.

Q. In your opinion is there any substantial hazard of getting gasoline vapor into the engineroom or into the bilges, by drawing it off from the drain valves, either into that can, Exhibit 13, or by means of a hose?

A. I don't think so. I would want it on my own boat.

Q. Mention has been made of your sea skiffs, and your use of copper tubing for the gasoline line. Why is it that you use copper tubing there?

A. Because there is an extremely small length of copper; the tank is built as a part of the engine, and with a tiny little length of copper, with two small fittings, there is virtually no head whatever, and no opportunity for the copper ever to be hit or twisted. Then the other reason is that the engine is gotten out on a manufacturing basis of the lowest possible cost; it is a price proposition.

Q. What is the length of the copper tube on that engine?

A. I would say offhand about six or seven inches, it may be as much as ten, I don't think so.

Q. You were asked a good many questions about the Fortuna; let me ask you a question about a boat which I think you repaired, a boat that belonged to Mr. DuPont; what was her name?

A. We have handled the work, a great many years,—the Nenemoosha.

Q. Do you know how to spell it?

A. N-e-n-e-m-o-o-s-h-a.

Q. Did you have anything to do with the installation or repair of a gasoline line in her?—Just yes or no.

A. I think we did; it was ordered done,—the work was ordered done.

Q. What type of boat was she, what power?

A. She was a large steel Diesel boat, with possibly seven or eight hundred horsepower.

Q. Did she have a supply of gasoline on board?

A. Yes, sir.

Q. Do you remember where the gasoline supply was?

A. On the deck.

Q. Was there a draw-off line?

A. Yes, sir.

Q. Where was it?

A. Down in the engineroom, under the control of the engineer.

Q. If an explosion occurred in the after part of the engineroom of the Seminole, and had upset Number One tank to some small degree, as you have observed in the photographs, would you expect any effect on the bulkhead between the engineroom and the tank compartment?

A. Explosion in the engineroom?

Q. Yes.

A. And the after part of the bulkhead?

Q. The after part of the engineroom.

A. Explosion is in the engineroom?

Q. Yes.

A. And you want to know what would be the effect—

Q. On the bulkhead between the engineroom and the tank compartment; if the explosion had any effect in deranging the position of Number One tank.

A. It would have pushed those plates away from the explosion, or in the direction of the bow of the boat.

Q. Have you examined Exhibits 3-X and 3-W?

A. Yes, sir, I have examnied them.

Q. Do those photographs show any displacement of Number One or Number Two or Number Three or Number Four gasoline tanks?

A. Not the slightest that I can detect.

Q. You have spoken about their being some holes in the engineroom floor. What holes do you know about, there, and what do you know about them?

A. The base of the engines are fastened to the scantlings of the boat, and timbers, which are not a part of the engineroom floor.

Q. Let's make it brief, Mr. Gibbs.

A. Wherever engines are installed, wherever these controls come through the engineroom floor, like clutch levers, couplings, and wherever the engineroom floor cannot be stepped upon,—as a rule that is a hole.

Q. Can you tell from your observation of what remained of the engineroom, whether there must have been holes through the engineroom floor to accomodate the two propeller shafts?

A. Yes there must have been.

Q. How about the flywheel?

A. Well, the whole engine.

Q. Engine itself?

A. Oh yes.

Q. How about the engineroom controls, those levers by which they were operated?

A. Oh yes,—slits.

Q. I think you inadvertently got your percentages and your proportions mixed in describing an explosive mixture of gasoline. Just so we will be clear about it, what is your understanding of the explosive range or mixture of gasoline vapor and air?

A. I understand that the range of gasoline vapor to air is above one and a half; not above six and a half.

Q. One further thing—

A. Percent.

Mr. Botts:

If it isn't in the record, do you know whether that refers to, by volume?

Mr. Underwood:

Just a moment, please, Mr. Botts, and then I will be through.

Q. I show you Libelants' Exhibit 12 and call your attention to a pipe which is indicated by an arrow, and ask you to assume that that was the pipe which lead from the back of the picture toward the foreground of the picture, and to the two draw-off valves. Do you see that pipe?

A. Yes.

Q. I will ask you to assume that it came from the starboard end of the manifold, a few inches to starboard of the drawoff valve from Number Four tank, and that that pipe was about six or seven feet long, from the place where it left the manifold itself and started back to port, to the place where it passed through the side of the desk. Do you visualize that situation?

A. Yes. You had the—what was your stand, can you tell me?

Q. The stand from the right-hand end of the manifold to the legs or the sides of the desk was six to seven feet; and I will ask you whether or not that in your opinion was proper support for that length of pipe?

A. What was the size?

Q. Half-inch diameter, half-inch pipe.

A. Yes that was sufficient.

Mr. Underwood:

I think that is all.

Re-Cross Examination.

By Mr. Matteson:

Q. This Nenemoosha that you spoke of is a Diesel vessel is she not?

A. Yes, sir.

Q. And she doesn't carry gasoline in her main fuel tanks, does she?

A. No, sir; she pipes it to the engineroom, from an auxiliary gasoline tank.

Q. There is an auxiliary gasoline tank?

A. She has a gasoline tank aboard for the uses that she has for gasoline; probably for the launches.

Q. Do you know whether they are used for launches, or not?

A. I know that she has launches and that they have to have gasoline.

Q. You don't know how the launches are supplied with gasoline, as a matter of fact, do you?

A. Yes I know that that pipe was designed to get gasoline for the launches; because the instructions were that all gasoline be lead to the place where the engineer alone could get it.

Q. How large a tank did they have?

A. I don't know, myself.

Q. Where is the Nenemoosha now, do you know?

A. I don't know that either. She has been in Jacksonville, last year..

Q. As a matter of fact, these various boats that you have mentioned, the only one that was designed by your firm was the Colonel, was it not?

A. Well I wouldn't say that even that boat was designed—it was largely by Colonel Greene himself.

Q. Then do you mean that all these boats that you built and have talked to us about, have been built to specifications, as you say the Fortuna was?

A. Many of them were, and many of them were built under this kind of an arrangement: that we would undertake to build a boat of such and such length, such and such speed, and with such and such other characteristics; we would be given a picture of the boat. Much of our Government work has been done on that basis, in which case we not only have to design the boat, but back up the design with as much as one thousand dollars per mile for failure to comply with the requirements of the owner, or the Government. A great many of the boats have been designed by our firm. Now in those designs we are given rather close specifications as to some of the details; the tank, for instance, must have a certain capacity. Now, the tanks must be tight, and it is up to us to make a design which will be not only satisfactory to the Government, but tight; and the speed—the lines must be of such form that the boat will make the speed. In a case of that kind I would say that we are designers, almost completely.

That is the situation with many of our boats. However, if the Government made a statement as to the tubing of the gasoline lines, we would not feel, as designers, responsible for the judgment that caused that line to be one material or another. For instance, the 75's, of which we built thirty, or approximately a million dollars worth, had brass pipes. The last boat we had, had copper tubing. Now I understand that that is to be substituted—the new specifications will come out with aluminium, brass, or bronze,—an alloy of those two; which we have already put in some portions of the last order of Government boats.

Q. Now Mr. Gibbs you have mentioned a number of yachts here to us that you have built; I have been trying to check them up here in Lloyd's Register as best I could, and the only one that I find that is designed by you, was the Colonel, and I find that she was a Diesel boat. Now am I correct in the assumption that, referring to yachts, that is the only one that you have mentioned that you have designed?

A. Well our yard does not go in much for the construction of yachts. We specialize in the construction and design of Government vessels; they are very similar to yachts; and Commercial vessels,—for oil companies: and the yacht repair business. For many years we have enjoyed the opportunity of having most of the yachts in our yard.

Mr. Matteson:
That is all.

(Witness excused.)

Mr. Underwood:
If your Honor please, I offer in evidence the paper which has previously been marked Respondents' Exhibit FF for Identification.

The Court:

Did you all get the matter of the plans straightened out?

Mr. Underwood:

We expect to have word on that this evening. Mr. Gibbs has telephoned his son to find the plans if they are there; and we expect to hear from him tonight.—I offer this letter, FF for Identification, in evidence; it is a letter which Mr. Hawkins testified that he wrote. I can't prove it was delivered to Mr. Pilkington, and I don't offer it as proof of anything that got to Mr. Pilkington. I offer it merely to prove that Mr. Hawkins wrote such a letter.

Mr. Botts:

I think that is immatterial.

Mr. Matteson:

He has testified to that.

Mr. Botts:

I don't see what it illustrates.

Mr. Underwood:

I offer it to prove that Mr. Hawkins, as an Officer of the Seminole Boat Company, was active in the business of trying to Charter the boat; he wrote that letter in pursuance of such activity. In other words, it wasn't a dormant, moribund corporation, but it was a working one.

The Court:

He has testified, hasn't he, that he did write such a letter?

Mr. Underwood:

Actually, I am not entirely clear whether he did or not.

The Court:

Well I will admit it. You can go into it a little more if you want to, and move to strike it.

Mr. Botts:

I don't think it has any materiality. I don't think it hurts whether it is in or not.

(The said paper so tendered, and previously marked Respondents' Exhibit FF for Identification, was admitted in evidence and filed as Respondents' Exhibit FF.)

Mr. Underwood:

As I read the record, your Honor, Respondents' Exhibit 5-N was merely offered by me for identification when Mr. Stein was on the stand, although my recollection is that I offered it in evidence. We all used it, so in order to complete the record, I offer it in evidence now.

The Court:

It will be admitted.

(The document previously marked Respondents' Exhibit 5-N for Identification, was admitted in evidence and filed as Respondents' Exhibit 5-N.)

Mr. Underwood:

The marking does not need to be changed, because it does not say, "For Identification", in the marking.—I have a number of corrections in the testimony of Mr. Munroe, which Mr. Matteson has agreed to, all but three. I am not sure whether Mr. Botts has had an opportunity to check them over or not.

Mr. Botts:

I haven't looked at them.

Mr. Underwood:

Well practically all of them are typographical; I don't know whether Mr. Botts will look at them and consider agreeing to them, in order to save time, or not.

Mr. Botts:

I don't want to take too much time; I won't bother with them.

Mr. Underwood:

Then may it be understood that Mr. Munroe's testimony be corrected in these particulars, with the exception of those three that Mr. Matteson questions, and about which I shall recall Mr. Munroe very briefly.

The Court:

Physically, how does that leave the record? You want somebody to be instructed to correct them?

Mr. Underwood:

I suggest that the stenographer correct the Court's copy, and make copies of this and furnish to everybody who is getting a copy of the record.

The Court:

Has Mr. Munroe gone over these?

Mr. Underwood:

Yes, sir.

The Court:

Just ask him in a general way about all except the three, and then in detail about the three.

3908 : Thereupon: WIRTH MUNROE was recalled as a witness on behalf of Respondents' and further testified as follows:

Direct Examination.

By Mr. Underwood:

Q. Mr. Munroe, you have read over, have you, that list of corrections to the record, with me?

A. I have.

Q. Let's speak of all but those three opposite which there is a question mark. Have you determined that the transcript of your testimony is inaccurate in those respects and should be corrected as represented?

A. It is inaccurate.

Q. Now turning to those three that Mr. Matteson has put a question mark opposite; on page 2298 I call your attention to this question and answer: "Q. Did you find any leaks in any seams or at any rivets anywhere?" "A. There were no leaks whatsoever in any seam or any rivet in that part of that tank".—I will say that that refers to your test of one of the tanks of the Seminole; last May. Have you any correction to make about that?

A. No, I want to strike out, "In the part of that tank"—"In that part of that tank".

Q. Did you find any leaks in any part of the tank proper?

A. None whatsoever except those that were mentioned; one in the threads of the filler pipe, and the crack in the discharge.

Q. Now on page 2301 I call your attention to the question and answer reading: "Q. What do you mean by 'improper threads'?" "A. The threads having been used for some time, the threads were naturally pitted and rusted, and they wouldn't make as perfect a connection as a new fitting." Do you have any correction to make, to that?

A. Yes, I believe, I may have used the word, "used", but I meant, "exposed"; because there was no pipe or plug or anything whatsoever in the threads at the filler pipe; they had been exposed to the air and rust, ever since the fire.

Q. Now on page 2397, I call your attention to a question as follows: "Q. You were saying that it was important to have a supply of gasoline available in the engineroom for certain purposes. It would be a very simple matter to have a separate tank on deck, in the vicinity of the engineroom, for storage of gasoline that the engineer might want to draw off for any purpose, would it not?" "A. You could have a tank on deck, yes; it would be handy". Do you have any correction you want to make to that?

A. Should have had the word, "Not handy", in there; that was my full intention in the answer.

Q. In other words, would it be handy if it were on deck?

A. It would not be handy to the engineroom.

Mr. Underwood:

That is all.

The Court:

As to that, it is a mechanical matter of handling, if Mr. Botts wants to look at them; and if they are to be made, the reporter may be instructed.

Mr. Botts:

I am willing to agree to the corrections that Mr. Matteson approves.

The Court:

Is it agreeable then that the reporter be instructed to use red ink and to be guided by this notation, and to "X" out with red ink, the transcript as it is, and correct it in red ink?

Mr. Underwood:

I think that is all right, so far as the Court's copy is concerned; and I would appreciate his making one copy for Mr. Matteson.

Mr. Matteson:

I have already made the corrections in mine.

The Court:

For that purpose, let this paper be preserved in the record, and let that be known as the COURT'S EXHIBIT 1.

(Witness excused.)

(The said Exhibit being in words and figures as follows:)

Munroe—Corrections.

2443	20	from top	Change "boat" to "day".
2445	9	bottom	Change "yes" to "no".
2448	1	top	Change to "The curved end of each pan".
2455	15	"	Change "construction" to "compartment".
2459	10	"	Change "grooved" to "curved".
"	18	"	Change "brace" to "base".
2467	18	"	Should be "bottom" of the side, not "seat".
2469	13 & 14	"	Strike out "in that part of that tank".
2470	26	"	Change "tank" to "tank's bottom".
2471	last		Strike out "not".
2472	12	from top	Change "used" to exposed".
2474	15	"	Change "widening" to "wedging".

2481	3	" bottom	Change "tank" to "desk".
2482	11	top	ditto
2492	16	from top	Change "tubing" to "pipe".
2497	8	"	Change "ceiling" to "sill".
2498	7	"	Change "dead throw" to "dead front".
2503	25	"	Change "under" to "in".
2504	10	bottom	Strike out "no".
2511	5	"	Change "impliedly" to "employed".
"	4	"	Strike out "in the employ of the widow" and insert "to remove the body".
2512	6	top	Change "morals" to "mouths".
2516	5	"	Change "Biscayne Blvd" to "Main Highway".
2528	4	"	Insert "not" after "would".
2555	7	bottom	Change "wood" to "crack".
2556	3	top	Insert "not where" before the first word.
2559	9	"	Change 1 to 2 and change 2 to 3.
"	13	"	Change "newell" to "Nuta".
"	16	"	ditto
2585	11	"	Change "side" to "sight".
? 2589	5	bottom	Insert "not" after "would". ?
2741	2	top	Change "can" to "could".
"	3	"	Change "after you" to "before removing".

Mr. Underwood:

At long last, we rest, your Honor.

Mr. Matteson:

There is one thing; when Mr. Simmon was on the stand he produced and there was marked as an Exhibit, some sheets which were merely a summary of some other re-

cords, he said he took from invoices. I don't take it that is evidence of anything, except there were at some time, invoices from which he made a summary. The best evidence of course would be the invoices themselves. I made that point at the time. Since then I have sent Mr. Underwood a letter asking for the production of the original document from which this summary was compiled. As a matter of fact I don't care an awful lot whether they are produced or not, except I make the point that the original documents are the best evidence, and that I shan't accept the summary as a substitute for the best evidence.

The Court:

Was Mr. Simmon a Respondents' witness?

Mr. Matteson:

Yes, sir; Simmon was the—they called him accountant,—or the man in the office.

Mr. Underwood:

He is an accountant by profession, anyway.

Mr. Matteson:

Anyway, he had some sort of a business position in the office, and he is the man who testified that he knew about the repairs that were made in 1927, and that the tanks were removed at that time and the bottoms taken out of them and a lot of work done in the engineroom, and what not; and in addition to that he testified that he had made up a summary from certain other records, and the summary was marked in evidence, with the understanding that it represented merely a summary of some other documents which hadn't at that time been produced.

The Court:

What is your response to that notice, Mr. Underwood?

Mr. Underwood:

If your Honor please, we have searched high and low, long before we got Mr. Mattesons', or Batchelor & Dyers' letter, and again since. I spent a good part of last Sunday looking, again; and as the record shows, half a dozen of us spent all of one evening and far into the night, at the office at 1315 Biscayne Boulevard, hunting for such things. We have not been able to locate them or identify them.

The Court:

Well in the absence of that, did I admit the summary?

Mr. Underwood:

There was no objection to that.

Mr. Matteson:

It was admitted solely as a summary of some other document.

The Court:

Are you satisfied with that search made now?

Mr. Matteson:

I take Mr. Underwood's word for it that they can't be produced; but I do make the point that the best evidence has not been produced, and I don't think what was produced is any evidence at all.

Mr. Underwood:

Our problem in the production of them, has been this: we have a lot of old vouchers, those of Merrill-Stevens are some; but these documents we are talking about, Exhibit 4-N, isn't it?

Mr. Matteson:

4-O.

Mr. Underwood:

4-N and 4-O, anything in the category, this Exhibit 4-O is a comparative statement of expenses; it deals in totals, and it does not give the name of the house from which any material was purchased, or the name of any member of the crew who worked at any particular time; it just deals in totals, by months and by years. Now it is a superhuman task, even if it could be done by a superman, to go through a batch of records now and by trial and error, add up bunches of figures on vouchers until you got the same figures that are on that statement. I don't doubt we have in the files at least some of the vouchers that were considered in making up those statements. So far as being able to produce one or a thousand vouchers, and say that numbers one to ninety-four are the ones used in support of a figure on page one at the top, and so on,—we just can't do it; it is not possible.

Mr. Matteson:

Well I didn't want the moment to pass without registering the fact that I had demanded the production of the originals, and that they haven't been or cannot be produced; and I am willing to let the record stand that way, as far as that is concerned.

The Court:

I believe the proper ruling to make would be to admit them, and if you wish—

Mr. Matteson:

I have no objection to their physically remaining in the record, because we have no jury here, and the matter is entirely for your Honor. As your Honor is aware, there isn't any such thing as reversible error in Admiralty. Both the District and Appellate Courts give to the evidence the weight it is entitled to under all the rules of evidence. I

don't see that it does any particular harm, but we may make proper comment on the evidence when it is cited.

(Thereupon the hearing was adjourned to be resumed at 9:15 o'clock A. M. of the following day, to-wit, November 17, 1939.)

Friday, November 17, 1939, 9:25 o'clock A. M.

Hearing was resumed pursuant to adjournment of the previous day.

3920 Thereupon: J. N. PATTON was recalled as a witness on behalf of Libelants, in rebuttal, and further testified as follows:

Direct Examination.

By Mr. Matteson:

Q. Captain Patton, after the adjournment of Court in May, May 19th, when did you next see the Seminole?

A. I believe it was five or six days afterward.

Q. How did that come about?

A. I had business up at Nuta's Yard, on another boat; I happened to remark to Mr. Nuta, "How is the Seminole?" He says, Oh there was trouble—

Mr. Underwood:

I object to what Mr. Nuta said.

Q. Don't tell what anybody else said; but you were out there on other business?

A. Yes, sir.

Q. Did you see the Seminole on that occasion?

A. Yes, sir.

Q. And what did you observe?

A. I observed that one of the tanks was taken out of her.

Q. And where was the tank when you saw it?

A. Laying in the corridor of the tank compartment.

Q. What did you do?

A. Went up the following day and took some pictures of it.

Q. Well did you go on board the Seminole?

A. Not at that time I didn't. The following day, I did.

Q. The following day. Did you observe the condition of the tank at that time?

A. Yes, sir.

Q. What did you observe?

A. I observed that on the side seam it had been soldered at some time; and also, on the bottom seam there was portions of that, that still solder remained.

Q. How much of the side seam had been soldered?

A. I didn't measure it, but I imagine about 20 inches.

Q. And you say that you took some pictures of it at that time?

A. Yes, sir.

Q. Let me ask you this: did you observe whether there was any evidence of solder on the rivets at that time?

A. No, sir, there was none.

Q. You say there was none?

A. No, sir.

Q. And was there any solder,—any evidence of solder, on the side seam above the 20 inches that you speak of?

A. No, sir, none that I could see.

Q. Did you examine the tank for the purpose of determining where the solder was?

A. Yes, sir.

Q. Was there any evidence of welding on the tank?

A. No, sir.

Q. Are you familiar with both welding and soldering?

A. Yes, sir, and brazing.

Q. Is there any difference in appearance between soldering and welding?

A. Yes, a great deal of difference.

Q. What is the difference?

A. Well in welding, either electric welding or torch, a man has to feed his stick of welding material; it makes little lumps like little waves, as he advances the steel into the flame of the torch, it makes little lumps; I don't know as I can describe it. And in soldering, the soldering material, it can be soldered properly, you can make a smooth —you can draw your solder right along the seam, also run the solder in the seam, providing you can get the material that is soldered hot enough so that it will run.

Q. Is there any difference in color between soldering and welding?

A. Yes, sir.

Q. What is that difference?

A. Well your solder would look like the tarnished silver, in time. The welding would look rusty, unless it was painted.

Q. Well I am talking about fresh work, Captain.

A. The silver,—the lead solder would have a silvery appearance, shiny. The welding would be the same as raw iron.

Q. And would there by any—outside of the color, would there be any difference in the texture of the surface?

A. Yes, the welding would be a little wavy, where the solder would be smooth.

Q. In your opinion, could anyone with any familiarity with welding, be mistaken as to whether work was welding or soldering?

Mr. Underwood:

I object to that. He is asking this witness whether some other witness could be mistaken.

Mr. Matteson:

If your Honor please, there was one witness who testified in this case, Mr. Simmon, and he testified at great length after his observations.

The Court:

Do you want this argument in the record?

Mr. Matteson:

Well I don't care whether it is in the record or not. I think your Honor should have it in mind, because this trial has been so disjointed we may lose track of things. But this witness Simmon testified in great detail that he was there when these repairs were done in 1927; that the tanks were taken out of the ship at that time, the bottoms were taken out of the tanks; that the bottoms were replaced and welded in place; that he personally had had experience with welding and knew what welding looked like. And the question of the veracity of that witness, or the credibility of that witness, is exceedingly important in this case. Now when the tank has been examined it appears very clearly that there was no welding on the tank. I think that will be conceded by our opponents. There was some soldering. What I am doing is bringing out further a witness who is familiar with both classes of work; that there is such a difference between the appearance of the two classes of work that anyone that has any familiarity with those types of work at all, would not be mistaken about a point like that. I think that is very important; that is the reason I asked this witness.

Mr. Underwood:

If your Honor please, I don't object to what Mr. Matteson says he is doing, but I object to his question; because it asks of this witness in effect to tell whether another witness could be mistaken. I don't object to his bringing out any difference which he says exists in welding and

soldering; but I object to his asking this witness whether another person could be mistaken when he looked at it.

Mr. Matteson:

Will you read the question as it is framed?

(The question objected to was read by the reporter.)

The Court:

I think the question is all right. I overrule the objection.

A. A professional welder or tinsmith certainly could not be mistaken.

Q. Well I am not talking about a professional, Captain; I am talking about anyone that has ordinary familiarity with that type of work.

Mr. Underwood:

I object to that now, on the ground that it is leading. He got an answer he didn't like, and now he is trying to cure it.

Mr. Anderson:

He asks for an opinion, that the Court is just as able to form as the witness. The basis of opinion evidence is upon matters that the Court does not know.

The Court:

Of course one way you look at it, it is for the Court to determine from the facts proven, as to what an ordinary person could or could not have seen; but I construe the question as just another way of asking him that, and helping the Court to draw that conclusion. So I think it is not objectionable; I overrule the objection.

A. May I make that answer clearer?

(By Mr. Matteson):

Yes.

A. What I wish to convey is that some farmer that never saw a plate welded, might not be able to distinguish; but anyone around a shipyard or boiler works or iron works would certainly know the difference between welding and soldering.

Q. Now were there any evidences of red paint on the tank, when you saw it—

A. No, sir.

Q. —in May. From your observation of the tank at that time are you able to form an opinion as to whether there had ever been any solder on the side seam of the tank above the 20 inch space where the solder was apparent?

A. My opinion it never had been; no, sir.

Q. Why do you form that opinion?

A. Well had that been soldered above that space, and even under intense heat, enough to burn it off, it would still show the discoloration of the solder where it had been attached to the galvanized iron.

Q. From your observation of the tank are you able to form an opinion as to whether or not it was galvanized after being put together, or simply made of galvanized plates?

Mr. Underwood:

I am sorry; may I have the question read, please?

(The question was read by the reporter.)

A. I am of the opinion those tanks were made of rolled galvanized plates, then put together.

Q. Why do you say that?

A. Well if they were dipped, it would show signs in the seams and around the rivet heads.

Q. And were there any such signs?

A. No, sir, not that I could observe.

Q. Now from your observation of the bottom of that tank, are you able to form an opinion as to whether or not the bottom of the tank had ever been removed and replaced?

A. Not that I could find; no evidence to prove it to me.

Q. Well if it had been removed and replaced, is there anything that you would expect to observe?

A. Yes, they would have to remove the rivets with a chisel; they would have to cut the heads of the rivets off with a chisel, to back them out; and if that was done, there would certainly be some marks on some of the rivets that would show the chisel marks.

Q. Were there any such marks on the tank?

A. No, sir.

Q. Now did you say that you took some pictures when you were there in May?

A. Yes, sir.

Q. What is this picture that I show you?

A. That of the tank, looking from the bottom of the tank, forward. That's the tank that has been removed.

Q. That's the one that was lying on deck?

A. Yes, sir.

Q. What kind of film did you use to take these pictures?

A. Just this 35c film, in a box camera.

Q. You don't know the kind of film?

A. No, sir, I don't; I could find out where I buy it. Is there a film called Verichrome?

Q. You mean Verichrome?

A. Verichrome, I think that's it.

The Court:

When did you take these, now?

(By Mr. Matteson):

Q. Will you tell me just exactly when you took that picture?

A. May 26th; I marked the date.

The Court:

1939?

A. Yes, sir; that was within a week after we all went out.

(By Mr. Matteson):

Q. And on the back of this picture I notice you have written a description; it says, "Close-up of the bottom of Number four tank of the Yacht Seminole, showing side seam of tank, where seam had been soldered approximately 20 inches from the bottom". Is that a correct description of the picture?

A. Yes, sir.

Mr. Matteson:

I would like to have that marked as 189.

By Mr. Underwood:

Q. This black mark at the side of the tank, is a shadow, I take it?

A. I shadow of the bent frame, I believe.

Q. At any rate, that is a shadow?

A. Yes, sir.

Q. And you can't see the bottom of the tank at all?

A. No, sir.

Q. Just all black, is that right?

A. Yes, sir.

Q. You said a moment ago that this was taken a few days after we were all out there. You don't mean that did you?

A. I do.

Q. After who all was out there?

A. Judge Holland was there.

Q. This was taken after that, was it?

A. Yes. The tank was removed—no, wait a minute. No, I am wrong; I am twisted.

Q. Your memory is faulty on that? It is faulty on that?

A. Yes, on that.

Mr. Underwood:

I have no objection to the picture.

A. It was a few days after Judge Holland set a date for us, when Court adjourned.

(By Mr. Matteson):

Q. And is the date on the back of this picture, the date on which the picture was taken?

A. That is the date on which the picture was taken.

(The photograph so tendered, was admitted in evidence and filed as Libelants' Exhibit 139.)

Q. I show you a second picture; what is that?

A. That is standing on Number One tank, looking across the coal bunker or the tank compartment.

Q. And when was that taken?

A. The same date.

Mr. Matteson:

I now offer that in evidence.

Mr. Underwood:

Have you extra copies of these?

Mr. Matteson:

I will have some made.

(The photograph so tendered was admitted in evidence and filed as Libelants' Exhibit 140.)

(By Mr. Matteson):

Q. Now what is this that I show you, Captain?

A. This is standing in the alleyway, that is the passageway, looking forward to this tank.

Q. And what is the wall that appears at the left-hand side of the picture?

A. That is the steel bulkhead of the engine room.

Q. Is that the passageway wall?

A. This is the passageway; these are the frames.

Mr. Underwood:

Let's mark that, steel bulkhead of engine room.

The Court:

Separating what, Captain?

A. Separating the passageway from the engine room; the other side of the steel bulkhead is the engine room. This part is the starboard side of the coal bunker.

Q. Then I understand it, when you took this picture you were standing in the passageway that goes on the starboard side of the engine room?

A. Yes, sir.

Q. Looking forward?

A. Yes, sir.

The Court:

And that tank with the shadow on it, is the Number One tank?

A. Number Four.

The Court:

Number Four, yes.

Mr. Matteson:
I offer that.

Mr. Underwood:
I would like to ask one or two questions:

By Mr. Underwood:
Q. Now Captain Patton, in this photograph that is offered in evidence now, you said that this bulkhead at the left is the engineroom bulkhead; is that right?
A. No that part—that is the same bulkhead that goes along, forming the coal bunker, too.
Q. How many plates show in that bulkhead in that photograph? Two, isn't it?
A. Two; there is your angle iron.
Q. Now let's look at this Exhibit 140 for a minute; how many plates show in that same bulkhead there?
A. Two.
Q. For as a matter of fact, Captain, the tank compartment bulkhead, where it is adjacent to the alleyway, is made up of two plates isn't it?
A. That's right.
Q. And in this photograph that is offered in evidence, only those two plates show, and not all of them; isn't that so?
A. That is right.
Q. So that is not the engineroom bulkhead is it?
A. It is a continuation.
Q. But it isn't the engineroom bulkhead is it? It is the tank compartment, isn't it? Isn't that right?
A. No.
Q. Please answer the question.
A. Wait a minute.
Q. Well please answer the question; is it or is it not only the tank compartment bulkhead?
A. Yes, which is a continuation of the engineroom bulkhead.

Mr. Underwood:

I have no objection to the photograph.

(The said photograph so tendered was admitted in evidence and filed as Libelants' Exhibit 141.)

(By Mr. Matteson):

Q. And what is this next picture that I show you, Captain?

A. Looking down between tanks and Number One and Two, at tank compartment bulkhead, showing remains of 2 x 4 battens used to secure tank.

Q. Taken at the same time and place?

A. Yes, sir.

Mr. Matteson:

I would like to have that marked.

Mr. Underwood:

I have no objection.

(The said photograph so tendered was admitted in evidence and filed as Libelants' Exhibit 142.)

Q. I show you another picture, Captain, and ask you what that is?

A. That is looking down in the space where Number Four tank was taken out.

Q. Was that taken at the same time and place?

A. Yes, sir.

Mr. Matteson:

I offer that; any objection to this?

Mr. Underwood:

No.

(The said photograph so tendered was admitted in evidence and filed as Libelants' Exhibit 143.)

Q. I show you another picture, Captain, and ask you what that is?

A. Standing on Number Two tank looking across the top of the tanks, or where this Number Four was. Number Four you can just see it down there.

Q. That is looking toward the starboard side of the ship?

A. Yes, sir.

Q. The left-hand picture is toward the bow of the ship?

A. That is right.

Mr. Matteson:

I offer that; any objection to that?

Mr. Underwood:

I have no objection to that.

(The said photograph so tendered was admitted in evidence and filed as Libelants' Exhibit 144.)

Q. I show you another photograph, Captain, and ask you what that is?

A. That was standing on the float, taken from the float, looking at the starboard side of the boat. Here is the tank.

Q. As you have drawn an arrow, to Number Four tank, it shows the tank that had been removed; is that right?

A. Yes, sir.

Mr. Matteson:

I offer that.

Mr. Underwood:

Of course as to all these, your Honor, I object to the description on the back as having no binding effect on me.

I don't mind the witness telling what it is, saying what he did. But I don't think—I take it that in none of these has the description on the back been offered—just the photograph itself?

Mr. Matteson:

I think the description the witness has given has been practically the same.

Mr. Underwood:

Well I don't mind your having the witness describe it; I have no objection to that.

(The said photograph so tendered was admitted in evidence and filed as Libelants' Exhibit 145.)

Q. I have one more, Captain; what is that?

A. That picture is of the starboard side of the Seminole, showing the tank and tank compartment, taken from the dock,—or from the dry dock.

Mr. Underwood:

I have no objection to that.

(The said photograph so tendered was admitted in evidence and filed as Libelants' Exhibit 146.)

Q. This last picture, 146, Captain Patton, there seems to be a pile of pipe in the background of the picture; what was that?

A. Oh that is dredging pipe.

Q. Was that on the Seminole?

A. No, no; dredging out the river; stored it on the bank.

Q. That has nothing to do with the Seminole?

A. Oh no.

Q. All these pictures were taken at the same time and place?

A. Yes, sir.

Q. Now did you accompany the Court and Counsel on a visit to the Seminole in October of this year?

A. Yes, sir.

Q. And did you observe the conditions of the tank,—Number Four tank which had been removed—at that time?

A. Yes, sir.

Q. Was there any difference in the appearance of the tank in October, than when you saw it in May?

A. None that I could see.

Q. What have you observed with respect to the side plating of the Seminole, Captain?

A. You mean, the condition of it?

Q. Not the condition; what is there on the ship in the way of side plating?

A. Well she was a single-plated vessel one time, but they replated over the other plate.

Q. Had new plates put on over the old plates?

A. Over the original plates; yes, sir.

Q. Was that true on both sides of the vessel?

A. To be perfectly honest, I didn't look at the starboard side, but I did on the port.

Q. You did observe then on the port side?

A. Yes, sir.

Q. And is that true to the extent of the part of the ship which contains the enginerpom and the tank compartment?

A. Yes, sir.

Q. What did you observe of the tanks with respect to whether it had been caulked or not?

A. I am of the opinion those tanks had not been caulked.

Q. Why are you of that opinion?

A. Well if the seam had been caulked, it would show the indentation of the caulking iron on the edges.

Q. And did you look and see whether there was such evidence of caulking?

A. Yes, sir, I did; the sides and top and bottom.

Q. Was there any such evidence?

A. No, sir.

Q. Captain I think you testified that you went out to the Pilkington Yard on the day of the fire?

A. Yes, sir.

Q. Just to refresh our recollection will you tell us what time you got there, about?

A. It was just coming on dark, around seven o'clock.

Q. You were there while the fire was burning?

A. Yes, sir.

Q. And how long were you there at the yard, off and on, during that period of the fire?

A. I was there practically all the time until we got Captain Abel's body out; that is two days later.

Q. And were you on the Seminole at that time, during that period?

A. The day they took the body out I was, yes. You couldn't get on her while it was burning.

Q. Were you on the Seminole while they were working preliminary to that?

A. Yes, sir. I run the air pump for the diver.

Q. Now Captain there has been some suggestion here that the Seminole, before the fire, had in her engine room on each side, four two-inch pipes running from the deck just outside of the trunk, from the engineroom down through into the lower part of the bilge. The pipes on the starboard side are said to have run just outside of the engineroom and fireroom bulkhead in the passageway; and the ones on the port side, down from the deck into the bilge space. Did you see any such pipes there at the time of the fire?

A. No, sir, I didn't. You mean after the fire?

Q. Well at any time while you were there at about the time of the fire.

A. No, sir, I did not.

Q. Captain, referring to Exhibit 11, and the joining of Crane valve Number 150, with the part of the union which is adjacent to it, there has been a suggestion that that might have been tight if it were screwed up so that the face of the union came in contact with the valve. What can you say of that joinder of the union with the valve, as to whether it would be satisfactory, in your opinion, for a gas tightness, or not?

A. No, sir, it wouldn't.

Q. Why not?

A. Well the valve and the union does not tighten up on the close nipple, not on the threads. To get that tight you would have to screw that up so tight in making a joint out of this end of the union and this end of the valve; a pipefitter wouldn't pass that job.

Mr. Underwood:

I move to strike that out,—what a pipefitter would do.

A. Well I have done some pipe fitting.

Mr. Underwood:

Wait a minute, let the Court rule, please.

The Court:

I think that is proper; I mean, I think this motion is well taken, to strike.

(By Mr. Matteson):

Q. Well assuming, Captain, that it could be screwed up so that there would be at least a temporary fit between the union and the valve, what would you say about it?

A. Well a very slight jar would be very apt to loosen it.

Q. In your opinion, would that be a satisfactory connection for gasoline?

A. No, sir.

Q. Captain, I think that you have testified that you saw this set of valves at the time of the fire, or shortly after. Now of course there are some marks that have been put on that by the tools which I think you and Mr. Munroe used to break one or more of the joints. Outside of that—

A. No, all we did was take the bonnets off.

Q. You didn't break any joints?

A. No, sir.

Q. There are some tool marks here—

A. On the bonnet of the valves.

Q. On the bonnet of the valves, where you took the bonnet off?

A. Yes, sir.

Q. Outside of those marks, is the exhibit in the same condition as when you first saw it?

A. Yes, sir, except that they are loose; that is, these other connections are loose.

Q. Except that the joints have been broken?

A. Yes, sir.

Mr. Underwood:

I move to strike that out as leading.

Mr. Matteson:

I thought I was summarizing what he said.

Mr. Underwood:

A distinct departure from what he said.

Mr. Matteson:

Okay, I will withdraw it.

(By Mr. Matteson):

Q. Will you just tell us, Captain Patton, any respects in which these are different from the condition in which you first saw them?

A. All the parts are here, except for being scarred up with a Stilson wrench, and the joints broken,—in the same condition.

Q. What do you mean by the joints broken?

A. Well all these connections are loose.

Q. Well I mean, we may not understand the term, "broken", Captain?

A. Well they were all rigid when I first saw them.

Q. What is that?

A. They were all rigid; none of these joints were loose when I first saw them.

Q. Captain, there has been some testimony here about the necessity of priming engines such as the Seminole had. Are you familiar with the operation of such engines?

A. Yes, sir.

Q. In your opinion, how much gasoline would be required to prime those engines when they were cold?

A. Well I should say, two squirts with a squirt gun, in each petcock, would be ample. If you got too much in they wouldn't start at all.

Q. How much would two squirts of a squirt gun amount to?

A. Possibly a teaspoonful; less than that, I should say.

Q. Can you give us an opinion as to whether engines of that type would require priming if they were hot?

A. No, sir, not if they were hot, if the engines were in fairly good working order.

Q. Well there may be some confusion between my question and your answer. Do I understand that you say they would or would not require priming when they were hot?

A. Not when hot, no, sir.

Q. Captain, in your testimony given last spring, I think that you testified that in your opinion it was not proper to have draw-off valves for gasoline in the engineroom. Now it has been suggested that the engines of the Seminole required priming when they started,—when they

were started, either hot or cold. If that were the fact, would you consider that in your opinion it was proper to have draw-off valves for gasoline in the engineroom?

A. In my opinion it is a great hazard to have a draw-off valve in an engineroom for any purpose whatsoever.

Q. And in your opinion is it proper to have such valves in an engineroom, even if the engines require priming, both hot and cold?

A. You mean, draw-off valves in the engineroom?

Q. Yes, sir.

A. No, sir, I don't approve it.

Q. Now if gasoline were required in the engineroom for priming or any other purpose, is there any method by which a supply of gasoline could be kept safely in the engineroom for such purpose?

A. In a screw top approved can, yes.

Q. And have you in mind a type of can which you think would be proper and safe?

A. Yes, sir; that red can is approved.

Q. You refer to Exhibit 137?

A. Yes, sir. There are various types, but they are all screw top filler, and screw discharge,—screw caps on them.

Q. Do I understand that there are other types that you would also consider satisfactory?

A. Yes, sir, providing they have screw caps.

Q. There has been some suggestion of a can of this type, to be used directly for priming the engines. In your opinion, would the can be suitable for that purpose?

A. No, sir. That can is suitable to fill your squirt can.

Q. You wouldn't attempt to prime engines with it?

A. No, sir; you could not regulate your gasoline that you needed in each priming,—anything like that.

Q. It has been suggested that such type of can would be unsatisfactory because it might wear out. What is your opinion as to that?

A. I don't see where it would wear out. You have got that chafing piece on the bottom, and if it did wear out, after a great number of years, it started to leak, that can would be kept in an engineroom on the workbench, and if it developed a leak it would show signs of gasoline on the workbench, and would call the man's attention to the fact it was leaking. I have known of cans like that to be in service for eight or ten years.

Q. Are such cans expensive, Captain?

A. That one cost $3.50.

Q. It has been suggested, Captain, that the fact that this can was fitted with a flexible metal outlet for pouring gasoline through, would be unsatisfactory; the flexible metal outlet might leak or might wear so that it leaked?

A. Then you could remove that plug.

Mr. Underwood:

Will you read the answer?

(The answer was read by the reporter.)

A. Remove this plug and put another piece of flexible tubing in it. Another thing, if it did leak, it would only leak at the time you were filling your squirt can.

Q. Is this piece of flexible hose any essential part of the can for this purpose?

A. It is only to convey your gasoline from your tank to your squirt can when it is in that position. When it is in that position your plug valve is closed.

Q. Do all of the types of cans that you refer to, that are on the market, which might be used for this purpose, have flexible hoses attached to them?

A. No, some that have spouts on them; but the majority of them have the flexible hose.

Q. In your experience, have you found any objection to the use of a flexible hose in that type of can?

A. No, sir.

Q. Captain, it has been suggested here that the fact that at times it was customary for the Seminole to supply gasoline from her tanks to other fishing vessels, or other vessels which might be accompanying her; would that in your opinion make it proper to have a draw-off valve for gasoline in the engineroom?

A. No, sir.

Q. Why not?

A. You have that danger of gasoline; the hoses might leak, might burst,—though there is very little pressure on it; you have still got your draw-off valve in the enginerocm.

Q. What is your objection to that?

A. A bad fire hazard. I don't believe in loose gasoline below decks in any engineroom or in any hull.

Q. Now is there any other method by which—which could be used for supplying gasoline from the tank of a vessel like the Seminole, to other vessels, which would not involve handling it below deck?

A. Yes, sir; you could hook up a transfer pump from your fuel line, your manifold, leading it up and discharging on deck through a hose.

Q. In that event would there be any loose gasoline handled in the engineroom?

A. No, sir.

Q. Where would you put your pump?

A. Pump could be mounted on your engineroom bulkhead.

Q. Now Captain you gave some testimony before, with respect to ventilation. Now with respect to the tank compartment, first, it has been suggested that the four holes at the top of the bulkhead between the engineroom and the tank compartment, through which the filler lines passed, four holes in that compartment, in that bulkhead, at a lower level where the feed lines came out from the gasoline tanks, and the square opening at

the bottom of the bulkhead, which lead from the engineroom floor to the space under the tanks, would constitute adequate ventilation for the space forward of the engineroom in which the tanks were located; what is your opinion as to that?

A. It is insufficient ventilation.

Q. What is that?

A. Very insufficient. It isn't what I would call thorough ventilation.

Q. Now Captain, it has also been suggested that as far as ventilating the engineroom—the space under the tanks, that that ventilation in the upper part of the engineroom, consisting of windows, cowl ventilators, hatch and skylight, would be adequate, because it is said that there is a force known as convection, which causes the gases which might accumulate in the lower part of the vessel, either under the floors, or just above the floors, to rise, due to variations in temperature, so that they would be carried out by the ventilation in the upper part of the engineroom. In your experience, can you tell us whether such an action occurs on vessels, which would make the ventilation in the upper part of the engineroom, adequate?

A. Ventilating the upper part of the engineroom, cross draft through the windows, might have some small effect on the bilges. It is my opinion that to get the gas out of the pockets in the bilges, you want a through draft; a ventilator going to the bilge, and an exit or exhaust ventilator to take it out. You have got to stir up those heavy gases in the bilge to get them out of there.

Q. And stir them up, how?

A. With air, a current of air passing.

Q. And in your opinion, is there any other way of securing adequate motion of air in the bilges, other than by installing ventilators such as you have suggested, leading to the bilges?

A. Install exhaust blowers. But in my opinion, the natural cowl ventilators ventilation twenty-four hours a day, goes on without switching any blowers, and all that thing,—that's my opinion.

Q. Well the point I was asking you about is, in the absence of some induced circulation through ventilator, either natural or forced, in your opinion would those gases in the bilges be dissipated and carried off?

A. No, sir, I think they would stay there. All bilges have pockets; this heavy gas gets in there and you have got to stir them up to get them out of there. Variations in temperature may lift some of it, but very little.

Q. Did you observe the bracing of the tanks in the tank compartment?

A. There wasn't much left of the wood braces. There had been 4 x 4's in there on the forward and after side, none that I could see on the sides.

Q. Without the bracing to the sides, would you consider that the other bracing—I mean, between the Number One tank and the port bulkhead, and between Number Four tank and the starboard bulkhead—would bracing be adequate to hold those tanks steady, in your opinion?

A. You mean, on the sides of the tank?

Q. Yes.

A. I just didn't catch that.

Q. I mean, assuming that there were saddles or braces, —separators, between Number One and Number Two tank, Number Two and Three, Number Three and Four, but that there were no braces between Number Four and the starboard bulkhead, or between Number One and the port bulkhead; do you think that such bracing would be adequate to hold the tanks steady?

A. No, sir.

Mr. Underwood:

I object to that on the ground there is no evidence in the case that there were no such braces.

TRANSCRIPT OF RECORD

Supreme Court of the United States

OCTOBER TERM, 1942

No. 246

CHARLES CORYELL, ET AL., PETITIONERS,

vs.

JOHN S. PHIPPS AND GEORGE J. PILKINGTON

ON WRIT OF CERTIORARI TO THE UNITED STATES CIRCUIT COURT OF APPEALS FOR THE FIFTH CIRCUIT

PETITION FOR CERTIORARI FILED JULY 20, 1942.

CERTIORARI GRANTED OCTOBER 12, 1942.

VOLUME V.

TRANSCRIPT OF RECORD

UNITED STATES
CIRCUIT COURT OF APPEALS

FIFTH CIRCUIT.

No. 10185

CHARLES CORYELL, ET AL.,
Appellants,

versus

JOHN S. PHIPPS and GEORGE J. PILKINGTON,
Appellees.

Appeal from the District Court of the United States for the Southern District of Florida.

(ORIGINAL RECORD RECEIVED DEC. 17/41.)

Mr. Matteson:

The testimony is that those that have examined the ship, have not been able to find any evidence that there was any such thing; while there has been evidence of other braces.

Mr. Underwood:

The ship has been through a fire.

Mr. Matteson:

And Mr. Underwood's witnesses have testified that there was no fire, to speak of, in the tank compartment, at least in the lower part.

The Court:

Read the question.

(The last question was read by the reporter.)

Mr. Matteson:

The question as to whether there was such bracing, or not, may be a fact that you will have to determine, from the evidence or otherwise; but I think I am entitled to ask the question, on that assumption, so the opinion will be here.

The Court:

You mean, Mr. Matteson, that there is a theory as to which that hypothesis could be sustained?

Mr. Matteson:

Yes.

The Court:

And with that, you are entitled to an opinion on that hypothesis?

Mr. Matteson:

Yes.

The Court:

I think that is reasonable; overrule the objection. Just generally speaking, I call your attention to this; as the examination is going on, I am endeavoring to require the proponent of questions to incorporate to his witness, hypotheses which call for an answer. On cross examination I have now adopted a different rule, as you probably have noticed. On cross examination I think a witness who is being examined should call attention to any missing element which he thinks should be incorporated.—You may answer the question.

A. If there were no braces between the bulkhead and Number One tank, no such bulkhead on Number Four tank, those tanks would be unstable if the vessel was rolling. In other words, if they weren't there, they should be.

Q. Now Captain, it has been suggested here that the fact that condensation might accumulate at the bottom of the Seminole's gasoline tanks, in V-shaped sections around the inverted bottom, which if it occurred would form a protecting seal of water which would protect the tank against corrosion. In your opinion is that so?

A. In my opinion, if they didn't get water in there in the first place, you wouldn't have corrosion.

Q. Do you think the presence of the water would be any protection against corrosion?

A. Well you would protect it this way; if there was corrosion there,—some water in there, exposed to the atmosphere, you would increase the corrosion.

Q. Now it has been suggested, Captain, that these tanks as constructed, and as you have observed them on the Seminole, in their new condition, would be good for a hundred years, or for at least a period beyond the life of the vessel. What is your opinion with respect to that?

A. I don't agree with that.

Q. What has been your experience with respect to galvanized tanks?

A. Well I have seen the galvanized tanks of that type, start leaking in seven and eight years; might get fifteen years out of them, might get twenty, according to the thickness, the care that they had. I have inspected manifolds of galvanized tanks, also copper tanks, that I found leaking; but the copper tanks leaking, that was due to fittings letting go, and solder; and on galvanized it is usually due to rust.

Q. Have you had any experience that would indicate the extent to which galvanized iron tanks, due to the gasoline, corroded?

A. Well, the houseboat Fortuna, for example, I inspected her, found three of the gasoline tanks rusted through; one of them had a hole you could put a derby hat through the bottom.

Q. How large was it?

A. As I recall it, it was two-foot in diameter by seven-foot long.

Q. What sort of a hole did you say you found in those tanks?

A. Along the bottom you could almost put a derby hat through the bottom; rusted and corroded away; that is in the one tank. There were two other tanks leaking. I recommended they renew all of them.

Mr. Underwood:

I object to what he recommended.

(By Mr. Matteson):

Q. When was it that you made that observation?

A. About two years ago.

Q. That would be in 1937?

A. Yes, sir.

Q. Did you make a survey of the Fortuna at that time?

A. Yes, sir.

Q. Will you tell me whether she had pans under her gasoline tanks?

A. Those gasoline tanks were in a lead lined box.

Q. What do you mean by that, Captain? Describe it to us.

A. Well it was a very large box, and lead lined; there was a lead that went from the box, that was down in the bilge, underneath the cabin floor.

The Court:

Do you want a ruling on that,—what he recommended? Or, are you satisfied to let it go as it is?

Mr. Matteson:

I am willing to have that stricken out.

The Court:

All right.

Q. With respect to the tanks that you observed on the Fortuna, were there any access plates on those tanks?

A. Examination plates?

Q. Yes.

A. Two on each tank.

Q. That is all.—Oh, may I ask this one other question; Captain, you have expressed various opinions on different things in the course of your examination, as part of the Libelants' case last spring. In view of anything that has transpired since, have you changed those views?

Mr. Underwood:

I object to that question, your Honor.

The Court:

It is pretty general.

Mr. Matteson:

Well if your Honor please, I simply—it is a very general question, I realize that. I don't want to extend the examination of this witness unduly; I just wanted to make it perfectly clear that he hasn't reneged on anything, that his testimony still stands without changes.

The Court:

Well I think there is a presumption that, once of one opinion, he remains that way.

Mr. Matteson:

All right.

Mr. Underwood:

Mr. Botts, have you any questions?

Mr. Botts:

I don't think so.

Mr. Underwood:

You are entitled to go first, you know.

Mr. Botts:

I will say this, that I may want to put him on with reference to a certain matter; but I didn't know he was going on this morning, and I don't know whether he has any information on the subject; and I am not going on a fishing expedition until I find out whether he is informed on the question.

Mr. Underwood:

It is the hunting season that starts Monday, not the fishing season

Cross Examination.

By Mr. Underwood:

Q. Captain Patton, were there any pans of any kind under the tanks on the Seminole?

A. Two pans.

Q. And they had rectangular angles at the outboard ends?

A. I think so.

Q. Rounded corners?

The Court:

As I understand it, so far as on the general line of interrogation now, Fred, you didn't want to ask him any questions?

Mr. Botts:

When the witness is through I want to speak to him and ask him—

The Court:

About another particular matter you had in mind?

Mr. Botts:

It is not concerning the matter he has been interrogated about this morning, at all.

The Court:

We did adopt that general rule and I thought we would follow that at this time; but of course I realize it is something else you have in mind, that you want to interrogate him before you did put him on as your witness.

Mr. Botts:

Yes, sir; it will take about a minute, either way.

Mr. Underwood:

Will you read the last question please?

(The testimony last preceding, was read.)

A. I believe they were.

Q. And Number One and Number Two tanks sat in one pan?

A. Yes.

Q. And Number Three and Number Four tanks sat in the other?

A. Yes.

Q. Is that right?

A. That is right.

Q. And the pans were bigger than the two tanks, of course?

A. Yes.

Q. So that there was a margin of pan all around the tanks, was there not?

A. Yes; that is, the lid came up.

Q. Did you observe whether those pans had been broken down or destroyed in any way?

A. Not that I could see.

Q. So that the tanks sat entirely within the pans, is that right?

A. No, the tanks sat on the wooden framework, which sat in the pans.

Q. But the tanks didn't extend beyond the margin of the pan at all?

A. No.

Q. That would leave the tanks several inches within the margin of the pans, is that right?

A. I don't know the exact distance, but they were inside of the lid of the pan.

Q. So if you were down below looking up, you couldn't see any of the bottoms the tanks, could you?

A. I don't think you could.

Q. Well it is clear that you couldn't, isn't it?

A. Yes.

Q. Now Captain I want to read you a question and answer that was put to you before, on Page 841: "Q. Could the tanks be inspected from underneath?" "A. I looked in there and it appeared to me to be metal on top of angle irons; but you could see pretty clearly all the bottom of Number One tank. I just looked in there out of curiosity, at that time." —Now is it true or is it not true?

A. It is not true.

Q. —that you could see the bottom of Number One tank?

A. No.

Q. Is it true—

A. I thought it was the tank, at the time, but I stand corrected on that.

Q. How do you account for the fact that you said that you "Could see pretty clearly all the bottom of Number One tank"?

A. Well I twisted my neck up there, and could tap it, and found it was metal; I assumed it was the bottom of the tank.

Q. Do you mean to tell me that you can't tell the difference between a pan that is as big or bigger than two of those tanks, and the bottom of the tank itself?

A. Yes, if I had a flashlight and went underneath there.

Q. You didn't have a flashlight?

A. No.

Q. And you didn't go underneath?

A. No, I just looked up and tapped it and found it was iron, and assumed that was the bottom of the tank.

Q. What shape was the bottom of this pan, Captain?

A. Well, oblong.

Q. Well, the bottom was flat, wasn't it?

A. Yes.

Q. But the bottoms of the tanks weren't flat, were they?

A. No, they were not.

Q. And you testified before that they were not flat, but concave, didn't you? Now how did you know they were concave bottom tanks if you looked under there and could see nothing but the pans?

A. Well in the engineroom you could see down in the pan and see the row of rivets; so it must be a concave bottom.

Q. You now say that you could not see the bottoms of those tanks at that time?

A. Not at that time, no, sir. What I assumed was the bottom of the tank, was the sheet iron, the pan.

Q. And you couldn't see the concave bottom?

A. Not at that time, no; not until you pulled one out.

Q. Well now Captain I refer you to another question and answer, on Page 861, of your previous testimony: "Q. This hole in Number Two tank, what was that?" "A. When I looked in there I could see what appeared to be metal under the tanks, all of the tanks, excepting a portion under Number Two tank, where you could look up and see the concave part of the tank." Is that true?

A. In the dusk I thought it was; in that darkness.

Q. This was dusk, now?

A. Well it is dark underneath that tank.

Q. And you had no flashlight?

A. No, at the time I had no flashlight.

Q. Well you didn't say, at the time when you were previously questioned, that you thought you could see the concave bottom, did you?

A. I know it was a concave bottom, and I thought was the bottom that was showing.

Q. Well now Captain, are you so inexperienced that you can't tell the difference between a flat bottom of a pan and the concave bottom of a tank?

A. I didn't go under there and examine it; you need overalls and a diving suit to get under there,—and a flashlight.

Q. Was your examination of the rest of the boat, of a similar kind?

A. Not where I could see it plain.

Q. You weren't entirely frank with us about that on your previous testimony, were you, Captain?

A. About the bottom of the tank?

Q. Yes.

A. I didn't think it amounted to much.

Q. I see, your testimony is frank or not frank, depending upon how important you think the matter is; is that correct?

A. In a way, yes, sir,—on the tank.

Q. Oh, you limit it to the tanks, do you?

A. Yes, the tanks alone.

Q. Nothing else, of course?

A. My testimony is correct; but I didn't pay much attention to the tanks, I admit that.

Q. But you didn't tell us that before, did you, Captain?

A. I wasn't asked. Had I authority to go up there and—

Q. You did stick your head in the space underneath the tanks and pans, didn't you, Captain?

A. I got down as far as I could without getting all messed up, and looked up.

Q. Well now Captain, that doesn't quite answer my question. Did you or did you not stick your head under the space below, in the space below the tanks and the pans?

A. Yes, as far as I could without getting dirty.

Q. Well now you know what your head is?

A. I think so.

Q. You know what this space under the tanks and pans, is? Is that right?

A. Yes.

Q. Did you or did you not put your head in that space under the pans and the tanks?

A. Yes, I stooped down and looked up. You mean, the framework where the tanks were?

Q. I want an answer to this specific question which I have put to you three times. Did you or did you not put your head under the tanks and the pans in that open space below?

A. Yes, I went down and looked,—from down below, up.

Q. And you saw nothing that you recognized, that you recognized as a drip pan?

A. No.

Q. Or, a pan of any kind?

A. No one knew much about the drip pans at the bottom of the tanks until you took Number Four out.

Mr. Underwood:

I move to strike that out, as not responsive.

Mr. Botts:

I think it illustrates the situation, if the Court please.

Mr. Underwood:

It certainly doesn't, Judge; because my witnesses testified to there being drip pans under the tanks, before Number Four tank was taken out. These people have just been caught out of bounds, that is all. They have said there were no pans; and I have demonstrated beyond any possible doubt that there were pans; they are there today. He says nobody knows.

The Court:

I think that motion to strike is proper; granted,—that portion of the testimony, what no one knew.

Mr. Underwood:

That is what I refer to.

Q. Now Captain, in your examination in May, 1939, did you obtain anybody's permission to go aboard the Seminole?

A. Yes.

Q. Whose?

A. Louis Nuta's. I asked him if I could go aboard, and he said, "Help yourself".

Q. You are quite clear about that?

A. Positive.

Q. You know who Louis is?

A. Oh, yes, I know who Louis is.

Q. Couldn't be any mistake about it being somebody else?

A. Only one Louis Nuta.

Q. Did you measure the height of the ash that remained in the tank compartment around Numbers One, Two and Three Tanks?

A. No, sir.

Q. Was it approximately 20 inches?

A. I couldn't say.

Q. You don't know?

A. No.

Q. What is the process of galvanizing a tank after it is manufactured?

A. After the tank is all built?

Q. Do you understand what I mean when I say, after it is manufactured?

A. Yes.

Q. That means, after it is manufactured?

A. Yes. They pickle a tank, to make the plating clean, and then there is a hot bath.

Q. First they dip it in acid and clean the plates, is that right?

A. That is what they call it, a pickle.

Q. And they take it out of that, is that right?

A. Yes.

Q. And then they dip it again in something else, is that right?

A. I have only seen them dip it once, in acid.

Q. You have never seen them dipped in anything else but the acid?

A. Dip in the zinc,—the galvanizing.

Q. First they dip it in acid?

A. Well it is a pickling bath.

Q. Then they dip it in something else?

A. Yes.

Q. What is that something else?

A. It is mostly zinc.

Q. What else is it?

A. I couldn't say; it is a galvanizing, that's all I know.

Q. Well what are the constituents of that material they dip it in?

A. I believe it is mostly zinc.

Q. What is the rest of it?

A. I couldn't say.

Q. Don't know?

A. No.

Q. A man of your experience, you don't know that?

A. I am not a galvanizer,—though I have seen lots of it done.

Q. You are a pipefitter, are you?

A. Yes, I am a pretty good pipefitter, too.

Q. What is the effect of that dipping in that zinc—and other things that you don't know? It adheres to the tank, is that right?

A. You have reference to the pickling, first?

Q. No, we are past the pickling now, and I don't want to talk about that any more.

A. Dipping it in the zinc puts a layer of what they call galvanizing.

Q. Over the whole tank?

A. Over the whole tank. They also use a spray method too, now.

Q. Do you know at what temperature zinc melts?

A. I can look it up in the book; I don't keep all those melting temperatures in my head.

Q. That is what the reference books are for, isn't it?

A. That is right.

Q. Suppose you do look it up. I think Mr. Matteson has a copy of Kents'; will you do that?

A. It is a low temperature.

Q. Do you want to approximate it, and let us look it up later on?

A. No, I would sooner you would look it up in the book; that's what I would do if I wanted to know.

Q. Captain, I suppose you have seen rivets burned out of various kinds of steel plating, haven't you?

A. Yes, sir.

Q. The process is to take an acetylene torch, put it in the middle of the rivet head; it burns right through in a minute, doesn't it?

A. Very shortly, depending on the size of the rivet.

Q. The process wouldn't leave any chisel marks, would it?

A. No, if she didn't blow up with it.

Q. You have seen that process used on tankers, haven't you, Captain?

A. Not without the tanks were thoroughly cleaned out and passed by chemical test.

Q. But you have seen it used on tankers, haven't you?

A. Yes, many.

Q. Of course if you were burning out the rivets in the bottom seam of the Seminole's tanks, you would not be burning into any gas filled chamber, would you?—you can answer that yes or no, can't you Captain? You wouldn't be burning into the tank, would you?

A. No, but you would be heating the metal.

Q. But you wouldn't be burning into the tank, would you?

A. Not into the body of the tank, no; that is on the bottom row.

Q. Yes, that is what we are talking about, the bottom row. How far down do you say the side plating of the Seminole is double plated now?

A. I can't say. I did look at the strake by the window.

Q. That is the first strake?

A. Yes.

Q. The first row of plates, counting down from the top?

A. From the window, yes. That is the only one I examined. No doubt she has got more in her, but I didn't see.

Mr. Underwood:

I move to strike out from "—No doubt", onward.

The Court:

I think that is proper.

Q. Did you ever operate any engines of the size of those in the Seminole?—any Winton engines like those?

A. Personally operate them? No. I am familiar with them, though.

Mr. Underwood:

I move to strike out the latter part of the answer, as not responsive.

Mr. Matteson:
What was the latter part of the answer?

(The second sentence of the last answer was read by the reporter.)

Mr. Matteson:
I think that is perfectly proper.

Mr. Underwood:
If your Honor please, I asked him the straight and simple question about whether he had ever operated them.

The Court:
That is true, but I don't think the voluntary statement is objectionable; I deny the motion to strike.

Mr. Underwood:
Can we agree that the melting point of zinc is 787 degrees Fahrenheit?

Mr. Matteson:
Yes.

(By Mr. Underwood):

Q. Captain, you spoke of the possibility of using a pump on the feed manifold system, to run gas up on deck; do you remember that?

A. Transfer pump.

Q. Well you would have a fitting where the line lead from the feed manifold to the pump, wouldn't you?

A. Union.

Q. And you would have, even if you used copper tubing, you would have another fitting—

A. I would use iron.

Q. Iron pipe?

A. Yes, the same as your manifold size, if you wanted to get a stream of gasoline.

Q. Iron pipe, not brass?

A. That is not a feed line.

Q. You wouldn't use brass pipe on that?

A. No.

Q. Why not?

A. Well you are just continuing this iron pipe; you might continue with the same size and material.

Q. Is it your understanding that the feed line on the Seminole was made up of iron pipe?

A. No, brass. I am speaking about this here; if you put a transfer pump from this line up on deck.

Q. But Captain, you are indicating the—

A. This iron pipe.

Q. You are indicating the valve marked Crane 150?

A. No, I am speaking about this iron pipe in here.

Q. But you are speaking about—

A. Dispense with all this hazard, and hook your transfer pump on this fitting. I have recommended that on several jobs, and it works very satisfactorily.

Q. Then you would have another connection where the pipe came in contact with the pump, wouldn't you?

A. Yes.

Q. And you would have various connections in the pump?

A. Just the inlet and discharge.

Q. Those would be the only two places where a pump could possibly leak?

A. No; you have a stuffing box there.

Q. You would have to manage to keep that tight, wouldn't you?

A. Sure; keep everything tight in an engineroom.

Q. Any other place where the pump might leak?

A. No, just the one stuffing box; that is assuming that your gaskets were put in properly.

Q. Then you have your riser from the pump?
A. Going up through the deck.

Mr. Underwood:
I think that's all.

Mr. Botts:
Judge, if you suspend a minute, so I might confer with this witness, I might have one or two questions.

(A brief informal recess was held.)

By Mr. Botts:
Q. Captain Patton, you have testified that you arrived at the scene of the fire while the conflagration was still in progress, and remained there almost continually until the body of Mr. Abel was recovered?

Mr. Underwood:
I dislike to interrupt, but is this Captain Patton called as a witness for Pilkington?

Mr. Botts:
I don't know, he is just here. You can put it down any way you want to, making him mine or anybody else's.

Mr. Underwood:
Anybody else but mine. I think we ought to have it clear whose witness he is, though.

The Court:
Mr. Botts is calling him, so he will be regarded as a witness for Pilkington.

(The last question was read by the reporter.)

A. Yes, sir.

By Mr. Botts:

Q. Do you recall the occasion when the Seminole and surrounding cooled down so it was possible for someone to go aboard her?

A. Yes, sir.

Q. And do you recall whether you were with the first people that went aboard the Seminole after she became cooled off enough?

A. Yes, sir, if not the first; I am not sure; I was there all the time.

Q. You were there at the time, and were among the first?

A. Yes, sir.

Q. I will ask you, at that time, if you observed the position of the tanks of the Seminole?

A. Yes, sir, I did.

Q. Did you observe the position of the tanks of the Seminole on the occasion when the Court and counsel visited the Seminole at Nuta's Boat Yard in October, I believe it was, of this year?

A. Yes, sir.

Q. I will ask you whether you can state from your observation on this occasion of your first visit to the Seminole, after the fire, and the visit out there at Nuta's Boat Yard, whether, save for the tank that had been removed, the position of the gasoline tanks in the Seminole was the same on those two occasions?

A. Yes, sir, as far as I could see.

Q. Well now I ask you whether you observed?

A. I did; yes, I looked at them.

Q. And was the position the same?

A. Yes, sir.

Q. I call your attention to a photograph—these are all in evidence?

Mr. Matteson:

I don't think it is.

(By Mr. Botts):

Q. I call your attention to a photograph—

The Court:

Mention it.

Q. It isn't in evidence and ask you if you took that photograph?

A. Yes, sir.

Q. Does that photograph correctly exhibit the condition and location of the tanks of the Seminole upon your visit immediately after the Seminole had cooled down—that is, your first visit?

A. Yes, sir.

Mr. Botts:

We offer it in evidence.

Mr. Underwood:

I take it by your testimony, Captain, you mean that this photograph correctly represents the position and condition of the tanks when the photograph was taken, August 13, 1935; is that what you mean?

A. Yes, sir; they hadn't been moved any.

Mr. Underwood:

I move to strike out, they hadn't been moved any.

Mr. Botts:

If he knows it, he can state.

Mr. Underwood:

I have the right to cross examine about it at the moment. This was taken August 13, 1935?

A. Yes, sir.

Mr. Underwood:

And the tank in the foreground is the starboard tank?

A. I think it is the port tank. Have you got any more of those others?

Mr. Underwood:

The tank at the bottom of the photograph is the port tank?

A. I believe so, yes.

Mr. Underwood:

Number One tank, is that right?

A. Yes, that's right. There is that mass of hyacinths over there.

Mr. Underwood:

I have no objection to the photograph.

(By Mr. Botts):

Q. And you say this was taken on August 13th, and correctly exhibits the condition immediately after the fire?

A. Yes, sir.

The Court:

That makes it unnecessary for the Court to rule on your motion to strike.

Mr. Underwood:

Quite so.—What will that number be?

(The photograph so tendered was admitted in evidence and filed as Respondent Pilkington's Exhibit 16.)

(By Mr. Botts):

Q. When you visited the Seminole the first time, after the fire, I will ask you if you observed any evidence of

an explosion having occurred; and if so, just answer, did you observe any such evidence?

A. Yes, sir.

Q. Now then with respect to the tank compartment, did you observe any particular evidence of an explosion in connection with the tank compartment?

A. Yes, sir; the bulkheads were pushed,—separated; pushed up.

Q. You mean, pushed away from the tanks?

A. That is right.

Q. So that the walls of the tank compartment had—

A. Expanded.

Q. Bellied out?

A. That is right.

Mr. Botts:

That's all.

By Mr. Underwood:

Q. When you say, bellied out, do you mean that the fair shape of a flat plate, had been changed, or that the two bulkheads were just further apart at the top than they were at the bottom?

A. That is right.

Q. The latter?

A. The latter, yes, sir. The bulkheads were bellied out, including the plating too.

Q. And that's the only evidence you saw of an explosion in the tank compartment?

A. Except for the tanks being misplaced. There must have been an explosion there to push them out of place.

Q. How many tanks were misplaced?

A. One that I know of.

Q. And only one that you know of, is that right?

A. I would have to take—

Q. Is that right?

A. I wouldn't admit but what the others were slightly misplaced; but there was one—.

Q. All I want to know is this, Captain; do you say that they were or do you say that they weren't?

A. They were.

Q. The others were misplaced?

A. One, to a great extent; I don't know about the others; I didn't put a line on them.

Q. Let's take them up one at a time. In the first place, you got there on the afternoon of the fire, after the Fire Department had gone; is that right?

A. That's right.

Q. And you say the first time you saw the tanks, Number One was misplaced,—out of place; is that right?

A. Yes.—No, Number Two tank was out of place.

Q. How about Number One?

A. Well, comparing Number Two with Number One and Three, Number Two was greatly out of place. I didn't line up all the rest of them.

Q. Did you run a line on any of them?

A. No, I did not. But I run my eye and could see that Number Two was well out of place.

Q. You are sure about that?

A. Pretty sure; it is a long time ago.

Q. You are sure aren't sure, Captain; please tell me what it is.

A. I wouldn't trust my memory; I would trust to the photograph.

Q. I can read photographs with some degree of accuracy; I want your memory. What is it, now?

A. Four years and a half is a long time to remember those details.

Q. Yes, and I appreciate you may be uncertain about a lot of things. Now what is your memory on that?

A. My memory would say, Number Two.

Q. And that Number One was not misplaced?

A. I wouldn't swear to that.

Q. Captain, you really don't know which is which, at this time, do you?

A. I will depend on the photograph.

Q. Well, Captain, I think it is fair to say to you that the Court is going to depend in some measure on the photographs, too; but we would like—I at least would like to have your memory.

A. I will say at least one tank was misplaced.

Q. Which one?

A. I think that was Number Two.

Q. Well we have got two things which you say are evidence of an explosion: One is the bulkheads, and the other is Number Two tank. Is there anything else?

A. No, except hearsay, and I can't quote that.

Q. That is right. What was it that indicated to you that this particular tank was out of place?

A. They didn't line up.

Q. At what point? Are you referring to the place where the valve came through the hole, or at the top or where?

A. No, that shows that it is Number Two tank; the draw-off valve, at the base of the tank, near the base of the tank, is centered in the hole in the bulkhead, and the other three are nearly so, but it is very much out; in fact it was sheared of, that valve, Number Two.

Q. Well did you observe that on the day after the fire?

A. No, two days afterwards. We were busy pumping her out, trying to get Captain *Thomas'* body.

Q. This observation refers to June 27 then?

A. Two days after the fire.

Q. The second day after the fire?

A. I believe so. The diver tried to get them the following day but couldn't find them; we had to pump her out.

Mr. Underwood:
That is all.

Mr. Botts:
That is all.

Mr. Matteson:
That is all I have.

The Court:
Captain let me ask you this question; maybe it is very academic: but assuming that there was a spark from the knife switch.
A. Yes, sir.

The Court:
The position of which in the engineroom was considerably above the engineroom floor; and assuming that there was gasoline vapor confined solely to the bilge of the boat; could that spark have been communicated to the gaseous substance in the bilge?
A. Yes, sir; it has been proven by the laboratory of the New York Fire Department—

Mr. Underwood:
If your Honor please, I hesitate to interrupt.

The Witness:
Isn't this off the record?

The Court:
I just want your idea.

The Witness:
Is this going in?

Mr. Matteson:
Yes, sir.

A. Yes, sir. With the strong gasoline fumes in a bilge, it might be too strong to ignite; but with that mixture of air, and him passing around through there, very probable that he started up the proper mixture, that sparking of a switch made the explosion. That was my opinion, two days afterwards, when I was able to investigate it. If I live to be a hundred years old I will always think that is what started it.

The Court:

You spoke of a possibility of there being gaseous substance in pockets in the bilge?

A. Yes, sir; I mean by that, many boats have web frame, intercostals, which form pockets down below decks.

The Court:

Assuming that the gaseous substance was confined to the pockets and had not been disseminated in the atmosphere, or the air, to which the spark could have had access, that is horizontally in contact with the atmosphere at that point; if the gaseous substance was confined to pockets in the bilge, could there have been any contact between this spark and the gaseous substance in the bilge --in the pocket in the bilge?

A. I don't know as I can explain that, but to my mind the denser gasoline vapors would be against the skin of the ship, and gradually decrease in density, to the top of the engineroom.

The Court:

Well do you assume then that on the theory that gas is heavier than air, and it had in the first place descended to the bottom-most part of either the bilge or the engineroom, to which it had access; is that a correct assumption, according to your ideas now?

A. My idea is that the bilge was full of a strong gasoline mixture, and so was the engineroom.

The Court:

Well let me ask you this; assuming that there was some opening through which gaseous substance could pass from the engineroom to the bilge, would, according to your ideas, and your teaching and learning on this matter of gaseous substance, and where it would locate,—would that gaseous substance go to the bilge and remain in the bilge, to the point that it would not remain in the engineroom?

A. The denser part of it would, your Honor. Gas can only get so dense until it liquefies; and I am of the opinion there was enough gasoline in the entire bilge of that Seminole, that the whole engineroom was a strong gasoline mixture.

The Court:

Well I am speaking about it now from the theoretical standpoint.

A. Well now, I don't know whether this should go in the record, but the night Mr. Botts and Miller and I went up to the hospital—

Mr. Underwood:

I am sorry, I will have to object to that.

The Court:

Don't get into hearsay.

A. I was an eye-witness.

The Court:

That is all right; I want your views from the theoretical standpoint.

A. I believe the whole engineroom—

The Court:

I am not asking you what your views are as to this particular case; I am asking you, from the theoretical

standpoint; that is all I am interested in now; I mean, from my questions to you,—just theory.

A. Have I answered that sufficient?

The Court:

Yes. Would the fact that according to your theory, now, that there could be a denser solution in the bilge, than from a higher portion, to wit, in the engineroom—

A. Yes, sir; you might have—

The Court:

In theory, would that be necessarily brought about by some circulation of air, or some outside influence, that would have brought about that rising of a portion of the more dense solution at the base, to wit, in the bilge, higher in the engineroom?

A. Yes, sir, that is quite right; that boat, even under a shed, in my opinion is insufficient ventilation. I admit that there was some ventilation, if you were to stir that up.

The Court:

I caution you, please, in answering my questions,—I am dealing in my questions to you, from a theoretical standpoint. We have had testimony here based upon hypotheses that there was no circulation. What I am interested in asking you about is, assuming that from a theoretical standpoint it was airtight,—assuming an airtight situation.

A. Then I believe the gas—

The Court:

Then would the dense solution at the base of the compartment, or apartment, wherever gas was confined, would it remain as dense solution until the volume of it had increased to the extent that the space occupied by the dense solution would naturally be increased?

A. Yes, sir, I believe it would.

The Court:

Well I gather then from your answer to my theoretical question, that, assuming that there was no outside influence in the way of circulation of air or heat or convection, or whatever it may be called,—nothing of an outside influence; if there was a denser solution at the base of the apartment or compartment, more so than there was at a higher point in the compartment, it would necessarily be brought about by some outside influence?

A. Yes, sir.

The Court:

Now—

Q. What you mean, your Honor, is some outside influence would have to stir up the thick stuff?

The Court:

That is right.

A. Either mechanical force or ventilation, or draft, or something—yes, sir, that is quite right.

The Court:

Well now is this correct; can you dissociate in your mind the mental picture of the engineroom and the bilge of the Seminole as you have it pictured, as it must have been at the time of the fire, or conflagration, or whatever it was started; but picturing that it was a boat, as distinguished from that particular boat; that it was a vessel, with an engineroom, and with a bilge, and with tanks in which gasoline was kept, in which there was a knife switch. Now from a theoretical standpoint, am I correct in this: that if a spark was emitted from the knife switch on the wall of such a theoretical boat, that either one of these two situations must have existed. That either the gaseous substance which in the first place was heavy enough to descend to the bottom of the available

space,—that either that gaseous substance in its density had increased in volume to the extent that it had arisen to the point even or in proximity to the knife switch; or else that there was a lessening of the density at the bottom, which lessened density had counteracted and gone into the upper portion of the apartment of the boat,—of the vessel, and that therefore according to what you have stated as to outside influences, that there must have been some method of outside influence to have brought about that situation? Now is that a fact?

A. Do you want me to give my opinion?

The Court:

Yes; it seems to me that that is—

A. Either could cause it.

The Court:

Sir?

A. I believe either way, as you describe it, could cause an explosion.

The Court:

Well my thought is that one or the other must have done it. Now am I correct in that?

A. Yes, sir; I am inclined to think that the first thing happened.

The Court:

I am not asking you, Captain, which in your opinion did happen; I am asking you, from a theoretical standpoint, is it a fact that one of those conditions must have existed?

A. Yes, sir, that is quite right.

The Court:

Now to go over that again; either the dense solution must have increased in volume sufficiently to have ele-

vated in the open apartment, to have occupied continually more space as its volume increased?

A. And richer.

The Court:

And richer; or else if it was a fact, in this theoretical case, that was a more dense solution at the base, as compared with a like solution at the top,—that that condition, of a more dense situation at the bottom, compared with the lighter solution at the top, was brought about by some outside influence?

A. Yes, sir.

The Court:

That is all I care to ask.

By Mr. Botts:

Q. In other words, as I understand it, Captain, if the air in the surface,—I mean in the bilge of this—and not the Seminole, but of any vessel, any boat, if it remained calm and stationary, without motion, then the heavier gas—

A. You said, air, Mr. Botts?

Q. All right, if the contents of the vessel was not being agitated in any way, whether it was gas or air, and there was in that an explosive mixture of gasoline and air, when it rose to the point equal to the knife switch, if the knife switch emitted a spark, it would explode?

A. Correct.

Q. So as I understand it, if there was this explosive mixture down in the—

A. Bilge.

Q. In the bilge of the vessel, and had risen to a constant level—

A. In other words, built up.

Q. Equal with that of the knife switch, that some current of air might have caused a swirl of air to come up and explode it, is that correct?

A. That's right.

Mr. Botts:

That is all.

By Mr. Underwood:

Q. Captain Patton, Mr. Matteson has said that I might use these photographs of his. Is that one that you took?

A. Yes, I took that.

Q. You took it on July 31, 1935?

A. That's right.

Q. And it is a photograph of the draw-off valve?

A. That's the same.

Q. I show you another one; did you take that?

A. Yes, sir.

Q. July 31, 1935?

A. That's right.

Q. And that's a photograph—

A. Of these fittings down here.

Q. Two of these fittings?

A. Do you want a copy of these?

Q. No, not these, it is the other. Where did you take these photographs, Captain?

A. This is an old bedspread hanging on to the side of my car, or the window of the car. That was in Coral Gables it was taken.

Q. These were taken out in Coral Gables?

A. Yes.

Q. At your house?

A. Yes, sir.

Q. Did you just get the fittings out of your house and hang them up on the back of your car?

A. I didn't get them out of the house.

Q. Where did you get them?

A. Let's see; I think I got them from Mr. Miller.

Q. Gary Miller? You mean you got them from him just before you took them?

A. Yes, sir, shortly.

Q. Within a day or two?

A. Yes; I didn't keep them out there, I didn't want them.

Q. I just want to get it straight, Captain. You got these contrivances that are shown in these two photographs, a day or two before July 31, 1935, from Mr. Gary Miller of Fort Lauderdale?

A. I believe that's right, yes, sir.

Mr. Underwood:

I offer those two exhibits.

Mr. Botts:

No objection so far as I am concerned.

Mr. Matteson:

No objection.

The Court:

They will be admitted.

Mr. Underwood:

The first one is a photograph of Exhibit 11.

(The said photograph was admitted in evidence and filed as Respondents' Exhibit 5-T.)

Mr. Underwood:

The next is a photograph of Exhibits Numbers 2 and 17.

(The said photograph was admitted in evidence and filed as Respondents' Exhibit 5-U.)

Mr. Underwood:
I have no more questions.

Mr. Matteson:
That is all.

(Witness excused.)

Mr. Botts:
Before I forget it, I would like to offer in evidence these two exhibits that have been marked 13 and 14 for identification, and concerning which the stipulation with reference to testimony was offered yesterday. Any objection to these, Mr. Underwood? I am just offering these in evidence now that we have that stipulation yesterday afternoon; 13 and 14 in evidence, instead of for identification.

(The said two exhibits were admitted in evidence and filed as Pilkington's Exhibit Numbers 13 and 14, in evidence, respectively.)

3983 Thereupon EDWARD S. THIBAULT as a witness on behalf of Libelants' in rebuttal, was sworn, and testified as follows:

Direct Examination.

By Mr. Matteson:
Q. What is your full name?
A. Edward S. Thibault.
Q. Where do you live?
A. Miami.
Q. And how long have you lived here?
A. Since '22.

Q. What is your business, Mr. Thibault?

A. Ship builder.

Q. In 1927, where were you employed?

A. I was superintendent of Merrill-Stevens Dry Dock Company.

Q. Have you lived here continuously since that time?

A. Yes.

Q. As superintendent of Merrill-Stevens shipyard at that time, what was your duty,—what were your duties?

A. Why I run the yard; in every capacity except the office; in charge of all construction.

Q. Repair work?

A. Repair work.

Q. Do you recall the yacht Seminole?

A. Yes.

Q. Being at the Merrill-Stevens yard, the latter part of 1927?

A. Yes.

Q. Was she also there earlier in the year, do you remember?

A. Yes, in the spring—some time in the spring.

Q. Now particularly with reference to the work that was done the latter part of the year, can you tell us what the nature of that work was?

A. Renewing shell plating, bottom shell plating, side shell plating.

Q. At that time—who was in charge of the work on the Seminole?

A. I was in direct charge, with the foremen of the different classes of work.

Q. Mr. Thibault, in connection with that work that was done at your yard, were the gasoline tanks removed from the Seminole at any time?

A. No.

Q. Was any work done on the gasoline tanks of the Seminole?

A. I don't think so.

Q. Was the side plating removed from the ship?

A. No, sir.

Q. You spoke of renewing bottom plating. What part of the ship were the bottom plating renewed?

A. When we started out, we started to remove the bottom plating on the after end of the ship, under the engineroom and back there; and when we got out we found we had to renew practically the whole bottom.

Q. Afterwards there was some done in the forward part of the too, you say?

A. Oh yes.

Q. Were the floor frames,—were the floors and frames under the engineroom and the tank compartment forward of the engineroom, removed at any time?

A. Why forward of the engineroom,—forward of the main window, where the water tanks was, we did renew some pieces of frames; but not in the after part of the boat at all.

Q. Was any work of that character done in the space under the tank compartment, or in the engineroom?

A. No.

Q. What was done with respect to the side plating of the Seminole?

A. Why we originally was going to renew the guard irons, some of the guard bars; and after we got them off, the top of a sheer strake was bad in spots, so we made it double, put another plate right on top of it; made good connections and put a guard bar on.

Q. Was that side plating that was covered with new plating,—was that removed at all?

A. The old plating was not removed.

Q. Was the bulkhead between the engineroom and the tank compartment, removed?

A. No.

Q. Were the engines taken out of the—main engines taken out of the engineroom?

A. No.

Q. Was any work done on the fuel piping in the engine-room?

A. Not that I recall, that there was anything done with that piping.

The Court:

Was she a coal or gasoline boat at that time? Was she a coal burner at that time?

Mr. Matteson:

Gasoline.

Mr. Thompson:

1922, your Honor, it is in evidence she was changed.

Mr. Matteson:

This is 1927 we are talking about.

Q. Was any electrical work done in the ship?

A. We might have done a little, but I don't remember what it was. I don't think any great amount.

The Court:

The witness spoke just now about water tanks. Are you referring now,—did you mean the gasoline tanks, when you said just now, water tanks?

A. No, sir, I meant water tanks.

The Court:

Where were those tanks?

A. In the forward part of the boat.

(By Mr. Matteson):

Q. What was done in respect to the water tanks?

A. Why after we got the plate off the bottom we found there was stops of the frame that was bad; and to get

in there to do the renewing, to renew the plate, we had to juggle the tanks around in there, move them from place to place so we could work.

Q. You say some repairing was done on the frames there?

A. Some slight, on a few frames; put in a few patches.

Q. The space where these water tanks were, was that forward of the space where the gasoline tanks were?

A. Yes, it was forward.

Q. Were the big cylindrical gasoline tanks of the Seminole taken out of the boat at that time?

A. No, they weren't taken out.

Q. Were the water tanks taken out?

A. No.

Q. Just moved around?

A. Just juggled them around so we could work around them, underneath.

Q. There has been a suggestion, Mr. Thibault, that the gasoline tanks were taken out and laid on the ways beside the ship, and that the bottoms of at least two of them were taken out and replaced. Will you tell us the fact with respect to that?

A. No, we didn't take them out or do any work on them.

Mr. Botts:

Will you read the answer?

(The answer was read by the reporter.)

(By Mr. Matteson):

Q. Was there any work done in the way of raising the level at which the gasoline tanks of the Seminole stood at that time?

A. No.

Q. Now Mr. Thibault it has been suggested that Merrill-Stevens did not keep any proper or accurate record

of the time of the men employed on that job, or what they did. Will you tell us what records were kept at that time?

Mr. Underwood:
We object to that on the ground that the records are the best evidence.

Mr. Botts:
We are not asking the contents of the records.

The Court:
Overrule the objection.

A. Go ahead?
Q. Yes, go ahead and tell us what the records were.
A. We had a system there of daily time slips for each man.

Mr. Underwood:
I object to the system; the question goes to the records kept on this particular job.

Mr. Matteson:
I think we are entitled to describe the system.

Mr. Underwood:
I don't think so.

The Court:
You would have to tie it up.

Mr. Matteson:
Yes, we are going to tie everything up as far as it can be.

Q. Well let's confine it to this particular job, Captain. Will you tell us what system you had with respect to keeping time and records of the work done on that job?

A. Each man made out a daily time slip, with the description of the job that he was doing, and the time that he spent on that job. His foreman that was directly over him took the time slips each night, went over them; if he found any discrepancies he would straighten it up with the man; and they were turned into my office and I went over them. If there was any notations on any of them slips, there was any question about it, it was straightened up before it went into the Accounting Department; and by ten o'clock the inspector on the job got a copy of the previous day's work,—time and materials, storeroom slips and so on; so if there was any question about these things, they was there to catch it.. And if they were all right, there was no question about them, he okayed the slips, and he kept one copy, the other copy went into the office. And as I understand it, the bills was made up from them daily time slips.

Mr. Underwood:

I object to what he understands as to how the bills were made up, and move to strike it out.

The Court:

You mean to say Mr. Thibault that that was actually done, or what you understood was done?

A. It was done; there is no question about that. It was done.

The Court:

You are not just describing the system, but what was done on the Seminole job?

A. The bill was made up from them daily reports.

The Court:
Overrule the objection.

(By Mr. Matteson):
Q. Now to whom did you refer when you said, inspector?
A. Captain Nelson, the owner's representative on the job.

The Court:
Wait a minute, read that answer.

(The answer was read by the reporter.)

(By Mr. Matteson):
Q. You said something about at ten o'clock, the records was ready for the owner's representative; what did you mean by that?

Mr. Botts:
He said by ten o'clock.
A. We tried to have them,—the office tried to have them out by ten o'clock, so that they would know what time to go into the office to get them; and if they didn't get in there shortly, they were hunted up and handed a copy of it.
Q. Ten o'clock, what day?
A. Every day, of the previous day's work.
Q. I show you these documents, comprising Exhibit 4-L. I think you have seen those before?
A. Well I don't know whether I have seen them before or not. If there wasn't any question, these bills would never come to me. These originals was made up—
Q. I am not referring to the system at the time. Have you seen these before, these particular papers, before this minute, do you recall?
A. No, I don't.

Mr. Underwood:

Referring to Exhibit 4-L.

Q. Well then, will you look at them and tell us what they are?

A. These are copies of our daily time slips; the hours, daily time of each man, independent. When they make up these bills, they take it, if it is carpenters, two carpenters or four carpenters or five carpenters, they would take the total time and put it on the bill; otherwise it would be too long, to bill each individual man on the bill.

Q. Now Mr. Thibault are those the bills representing the work that was done on the Seminole in the latter part of 1927, beginning June 20th?

A. Well we hauled that boat out first for a survey, originally, in the spring some time; I don't know whether it was April or May, somewhere along there; and we made a survey and ordered materials. Then the boat didn't come until the latter part of the summer; August I guess—or September. It says here, August 25th hauled out.

Q. Mr. Thibault I call your attention to the fact that as you go through these bills, under the labor charges, where you have, classification of labor, such as carpenters, helpers, electricians, boilermakers, or what not, in practically every case there is after the labor charge, a statement evidently—for instance the word, staging, after carpenters; what does that indicate?

A. Well that is building staging; that there would be staging, building staging to do the work on.

Q. Did these designations indicate the kind of work on which the men were engaged during the time for which the charge is made?

A. For that day, yes.

Q. Well taking these bills as a whole, do the designations placed on the labor charges in the bill, correctly show the work that was done by the men?

A. Absolutely.

Q. Now it has been suggested Mr. Thibault on this particular job, Merrill-Stevens had no supervision of the men, but simply assigned a certain number of men to Captain Nelson, and that the work of the men was done under the direction of Captain Nelson. Will you tell us what the fact is with respect to that?

A. The work was done under my supervision. I didn't see every rivet that was driven or every hole that was drilled or every nail that was driven. We had foremen on the job, and while Captain Nelson was the owner's representative, and inspector on the job, we done the work and put in the kind of plates that he designated. As far as having direct charge of the men, Captain Nelson didn't have any direct charge of the men.

Q. And who kept the records of what the men were doing?

A. Why as I say, we kept them ourselves, made up these daily time slips, and gave Captain Nelson a copy of them every morning.

Q. Are you still connected with Merrill-Stevens?

A. No.

Q. When did you sever your connection with them?

A. The spring of '34.

Q. Do you know where the original records from which these bills were made up, are now? Do you know?

A. No, I do not.

Q. Mr. Thibault, if the Seminole tanks,—if the gasoline tanks of the Seminole had been removed from the vessel and deposited on the slipway, and was later restored to the vessel, would there have been any charges that Merrill-Stevens would have made for that work, that would have appeared on the bill?

A. Absolutely.

Q. What sort of charges?

A. Well, charges the same as on this other one. Charges for hoisting, if we had had to remove plates or frames to get them in, it would have been mentioned. If we did move them out, there would have been charges for steaming,—freeing from gas, which we had no facilities for doing; we would have had to send them out. We didn't have steam enough to do it.

Q. You would have had to send the tanks somewhere else?

A. Somewhere where they had a steam plant, to steam them.

Q. Would there be any charges for transportation of the tanks?

A. Absolutely.

Q. Would there be any charges for steaming the tanks?

A. Absolutely, there would.

Q. About steaming the tanks, what does that amount to?

A. Well they say that clears them.

Q. I mean, how long do they have to be steamed?

A. Well, that is problematical, I guess.

Q. What was the usual practice?

A. I have never seen any that were steamed out that I thought was absolutely safe to put fire around them.

Q. Well is that the usual method of freeing them for work?

A. I think so, yes.

Q. Do you know how long it takes to steam them?

A. No, I couldn't say.

Q. Do you remember Mr. Simmon?

A. I believe I have seen him, I don't know that I ever spoke to the man in my life. I have heard of him.

Q. Could the gasoline tanks have been removed from the Seminole, through the side or bottom of the vessel, while on the ways, without the side plating or the floor frames or plates being removed?

A. No, sir, they could not.

Q. Would it have been practical to have removed them through the bottom of the vessel?

A. No.

Q. On the ways?

A. No.

Q. Why not?

A. After you got them down you had no place to get them out.

Q. You mean the vessel—

A. The keel of the vessel was not over 4½,—between 4½ and 5 feet off the ground, in the first place.

Q. And there wasn't room?

A. The railway was there in the road.

Q. Were any trays made to be placed under the tanks of the Seminole?

A. No, sir.

Q. Were there any trays placed under the tanks of the Seminole?

A. No, not at Merrill-Stevens at that time.

Q. Would it have been possible to place trays under the tanks of the Seminole without first removing the tanks?

A. I don't think so.

Q. Can you give us any idea with respect to the relative cost of removing bottoms of the tanks of the Seminole and testing—examining the tanks and placing them back and re-riveting them,—the necessary incidental expenses that would be involved, as compared with the cost of new tanks?

A. Well even if you placed new tanks, you would have to go through the same procedure to take the old ones out.

Q. Without the procedure for taking them in or out, of course you would have that; but including the expense of steaming, and taking rivets out, re-riveting them, whatever was needed in them, could you give us any idea of the relative cost of that operation as against the cost of new tanks?

A. No, I don't know that I can.

Q. Do you remember whether there were any zinc plates placed on the Seminole at that time?

A. Yes, sir.

Q. Can you give us any idea of the number of them?

A. No, I don't know as I know the number of them. There was plenty of them placed around the struts and the shaft logs and over the shafting between the shaft log and the struts; and over the wheel.

Mr. Underwood:

I am sorry, I can't hear you Mr. Thibault.

A. I say, there was plenty of them placed over the wheels and on the struts and on the shaft log, that project from the hull that the shaft came through; both sides of the boat, you know; it was a twin-screw.

Q. Were they placed at any other parts of the ship that you recall?

A. No, I don't.

Q. If the rivets were taken out of the bottom of the tank, and then the bottom of the tank were replaced and re-riveted, can you tell us whether or not the same sized rivets would be used?

A. No, sir, they would have to be larger rivets.

Q. Have to be a larger rivet?

A. Reamed for larger rivets.

Q. Why would that be?

A. Well most of the holes, when you drive a rivet, a hot rivet into a hole, you swell your material enough that when you drive that cold rivet out of there you de-

face that hole more or less; so you would have to ream them and use a larger size rivet.

Q. Were you at one time employed by the Gibbs Gas Engine & Power Company?.

A. Yes.

Q. Did you have something to do with the construction of the Fortuna?

A. Yes.

Q. What did you have to do with that?

A. Well I was superintendent of construction at that time,—Gibbs Gas Engine Company.

Q. Do you remember the type of gasoline tanks that were placed in her?

A. They were brazed steel tanks, called the Jennie Steinway.

Q. Were they cylindrical tanks?

A. Yes.

Q. And they were galvanized, do you remember?

A. I don't remember.

Q. Did you afterward have something to do with the building of the Fortuna?

A. Yes, I lengthened her out, here in Miami; about seven feet on the after end.

Q. When was that?

A. '25 I think; fall of '25.

Q. Was any change made in her gasoline tanks at that time?

A. No, sir.

Mr. Underwood:

I didn't hear an answer to that last question.

(The last question and answer were read by the reporter.)

Q. Did the alterations affect the part of the boat where the gasoline tanks were?

A. No.

Q. Gasoline tanks were not disturbed?
A. Not disturbed.

Mr. Matteson:
That's all.

Cross Examination.

By Mr. Botts:
Q. Mr. Thibault, will you tell us what is the nature and extent of your experience as a shipbuilder?
A. Well I have been at it over 50 years.
Q. And where did you get your early experience?
A. I learned my trade as a ship carpenter in Marine City, Michigan, in the Wm. B. Marley plant.
Q. And have you ever worked for any of the larger ship-building companies?
A. Oh, yes; I worked for several of the Lake companies; worked for Wm. Kraft & Sons.
Q. Philadelphia?
A. Yes.
Q. How long did you work for them?
A. Oh, about three years, during the Spanish-American War, and after.
Q. What kind of work did you do?
A. At that time I had charge of the lining; that is what they call the lining; that is laying out shell plating; lining out plates for the shell plating.
Q. You were in capacity as a foreman or superintendent of that work?
A. Not superintendent; they used to call us "five-eighters" in those days.
Q. Did you do any loft work?
A. Oh, yes.
Q. What do you mean by that?
A. Well that is taking the architects' drawings and offset of of the vessel to be constructed, and reproduc-

ing them full size for getting out the shapes, forms and so on.

Q. Now then you stated that you worked for the Gibbs Gas Engine Company and for Merrill-Stevens in Miami. Did you ever work for any of the other boat building or drydock companies in Florida?

A. In Florida?

Q. Yes.

A. No.

Q. Didn't you work for Merrill-Stevens in Jacksonville at one time?

A. I worked at Jacksonville, but that is all the same company.

Q. But I distinguish between Miami and Jacksonville. How long did you work for Merrill-Stevens in Jacksonville?

A. I came down to Jacksonville in the fall of 1906, and finished up their drydock, and I stayed with them,—I was to stay with them two years, but I stayed nearly three; then I went into a little boat building place of my own.

Q. Operated your own establishment over in South Jacksonville?.

A. Yes, I operated that until the war came on, then the Shipping Board came in there and took everything I had,—my machinery and my lumber and my men. I was doing all the essential work,—yacht work; and then that is what I hooked up with the Gibbs Gas Engine Company.

Q. Well you have been in the ship building and boat building and repair, for over 50 years you say?

A. Over 50 years.

Mr. Botts:

That is all.

By Mr. Matteson:

Q. Are you employed by anyone now?

A. I am working on my own hook now.

Q. Doing ship building?

A. Boat work.

By Mr. Botts:

Q. Trying to get back to where you were before the Government caught you?

A. Yes.

Mr. Anderson:

That is a long way off.

By Mr. Matteson:

Q. Just one more question, Mr. Thibault. Would it have been possible to have done work on these tanks on the ways alongside of the Seminole?

A. No, sir.

Q. Why not?

A. Wasn't any room on the ways. Another thing, we wouldn't monkey around with gas tanks close to where men was working.

Mr. Matteson:

That is all.

(Thereupon the hearing was recessed until 1:45 o'clock P. M. of the same day.)

Friday, November 17, 1939, 1:50 o'clock P. M.

Hearing was reconvened pursuant to the noon recess, and the witness THIBAULT resumed the stand and further testified as follows:

Thereupon:

Cross Examination.

By Mr. Underwood:

Q. Mr. Thibault, how do you happen to be here today?

A. Why, Mr. Matteson over there asked me to come.

Q. When did you make his acquaintance?

A. Oh, some time about a month ago.

Q. Who introduced you to him?

A. Captain Patton.

Q. When did you meet Captain Patton?

A. Oh, I have known Captain Patton for several years, I don't know just how long.

Q. When did you first talk to Captain Patton about this case?

A. About a month ago, when he asked me.

Q. Have you seen any of the records of the Merrill-Stevens Company with reference to the work that was done?

A. When?

Q. Since 1927.

A. No, only I have seen them here this morning.

The Court:

Talk a little louder.

A. Only that I seen here this morning.

Q. Referring to this batch of bills?

A. Yes.

Q. Exhibit 4-L and perhaps this little batch of bills?

A. Yes, I imagine.

Q. Exhibit 4-M. Now you looked at these for about five minutes this morning, didn't you?

A. That is all.

Q. And that is the first time you have seen those bills since 1927, is it?

A. I don't even know whether I have seen them in 1927.

Q. At any rate, if you did see them in 1927, you didn't see them until this morning?

A. Not until this morning.

Q. It was in August of 1927 the Seminole was hauled out on the marine railway, was it?

A. It was the latter part of the summer, some time.

Q. And it was on the marine railway, and not a drydock; is that right?

A. Railway drydock.

Q. But she wasn't in a proper drydock, was she?

A. It is a railway drydock; that is a proper drydock, a railway drydock.

Q. You mean, it is a combination?

A. There is three kinds of drydocks; a graving dock, floating drydock, and a railway drydock.

Q. Suppose you tell us what this was?

A. This is a carriage that works on rollers, that rolls down in the water and floats the boat on it; then pull her up out of the water.

Q. You mean that she is placed on the carriage of the railway while afloat in the water?

A. Yes.

Q. And then she is hauled out?

A. She is hauled out, cradle and all.

Q. There isn't any structure out of which the water is pumped?

A. No.

Q. Such as in a, strictly speaking, drydock?

A. No.

Q. How many such marine railways were there at that time?

A. Two.

Q. Were they side by side?

A. No.

Q. How far apart were they?

A. Oh, I imagine the number one railway at that time was four or five hundred feet from number two; but at the same time they were digging a slip for number three railway next to this number two.

Q. Which marine railway was the Seminole on?

A. Number two.

Q. Do you remember how long she was on the marine railway, out of the water?

A. Oh, I imagine she was out there eight or nine weeks.

Q. You did quite a lot of steel work on her, didn't you?

A. Yes, sir, we did.

Q. I think you said that included the bottom and side shell plating, is that right?

A. Bottom and sheer strake shell plating, yes, sir.

Q. Suppose you tell us just how far up,—start at the keel and go up; how far up did you work?

A. Came up from the bottom to the turn of the bilge where places were bad; and then the sheer strake, which is the top strake on the boat; the top strake and the main hull structure.

Q. Is it your recollection that you took off any plates below the sheer strake and above the bilge?

A. No, took none,—removed none of them.

Q. You mean your recollection is that you didn't remove any of those?

A. Absolutely.

Q. Quite clear about that?

A. Quite clear.

Q. Have you refreshed your recollection from looking at any other papers of any kind?

A. No.

Q. And you are not at all clear that you ever saw these bills before, is that right?

A. No, sir.

Q. You now have no recollection of ever seeing them?

A. No, I can't say that I have.

Q. How many men were employed in Merrill-Stevens plant, approximately, during the late summer and fall of 1927?

A. Oh, we probably had between 50 and 60.

Q. And how many jobs besides the Seminole were done between August and through the balance of that year?

A. I don't remember that.

Q. That was the busy season for your business out there then, wasn't it?

A. At that same time we were building them steel sheds, and also building number three railway.

Q. Have you any idea now what other jobs were in the yard at that time?

A. No, I couldn't remember.

Q. Can you remember the name of any other vessel that you worked on at that time, during that interval?

A. Not unless someone called my attention to it.

Q. What was the shape of these tanks that you worked on in the Seminole?

A. Cylinder tanks, water tanks. We didn't work on any gasoline.

Q. You say they were cylindrical tanks?

A. Yes.

Q. Sure about that?

A. I am almost positive of it, yes.

Q. Have you any recollection as to what their capacity was?

A. No.

Q. What did you do to them?

A. I didn't do anything to them but take the piping away so we could work around them, to get at the rivets and the shell plating.

Q. Where were they?

A. Under the cabin floor and the forward end of the boat.

Q. Did you do any work on the top side at all?

A. Yes, we put a double strake and new guard irons, new guard bars.

Q. Apart from the steel work now on the passenger's or crew's quarters, or on the deckhouse?

A. Yes, I believe we did do some general work all over, around in different parts of the boat.

Q. Do you remember what that was?

A. No, I can't remember the details of it.

Q. Did you do any work on the anchor or the anchor chain?

A. Possibly, I don't know.

Q. Do you remember that?

A. I don't remember that, no; I wouldn't remember that little item.

Q. Draw the tail-shafts?

A. I wouldn't swear to that.

Q. Don't remember that. What was the deckhead of the engineroom constructed of?

A. The what?

Q. The deckhead of the engineroom. The deckhead; do you know what that means?

A. I don't know what you mean.

Q. Well what was the roof of the engineroom constructed of?

A. I guess that was a wooden deck, I believe.

Q. Is that your recollection?

A. Yes; may have been steel beams.

Q. Were you in the tank compartment where the gasoline tanks were?

A. No.

Q. Do you know what the roof of that compartment was constructed of?

A. No.

Q. Do you know what was situated above the engineroom?

A. Nothing I believe except there had been a skylight sometime or other, over the engineroom; just an open deck.

Q. You mean there had once been a skylight there but there was no skylight at that time?

A. I believe when she was steam, there was a skylight there.

Q. But at the time you were in her, there wasn't any skylight?

A. Not that I remember.

Q. What was above the tank compartment?

A. The Captain's stateroom.

Q. You remember that?

A. Yes.

Q. Did Nelson live on the boat while you were working on her?

A. Several men on the boat; whether they stayed there night and day, or not, I don't know. They were on the boat in the day.

Q. What other steel work did you do besides steel plating?

A. Why we patched up some frames, renewed some bad frames in the forward end of the boat; put new guard bars around her on the top strake. That is all the steel work we done. I think we done a little rail stanchion work; maybe a little general repairs, and something like that. I wouldn't remember them little items.

Q. You say you patched up some frames?

A. Yes, forward.

Q. Do you remember which frames those were?

A. I don't remember which ones, but they were in the forward part of the boat, under the water tanks.

Q. Under the water tanks?

A. Under the water.

Q. Do you remember whether you patched up any frames any place else?

A. No, I don't.

Q. Sure about that?

A. Absolutely.

Q. How long since you have been employed by Merrill-Stevens?

A. I left the spring of '34.

Q. What was the occasion of that?

A. Well I just left, I just wanted to change.

Q. What have you been doing since that time, Mr. Thibault?

A. Well part of the time I wasn't doing anything particular; part of the time working on my own hook.

Q. What are you doing now?

A. Rebuilding a boat.

Q. Whose boat?

A. Belongs to Peters; 60-foot sight-seeing boat.

Q. Do you have a plant of your own now?

A. No, I rent space in Nuta's yacht basin.

Q. Where?

A. Nuta's yacht basin.

Q. How old are you Mr. Thibault?

A. Seventy,—past.

Q. I would like to have it a little clearer, just what your job was at Merrill-Stevens in 1927.

A. Well I was General Superintendent in charge of all operations in the yard.

Q. Were you in charge of the construction work that was going on for Merrill-Stevens as well as the repair of vessels?

A. You mean, construction work in the yard?

Q. Yes.

A. No, not in charge of it so much, except seeing that they were doing it according to contract, that's all.

Q. Was that your job?

A. Absolutely.

Q. Was your job to see that number three marine railway which was being constructed then—

A. Absolutely.

Q. —was constructed according to the plans?

A. According to my plans that I made myself.

Q. What was this other job that was going on?

A. Building them steel sheds.

Q. Was it your job at that time to see that they were properly constructed?

A. Absolutely.

Q. How many sheds were there?

A. Well there was about 56,000 square feet under coyer down there. They are practically all connected; they run different sheds, but they are all under one roof.

Q. All steel framework?

A. All steel.

Q. You inspected those things every day, did you?

A. Absolutely. Put in our own foundations, contracted for, the erection of the building.

Q. Now did you have occasion during that summer and fall to do work on other boats besides the Seminole?

A. Oh, I believe we did. We always was doing work on other boats.

Q. Some of them would be afloat I suppose?

A. Some afloat, some in dry storage, some in wet storage.

Q. You did work on vessels that were afloat, as well as vessels that were dry?

A. Oh, yes.

Q. Were you personally in charge of all the work that was done on all those vessels, too?

A. I was the General Superintendent. I didn't see every nail that was driven or every hole that was bored or every rivet that was put in; that was an impossibility.

Q. Were the gasoline tanks taken out of any other boat between the first of August and the end of December, 1927?

A. No; no gasoline tanks were taken out of any boat, no.

Q. Did you ever take a gasoline tank out of a boat?

A. Yes.

Q. Quite sure you didn't do it that year?

A. No; I took a gasoline tank out of a boat this year.

Q. Well I am thinking about 1927 Mr. Thibault. Quite sure you didn't take a gasoline tank out of any boat at all in that year?

A. Not that I can remember. There might have been some little boat there that had a five or ten or a fifteen gallon tank that came out; I wouldn't pay much attention to that.

Q. Then you might have taken a gasoline tank out of some boat?

A. We might have.

Q. You don't remember whether you did or not, is that right?

A. I don't know.

Q. I suppose you were around the yard every day?

A. Every day.

Q. All day, every day?

A. No, I can't say that I was right in the yard all day every day, but I was in the yard most of the time every day.

Q. Did you inspect every job every day?

A. Absolutely.

Q. No question about that?

A. No question about that.

Q. Who was the foreman that you spoke of this morning?

A. Well we had a gang of the iron workers from Jacksonville; a man by the name of Reinahan was fore-

man of that crowd. Then we had A. R. Saruis that was foreman of the carpenter gang,—laborers.

Q. Do you have only one gang of iron workers?

A. Well, what do you call a gang?

Q. Well, whatever the terms are.

A. A gang can consist of two men or it can consist of fifty men.

Q. Well you had one foreman for the steel work, did you?

A. One foreman for the steel worker's, yes.

Q. And you might have had several gangs working under him?

A. We had two or three gangs of riveters, and we had lay-out platers, that lay out the plates, and fellows to punch the holes, and so on.

Q. Then if steel work was going on elsewhere than on the Seminole, one foreman would have charge of the Seminole and the other work too?

A. No.

Q. That is not right. Well what is right? You tell me.

A. Well if we had other jobs of steel work going on, there would be another foreman on the job.

Q. Did you have more than one foreman there that fall?

A. That is all the steel work we done.

Q. From the first of August until the end of December, is that right?

A. Yes.

Q. What was his name?

A. Callahan, or Reinahan; he come out of the Jacksonville yards; they sent the steel working crowd down here from Jacksonville.

Q. Where is he now, do you know?

A. I suppose, in Jacksonville, I imagine.

Q. Now you say these men kept their own time?

A. No, sir, I didn't say they kept their own time. They made out their own time slip, submitted it to their foreman.

Q. That would be Callahan, or whatever his name was?

A. Whoever he was; and they checked them over, and they were returned to me.

Q. Every day?

A. Every day.

Q. Now is that the ordinary routine you are talking about?

A. Absolutely that is the ordinary routine, every day.

Q. What was the routine on the Seminole, do you remember that?

A. The same as that, exactly, every day.

Q. Sure about that?

A. Absolutely.

Q. And do you mean that you would look them over every day?

A. Absolutely.

Q. Every time slip in the yard?

A. Every time slip in the yard went through my hands before it went into the office.

Q. What were the working hours there at that time?

A. Eight hours a day.

Q. What time did that start and stop?

A. From eight to twelve, twelve-thirty to four-thirty.

Q. Four-thirty you would get all these cards?

A. Yes; I would get them at four-thirty, no, it would be about five o'clock. Lots of times I wouldn't get through with them until eight o'clock the next morning, because I didn't have that kind of hours; I went to work at seven o'clock.

Q. You looked over every time card?

A. Every one.

Q. And what did you do with them?

A. After I satisfied myself they were all okay, they were turned into the office.

Q. Okay in what respect?

A. That the times were right, and the charge to the right job, that particular part of the job.

Q. What do these time cards look like?

A. They are printed slips, with the location for a man's time,—his straight time and overtime, and so on, on it; a place for a description of the work that he worked on, and a place for the number of hours.

Q. You indicate a slip about eight inches high?

A. No, I imagine they were about 4½ x 7.

Q. Four and a half by seven?

A. Something like that.

Q. A man had his name on there?

A. Absolutely, it had a name, a job that he worked on.

Q. The name of the boat or boats that he might work on that day?

A. Name of the boat.

Q. The number of hours on each?

A. Yes.

Q. What else?

A. Wasn't anything else for him to put on.

Q. Now the foreman, what did he put on? Anything at all besides his okay?

A. Foreman looked over them and okayed them, and if there was anything they couldn't agree, he made a notation on that time slip.

Q. In the ordinary course he wouldn't put on anything but his okay, unless there was some discrepancy?

A. If he was satisfied they were all right, he okayed them; if not, there was a notation made on that particular slip; and I took it and the next morning we cleared it up.

Q. The ones there was a dispute about, you looked at?

A. I looked at them all and had to okay them.

Q. You had to put your okay on every one?

A. Every one.

Q. How many would there be in the course of a day?

A. According to the number of men.

Q. Well how many?

A. Well we would have anywhere—

Mr. Botts:

At what day are you talking about? Fix a day.

(By Mr. Underwood):

Q. Can you fix a day?

A. Certain date? No.

Q. Well what would an average day be? How many time slips?

A. How many time slips? Probably about fifty.

Q. The Superintendent of the yard looked at every one?

A. Absolutely every one of them.

Q. What did you do with them?

A. I turned them into the office; that is what they made the bills out by.

Q. Did you ever see them again?

A. Not necessarily.

Q. Did you have anything to do with the making up of the bills?

A. No, nothing in the world.

Q. You never have been in the Accounting Department, have you?

A. What?

Q. You have never been a part of the Accounting Department, have you?

A. No.

Q. I still don't quite understand the purpose of your putting your okay on these daily time slips. Were you in a position to check each slip as to the number of hours each man put on each job? Were you?

A. Absolutely.

Q. That is to say, if John Jones, carpenter, put down eight hours on the Susie Bell, and his time slip came to you for your okay, you would know whether he had put eight hours on the Susie Bell?

A. I would absolutely know if that carpenter had eight hours on the Susie Bell; I would absolutely know it.

Q. And you would know it from what?

A. From my own experience, and knowing how to take care of the men.

Q. If you had fifty men in the yard working on a particular day, whose time slips you looked over, you would know of your own knowledge when you came to check over those time slips, how many hours each man had put on each job?

A. If I wasn't satisfied—

Q. Is that right?

A. Just wait a minute.

Q. Well I am not asking you about, if you are satisfied. Will you read him the question, please?

Mr. Matteson:

If your Honor please, I think the witness is entitled to answer it and make his explanation.

Mr. Underwood:

Well, to answer it, certainly; but he hasn't answered it.

Mr. Botts:

You didn't give him a chance to answer it.

Mr. Underwood:

He wasn't answering.

The Court:

Will you read the question?

(The last question was read by the reporter.)

A. Can I answer that in my own way?

The Court:
Yes, sir.

A. If I had any doubt, in running over them time slips, if there was any doubt in my mind, then I took that time slip, went to that man's foreman and that man, and we got it straightened out right then before it was okayed.

(By Mr. Underwood):
Q. Well I am afraid you haven't quite understood my question, Mr. Thibault. Suppose you had fifty men working in the yard on a particular day, one of them was John Jones, a carpenter, and he was working on the Susie Bell. At the close of that day would you get a time slip from him which says, "John Jones, Carpenter, Susie Bell, eight hours"? Would you know of your own knowledge that he had spent eight hours on the Susie Bell?
A. Sure.
Q. Would you remember, at the close of each day, what time he checked in the morning and what time he checked out at night?
A. Just a certain time he had to check in; he couldn't check in any other time.
Q. Suppose he put six hours on the Susie Bell and two hours on some other boat, on his time slip, would you know of your own knowledge what time he left the one and went to the other?
A. I expect I would, because I would be the fellow that would assign him to the job.
Q. It wouldn't be the foreman?
A. Not on jobs like that; I did that myself.
Q. So you want us to understand, do you, that at the close of each day, you would know how many hours each man in the yard had spent on each job?

A. After checking up his time slips, yes.

Q. Well, only after checking up his time slips?

A. Sure.

Q. Do you remember how much of the bottom plating you renewed?

A. No, I don't remember. I know the total number of plates was somewhere around seventy, on the job.

Q. Were they scattered all over the boat, or all concentrated in one section?

A. On the sheer strake, they went all the way around the boat; and under the bottom, on the end, I think on the ends of the boat, there was some left,—some of the old plating left.

Q. Well you said something about renewing plating under the bottom, forward. Do you remember how much plating you renewed up there?

A. I don't remember the exact number of plates, no.

Q. Did you renew the bottom generally, forward?

A. Yes, generally. We opened up quite a big body of it, I know.

Q. How much amidships?

A. Some of it run back amidships, and ran all along on the bottom.

Q. And how about aft?

A. Same way.

Q. Well let's see; how about the strake next to the keel; did you take all the plates out on either side?

A. I don't remember whether we took them all out or not.

Q. Well did you take out any under the gasoline tanks?

A. I don't even remember that, but I imagine we did.

Q. Take out any under the engineroom?

A. Oh, yes.

Q. Are you sure about that?

A. Yes.

Q. Do you remember how general that was?

A. Pretty general under the engineroom, I believe.

Q. You wouldn't go so far as to say you took them all out under the engineroom, would you?

A. No.

Q. Do you remember whether she had a generator in the enginercom?

A. I don't know whether she did or not; I had nothing to do with that.

Q. Take out any plates under the generator?

A. I don't know. That is in the engineroom I suppose, and I expect we did.

Q. Took out any plates under the engines themselves?

A. I think so.

Q. But you didn't take up the engines?

A. No, we didn't take the engines out.

Q. Do you remember how the engines were bedded?

A. That has got nothing to do with the plating, how the engines are bedded. They don't touch the plating.

Q. Do you remember how they were?

A. No, I can't say that I do.

Q. Well how did you get to the plates, under the engines, to rivet the plates back on?

A. There is plenty of room under there; them engines are probably that high.

Q. Lots of room under the engines, were there?

A. Yes.

Q. Practically about a foot?

A. Yes.

Q. A man could work under there without any trouble?

A. Yes.

Q. Since we have been discussing this, Mr. Thibault, have you thought of the names of any of the other boats that were there from the first of August to the end of December, 1927?

A. We had at that time approximately a hundred boats in the yard; I don't know that I could. I might offhand

name a few of them. We probably had a hundred boats; the yard was full of storage, at the time.

Q. Have any of the photographs of the Seminole been shown to you recently Mr. Thibault?

A. I think I have seen a couple, some time ago, down there around Nuta's yard; they was showing some of them pictures. Whether it was Pilkington's yard, I don't know; I have seen some of them from somebody, but I don't remember who.

Q. Then as I understand it Mr. Thibault you haven't seen the Seminole since this job was done in 1927—early 1928?

A. Oh, yes, I have seen her lots of time.

Q. I mean, to work on her?

A. No; I don't know that we ever hauled her out after that, or not. She was hauled out a couple of times a year; I don't remember when the last time was.

Q. You say she had been surveyed in the spring of 1927?

A. Yes, if I remember rightly they went over it and we made them up a—

Q. I am sorry, but I am afraid the reporter is having difficulty in hearing you.

A. She come in there for a survey and we ordered plating and angle bars and so on, like that, which we expected, and after we hauled out they found out they had to remove extra plates and had to put double that, if I remember rightly.

Q. Do you remember who made that survey?

A. That was made directly under Captain Nelson's supervision.

Q. Anybody else participate in it, as far as you know?

A. He was the man that said what was to come out. We gave him the men to help him.

Q. Did you go over the job with him at that time, to decide how much plate to get, and that sort of thing?

A. Yes; I think, if I remember rightly, we made him up a plan showing the number of plates, so he could submit to his owner, the number of plates that had to be removed.

Q. Was there a survey written up?

A. I don't remember.

Q. Were the plates marked and numbered?

A. They were on this plan, yes.

Q. How long since you have seen that plan?

A. I have never seen it since.

Q. Then you don't remember doing any work on the Seminole from the time you finished this job in 1927 or early 1928, is that right?

A. No, I don't remember whether we ever hauled her out after that or not.

Q. Well when did she next come to your attention in any particular way?

A. Why I don't know, unless when she burned up up there at Lauderdale.

Q. You remember reading about that in the newspapers I suppose?

A. Yes.

Q. Then the Seminole was next brought to your attention when Captain Patton called on you about a month ago?

A. No, I had seen her every day for the last couple of years.

Q. I mean, the next time you had any conversation about her?

A. Oh, I guess I have had conversations about her with different people, in an offhand way I guess; I don't know.

Q. About the work that was done in 1927?

A. No.

Q. You hadn't considered this 1927 work since the time the job was finished, until Patton called on you?

A. No; not in any particular way, I don't suppose I have.

Q. Hadn't discussed it particularly with anybody?

A. No.

Q. Well what you have given us here today is your recollection after twelve years, approximately?

A. Well it is very easy to recollect.

Q. Is that right?

A. Yes.

Q. Unrefreshed by any written documents; and you began thinking about that work for the first time when Captain Patton called on you about a month ago; is that right?

A. Yes.

Mr. Underwood:

That is all.

Re-Direct Examination.

By Mr. Matteson:

Q. Mr. Thibault you said something about it was easy to recollect; what did you mean by that?

A. Why because it was a job out of the ordinary for that yard. We had no facilities ourselves for doing steel work, and it was the only real job of steel work that the yard ever done. That's why it is easy to recollect it.

Q. You spoke of several men being on board the yacht at the time the work was done. Do you refer to members of the crew?

A. If I remember rightly, there was an engineer aboard, and some of the crew aboard.

Q. Do you remember who the engineer was at that time?

A. I think it was a man by the name of Brown.

Q. Do you remember any of the others?

A. No, I don't remember any of the crew's name.

Q. These plates that were renewed, of course it is abc to you, but are these on the outside of the ship?

A. Outside, absolutely.

Q. On the outside of the frames?

A. Yes, absolutely.

Mr. Matteson:

That is all.

Mr. Underwood:

In order to rivet the plates on the outside, you have to have a man both outside and inside, didn't you?

A. Yes.

Mr. Underwood:

That is all.

By Mr. Matteson:

Q. Of course, whenever you do any riveting, you have to have a man on each side?

A. If you rivet, yes.

Q. And the man on one side operates the hammer, the man on the other side holds—

A. The "holder-on".

Q. So the "holder-on" holds the tool against the rivet, to hold it in place?

A. The head of the rivet.

Mr. Matteson:

That is all.

(Witness excused.)

4026 Thereupon L. T. BROWN was recalled as a witness on behalf of Libelants, in rebuttal, and further testified as follows:

Direct Examination.

By Mr. Matteson:

Q. Mr. Brown, were you on the Seminole in 1927 when the Seminole was at the Merrill-Stevens yard for some work, in the latter part of that year?

A. Yes, sir.

Q. What was your position there?

A. Chief Engineer.

Q. Were you there during the whole period of the repairs, in the latter part of 1927?

A. Yes, sir.

Q. Did you receive pay, were you on the payroll I mean, of the Seminole, at the time?

A. Yes.

Q. Were there any other members of the crew on board?

A. Yes, there were several that I remember,—that I recall.

Q. Do you remember who they were?

A. The Captain and myself, and my oldest boy was on,—that I know definitely. I couldn't swear to the other names, but there was several of the deck crew retained.

Q. Was that during the whole period of repairs?

A. Yes.

Q. In the course of about what part of the year did that work begin, do you recall?

A. I don't recall exactly; along during the summer, it seems; the latter part of the summer.

Q. Now during that period of repairs there at the yard, were the gasoline tanks of the Seminole removed from the vessel at any time?

A. Gasoline tanks?

Q. Gasoline tanks.

A. No, sir.

Q. Was the position of the gasoline tanks changed?

A. No, sir.

Q. Were the tanks elevated,—that is, put in a higher position, two or three feet?

A. No, sir.

Q. Was the bulkhead separating the space where the tanks were, from the engineroom, removed?

A. No.

Q. Were there any trays installed under the tanks in the Seminole at that time?

A. None whatever; during that job?

Q. During that job.

A. No, sir.

Q. Were the engines removed,—the main engines of the Seminole?

A. The main engines were not moved; no, sir.

Q. Tell me what work was done in and about the engineroom during the period of the repairs that I speak of?

A. I pulled the generating set, which is a small Winton, from under the Engineer's room, and set it out just to the port side of the port main engine. Of course that necessitated making new timbers for her, and bolting it in; but that was just simply moved from one position to the other, to make it more accessible. Put in a new workbench; and a small auxiliary set was built,—I built it out of some pieces I had around there,—an old engine and an old motor that I used.

Q. Who did the work in moving the generator?

A. Well I did most of it myself, with the help of a man from the yard, for a while; possibly two men for a while; that is the yard,—the Merrill-Stevens furnished. I would say one or two men for one or two days, but for a short time, to help on the job.

Q. Any of the members of the crew assist you?

A. Well I worked that boy of mine wherever I could work him; he was possibly helping too while we were moving it.

Q. In connection with the moving of the generator, did that involve any alterations or changes, anything else in the engineroom?

A. No, I wouldn't say any changes that did not affect the generator itself.

Q. Was any electrical work done?

A. The generator wires were possibly lengthened out, a matter of seven or eight feet.

Q. Was that all?

A. That's all.

Q. Were any changes made in the gasoline piping from the tanks?

A. The only change in that generator of mine, taking out the old line and running a new line to the new position.

Q. Was the gasoline piping renewed at that time?

A. That part was; I put in copper tubing as I remember it.

Q. For the generator?

A. For the generator.

Q. Any of the rest of it changed?

A. No, sir.

Q. Prior to the time that you went to Merrill-Stevens for repairs, had you had any difficulty in the gravity feed of gasoline from the tank to the main engines?

A. No, sir.

Q. Was the side plating of the Seminole removed in the way of the engineroom and tank space at that time,—any of the side plating?

A. No, there was no side plating removed.

Q. Was there some bottom plating?

A. Yes, part of it.

Q. Were the floor frames or plates removed under the engineroom or tank compartment?

A. No, sir.

Q. With the side plating in place, and the floor frames and plates in place, it would have been possible to remove the gasoline tanks from the Seminole through the bottom or sides of the ship?

A. No, it wouldn't.

Q. Was any work done on the gasoline tanks at all at that time?

A. None whatever.

Q. What construction of the vessel was over the tank space or the space where the gasoline tanks were, can you tell me?

A. Amidships there was the after end of the forward deck house, which was used as a Captain's cabin.

Q. Can you point that out on this plan which we have here, Phipps Exhibit A?

A. There is your tanks, engineroom and the tanks; across here would be the Captain's room; it set directly above here. It seems to be a little bit long, but the Captain's room would come right about in there somewhere. That may be just right; I guess it is.

Q. And the Captain's room to which you refer is the room that is marked "Captain's Stateroom" on the plan, on the upper half of the sheet, is that right?

A. That is right. This is the forward deck house, or the music room as we called it.

Q. That is forward of the Captain's Stateroom?

A. Forward of the Captain's stateroom; and this Captain's room extended back to the smokestack, which we installed at Palm Beach; we installed a toilet and wash stand and shower bath and the smokestack; that extended out in here.

Mr. Underwood:

In the engineroom.

Q. Was there any opening through the tank space to the Captain's room or the deck over the tank space?

A. No, sir.

Q. Was any part of the deck or the Captain's cabin, over the tank space, removed at this time, during this period of repairs?

A. No, sir, there was none of this removed; no, none of it.

Q. Was there any means of access to the tops of the tanks through the Captain's room or through the deck, over that space?

A. No, sir.

Q. No way of getting at them at all?

A. No way of getting at them at all.

Q. Was there any way in which you could get at the air vent lines on the tops of the tanks to do any work on them or inspect them?

A. No, sir; they were forward of the engineroom bulkhead.

Q. And under the Captain's cabin, or the deck, as you described?

A. Yes.

Q. It has been suggested Mr. Brown that during this period, between midsummer and the end of the year, while these repairs were under way, that the gasoline tanks were removed from the vessel and that two of them were laid alongside of the vessel, on the ways, or on the dock, and that the bottoms of at least two of them were removed so that the interior of the tanks could be examined. Will you tell us what the fact is with respect to that?

A. The tanks were removed and placed?—I think it has been covered, hasn't it? They were not removed.

Q. They were not removed.

A. No, sir.

Q. Then the work that I described was not done?

A. No, sir.
